British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Nov. 7, 1888.

There has been a large business *sub rosa* in Copper and Copper furnace material, and the actual transfers the past week or ten days are in marked contrast with the transactions as reflected by the ordinary speculative trading. The purchases have been largely by the "syndicate" agents, and suggest that, while meeting the demand for Chili Bar futures freely at £78. 10/, they are ready buyers of either prompts or futures at 10/ less. One firm is reported to have sold the "syndicate" a block of 200 tons at £78, deliveries running the next two months. Among sales of Anaconda Matte the past fortnight Messrs. James Lewis & Sons' circular notes 150 tons at 15/6, at Liverpool.

Several new copper companies have been floated the past 30 days, and their shares nearly all subscribed for.

In the face of the steadily downward course of prices the greater portion of the week, prominent operators in Block Tin are prophesying a higher market for the future. Their belief is based upon the merits of the statistical position. However, the demand from other than American buyers is somewhat disappointing. It is stated that the principal buyer for the American market took 1300 tons from the London stock last month.

Pig Iron "warrant" speculation has been dormant. Inside brokers who were conspicuous in the efforts made recently to advance prices have since figured more prominently in operations of the reverse character. There is, however, a tendency to proceed with caution in view of the several influences that might be brought to bear with unfavorable effect in the event of either excessive buying or overselling. Makers' brands of Scotch Pig have ruled irregular, some showing a slight advance and others a decline. Hematites are lower, but Cleveland Pig remains steady.

There has been no change of importance in the Tin-Plate market. Makers still offer very moderately for prompt delivery in view of the extent to which they have orders booked ahead; but new orders are running very light, and those from America are disappointing. What little business has been done indicates a slight margin of difference between the actual trading basis and the prices generally quoted. The works of the Villiers Tin-Plate Company, Limited (two mills), have been started up.

In the Steel trade there has been no material change. A good business is doing in shipbuilding and railway descriptions and in Billets but at somewhat variable prices, while Blooms, Slabs and Rods are in only moderate request. Manufactured Iron continues to meet with brisk sales and prices are strong, with a further 2/6 advance on Common Bars. Old Material is in only moderate request, but the offers made find holders firmer on prices and less anxious to sell.

Scotch Pig.—The market has been very quiet and prices show some irregularity:

No. 1 Coltness, f.o.b. Glasgow.....	49/
No. 1 Summerlee, " ".....	50/
No. 1 Gartsherrie, " ".....	47/
No. 1 Langloan, " ".....	48/6
No. 1 Carnbroe, " ".....	43/6
No. 1 Shotts, " at Leith.....	48/6
No. 1 Glengarnock, " Ardrossan.....	47/6
No. 1 Dalmeilington, " ".....	42/6
No. 1 Eglinton, " ".....	41/6

Steamer freights, Glasgow to New York, 6/6

Liverpool to New York, 10/.

Cleveland Pig.—Business moderate, but no change in prices. No. 1 Middleboro', G.M.B., 37/; No. 3 do., 34/6.

Bessemer Pig.—Transactions have been on a smaller scale and prices are weaker. West Coast brands, mixed numbers, 42/6, f.o.b. shipping point.

Spiegeleisen.—The demand for Spiegel keeps up well and prices are firm. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—The market continues active, and prices, while irregular, are firm. Standard English sections quoted at £3. 18/9, f.o.b. at N. W. England shipping point.

Steel Blooms.—No improvement in the demand for these, and prices unchanged. We quote £3. 18/9 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—There is still a fairly active business and prices are held firmly. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—A moderate business passing at about former prices. Bessemer, £3. 18/9, f.o.b. at N. W. England shipping point.

Steel Wire Rods.—Makers very firm on prices and report a good demand. Mild Steel No. 6 quoted at £6 and No. 5 at £5. 19/3, f.o.b. at N. W. England shipping point.

Scrap Iron.—The market slow and prices irregular. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Old Rails.—Business moderate, but sellers firmer on prices. Tees quoted at £3. 2/6, and Double Heads £3. 5/ @ £3. 6/3, c.i.f. New York.

Crop Ends.—A fair business at steady prices. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—Slightly lower prices on prompt deliveries and no improvement in

volume of sales. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/	@ 15/6
IC Bessemer steel, Coke finish.....	14/	@ 14/3
IC Siemens.....	14/	@ 14/3
IC Coke, B. V. grade.....	13/6	@ 13/6
Charcoal Terne, Dean grade.....	12/	@ 12/6

Manufactured Iron.—Demand continues brisk and the market strong. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d.	£ s. d.
" Common.....	@ 8	2 6
Staff. Bl'k Sheet, singles.....	@ 5	10 0
Welsh Bars (f.o.b. Wales).....	4 17 6	@ 5 10 0

Tin.—A fair business at irregular prices. Straits quoted at £102 @ £102. 5/, spot, and £102. 10/ @ £102. 15/ for three months' futures.

Copper.—The market firm, but rather quiet. Chili Bars, £78. 7/6, spot, and £79, three months' futures. Best Selected, £82 @ £83.

Lead.—Dealings have been large and the market shows more firmness. Soft Spanish, £13. 15/.

Spelter.—A fairly active business at steady prices. Silesian, ordinary, £18. 15/.

BRAZIL.

PARA, October 30, 1888.—*India Rubber*.—Shipments from Para to the United States for the months of August, September and October are 600 tons less than for the same time last year, the falling off being due to an increased demand for Europe. The stock remaining on hand is a mere trifle, and so is the amount afloat for New York.—*Per cable direct*.

EAST INDIES.

SINGAPORE, September 19, 1888.—*Tin*.—Our last report was dated 5th inst., since when a large business has been done at up to \$39.25 picul, and the market closes firm at \$38, with buyers, but no sellers. Shipments for the remainder of the year are expected to average at least 2000 tons per month. During the first eight months there have been shipped from the Straits Settlements to the United States 22,289 piculs, as compared with 59,481 last year, 52,817 in 1886, 20,253 in 1885, 41,857 in 1884, and 78,739 in 1883. *Gum Copal*.—There are some signs of a revival in the demand, and we have to report sales of upward of 4600 piculs, mostly for the United States. Prices have ranged from \$4 to \$11, according to quality. *Gum Damar*.—Some sales of Palembang have been made at \$20.25 @ \$21.50. *Tonnage*.—London rates via canal have advanced owing to scarcity of tonnage, to 35/ for weight. New York via Cape, the Sontag and W. Gildemeister are loading; cargo is very scarce, and rates are a shade easier. For Boston the John M. Clerk is loading. *Exchange* is firm at 3/2½ for six months' sight credits.—*Gilfillan, Wood & Co.*

MANILA, October 29, 1888.—*Hemp*.—Has been steady at \$11.12½ @ picul, against \$9.50 same date last year, equaling per ton cost and freight, £38. 7/6, against £33. 17/6. Clearances for the United States since last cable amount to 12,000 bales, against none last year; since January 1 they reach 184,000, against 190,000 bales; there remain loading for ditto 42,000, against 56,000; clearances for England since January 1, 284,000 bales, against 184,000; loading for ditto, 1000, against 5000; cleared for other countries, 61,000, against 34,000; receipts at all ports since last cable, 17,000, against 12,000; since January 1, 532,000 bales, against 443,000 in 1887, and 337,000 in 1886. *Freight*, \$1, against \$5.50. *Exchange*, six months' sight on London, 3/7, against 3/8½.—*Ker & Co. to Mr. Charles Nordhaus, their agent, 89 Water street, New York, per cable direct.*

SPAIN.

BILBAO, October 20, 1888.—*Iron Ore*.—A good deal of business has been done during the week, not only on the spot for single cargoes, but considerable amounts have been bought

for forward delivery next year extending over nine months in succession, at 8/ @ 8/4 for Cam-pinil, and 7/ @ 7/6 for Rubios. These are the figures current to-day, but they may have been slightly different at private sale. The number of steamers in port is still quite reduced, hence the amount of Ore shipped is not as heavy as last year, not exceeding since January 1 3,019,759 tons, as compared with 3,546,227 during the corresponding period in 1887. *Pig Iron*.—Shipments to Hamburg have been made to the extent of 1480 tons, and 235 tons coast-wise.—*Bilbao Marítimo y Comercial*.

GERMANY.

HAMBURG, October 27, 1888.—*Iron*.—The Rhenish-Westphalian Pig Iron market has, on the whole, been getting livelier. The demand for Steel material from abroad has resulted in larger orders; should this movement continue a little longer, it cannot fail to have a favorable influence on Pig Iron of all sorts. The feeling in Spiegel is improving; more is asked for it. Siegen makers have raised the price for Forge Pig to 48; there are orders for delivery next year. Thomas is in brisk request at 44. Bessemer, on the other hand, is dull at 52 @ 53. Foundry Pig is taken steadily at 53 @ 56. English Bessemer cannot be had for less than 44/8 on the West Coast. White Luxembourg Pig is worth 37.50; Gray, 43. Finished Iron is selling well for domestic use; the reverse is the case for export. At ruling high prices for Pig, Finished cannot be made cheap enough for export. Hoop Iron remains steady at 127.50. Plates and Sheets of all sorts continue doing well. The drawn Wire syndicate is to terminate on November 28; efforts will be made to continue it on a modified basis, pending which the Wire branch is unsettled. Wire Nails have of late been selling easily enough, but at depressed, unremunerative figures. Both foundries and machine shops are, if possible, still busier than before; this applies quite as much to car works. *Metals*.—Lead is drooping, Copper weaker, Spelter sustained.—*Bor-senhalle*.

The Paris Exhibition.—Preparations for the Paris Exposition of 1889 are on a colossal scale. The Eiffel Tower has reached an altitude of about 500 feet, or one-half of the total elevation. To the right and left rise two gigantic and graceful domes, and beyond, interspersed with kiosks and fountains, are seen the lofty roof and domed portico of the great central exposition hall. Between the central building, with its two enormous wings, are fast rising a number of minor structures, destined to receive the products of favored industries. Then all along the Quai d'Orsay and the river front, down to the esplanade of the Invalides, are series of long galleries for the reception of agricultural produce and machinery. On each side of the Pont de Jena, and fronting the Trocadero, they are constructing groups of buildings representing the habitation of man in every country, among all races, and at every stage of civilization, furnished as near to the historical reality as possible. The Trocadero itself, with its central buildings, its vast semicircular galleries and colonnades, its cascades and grounds, is to serve for a horticultural exhibition. In the left wing are exposed casts of all the masterpieces of ancient, mediæval and modern sculpture, together with casts and photographs of all the most renowned building of the East and West. The ethnological museum and the objects secured from New Mexico, Colorado and other Western regions are especially attractive.

A tunnel, over a mile long, and cut through solid rock, at a cost of \$1,000,000, has just been completed on the Montana Central railroad.

Burton H. Cook, 140 Quiney street, Brooklyn, N. Y., exhibits, at the American Institute Fair, Cook's Rotary Ash Sifter and Coal Screen. The device is shown in Mr. Cook's exhibit, which stands at the north side of the main hall. The circulars state that the Cook's sifter took the first medal ever awarded by the American Institute, and in 1887 was given the medal of superiority.

Hardware.

During the past week business has been exceptionally quiet and there is little new to be reported, but it is expected that with the subsidence of engrossing attention to politics there will be a return of trade to its former regular and satisfactory condition. Prices in most lines are unaltered.

Cut Nails.

Very little has occurred during the week to change the tone of the market, Cut Nails remaining \$1.80 to \$1.90 from dock for carload lots, and \$1.90 to \$2 from store. The refusal of a Chicago concern to enter into any arrangement has caused the proposed Western Nail Association to be given up for the present.

Barb Wire.

The market remains unchanged, prices continuing as before, with only a moderate demand. Quotations in this city are as follows: Galvanized Four-Point, 8.55 to 3.6 cents, with concessions for large lots.

Wire Nails.

The market remains unchanged since our last report, prices being regularly maintained by the manufacturers, whose business is, however, limited on account of the frequent offerings by parties who purchased largely at the lately ruling low prices, from whom the goods may be purchased at from 5 to 10 cents per keg below the extreme price at which the associated manufacturers are at liberty to sell. The regular quotations remain as before: \$2.65 for small lots, and \$2.55 for carloads. Wire Nails in papers are not as firm as the Standard Nails, owing especially to the fact that they are made by several outside parties, and there is no difficulty in obtaining the goods at slight concessions beyond the regular prices.

Miscellaneous Prices.

A very large business is done in Mica in Chicago, and, until quite recently, prices have been very steady, and results have been satisfactory to both the dealers and the producers whom they represent. A reasonable profit was obtained, which was fairly remunerative to all parties, and, at the same time, repressed speculation. Now, however, the trade is demoralized, values ruling below the actual cost of production, according to statements made by those in a position to ascertain the facts. One large dealer claims that some of his competitors have lowered prices fully 25 per cent. The reduction was not caused by a sudden increase in the supply, but by injudicious salesmen who were unduly influenced by buyers. It will take some time for the Chicago Mica market to recover from the effects of this ill-advised action. It is another illustration of the evils of giving salesmen discretionary power to name prices.

Hibbard, Spencer, Bartlett & Co., Chicago, Ill., have added a new and important department to their business, as they are making a specialty of Fire and Burglar-Proof Safes. These goods, which are illustrated in a separate catalogue, are offered to the trade at special prices as follows, terms 60 days, or 2 per cent. discount for cash in 10 days:

No. 2 Safe.....	\$17.50
No. 3 Safe.....	25.00
No. 4 Safe.....	35.00
No. 5 Safe.....	55.00
No. 6 Safe, with usual hinges.....	65.00
No. 6 Safe, with double crane hinge.....	70.00

Henry's Patent Combination Haft, manufactured by Joshua Britton & Son, Stoughton, Mass., and shown in their advertisement on page 55, is sold at \$6.50 per dozen.

We are advised that P. Lowentraut, Newark, N. J., for whom James Forsyth is agent, 116 Chambers street, New York, has as many orders for Skates as he will be able to fill by December 1, and in order that his customers may not be disappointed desires it to be noted that he is not in a position to fill other orders until that date. He also announces an advance of 20 cents on No. 1 and No. 8 Skates, and 25 cents on all other numbers.

The following revised prices, under date November 1, have been announced for Lead Pipe, Sheet Lead, Block Tin Pipe and Tin Lined Pipe:

Lead Pipe, per pound.....	6 1/4 cents.
Block Tin Pipe, per pound.....	45 cents.
Sheet Lead, per pound.....	7 1/2 cents.
Tin Lined Pipe.....	15 cents.

McIntosh, Huntington & Co., Cleveland, Ohio, announce special prices on Slaw Cutters and Cimeter Hay Knives.

The prices of Wrought-Iron Pipe are firmly maintained at the last advance and the quotations named by the different manufacturers are substantially the same, an understanding in regard to prices having been again reached.

The ruling prices of Tacks show a considerable divergence in the quotations of different manufacturers, and some lower prices than have heretofore prevailed are now ruling.

The following revised prices for Shot were announced by the manufacturers November 1. They are subject to the usual discount of 2 cents for cash in five days:

Drop, per 25-pound bag.....	\$1.85
Drop, per 5-pound bag.....	.32
Buck and Chilled, per 25-pound bag.....	1.60
Buck and Chilled, per 5-pound bag.....	.37

Foster Bros., Fulton, N. Y., in their catalogue represent their line of Cleavers, Butcher Knives, &c., giving illustrations of the goods, their price list being furnished in a separate sheet. Their announcement in regard to this line of goods will be observed on page 59, in which some of their patterns are represented. Their Knives are subject to a discount of 40 per cent., and their Cleavers to a discount of 30 per cent.

Ammunition.

As the result of conferences between the special houses and the Ammunition Association some important changes have been made in the system by which the association markets its goods and regulates prices. The E. C. Meacham Arms Company, St. Louis, has been reinstated as a Special House. This action was taken so that the market might be free from the serious disturbance that would result from the continued opposition of the company and their offering goods at irregular prices. It was ultimately approved by the other specials, by whom the modifications made in the system of the association were also accepted. These changes are made with a view to correcting the irregularities which had developed and also making the arrangement more satisfactory and permanent. No change has been made in the prices of the goods or in the terms at which they are obtained by contract or non-contract houses, but a modification of the arrangements with the special houses has been decided upon. In the new plan, the main features of which are settled, though some minor details are still undecided, the special houses will receive from the association a fixed sum in lieu of the commission heretofore given them on goods sold by them to the contract houses, thus removing, it will be seen, some incentive for seeking as large a proportion of the business of the A houses as they have recently been obtaining. The one-third clause, to which strenuous objection has

repeatedly been made, has been rescinded, and also the requirement that the reports of the special houses be attested by affidavit. It is hoped that the new measures thus adopted will have the effect of putting the Ammunition business in better shape than it has been for some time. Precisely what effect the new method of remunerating the special houses as distributors of the goods may have remains to be seen, but it will probably lead them to seek more than heretofore the orders of non-contract houses, on which they are given a commission or rebate, and at the same time it removes the inducement to special efforts to sell the contract houses, as for such business they are paid a fixed sum, without reference to the amount of their sales. The fact that the E. C. Meacham Arms Company have been restored to their former place as a special house, and are understood to be heartily in accord with the new system, is an important feature in the situation.

Trade Topics.

At the last meeting of the Heavy Hardware Jobbers' National Union, held in St. Louis, on the 19th ult., the following resolution was offered and unanimously approved:

Whereas, The present tendency in trade and traffic is developing into combinations and trusts, the very spirit of which savors of centralization of capital and power, which of itself is directly opposed to the genius of our national institutions. This association favors the broadest freedom and independence, in both buying and selling, and it is not the purpose of this association to combine on prices in either buying or selling; therefore, be it

Resolved, That no combination or selling prices are intended by this association, but that we associate for mutual protection with each other in trade, and while not establishing prices which will bind any locality, or individual member, each member of this association pledges himself to each other to sell his goods, of all classes, at prices which will yield a reasonable net profit, and that we each recognize the fact that legitimate trade requires this and no more to preserve individual freedom of action, while at the same time mutual cooperation as members of an association.

The unbusiness-like habit which is sometimes practiced of failing to prepay telegrams when desiring information from merchants and manufacturers in regard to goods which they offer, is referred to in the following letter:

I wish to all your attention to the fact that some business men send all their telegraphic dispatches collect. It is a nuisance. Some persons, I suppose, think that because a man favors another with his trade that he is at perfect liberty to wring out of him all the expense of wiring, whereas such expenses between the two parties that are dealing with each other ought to be mutual—that is, each party prepay his own dispatches. Of course, I do not mean that answers ought to be prepaid where such answers do not involve or anticipate any prospective business between the two, but where two merchants or a merchant and manufacturer are dealing together, each ought to prepay his own dispatches. Some three months ago a merchant commenced wiring me collect, negotiating for a carload of goods, and before I could stop him it cost me \$9.50 and I did not sell him after all.

A recent issue of the *Graphic* of this city is devoted largely to Louisville, Ky., with illustrations representing some of the principal business establishments, and articles relating to the city, its manufactures, business, &c. Among these il-

lustrations are some of the Hardware house of W. B. Belknap & Co., the front of their store being shown and a view of their sample room given. In the article relating to the house, their prominent position among Hardware jobbers of the Middle and Southern States is alluded to, and a reference made to the various departments of their business. As referring to the position which jobbing houses occupy in the Hardware trade, the following extract from the article may be of interest:

Among the best evidences of Louisville's growth, prosperity and expanding trade is the development of a better class of jobbing houses. Manufacturers have multiplied surely, and are increasing in variety and magnitude, but concurrent with this go the jobbers or the great distributors of goods, quite as essential in the second place as are those who manufacture in the first. Large stocks of goods in the hands of wholesale houses tide over times of suspension of manufacturing and afford a supply to the consumer when it could not be otherwise had. In short, jobbing houses are the grand reservoirs of over supply in times of excessive production and main sources of distribution when the supply runs short of the country's needs, exerting thus a conservative force of inestimable value. So much for generalities.

Items.

Simmons Hardware Company, St. Paul, Mo., have issued their fall catalogue. It is devoted to Skates, Sleds, Sleigh Bells, Boys' Wagons and Wheelbarrows, Fire Goods, Ice Tools and Lumbering Tools. The Ice Tools which are tastefully exhibited on page 30 are those manufactured by Wm. T. Wood & Co., for whom the house are Western agents. A complete line of the goods is carried in stock. The company have also recently taken the agency for the Champion Lumbering Tools, some of the leading patterns being illustrated. It is stated that special catalogues of the Ice Tools and the Lumbering Tools will be sent to those who desire them. As evidence of the enterprise of the house and the completeness of their establishment it is to be noted that the catalogue has been printed by them in their own printing department.

Kingman & Co., Peoria, Ill., and St. Louis, Mo., issue a handsome catalogue of more than 200 pages, in which they illustrate their extensive line of Farm Machinery, Wagons, &c. It opens with a list of their principal agencies, including the Moline Plow Company, Moline, Ill.; Stoddard Mfg. Company, Dayton, Ohio; Marcellis Mfg. Company, Marseilles, Ill.; Vandiver Corn-Planter Company, Quincy, Ill.; Russell & Co., Massillon, Ohio; Milburn Wagon Company, Toledo, Ohio, and Fish Bros. Wagon Company, Racine, Wis. They have also a warehouse in Kansas City, Mo.

Palmer Hardware Mfg. Co., Troy, N. Y., issue circulars of King's Patent Adjustable Bit Gauge and King's Improved Sash Support and Bolt, which they are putting on the market.

McIntosh, Huntington & Co., Cleveland, Ohio, issue a number of new pages for their catalogue. They relate to Locks, Vises, Registers and Door Springs.

Edward Kirby & Co., commission merchants, Alexandria, Egypt, have added to their business a tourists' office, and they are making arrangements to convey travelers up the Nile, also to Palestine, Constantinople and other points.

John Pritzlaff Hardware Company, Milwaukee, Wis., have issued a price current devoted to Axes, Cross-Cut and Wood Saws,

Lumbering Tools, Hay Knives, Stove Boards, Meat Cutters, Skates, Sleigh Bells and other seasonable goods.

The death of Phineas S. Hadger, secretary of the E. D. Clapp Mfg. Company, Auburn, N. Y., occurred on the 25th ult. The funeral was attended Monday, 29th ult., from his late residence in that city.

The Yale & Towne Mfg. Company have most handsomely fitted up their new Chicago office and salesroom at 152 and 154 Wabash avenue. The room is very wide and deep, giving them most spacious quarters, and affording ample opportunity for a tasteful arrangement of their several departments, as well as a very striking display of their goods. The cabinets have not yet been completely furnished with the samples which are to occupy and adorn them, but enough has been done in this line to enable the visitor to form some conception of the artistic possibilities in a display of Builders' Hardware. It is expected that the stock will be completely arranged at an early day, when a more detailed description of this establishment will be given. The company propose to make it one of the finest salesrooms for Builders' Hardware in America.

The Lissberger Metal Company have established an office and salesroom at 21 West Lake street, Chicago. They are manufacturers of Plumbers' and Tinnerns' Solder, and of Stereotype, Electrotype and Babbitt Metals; also smelters, refiners and dealers in Ingot Copper, Pig Lead, Pig Tin, Antimony, &c. Their works are in New York. The Chicago representatives of the company are M. J. & J. D. Lissberger.

Chase & Churchill, an old and well-known firm of high standing, at Weeping Water, Neb., have sold their Hardware business to Sackett & Amerman. The purchasers are old residents of that place, and are understood to have abundant means to carry on the business. Chase & Churchill will continue in the Crockery trade, having hitherto been interested in both Crockery and Hardware.

In the item relating to the manufactures of the F. B. Harkins Foundry Company, Bristol, Pa., in our issue October 25, the address was incorrectly given as Bristol, Conn. The trade will please to note the correction, as it may have led some of them to address letters erroneously.

G. & H. Barnett, Black Diamond File Works, Philadelphia, have been awarded a silver medal for the best Files and Rasps by the Centennial Exposition of the Ohio Valley and Central States at Cincinnati.

Tendencies in Trade.

The following letter, from a Missouri Hardware house, while referring to the increase of direct dealings between the merchant and manufacturer, alludes to the important place filled by the jobbers as distributors of goods:

In our opinion there are more goods sold direct from the manufacturers to the retailers than there were one or five years ago, and there seems to be a general tendency in that direction; but we think it will never become universal, as, in one sense, the jobber is as necessary to the trade as the manufacturer or retailer. There are several reasons on which we base our opinion, one or two of which we give, as follows: Retailers are getting educated to the idea that it is better to order often and in smaller quantities, which does not require as much capital in their business as it would to purchase in jobbing quantities in order to obtain the extra discount given by the manufacturers. Another point in favor of the jobber is that they carry in stock a variety of goods usually sold in the retail Hardware busi-

ness, which could not all, nor 10 per cent. of them, be furnished by the general manufacturers of the country, thus making it necessary for the retailer to send out ten orders in order to obtain what he can get through the jobber in one. Not only that; from the jobber he always has such a variety to select from that he can make out an order large enough to make up a freight order, which, for profit, should never be less than 100 pounds shipping weight, as the railway companies charge as much for 10 or 50 pounds as they do for 100 pounds, and then the goods in the hands of the jobbers are at points nearer to the retailer, which assures him less freight and greater promptness in receiving his goods, and the small per cent. taken by the jobber is but just compensation for the convenience and advantage the retailer and consumer derive from receiving their goods in small quantities and the time saved in obtaining them.

From a gentleman who has exceptional opportunities for observing the tendencies of trade we have the following, in which it will be seen that the opinion is expressed that jobbers are more than holding their own:

It was my impression six months ago that the jobbers were losing their grip on the large trade, which was going to manufacturers. But my opinion now is that the large retailers do not care to pay a premium for the privilege of buying goods of manufacturers, and they seek to buy in the cheapest market and the large jobbers are doing more business than ever in their history, and I see no reason why they will not continue to have the same experience right along. It is an advantage to a buyer to place his orders with a jobber for many reasons, among which may be mentioned that they are filled quicker and he can order many lines of goods from the same concern, while in buying from factory he is often compelled to buy more than his trade demands to make an order of sufficient volume to justify separate shipment. Jobbing houses are extending their lines constantly to meet the wants of the trade.

The letter printed below from Minnesota compares the experience of our correspondents with that of F. B. Straub & Co. as represented in their table recently published:

We were particularly interested in the table as prepared by Fred. P. Straub & Co. in *The Iron Age*, October 11. It shows a systematization rarely found among retailers. While we cannot give percentages, we know full well that our trade with the manufacturers is increasing as against the jobbers. As to the Eastern manufacturers gaining over the Western, we hardly think it is true in our case. We think the West is holding its own.

Referring to the proportion of purchases from the manufacturers and jobbers, respectively, a Hardwareman in this State writes:

I have never kept any exact account of the proportion of purchases made from manufacturers as separated from jobbers, but should think in Hardware it would be four-fifths; in Carriage-makers' material, as Wagon Tire, Springs, Wheels, Spokes, Rims, &c., the whole; in Tinware the whole; in Woodenware pertaining to House-Furnishing goods nearly all from the jobbers; in Brushes about half from each. I purchase where I can find the best goods for the money. Do not care whether from jobber or manufacturers, but am apt to find more goods with a jobber than a manufacturer.

The following letter from Illinois goes with some detail into the matter of purchasers from jobbers and manufacturers

and alludes to the important place held by the great Western jobbers:

In looking over our invoice book we find that from 1874, when we commenced business, until 1882 we bought nearly all our goods of New York and Philadelphia jobbers and Eastern manufacturers. Such firms as Landers, Frary & Clark, Reading Hardware Company, Sargent & Co., Oliver Bros. & Phillips, Biddle Hardware Company and others sent their men here regularly, and from them we bought a great many goods. But within the last six or eight years they have all quit coming here. Owing to the active competition between the rival cities of Chicago, Milwaukee and St. Louis for trade in this section we have been able to buy as cheap of them as we could in the Eastern markets for such quantities as we buy. The consequence is the Chicago and St. Louis jobbers have driven out their Eastern competitors. As an instance I might mention that a short time ago we wrote to H. Disston & Sons for price on eight dozen Saws. The Chicago jobber sold us the Saws 5 per cent. better delivered than Disston's quotation in Philadelphia. We, of course, buy Nails and Barb Wire in carlots from the manufacturer. Speaking of Nails I would say we have bought all our Nails from Centralia Illinois Mill for the past six years. Formerly bought them in Wheeling or Pittsburgh. With such firms as Simmons Hardware Company, St. Louis, and Hibbard, Spencer, Bartlett & Co., and Horton, Gilmore, McWilliams & Co., Chicago, with their large stocks and varied assortments, the retail merchant in this section who is a close cash buyer can do as well as by going further East and is in less danger of overstocking, as is often the case in buying of the manufacturer who offers a special 5 per cent. for quantities.

A well-known wholesale Hardware house of the Northwest gives the following general view of the situation as seen from their standpoint:

In our opinion the manufacturers each year are reaching a smaller class of trade than ever before, and a great many of them oftentimes sell to smaller dealers as cheap or cheaper than they do to jobbers. This habit seems to be growing and it has got about to the place where, on a great many line of goods, a good large retailer can buy them as cheap as the average jobber does. This, of course, does not seem a fair thing to the jobber, but in our minds it is nevertheless a true state of the case. And while we are glad to see that there are some notable exceptions to the rule, still the tendency is growing more and more the other way.

From a number of letters which we have received from merchants in various parts of the country we extract the following remarks in regard to the question, in which it will be seen that the matter is looked at from different standpoints:

Evansville, Ind.—As far as I observe, there is no change in the retailer's method of buying. All the retailers I am acquainted with, with a few exceptions, buy direct from the foundries or manufacturers. Drummers representing the manufacturers are as numerous as ever. Retailers now send their orders for odd plates for stoves to the jobber, sending also a collection of small broken orders, thus saving the dealer the trouble of writing to different parties and lessening express expenses, and generally these orders are more punctually attended to.

Fenton, Mich.—So far as my experience goes I think that nine-tenths of all the goods are bought from jobbers. There are certain lines of goods bought now and then from manufacturers, such as Nails, Bar Iron, Glass, White Lead, Tinware, &c., but they are now-and-then purchases. Most of the country dealers buy in too small quantities to stock from manufacturers. Our orders are of numerous kinds and quantities and almost daily, so to deal with manufacturers is out of

the question; and then there is no speculative tendency with dealers in laying in stock with an expectation of an advance. Hence the often purchasing for daily wants.

Wellston, Ohio.—From our personal observation we do not find any advantages in dealing direct with the manufacturers, as the jobbers are able to offer the same inducements as the manufacturers. Believe the jobbing business to be on the increase in our locality.

Ithaca, N. Y.—We buy more goods from the manufacturers than formerly. We do not keep a record of the amount we buy from the jobber or manufacturer, but our opinion is that three-fourths of our trade is with the latter. It seems as if the manufacturers are making a greater push than ever to deal direct with the retail trade; they don't like the extreme cutting the jobber indulges in.

Wichita, Kan.—We purchase mostly from jobbing houses, especially Shelf Hardware. Pieced Tinware mostly from manufacturers, while we get most of our Stamped Tinware from jobbers. Granite Ironware we get from jobbers, while Stoves and Nails are bought direct from the manufacturers. Some lines of goods we can purchase cheaper from the jobber than from the manufacturer. Other lines we can purchase cheaper from manufacturers than jobbers. In heavy goods we think we can do better by dealing directly with the manufacturer as a general rule. For instance, purchasing Wheelbarrows from the manufacturer we receive them in better shape than when we get them from jobbing houses, as they are not handled so often.

Springfield, Mo.—Our business is almost entirely jobbing. We intend to and do buy all our goods direct from manufacturers. Cutlery, &c., we import through New York houses. Should think much the larger proportion of our purchases were west of Buffalo, as we buy all staples and heavy goods West, except Burden's Horsehoes. Some Axes, Scythes and Shelf Goods come from New York State and New England.

Cooperstown, N. Y.—So far as my experience goes in regard to purchasing directly from manufacturers, I buy no more goods from them direct than I did five years ago. But a few years ago nearly all my purchases were made from jobbers, but gradually this was changed, and for the last five years nearly all my goods were bought from manufacturers, and the purchases from jobbers are in smaller quantities. I find that I cannot easily get along without the jobber, as my orders are more assorted and I find it very convenient to make up my orders of assorted goods from them.

Willmar, Minn.—I am of the opinion that the table of Fred. P. Straub & Co. is as true a reflection of the general tendency of trade, as between manufacturer and jobber, as it would be possible to produce.

Arrangement of Stores.

The accompanying illustrations, Figs. 289 and 290, relate to a method of managing Glass, as described by H. G. Hall & Son, Boston, Mass. It will be observed that the Glass Rack, which may be di-

Fig. 289.—Glass Rack and Folding Table.

vided into a greater variety of partitions than are shown in the illustration, is placed upon the counter, and the Glass Board is arranged so that it can be readily placed in position for use, or raised up out of the way so as to rest against the front of the Glass Rack. The illustration, Fig. 289, shows it let half-way down. Fig. 290 represents the face of the Glass Board, which has a raised edge on two sides. Rules

29 and 47 inches, respectively, are set in flush with the face of the board in the manner indicated, thus giving a convenient arrangement for measuring and cutting the glass. The board is attached to the counter by Chest Hinges, the supports or legs in front being attached by

Fig. 290.—Top of Glass Table.

Back Flaps. There is a hook and eye, as indicated in Fig. 289, for the purpose of holding the board close up to the Glass Rack. The entire length of the Glass Board is 48½ inches, and its entire width 30¼ inches.

From F. A. Herrick, who has been for a number of years with Warner & Dodge, Jackson, Mich., we have the description of a rack for displaying Pumps and other goods, which is shown in Fig 291. The rack is made by taking a piece of 4 x 4

Fig. 291.—Method of Displaying Pumps, &c.

timber and beveling the corners and making it of such a length that will reach from floor to ceiling, when it is fastened securely at top and bottom. The first shelf is 34 inches from floor and is made of 1½-inch plank and is 21 inches in diameter, with cleats nailed to the post under the shelf, and four iron braces 18 inches long

underneath running from the outside of the shelving to the post. Holes are bored near the outside of the shelf to let the pipe to the Pumps on the top shelf reach in, so as to hold them in place. The top shelf is made the same as the bottom except that it is 28 inches in diameter. Well Pumps are placed on the top with holes or notches for the pipe to fit in, and, being larger than the bottom, the lower ends of the Pumps fit into the notches on the lower shelf. Cistern Pumps are placed on the lower shelf, as shown in the cut. By this arrangement it will be seen that the lower shelf will easily hold four Pumps and the upper shelf four to six. Near the top of the post a round iron hoop is supported by iron braces attached at the top. On this hoop Lanterns are hung, a wire hook bent around the rod

Fig. 292.—Counter Show Case.

being used to attach them. Screw hook are also inserted in the ceiling, making a somewhat larger circle, and from these Lanterns are also suspended, making, it is stated, a very attractive display. This second circle of Lanterns is not, however, shown in the illustration. The economy of space that is thus secured is another feature of this arrangement.

From S. W. Snodgrass, Miffenburg, Pa., we have received the description of the Counter Showcase which is represented in Fig. 292, which he has in use and to the merits of which he refers. The general form and purpose of the case may be gathered from the illustration. The Cutlery is fastened to a door which hinges so as to open whenever a change of goods is desired. The door is trimmed or painted black to secure an effective contrast, and the goods are attached by means of a brass wire or in any other suitable way. The glass in front protects the goods from exposure and handling. This method is referred to as desirable for displaying holiday Cutlery, having one case devoted to Carvers, another to Pocket Cutlery, another for Butcher Knives, another for Shears, &c., but the same method can obviously be used with a varied line of goods. It is suggested that several doors might be made to fit the same case, as they are hung on loose joint butts, thus permitting a change of goods easily and quickly.

Another design of Mr. Snodgrass's is shown in Fig. 293, which represents a method of displaying and accommodating

Saws. From the illustration it will be seen that the shelving in which the stock is held extends to the height of 54 inches from the floor, there being above a case, in which, on a black background, Saws are exhibited the entire height of the structure from floor to ceiling. The Saw case thus occupies the vacant space usually above shelving, which in this way is put to good use, giving an effective display and adding much to the general appearance of the store. The drawers in the upper part of the shelving are devoted to Back Saws, Hand Saws, &c. The manner in which the Cross-Cut Saws are placed in the lower and larger divisions is indicated in the engraving.

Exports.

BY SHIP JOAQUIN, OCTOBER 13, 1888, FOR SIDNEY, N. S. W. (Continued).

By McLean Bros & Rigg.—5½ dozen Locks, 13 dozen Bench Screws and Mouse Traps, 104 dozen Pulleys, 4 dozen Wringers, 46 dozen Axes, 1 dozen Pumps, 12 dozen Screw-Drivers, 6 Guns, 18 Clocks, 24 dozen Hammers, 31 dozen Saws, 48 sets Axes, 12 dozen Axes, 13 cases Agate Ware, 9000 Bolts, 2 dozen Vises, 20 dozen Washboards, 35 dozen Axes, 11,000 Bolts, 3 dozen Match Boxes, 30 dozen Handles, 5 dozen Hammers.

By Strong & Trowbridge.—4 cases Hardware, 2 cases Picks, 10 cases Hardware, 1 case Nails, 1 case Locks, 3 cases Hardware and Cutlery, 6 cases Firearms, &c., 1 case Hardware, 1 case Lampware, 5 cases Cartridges, 2 cases Hardware, 1 case Cutlery, &c., 1 case Carriage-Ware, 25 cases Axes, 1 barrel Glue, 55 cases Axes, 1 case Nails, 2 cases Wringers, 2 cases Hardware, 1 barrel Pulleys, 40 cases Axes.

By V. Basanta.—6000 packages Tacks, 784 pounds Nails, 5 gross Rat Traps, 6 dozen Cranks and Rollers, 3 dozen Well Wheels, 6 gross Rat Traps, 10 dozens Axes, 6 Clocks, 10 dozen Shovels, 1½ gross Hat Racks, 12 Rifles, 200 Clocks, 114 dozen Slaters, 60 dozen Shovels, 5 gross Wire Goods, 54 Rifles, 2 cases Ammunition and Tools, 40 gross Fruit

Fig. 293.—Saw Case.

Jars and Trimmings, 17 dozen Axes, 22 dozen Wrenches, 12½ gross Axle Grease, 13 Clocks, 50 Lamps.

By R. W. Cameron & Co.—53 crates Fruit Jars, 11 cases Hardware, 1 case Whips, 12 boxes Hardware, 8 crates Wheels, 2 cases Machinery, 5 cases Hose, 1 case Hardware, 13 packages Hardware, 1 case Whips, 2 cases Whip Handles, 36,861 pieces Roofing Slate.

By Coombs, Crosby & Eddy.—12 dozen Pump Parts, 6 dozen Axes, 2 Corn Shellers, 2 dozen Axes, 15 dozen Handles, 1 dozen Spades, 6 dozen Shade Rollers, 5 dozen Washboards, 6

dozen Axle Grease, 5 dozen Hardware, 7 dozen Hardware, 2 dozen Hoes, 1 gross Stove Polish, 35,000 Cartridges, 20 dozen Edge Tools, 60 dozen Edge Tools, 10 dozen Axes, 39 Churns, 102 Stoves, 4 dozen Picks, 10 dozen Carpenters' Tools, 10 dozen Bird Cages, 2 dozen Wringers, 2 dozen Lawn Mowers, 15 dozen Hammers, 168 pounds Oil Stone, 672 pounds Nails, 9 dozen Hardware, 2 dozen Grindstones, 69 dozen Hardware, 31 dozen Edge Tools, 20 gross Stove Polish, 5 dozen Carpenters' Tools.

By Arkell & Douglas.—300 dozen Handles, 1 dozen Perambulators, 3 dozen Shellers, 6 dozen Handles, 200 dozen Tools, 11 dozen pairs Roller Skates, 10 dozen Tools, 40 dozen Hammers, 1 gross Rat Traps, 3 dozen Shellers, 18 cases Carriage-Ware, 3 dozen Hay Knives, 32 dozen Tools, 72 dozen Handles, 3 dozen Corn Mills, 24 dozen Saws, 11 dozen Forges, 12 dozen Axes, 6 dozen Grindstone Fixtures, 784 pounds Hardware, 38 pounds Hardware, 18 dozen Squeezers, 15 dozen Axes, 18 dozen Brushes, 504 dozen Handles, 55 dozen Washboards, 1016 pounds Hardware, 20 Corn Mills, 88 dozen Hardware, 40 dozen Shovels, 35 dozen Axes, 3 dozen Churns, 85 dozen Whips, 20,000 Cartridges, 30,000 Primers, 590 pounds Hardware, 6 gross Blacking, 755 pounds Castings, 100 dozen Whips, 13½ dozen Harness, 4 dozen Brushes, 138 pounds Wagon Springs, 24 dozen Braces, 10 dozen Bird Cages, 1 dozen Air Guns, 898 pounds Hardware, 36 dozen Hoes.

By W. H. Crossman & Bro.—2 Drilling Machines, 96 dozen Mouse Traps, 50 dozen Shovels, 1 dozen Vises, 1 case Tinsmiths' Tools, 12 dozen Mop Holders, 100 Clocks, 2 dozen Grindstone Fittings, 1 dozen Wringers, 2 dozen sets Reloading Tools, 70,000 Primers, 30,000 Cartridges, 12 dozen Bird Cages, 6 dozen Rolling Pins, 10 dozen Potato Mashers, 1 dozen Vises, 2 dozen Meat Cutters, 690 dozen Files, 2635 pounds Nails, 1 dozen Stove Trucks, 1 dozen Washers, 75 boxes Axes, 75 dozen Hatchets, 62 dozen Picks, 12 dozen Carpenters' Tools, 6 cases Hardware, 5 cases Carpenters' Tools, 3 packages Lamp Goods, 412 pounds Oil Stone, 1 dozen Wringers, 2 cases Hardware, 4 dozen Picks, 7 Scales, 18 dozen Washboards, 2 packages Carpenters' Tools, 6 dozen Cow Bells, 12 dozen Mouse Traps, 16 dozen Hatchets, 336 pounds Oil Stone, 1 case Chalk Lines, 20 dozen Axes, 36 dozen Files, 2 dozen Corn Shellers, 110 dozen Shovels, 50 dozen Washboards, 6 dozen Grindstone Fittings, 2 dozen Meat Cutters, 1 dozen Lawn Mowers, 10 packages Carpenters' Tools, 4 cases Hardware, 4½ dozen Sad Irons, 56 Corn Shellers, 3 dozen Stove Trucks, 5 dozen Wringers, 1½ dozen Wrenches, 23 packages Lamp Goods, 60 Stoves, 36 dozen Mouse Traps, 3 dozen Fluters, 16 dozen Picks, 28 dozen Hatchets, 4 packages Carpenters' Tools, 3 cases Hardware, 7 crates Carriage-Ware, 1 case Carriage Hardware, 90 dozen Shovels, 2 cases Hardware, 5 dozen Axes, 3 cases Carpenters' Tools, 1 dozen Guns, 18 sets Reloading Tools, 60,000 Primers, 10,000 Cartridges, 5 dozen Bird Cages, 1 dozen Perambulators, 1 case Tinsmiths' Tools, 30 dozen Mouse Traps, 96 dozen Handles, 6 dozen Wrenches, 10 dozen Mop Holders, 6½ dozen Saws, 5 dozen Thermometers, 5 dozen Bush Hooks, 560 pounds Nails, 18 dozen Picks, 80 dozen Axes, 30 Guns, 30 sets Reloading Tools, 100,000 Primers, 6 dozen Files, 2 dozen Tills, 6 dozen Shovels, 24 nests Pails, 1 case Hardware, 8 cases Carpenters' Tools, 20 dozen Handles, 4 dozen Picks, 940 pounds Tacks, 9 dozen Razor Strops, 235 pounds Oil Stone, 20 dozen Shovels, 20 dozen Handles, 24 Guns, 30,000 Cartridges, 3 dozen Tills, 10 dozen Axes, 8 packages Hardware, 2 cases Carpenters' Tools, 27 cases Hardware, 195 packages Carriage-Ware.

PER BARK MATHILDE HEMING, OCTOBER 15, 1888, FOR LYTTELTON, NEW ZEALAND.

By H. W. Peabody & Co.—13 packages Hardware, 3 packages Agricultural Implements, 3 packages Lampware, 72 dozen Handles, 2 dozen Razors, 42 packages Carriage-Ware, 20 packages Hardware, 105½ dozen Handles, 1 case Plated-Ware, 1 case Agricultural Implements, 5 cases Stone, 4 cases Wringers, 13 packages Hardware, 6640 pounds Nails, 1 case Flint Paper, 3 packages Hardware, 5 tons Twine, 50 dozen Handles, 40 dozen Handles, 10 dozen Shovels, 14 packages Hardware, 1375 pounds Horse Nails, 15 packages Stoves and Wicks, 20 dozen Shovels, 132 dozen Handles, 8 cases Wringers, 1 bundle Whetstones.

By Coombs, Crosby & Eddy.—2 dozen Hatchets, 5 dozen Washboards, 5 dozen Brooms, 1 dozen Shovels, 29 pounds Twine, 16 Blocks, 7 dozen Carpenters' Tools, 5 dozen Edge Tools, 7 dozen Lamp Goods, 1 dozen Oil Stoves.

By R. W. Forbes & Son.—40 packages Hardware, 475 pounds Horse Nails, 16 packages Stoves, 1 dozen Mallets, 1 case Forges, 711

pounds Carriage Bolts, 21 dozen Hammer Handles, 1 case Plated-Ware, 2 dozen Sash Cord, ½ gross Egg Beaters, ½ dozen Store Trucks, 2 dozen Sad Iron Handles, 7 packages Hardware, 4 cases School Slates, 1 case Agricultural Implements, 1 case Carriage Hardware, 20 cases School Slates, 1 case Carriage Hardware.

By Arkell & Douglas.—4 dozen Axes, 12 dozen Locks, 8 dozen Pumps, 15 pounds Sash Cord, 1 dozen Braces, 30 dozen Handles, 3 dozen Saws, 12 dozen Hammers, 1 dozen Wringers, 26 dozen Locks, 192 dozen Handles, ¼ dozen Mills, 10 dozen Shovels, 24 dozen Axes, 12 dozen Picks, ½ dozen Mangles, 8½ dozen Hog Rings, 1205 pounds Bolts, 1 case Drills, 700 pounds Horse Nails, 116 pounds Wagon Springs, 6 dozen Hinges, 3 dozen Churns, 4½ dozen Blocks, 6 dozen Molasses Gates, 2 dozen Lamp Goods, 2 dozen Mallets, ¼ dozen Cultivators, 31 dozen Lampware, 4 dozen Axes.

By A. Field & Co.—156 pounds Malleable Castings, 30 sets Rims.

By Charles Brewer & Co.—7 cases Carpenters' Tools, 4 cases Handles, 1 case Hardware.

By Healy & Earl.—4 boxes Reaper Extras.

By Dunbar, Hobart & Co.—3860 pounds Nails.

By D. D. Pratt.—600 gross Chalk Crayons.

PER BARK ALICE REED, OCTOBER 18, FOR DUNEDIN, NEW ZEALAND.

By H. W. Peabody & Co.—21 packages Hardware, 3360 pounds Axle Grease, 4 packages Lampware, 8 packages Carriage-Ware, 33 packages Stoves, 1 case Wood-Working Machinery, 40 dozen Handles, 10 dozen Shovels, 250 pounds Twine, 75 boxes Horse-Nails, 3 cases Hardware, 600 pieces Stoves, 1 case Flint Paper, 204 pounds Wire, 125 dozen Brooms, 7 cases Hardware, 65 cases Hardware, 4 cases Churns, 8860 pounds Bolts, 62½ sets Axes, 33 packages Carriage-Ware, 1 case Machinery, 2 cases Brooms, 10 dozen Shovels, 4 cases Agricultural Implements, 4423 pounds Axle Grease, 26 packages Tacks and Nails, 4 cases Wringers, 42 dozen Handles, 28 packages Stoves, 1 case Pumps, 4 packages Lampware, 22,400 pounds Wire.

By Chas. Brewer & Co.—23 cases Handles, 1 case Hardware, 7 cases Agricultural Implements, 10 cases Nails, 16 cases Tools, 1 Chain Pump, 3 cases Scales, 1 case Hardware, 1 case Flint Paper, 1 case Handles, 1 case Tools, 3 cases Carriage Hardware, 1 case Handles, 11 cases Hardware, 1 case Sandpaper, 1 case Tools, 17 cases Nails, 1 case Mangles, 1 case Nails, 1 case Tools, 9 packages Creamery Goods, 43,055 pounds Wire, 8877 pounds Wire, 2 cases Agricultural Implements, 8 cases Nails, 10 cases Hardware.

By Arkell & Douglas.—2000 spokes, 3 dozen Whiffletrees, 36 sets Hubs, 100 pounds Carriage Hardware, 200 pounds Hardware, 3 dozen Harness Hardware, 36 dozen Whip Handles, ¼ dozen Mallets, 12,984 pounds Barb Wire, 11,200 pounds Barb Wire, 2 dozen Hay Knives, 10 dozen Shovels, 70 dozen Handles, 1 dozen Wringers, 1 Scale, ¼ dozen Wheels, ¼ dozen Drills, 4 packages Lampware, ½ dozen Ranges, 1 case Carriage-Ware, 39 sets Rims, 112 pounds Nails, 20 dozen Lampware, 3 cases Hardware.

By W. H. Crossman & Co.—8 packages Lamp Goods, 3 cases Slates, 2 gross Fruit Jars, 18 dozen Handles, 52 dozen Clocks, 8 cases Plow Parts.

By Strong & Trowbridge.—1 case Hay Forks, 1 case Wringers, 2 cases Hatchets, 1 case Wrenches, 1 case Pumps, 1 case Brace Bits, 1 case Hammers, 1 case Axle Grease, 1 case Nails, 1 case Handles, 6 cases Handles, 1 case Hardware, 2 cases Axes, 1 case Pumps, 1 case Whetstone, 5 cases Hardware, 1 case Paint Mills, 2 cases Carriage-Ware, 8 cases Nails, 1 Bale Twine, 7 cases Hardware, 2 packages, 1 case Hardware, 1 case Hardware, 9 packages Lampware, 7 cases Hardware, 1 case Forks, 1 case Saws, 3 packages Churns.

By W. K. Freeman.—10 cases Grease, 6114 pounds Horse Nails, 624 pounds Hardware, 10 crates Churns, 400 pounds Bolts, 828 pounds Axes.

By R. W. Forbes & Son.—5 packages Axes, 200 pounds Horse Nails, 120 dozen Axe Handles.

By R. W. Cameron & Co.—1 case Cutlery, 1 box Castings, 2 boxes Carriage Hardware.

By A. Field & Co.—18 dozen Toys, 12 gross Tinware, 7 dozen Fire Sets, 6 dozen Shovels, 5 dozen Mouse Traps, 4½ gross Tinware, 1 dozen Tools.

By New Haven Clock Company.—1 case Clocks.

By Ansonia Clock Company.—25 boxes Clocks, 23 boxes Clocks, 44 boxes Clocks.

By A. S. Lascelles & Co.—2 cases Crayons, 15 packages Lampware, 9 pairs Skates.

By Slover & Tyler.—14 packages Cordage.

By B. W. Hartman.—37 cases Nails.

By Welsh & Lea.—12 cases Handles.

On the Chemical Processes Involved in the Rusting of Iron.*

In this short paper there is, so far as I know, no new fact described. I believe everything, or nearly everything, in it is to be found in the records of chemical research; but as I find that the process involved in the rusting of iron is often misunderstood, and that the known facts have not been put together in their connection, I have thought it might be worth while to do so. My attention was first called to the subject by observing what happens when a drop of rain falls on a clean bright surface of iron. At first, for a short time, the drop remains clear, and the bright surface of the iron is seen through it; but soon a greenish precipitate forms in the drop, and this rapidly becomes reddish-brown. The brown precipitate does not adhere to the iron, but is suspended in the water, and becomes a loosely adherent coating only when the water has evaporated. I may premise, that in speaking of rusting, I mean the formation of rust on the surface of metallic iron exposed to ordinary atmospheric conditions. I do not intend to treat of the corrosion of iron by substances such as sulphuric or sélphurous acid, hydrochloric acid, or any other occasional impurities which may be present in the air. It has been conclusively shown that the necessary conditions of rusting are: (1) metallic iron, (2) liquid water, (3) oxygen and (4) carbonic acid, both the latter being dissolved in the liquid water. Iron remains quite free from rust in an atmosphere containing oxygen, carbonic acid and water vapor, as long as the water vapor does not condense as liquid water on the surface of the iron.

Let us consider now the action on iron of the three substances, liquid water, oxygen, carbonic acid, singly, and then two and two. Liquid water, quite free from dissolved gases, does not act on iron at ordinary temperatures. At high temperatures, very rapidly at a red heat, iron is oxidized by water or water vapor, and is converted into the magnetic oxide of iron. This magnetic oxide is formed on the surface of the iron as an adherent coating, and only when it is detached can the water gain access to the lower layers of the iron. Oxygen gas alone does not act at ordinary temperatures on iron. At high temperatures it also converts the iron into the magnetic oxide, which forms an adherent coating. The same is the case with carbonic acid gas, acting alone. At ordinary temperatures it is without action. At high temperatures the carbonic acid is reduced to carbonic oxide, and the iron is oxidized to magnetic oxide, which forms an adherent coating. Liquid water with oxygen dissolved in it does not act at ordinary temperature on iron. This is shown by the fact that ordinary water exposed to the air does not rust iron if the water contains a substance such as lime, or caustic alkali, capable of combining with carbonic acid and itself without action on iron. As long as the lime or caustic alkali is there no rusting occurs. When the lime or caustic alkali has been converted by the carbonic acid of the air into carbonate, then, and not till then, can the carbonic acid of the air dissolve as such in the water, and then, and not till then, does rusting begin. Water containing carbonic acid dissolved in it acts on iron at ordinary temperatures, forming ferrous carbonate, which dissolves in the carbonic acid water, forming, no doubt, ferrous bicarbonate. In this way artificial chalybeate water has been prepared by shaking up finely divided iron with carbonic acid water. In this action hydrogen gas is

* Paper presented by Prof. A. C. Brown at the Edinburgh meeting of the British Iron and Steel Institute.

given off. Solutions have been thus prepared containing nearly one-tenth per cent. of iron. If oxygen is present dissolved in the water it will unite with the nascent hydrogen, and if we have sufficient water, iron and carbonic acid, the whole of the dissolved oxygen will be thus consumed. The presence of dissolved oxygen quickens the solution of the iron, the tendency of the oxygen to combine with the nascent hydrogen supplying an additional motive to the action.

Probably in ordinary rusting no hydrogen actually becomes free, as under ordinary conditions there will always be enough dissolved oxygen to convert all the nascent hydrogen into water. When a solution of ferrous bicarbonate is exposed to an atmosphere containing neither free oxygen nor carbonic acid it loses carbonic acid, and insoluble ferrous carbonate is precipitated. If free oxygen is present in the atmosphere to which it is exposed the ferrous carbonate is oxidized into ferric hydrate, carbonic acid being given off. This, if the water is not already saturated with carbonic acid, dissolves in the water. We can now follow the whole process of rusting and divide it into stages—these stages being really separable, if we take proper precautions,* but in the usual case overlapping one another. We have (1) the formation of soluble ferrous bicarbonate; (2) the conversion of ferrous bicarbonate into ferric hydrate, the white ferrous carbonate passing through green and black intermediate substances into the reddish-brown ferric hydrate—i.e., rust. We have to note that the carbonic acid dissolved in the liquid water, which is necessary for the process of rusting, is not used up in the process. It is given off during the oxidation of the ferrous bicarbonate to ferric hydrate, and is thus ready to act on the new surface of the metallic iron. The continuation of the process of rusting is not therefore dependent on new carbonic acid absorbed from the air, but the original carbonic acid, if not removed, can carry on the process indefinitely, as long as liquid water is present, and oxygen is supplied from the air. Once the process is started it goes on more rapidly, because the porous rust not only does not protect the iron, but favors, by its hygroscopic character, the condensation of water vapor from the air as liquid water. A piece of iron, therefore, which has begun to rust will continue rusting in an atmosphere not saturated with water vapor, an atmosphere in which a piece of clean iron will not rust, because liquid water will condense on the hygroscopic rust from such an atmosphere, but not on the bright iron.

The copper wire department of the plant of the Hartman Steel Company, Limited, at Beaver Falls, Pa., is being operated to its full capacity, with plenty of orders on hand.

Messrs. James W. Queen & Co., of Philadelphia, Pa., have just issued a special catalogue devoted to chemical apparatus, assayers' materials and general laboratory supplies. The publication is undoubtedly one of the most complete of the kind that we have seen, and to the scientific worker will be of considerable value and convenience. A large number of illustrations are given of different appliances in current use, together with sizes, prices and, in some cases, brief descriptions. On one of the opening pages of the catalogue we notice a somewhat peculiar announcement to the effect that the catalogue will be mailed upon application to any address on receipt of 50 cents, but it is explained immediately after that this will be deducted from the first purchase amounting to \$10 or more, so that practically the catalogue will be delivered free of charge.

Fire-Proof Buildings.

The value of fire-proof buildings in a large city is certainly a question well worthy of consideration as regards its bearing upon fire-insurance interests and the reduction of losses. Not only impervious to fire from within, they offer in case of large conflagrations an equally effective barrier to the passage of the flames in their destructive course. The natural stages of growth through which a city has to pass in the course of its natural development is essentially the same. First the gathering of a few humble cottages, then the post office, general store, &c., until the aggregation of numbers swells into, first, the village, then the town or city. Some may take longer to develop than others, but the steps noted are essentially the same. Naturally, at the outset no restrictions could be placed upon the first settlers as to precautions against fire in the erection of their homes. For the most part the latter are humble in the extreme and in the event of loss could be easily replaced at no great expense. The community interest—that arising from the contiguity of buildings—does not exist until a later period, when the land has grown so valuable that buildings adjoin. Business blocks at the outset are built of wood, on the score of cheapness, but as the town prospers new buildings of brick or stone begin to make their appearance; and, like the strata in the rocks, the different types of wood, brick and stone structures mark the eras of a city's growth. Old as is New York City, this is also true in regard to it, and sandwiched in among some of its most substantial and solid business edifices can still be seen here and there the gable-roofed frame building put up many years ago for a farmhouse.

It is evident, then, that the fire-proof building is the outcome of the higher evolution of cities. A certain combination of factors are needed before such buildings can be reasonably looked for. A city can protect its interests to some extent by building ordinances which forbid the erection of frame structures within certain limits, but it cannot specify as to the expense an owner shall go to in construction. He may put up a brick building, keeping just within the limit of the law, and yet have a structure that is just as easily destroyed as the prohibited frame. Such buildings are put up purely for speculative purposes, and the builder has no interest in them save as to the extent of profit the transaction will yield. The great objection to the general introduction of fire-proof buildings is their much higher cost. This has been lessened to some extent by the introduction of new and cheaper fire-proof materials, but there is still ample room for further improvement. The average property-owner is guided in his choice of a building by the item of interest to be returned upon the capital invested. As a rule, it is the wealthy corporations, or individuals, who are content with a fair rate of interest: that can be relied upon as permanent who indulge in fire-proof buildings. There is not a structure of this description in New York City that has not been constructed by one of these classes, and the rule doubtless holds good everywhere. No laws or municipal ordinances can ever be effective in dealing with the fire danger other than in requiring certain conditions in building as a matter of precaution, such conditions being merely the avoidance of known sources of danger in construction. The fire-proof structure, if absolutely fire-proof, would require no insurance whatever; but there is the added cost of erection, the interest on which must be taken into account when the saving in fire premiums is to be calculated. The same rule also holds

good in regard to buildings supplied with automatic devices for the suppression of fires. The cost of the plant and the interest thereon must not be forgotten. This is exemplified in the case of the mill mutuels.

It is evident, then, that the sporadic erection of fire-proof buildings can have but little effect upon the cost of insurance to the general public. Not until such buildings become so general as to have an effect upon the hazard, by materially lessening the danger of a fire spreading, would it be worth while to take them into consideration in the matter of reducing premiums—the more so as these buildings paid no premiums for protection themselves, and consequently were not a source of profit to the companies. In point of fact, a great many buildings supposed by their owners to be fire-proof are far from being such. A building to be fire-proof in the true sense of the word is one in which the materials are actually impervious to the action of fire. The conflagration in Chicago proved that so-called fire-proof buildings were actually worthless when put to the test. Iron fronts curled up like paper under the fierce heat. Granite blocks cracked and split apart under the same influence, leaving the contents of the building quickly exposed to the devouring element. It would seem, then, that the study of the future of the various building materials employed and their value from the underwriters' standpoint in determining the rate to be charged would be well worthy of careful attention in connection with the inspection of buildings at the time of their construction. Fire insurance, like many other branches of business, has been brought to such a point through close competition that it requires the greatest skill in management to yield a fair return on the money invested. The careful study of questions connected with the business that were formerly considered as not worth noticing will at the present day often determine the result of a net gain or actual loss at the end of the year.

The D. Moore Company, Limited, of Hamilton, Ont., favor us with one of the 1888-89 wholesale price lists of their manufactures. The catalogue is a convenient-sized pamphlet, bound in cloth, and a feature that commends itself especially, is the ledger indexing, by means of which the quickest reference may be made to the contents. To show the character and extent of the goods enumerated, we will repeat the section headings as they appear on the ledger index: Stamped Ware, Spoons, Tinnings' Trimmings, Japaned-Ware, Miscellaneous Goods, Copper and Brass Goods, Wire Goods, Galvanized and Sheet-Iron-Ware, Agate Enamel-Ware, Milk Can and Creamery Can Trimmings, Pieced Tinware, Tools, Machines and Coal-Oil Stoves. The pamphlet is illustrated throughout, and full price lists are given, together with brief descriptive particulars where necessary. A further alphabetical index is provided at the back of the book, while the front page is a discount sheet with a general price list for 1888.

From the Marquette (Mich.) *Mining Journal*, of the 20 ult., we take the following table, showing the shipments by ports up to date this season, in comparison with shipments for the corresponding portion of the two preceding years:

Port.	1888.	1887.	1886.3

Gould's New Deluge Suction and Lift Pumps.

Fig. 1 of the accompanying illustrations represents the new deluge pump of the Goulds Mfg. Company, Seneca Falls, N. Y., and is designated as their No. 829 in their new catalogue. It is designed for shallow or small vessels of not more

Fig. 1.—New Deluge Suction and Lift Pump.

than 15 to 20 feet depth of hold, for contractors who wish to pump large quantities of water from excavations, and for irrigation where a compact and capacious pump is desirable. The cylinder is lined with brass, the valves rubber faced, and the lever socket made at such an angle that the bent wrought-iron lever when put in one side up is right for ordinary pumping, and by simply changing it to the other side up it becomes a vertical lever. This lever may also be worked from three different points, as shown by the lugs in the cut. The pump has large valves, accessible and removable by hand from above, while to the bottom of the base is bolted a flanged screw which may be for any size of pipe ordered, or changed for other sizes if desired. The pump is made in two sizes, 6 and 8½-inch cylinder with 4 and 6-inch stroke. It is also made with elevated base to be used above deck, or foundation where it is desired to use hose connection, or more convenient to make pipe connections in this manner. Fig. 2 represents the pump with the addition of a heavy forked rod, adapting it for power as well as hand use. This forked rod may be connected to wood rod of wind-mill walking beam or other power, and operated in any place where the water is not more than 25 feet distant for irrigation, excavations, &c. It is also made with elevated base for attaching hose or wrought-iron pipe at side. Fig. 3 shows the pump surmounted with a strongly bolted heavy frame supporting bearing boxes with crank shaft, spur and pinion gears below, &c. The capacity of this pump is from 3000 to 4000 gallons of water per hour.

Myron J. Carpenter, general agent of the Union Steel Company, of Chicago, for

the past year, has been appointed general manager of the Duluth and Iron Range Railroad, over which the Vermillion Range iron ores are taken on their way to market. The *Railway Age* states that few men have had such varied experience in the railway service as Mr. Carpenter, he having been at various times telegraph operator, station agent, shop clerk, store-keeper, traveling auditor, superintendent, agent for freight, &c., during a score of years. The last railway position he held before entering the service of the

Union Steel Company was superintendent of the Chicago Division of the Chicago, St. Paul and Kansas City Railway. His efficiency in previous official stations would appear to be a guarantee of his success in his new one.

Awards to Inventors.

We have received through Mr. William H. Wahl, Secretary of Franklin Institute, of Philadelphia, a circular recently issued in which attention is directed to certain awards in the gift of the Institute to inventors and others. The object in issuing the circular is to make the information more public, and in that way be able to award the medals more satisfactorily. The first is the Elliott Cresson Medal of gold, which was founded by the legacy of Elliott Cresson, of Philadelphia, and conveyed to the trustees of the Franklin Institute. The committee having the matter in charge, after proper investiga-

Fig. 2.—Deluge Pump, for Manual or Wind Power, with Side Inlet.

tion, grant the medal either for some discovery in the arts and science, or the invention or improvement of some useful machine, or some new process of combination of material and manufactures, or for the ingenuity and skill of architectural workmanship. In this enumeration it will be seen that a very extensive field is covered, and that applications may properly come from a very great number of sources. The second award is the John Scott legacy, premium and medal, which is \$20 and a medal of copper. This was founded in

1816, the specifications of the donor being "that it should be given to the most deserving." This award is in trust of the city of Philadelphia, but is given under the advice and recommendation of a committee of the Franklin Institute. As it was stated, the circular of Mr. Wahl is to make public these facts, and the object of getting as many applications as possible. Any person interested in these awards, by addressing the Secretary of the Franklin Institute, will receive fuller information respecting the manner of making application, and the Committee on Science and Art will give attention to reports upon

Fig. 3.—Deluge Pump, with Crank, &c., Side Inlet.

discoveries and inventions which may be sent with a view to receiving one or the other of the awards. The conditions of these medals are so very broad that almost every one of an inventive turn of mind has a certain personal interest in them. It is a very simple matter to communicate with the Franklin Institute if any one has a patented device which they think of merit, and we think Mr. Wahl ought to receive a host of communications within a twelvemonth.

King's Improved Sash Support and Bolt.

The accompanying illustration represents this article attached to the sash, a portion of which is removed to show the construction of the Bolt and the method of its operation. The barrel, as will be inferred from the cut, is pressed against the jamb by means of a large spiral spring, D, the object of this pressure being to hold the sash at any desired point and prevent rattling. Through the barrel a bolt passes, which is actuated by a small spiral spring inside the larger spring. This bolt thus acts independently of the barrel, and the office of the spring is to force the bolt into the hole N, and lock the sash when closed. This bolt is connected with and operated by the lever C by means of a rack and pinion movement,

so that it is readily withdrawn when desired. By moving the same lever C upward, the bolt is carried backward to a point where it engages with the barrel, so that by continued lifting on the lever it is drawn in, and its pressure on the jamb

King's Sash Support and Bolt.

relieved, the sash being thus allowed to slide freely. The lever also serves as a lifter in raising the sash. Whenever the lever is dropped, the barrel is again forced against the jamb, so as to hold the sash securely, preventing it from falling. The points made in regard to this article are: That it supports the sash at all points, locking it when closed; that it prevents rattling and does not disfigure the sash; that it is almost entirely out of sight; that it can readily be applied; that it is not liable to get out of order, and is furnished at a moderate price.

Improved Potato Masher, Press and Strainer.

Silver & Co., 56 Warren street, New York, are manufacturing a new upright press for mashing potatoes, pressing fruit, &c. It is represented in the accompanying illustrations, which indicate its general features and the different ways in which it can be used. It will be observed that it is mounted on a support, which can be attached to any table, and in which it is swiveled, permitting it to be used either over a dish on the table or a large

Silver & Co.'s Improved Potato Masher, Fruit Press, &c.

pan or other receptacle off of the table. The cups or strainers are made with openings of different size, according to the use for which they are intended, and they are removable, so as to permit them to be easily cleaned. One fine perforated cup is furnished for jellies, jam, &c., and one coarse perforated cup for potatoes, fruits, &c. The manufacturers allude to the efficiency with which this article does its work and the economy of power connected with its use. Its convenience is referred

to, especially in the fact that it is not necessary to hold it up over the table or dish when in use.

The Cleopatra Hair Curler.

The illustration given below represents a new hair curler which is put on the market by Haff & Walbridge, 76 and 78 Leonard street, New York. The cut gives a general view of the curler, but does not indicate clearly its special feature, which consists in the fact that the iron to which

The Cleopatra Hair Curler.

the handle is attached after being heated is inserted in the tube, thus preventing the soiling of the hair or fingers by contact with the iron. The tube in which it is inserted as well as the arm by which the pressure on the hair is obtained is nickel-plated, thus giving an attractive appearance.

Little Giant Wire Cutter.

This article, which is represented in the accompanying illustration, is made by the Collins-Gibbons Mfg. Company, St. Louis, Mo. This tool is referred to as small but very powerful, the cutting leverage being

Little Giant Wire Cutter.

almost directly on the center. The tool is referred to as cutting any size of wire up to $\frac{1}{4}$ inch diameter, just as if it were sawed off. There is a gauge attachment with each cutter.

The Caldwell Sash Balance.

A substitute for the ordinary sash cord and weight, possessing certain features of

end of which is shown in the illustration projecting through the opening in the face-plate. By reference to the engraving it will be noticed that there are two screws indicated in the face-plate of the device. By turning these screws the outer edge of the plate is drawn forcibly against the side of the roller or drum, thereby clamping it, as it were, against the fixed side of the plate and holding it with any desired tension. The adjustment is made before the fixture is applied to the casing of the window and causes the roller to run with greater or less friction as may be found

The Caldwell Sash Balance.

wind into the balance. The point at which the loop is attached to the tape is made sufficiently large to prevent that end when released from the window sash from disappearing within the outer casing of the balance. It is claimed for this device that it is applicable not only to window sash, but also to lifting doors, show-cases and similar work. It is so constructed that it may be adjusted to different weights according to the work required of it. While recently introduced to the trade, it has been tested in a number of buildings in Rochester and is being put into others in process of erection. It is well made and is claimed to be durable and economical.

The rivet steel, tests of which were published on page 658 of *The Iron Age*, November 1, was made by the Troy Steel and Iron Company, of Troy, for John Roach.

Japan is supplying herself from England with machinery for the manufacture of cotton and woolen fabrics.

CURRENT HARDWARE PRICES.

NOVEMBER 7, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

THE IRON AGE

THURSDAY, NOVEMBER 15, 1888.

The Homestead 32-Inch Universal Mill.

In *The Iron Age* of November 1st, page 656, we published a general plan of the famous slabbing mill at the Homestead and Fig. 3 an elevation of the vertical rolls. It will be remembered that both sets of rolls are driven by special engines, the heating pits being grouped around the end of the feed table of the vertical rolls, distance between center and center of the vertical and the horizontal rolls is 10 feet, the latter are 32 inches in diameter and 60 inches long, being driven by their special engine in the manner shown in Figs. 4

Fig. 1.—Elevation Horizontal Rolls.

Fig. 2.—Side Elevation.

HOMESTEAD 32-INCH UNIVERSAL MILL.

Steel works, of Carnegie, Phipps & Co., Limited, of Pittsburgh, Pa. We present herewith drawing of the 32-inch Universal Mill itself, Fig. 4 being a general plan, Fig. 1 an elevation of the horizontal rolls, Fig. 2 a side elevation of both sets of rolls,

while the shear is located at the end of its table, a continuation of the table of the horizontal rolls. A glance at Fig. 3 will show how the vertical 20-inch steel rolls are driven. They are set in the manner which can be traced in Figs. 2 and 3. The

and 1, which illustrate also the arrangement for lifting and lowering the rolls. The ingot manipulator is shown in Figs. 4 and 2. In the case of both sets of rolls an ingenious arrangement is provided which it is somewhat difficult to trace in

our drawings for transmitting to a gauge an exact measure of the movement of the rolls to or from one another. This allows for adjustment up to a very small fraction of an inch. It is in clear sight of the operator, who can set his rolls to a nicety after every pass.

Torpedo Warfare.

Lieut. W. S. Hughes, U. S. N., has prepared an interesting *résumé* of what has, up to the present time, been accomplished in the line of torpedo warfare.

It was not until our late civil war, he remarks, that the vast possibilities of the torpedo became known, and these floating mines became recognized means of warfare. Since that time the inventive American mind has made improvement upon improvement over the old torpedoes, and to-day this nation is very far ahead in this one method of naval defense and offense. While England and Continental powers have been developing the ironclad and steel guns America has been slowly perfecting the torpedo.

Torpedoes are no longer condemned by the civilized world as "infernal machines," too barbarous and inhuman to be employed even against an enemy. They are acknowledged features of all future naval warfare. Whatever credit may be due to their originator belongs to an American, Capt. David Bushnell, of Saybrook, Conn. Bushnell's torpedo, designed in 1775, consisting simply of a copper cylinder containing 20 or 30 pounds of gunpowder and provided with a clockwork igniter, was intended to be used in conjunction with a submarine boat which he devised and christened the American Turtle. This boat was propelled by means of a small screw worked by hand. It carried but one man, and contained sufficient air to permit him to remain submerged nearly half an hour. The depth below the surface was regulated by admitting or pumping out a certain quantity of water. The torpedo, carried on the outside of the boat, was designed to be attached to the bottom of the hostile vessel by means of a large screw worked by a spindle projecting into the boat. The act of detaching the spindle set in motion the clockwork fuse, so constructed as to allow an interval to elapse before the explosion long enough for the operator and his submerged boat to reach a place of safety.

Twenty years after the subject of torpedoes had been abandoned by Bushnell, it was revived by Robert Fulton, whose name was destined in later years to become famous as the inventor of the steamboat. Fulton's first experiments were made in France, where, under the patronage of Bonaparte, then First Consul, he built the Nautilus, one of the most successful submarine boats ever constructed, and in which he was enabled to remain submerged upward of four hours, and to direct the movements of the boat at will. This novel vessel consisted of a cigar-shaped copper shell, with iron ribs, and was designed to be used in conjunction with a torpedo, much in the same manner as Bushnell's Turtle. With the aid of the Nautilus Fulton blew up an English brig, near Brest, by exploding under the vessel's bottom a torpedo containing 20 pounds of gunpowder, and succeeded for a time in keeping the whole British fleet in a state of apprehension. Notwithstanding this success, the failure of an attempt to destroy one of the channel squadron so disappointed Bonaparte that he summarily withdrew his financial support.

Fulton then crossed over to England, and, under the name of Dr. Francis, offered his invention to the enemies of his former patron; but Mr. Pitt, the British Prime Minister, after considerable vacillation finally decided "not to encourage a

mode of warfare which, if successful, would wrest the trident from those who then claimed to bear it as the scepter of supremacy on the ocean." Fulton was followed by Col. Samuel Colt, of Hartford, Conn., better known as the inventor of the revolver. The chief peculiarity of Colt's torpedoes was the employment of electricity to explode them, and to him belongs the honor of having first used in actual practice an element that has since assumed an all-important part in torpedo warfare. Although Colt's introduction of an electric fuse marks a distinctive epoch in the development of the torpedo, it was not until the late rebellion that its formidable character as a weapon of war began to be generally realized. The Confederates, having no navy, resorted to the use of torpedoes to protect their harbors from Federal gunboats. A "torpedo bureau" was established at Richmond in the first year of the war which employed upward of 500 men, and official records show a list of 25 Federal vessels totally destroyed and five seriously injured by Confederate torpedoes.

The torpedoes used were generally of a simple type. One of those most frequently

was held just below the surface of the water by a rope attached to an anchor, and had a number of the sensitive fuses before described, so that the shock from a passing vessel would cause an explosion.

A very formidable torpedo, called a "Devil Circumventor," was made of boiler iron, shaped like a turtle's shell, and containing sometimes more than a ton of powder. It lay so close to the bottom that it was not likely to be discovered, and was exploded by electric wires leading on shore. But these torpedoes were far from infallible, as was demonstrated by the fact that, after the capture of Charleston, one of the most powerful Federal ironclads, the New Ironsides, was found to have lain for several weeks directly over a "Circumventor," charged with 3000 pounds of powder, which repeated attempts had failed to explode.

Another form of torpedo employed had the outward appearance of a harmless lump of coal, but was in reality a rough mass of cast iron with a hollow core, containing from 5 to 10 pounds of powder.

A number of novel torpedo boats, generally known among the Federals as "Davids," were built by the Confederates

Fig. 3.—Vertical Rolls, Homestead Mill.

encountered was what is known as the "Frame Torpedo" which consisted of a series of cast-iron shells, each containing from 30 to 50 pounds of powder, bolted to the timbers of a large wooden frame, placed in rivers and at harbor entrances, and kept at the desired depth below the surface by ropes secured to an anchor. An aperture in the upper end of each torpedo was covered by a soft leaden cap, which inclosed a glass tube extending down into the torpedo, containing sulphuric acid and surrounded by a mixture of chlorate of potash and sugar. It was intended that if the enemy's vessel in passing over the frame should come in contact with the leaden cap it would be crushed, cause the glass tube to break and the acid to mingle with the chlorate, thus producing flame and igniting the charge of the torpedo.

The want of proper materials greatly restricted the operations of the torpedo bureau, and consequently soda fountains, oil tanks, steam boilers, demijohns and any similar articles that could be made to subserve the purpose were called into play. One of the most successful as well as one of the most easily constructed torpedoes was a lager-beer barrel, coated inside and outside with pitch to prevent leaking and hooped with strong iron bands. Wooden cones were secured to each end to prevent the current tumbling it over, and to give it additional buoyancy. The barrel, containing from 50 to 100 pounds of powder,

during the war. These little vessels were cigar-shaped, 30 or 40 feet in length, built of boiler iron, propelled by steam, and carried a crew of nine men. Little more than the smoke-stack was above water, and the torpedo, carried on the end of a wooden spar that projected 10 or 12 feet ahead of the boat, was exploded by a mechanical lock on coming in contact with the enemy's ship. Five attacks were made with these small boats, only that against the Housatonic, in Charleston Harbor, being successful. In this instance the ship sank so suddenly that many of the crew failed to escape, though the water was shallow and assistance was near at hand, while the little "David" that had caused the disaster went down with its huge antagonist, drowning all its crew of nine men.

The only torpedo attack actually made on the part of the Federals was that by Lieut. W. B. Cushing, and resulted in sinking the Confederate ironclad Albatross, an act unparalleled in daring by any other event of the war. The torpedo used consisted simply of a copper cylinder charged with 40 pounds of powder, which, upon pulling a trigger line, was exploded by a fulminate cap. It was carried on the end of a wooden spar projecting from the bow of an ordinary steam launch. The civil war revolutionized the science of naval construction. Ericsson's Monitor and the ironclad Merrimack startled the naval architects of the world. The death-knell of wooden ships-of-war was sud-

denly sounded by the booming of the guns in that famous "first fight of iron-clads" at Hampton Roads, and the new element of torpedoes had later on sprung into importance. Crude as torpedoes were at the close of the war when compared

to rise to the surface. While the full capabilities of this torpedo have not yet been developed, the latest trials demonstrate that it possesses the invaluable quality of always preserving an absolutely straight course when moving through the water.

carries a charge of 70 pounds of dynamite or gun cotton, and is exploded by a percussion lock in its forward point upon impact with the enemy's ship. The torpedo is protected by patents in the United States and in European countries, and a

Fig. 4.—General Plan.

HOMESTEAD 32-INCH UNIVERSAL MILL.

with approved types of the present day, the important part they were destined to play in all future maritime wars was clearly comprehended both in this country and in Europe, and inventors at once turned their genius toward the development of the novel weapons.

Many remarkable inventions have since made their appearance, the most notable of which are the self-moving or "locomotive" torpedoes now attracting such wide attention among the naval powers of the world. Only a few of these latter inventions can be mentioned here. They are naturally divided into two general classes—the projectile class, over which no control is retained by the operator after starting the torpedo on its deadly mission, and the controllable class, which remains under the guidance of the operator until the moment of striking the enemy's ship. At the head of the list of the former class undoubtedly stands the torpedo recently invented by Capt. John A. Howell, of the United States Navy.

The Howell torpedo is cylindrical in form in its middle section, tapering off to sensitive branches to the agitation of a point at each end, and is 8 feet 6 inches long by 13 inches diameter. It is built of sheet copper, and is driven through the water by small screw propellers, the motive power being stored in a heavy steel fly-wheel within the torpedo, and to which a very high velocity of rotation is given by suitable machinery on board ship before the torpedo is launched. Upon reaching the water the torpedo is propelled by its own engines. It may be arranged to run at any desired distance below the surface, and is kept at that constant depth by side rudders, actuated by the pressure of the surrounding water, which work automatically and oppose any tendency of the torpedo either to sink or

The action of tides and currents for rough water causes little or no deflection from its original course, and the torpedo is practically independent of such outside forces. With only half the power which can be stored in its motor-wheel, the torpedo attained a speed of upward of 20 miles an hour for a distance of 200 yards, and had a total range of 750 yards. It

company with a capital of \$180,000 has been lately incorporated for its manufacture.

The Howell torpedo, like others of its class, may be effectively used in defending the narrow entrances to a harbor like that of New York, by discharging it at an approaching ship from behind an armor-clad fort or other suitable protection. But it is

mainly designed to be carried on board a very swift torpedo boat capable of overtaking the fastest ironclad, and upon reaching an effective range to be discharged at the hostile ship.

Another torpedo of the projectile class, and that which has been adopted by nearly every naval power of Europe, is the "Whitehead," the invention of an Englishman. This torpedo, in its outward form, resembles the Howell, but is much larger and heavier than the latter—the largest size being 19 feet long by 16 inches in diameter. It is designed for use under similar circumstances and in the same manner as the Howell. The motive power is compressed air, carried in a reservoir within the torpedo at a pressure of about 70 atmospheres. The secret of the inventor lies in the automatic device by which the pressure of the surrounding water causes the torpedo to remain at a constant depth below the surface. The reports of recent trials of the Whitehead, made at Woolwich, England, state that a speed of 31 miles per hour was attained for a distance of 400 yards. The largest size carries a charge of 93 pounds of gun-cotton. It is exploded, like the Howell, by a percussion lock, upon striking the enemy's ship. The torpedo invented by Mr. W. Scott Sims, of Newark, N. J., with whom the famous inventor and electrician, Thomas A. Edison, is now associated in perfecting the weapon, is the only purely electrical torpedo yet invented.

This torpedo differs widely in appearance from those before mentioned. The Sims-Edison belongs to the controllable class—that is, while attacking the enemy its movements are under control of the operator until the moment of explosion. The torpedo consists of a cylinder of copper with conical ends, is 28 feet long by 21 inches in diameter and is supplied with a screw propeller like those already described. The hull is attached to a hollow copper float, which moves upon the surface of the water, by upright rods about 4 feet in length. The power by which the torpedo is propelled, steered and exploded is electricity. It carries in its forward end a charge of 400 pounds of dynamite. An electric cable 2 miles long and containing two copper wires is coiled within the torpedo and unwinds as the latter proceeds upon its course. The cable is connected with a dynamo machine on shore, one of the wires being employed to supply the requisite electric current for working the engines, while the other controls the steering machinery. The torpedo is intended principally for harbor defense, the operator, stationed at some place of safety on shore, sending it out to intercept an approaching hostile ship, and causing the explosion at the instant of impact with the enemy by closing the circuit of an electric fuse. The inventors, however, claim that their invention may also be effectively employed for naval aggressive purposes on board ship, and propose to have one or more of the torpedoes travel in the water about 100 feet in advance of an ironclad ram, to which it is attached by its cable, and in making an attack upon a hostile ship to explode the torpedo as it comes in contact with the enemy just before the act of ramming. The control of the operator over the movements of the torpedo is very complete so long as the steering mechanism and insulation of the cable remain intact. By simply increasing, weakening or reversing the current passing through the "steering-wire" he can easily cause the torpedo to turn to the right or left, move in a circle or return to the point from which it started. The torpedo attains a speed of about 11 miles per hour, and can be sent out a distance of 2 miles. In order that its position may be always known to the operator two guide rods project upward

from the float a distance of 2 or 3 feet, and carry small globes by day and differently colored lanterns at night, so screened as to be invisible to the enemy.

The American invention known as the "Controllable Auto-Mobile Topedo" is another type of the class we have last described, but it differs from the Sims-Edison in some important respects. Like the latter, it is steered by an electric current conveyed through a cable, but the motive power is carbonic acid gas contained within the torpedo itself. This gas, as is well known, becomes a liquid when subjected to a pressure of about 600 pounds per square inch. The liquid gas is carried in a small iron reservoir near the center of the torpedo, and on its way to the engines passes through 100 feet of coiled copper tubing, during which it is expanded again into a gaseous state by intense heat produced by the chemical action of a mixture of dilute sulphuric acid and quicklime. This torpedo has developed a speed of 20 miles per hour, the highest that has been yet attained by its class, and has a range of 1 mile. It is made of copper, and is 36 feet long by 22 inches in diameter. It is attached to a hollow copper float, which moves upon the surface of the water, by upright rods about 3 feet in length. The float is itself about 42 feet long, and, being filled with cotton, lamp-black or some similar light substance, may be repeatedly perforated by the enemy's bullets without destroying its buoyancy. Projecting 2 or 3 feet above the float are two guide rods, carrying small flags, which enable the operator to know the position of the torpedo. When used at night small lanterns are substituted for the flags. The torpedo is under perfect control of the operator. An electric cable, one end of which is connected with a storage battery on shore, is coiled in the middle section of the torpedo, and unwinds as the latter runs its course. Upon passing an electric current through the cable one end of a magnetized lever is attracted, which communicates its action to the steering machinery and turns the torpedo to the right. When the current is reversed the opposite effect is produced and the torpedo moves to the left. A series of trials of the invention was recently made at College Point, L. I., before a commission of French and Turkish officers, who reported favorably upon its action to their respective governments. Still further trials are soon to be made in France. The torpedo carries a charge of 200 pounds of gun-cotton or dynamite, and is exploded by a percussion lock upon impact with the enemy's vessel.

Lieutenant Hughes gives also brief descriptions of Captain Ericsson's torpedo gunboat Destroyer, the Stilleto, and several of the submarine boats which have of late been brought out.

The Paris Exhibition.—The United States Commission to the Paris Exposition of 1889 has issued a circular, from which we quote: "It may be well to call the attention of manufacturers and others who wish to make exhibits at the Universal Exposition at Paris next year to the limited time for preparation. The allotment of space takes place on November 15, and shipments by steamer begin in January. The amount of space allotted to the United States is being filled up by applicants from all parts of the country. The commissioners are progressing with their work on a basis of absolute impartiality. It is simply a case of first come first served. According to the provisions of the French Government, there is to be no charge for space occupied by exhibitors. Moreover, as it is the intention of the United States Government in participating in this exposition to demonstrate the merit and comparative excellence of our products and

manufactures, the commissioners will forward, free of freight between New York and the exposition, going and returning, all articles received for exhibit. The sum of \$250,000 was appropriated to be used under the direction of the Secretary of State to defray all expenses. All communications must be addressed to the Commissioner-General, William B. Franklin, or the assistant commissioner-general, Somerville B. Tuck, whose offices are in the Washington Building, No. 1 Broadway, New York. The French Commission will not correspond with foreign exhibitors."

Oil as Fuel at South Chicago.

We have received from E. C. Potter, vice-president of the North Chicago Rolling Mill Company, Chicago, the following interesting communication with reference to the use of oil for fuel at the South Chicago plant of that company:

We have a battery of 14 boilers in our converting department, operated with fuel oil supplied through the medium of the Reid burner. The returns for the month of October relative to the consumption of oil as compared with the coal consumption under these same boilers, show that 3 6-10 barrels of 42 gallons to the barrel do the work of 1 ton of Indiana block coal. The cost of the oil is slightly under the cost of the coal. The great saving in the use of oil is found in the saving of labor for stoking, for wheeling out ashes and for unloading coal. When using coal 25 men were required to operate this battery of boilers for 24 hours. With the use of oil 4 men accomplish the same work. Considerable saving over coal in the cost per ton of ingots turned out of this department is also effected by the use of oil. The efficiency of the battery of boilers is materially increased, and the cost of maintaining is very materially lessened, as the oil flame seems to be much less severe upon the boiler than that of coal. There is practically no smoke, no ashes, no dust or dirt of any kind. The odor of oil is so slight as to be scarcely appreciable. The oil fuel is clean, easily handled and in every way thoroughly satisfactory, and as a fuel for raising steam, in my estimation, is second only to natural gas. We expect to equip our entire plant with oil as fuel for steam raising at the earliest possible day.

The Supply of Currency.—The *Bulletin* shows the changes in the money circulation during the past month and year in the following table, giving the actual amounts of currency in the hands of the people, so far as it can be shown by Treasury records, at the dates named:

Money Circulation of the United States.			
	Nov. 1, 1887.	Oct. 1, 1888.	Nov. 1, 1888.
Gold coin.	\$302,585,770	\$377,329,865	\$380,016,817
Silver dollars.	62,934,625	57,959,356	59,901,350
Subsidiary silver.	51,290,061	52,020,975	52,571,712
Gold certificates.	99,684,773	134,538,190	140,613,658
Silver certificates.	180,713,957	218,561,801	229,783,152
U. S. notes.	331,419,950	300,052,053	309,867,696
Nat. bank notes.	267,883,223	237,578,240	235,217,283
Total.	\$1,303,512,349	\$1,334,310,280	\$1,407,971,688

The probability is that the money circulation of the United States on January 1, 1889, will be greater by a full hundred million of dollars than on January 1, 1887 (\$1,418,000,000 compared to \$1,318,000,000 on January 1, 1887, and \$1,384,000,000 on January 1, 1888), and surely such a comparison affords little reason to fear a deficient money supply.

There was more coke shipped out of the Connellsville region last month than ever before in the same time. There were 17,800 cars shipped over the various lines west of Pittsburgh. That amount does not include the coke that went East, nor that which was shipped to Pittsburgh. A carload of coke will average about 18 tons. The aggregate shipments for the last month amounted to 820,400 tons. Allowing 30 cars to the train, it would require 593 trains to haul the coke.

English Sewage and Sludge Pump.

We take from a recent issue of the *London Engineer* the annexed cut showing a section of a neat and simple type of pump, which should meet the difficulties experienced by sanitary engineers in the removal of semi-fluid matter. All complications of passages in the pump are avoided, as well as reversals of the fluid pumped, which passes through in a direct line unimpeded. The valves are large and the removable seats are dished in, formed somewhat like a saucer, the effect being that the material pumped is guided into the barrel and no corners or pockets are left where accumulations can take place. An important feature is that by slacking back four screw bolts and taking off the cover the valve seats, as well as the valves, are removable, but when in position the seats are held firmly against the face of the box.

In all pumps, especially where thick or gritty fluids have to be passed through them, the valves and seats are liable to damage, hence it is of great importance that a change can be quickly effected, also that an internally packed plunger be used in preference to piston pumps. The pump

busiest moment in the evening is at 5.40 o'clock. At that instant ten trains simultaneously leave the various stations. In the 15 minutes between 5.30 and 5.45 50 trains in all go out. The busiest single hour is from 5 to 6 p. m. The busiest moment in the morning is 8.45 o'clock, when nine trains enter the stations simultaneously.

The Validity of Monopoly Contracts.

A recent decision of the Supreme Court of California concerning the contracts by means of which a combination of manufacturers had undertaken to suppress competition in the sale of lumber may be added to a long list of similar decisions. It appears that all the manufacturers of lumber at a certain point contracted to sell to a corporation the product of their mills, so far as such product should be required by the people of four counties. It was also agreed in the contracts that none of these manufacturers should sell lumber to any other buyer in those counties, the penalty for making such a sale being a fine to be collected by the corporation. One of the manufacturers in this lumber pool

the plaintiff company could not recover, on the ground that the combination was illegal and void, but also that the combination was a conspiracy. In New York it was held, in the case of Clancy against Onondaga Fine Salt Company, with respect to a similar combination, that "the end to be attained being illegal, the contracts and agreements entered into to secure the end must be equally so." And substantially the same decision was made in the case of Arnot against Pittston Coal Company, also in New York, and in cases of the same kind in Louisiana and Illinois.

Shooting Oil with Rockets to Troubled Waters.—The efficacy of oil in stilling troubled waters has often been demonstrated, but it has not yet become a distinct practice to carry a sufficient quantity to enable a ship to imbed itself in peaceful quarters while the sea around is angry and boisterous, so that a patent taken out in Germany, whereby oil may be fired in rockets to a given point, may be the means of enabling vessels to help smaller ships and less thoughtful mariners in danger, and thus add to the efficiency

AN ENGLISH SEWAGE AND SLUDGE PUMP.

illustrated should effect this. It is brought out by Mr. J. C. R. Oaks, of London, E. C. The pump can be driven either directly by a steam engine, duplex or single, by crank or other methods. As a vertical pump it appears well adapted to sinking purposes on account of its simplicity and the accessibility of the valves and seats.

New York Passenger Traffic.—The New York *Sun* has recently collected some statistics of the passenger traffic in and about New York. It is found that 1672 regular passenger trains leave the stations of New York, Brooklyn and Jersey City every 24 hours. The Long Island road's summer service runs on its various lines 577 trains daily. The next largest business is done in the depot of the Erie in Jersey City; where 288 trains daily enter and leave, and there are 216 in and out of the Grand Central Depot, and 204 in and out of the Pennsylvania Depot. Between 7000 and 8000 cars are employed daily in this traffic, and it is said that the number of people who entered and left the city by rail during the year ending May 1, 1888, was 40,188,000. Of this number the Long Island road carried about 8,000,000, the Pennsylvania 6,867,000, and the passengers entering and leaving the Grand Central Depot in the same year were 8,881,000. The daily average of passengers in and out is 110,000. It is said that the Long Island road carried 98,000 people to Coney Island on the 4th of July. The

broke his contract, and the corporation—representing the other members—brought suit against him. The court held that any one of the manufacturers could safely repudiate his contract. It said:

Plaintiff had an undoubted right to purchase any or all of the lumber it chose and to sell it at such prices and places as it saw fit; but when, as a condition of purchase, it bound the vendor not to sell to others, under a penalty, it transcended a rule the adoption of which has been dictated by the experience and wisdom of ages as essential to the best interests of the community and as necessary to the protection alike of individuals and legitimate trade. With the results naturally flowing from the laws of demand and supply the courts have nothing to do; but when agreements are resorted to for the purpose of taking trade out of the realm of competition and thereby enhancing or depressing prices of commodities, the courts cannot be successfully invoked, and their execution will be left to the volition of the parties thereto.

Among the other decisions which are recalled by this is that of the Supreme Court of Ohio in the case of Central Ohio Salt Company against Guthrie, in which the court refused to enjoin a producer from breaking his contract with a combination, saying: "The clear tendency of such an agreement is to establish a monopoly and to destroy competition in trade, and for that reason, on grounds of public policy, courts will not aid in its enforcement." Also the decision of the Supreme Court of Pennsylvania in the case of Morris Run Coal Company against Barclay Coal Company, in which it was held not only that

of the method of saving ships. The method has just been tried repeatedly between Bremen and New York. The rocket, to which is attached a cylinder filled with oil, can, it is said, be fired with accuracy from a ship to a required spot and explodes, pouring the oil where wanted. In one of the rockets fired experimentally the distances were from 1500 feet downward. By the explosion of five rockets at a distance of from 1200 feet to 1500 feet from the ship a space of from 1500 to 2000 square feet of water was covered with oil. The rocket was fired 900 feet against a gale. It is stated that the invention has been purchased by the North German Lloyd.

Mr. Geo. W. McKine, of Martin's Ferry, Ohio, has just completed his latest self-feeding attachment for cut-nail machines. He has placed it upon a new 10d machine from the Ashtabula Nail Machine Company, and the two machines, already ground, and in perfect condition for making first-class cut nails will be shipped at once to Leeds, England. The machines will not be taken down for shipment, but crated, so as to be ready for putting on belt in Leeds.

The Cowles Electric Smelting and Aluminium Company, of Lockport, N. Y., have issued a new pamphlet descriptive of the alloys of aluminium and silicon.

The Poughkeepsie Bridge.

Lately an engineering undertaking has been completed which promises to be far reaching in its effects upon the business interests of an important section of our country, and which is of general interest, too, because from a technical point of view it is an achievement deserving of a place among the great successes of American engineers. The value of a bridge below Albany to the traffic of New England was recognized a good many years ago by so shrewd a railroad manager as J. Edgar Thomson, then president of the Pennsylvania Railroad, who subscribed the majority of the stock of the Poughkeepsie Bridge Company in 1871. Work was begun, but ceased in 1873. Mr. Thomson's death, and the panic of that year combining to lead a suspension of work, the Pennsylvania Railroad having voted that no new work should be undertaken without the consent of the stockholders, which was withheld. The project rested until 1876, when a contract was entered into with the American Bridge Company of Chicago. This company suspended work in 1878 until 1886, when the Manhattan Bridge Building Company, having acquired the rights of the American Bridge Company, made a contract with the Union Bridge Company for the entire structure complete. The organization now has at its head such men as Simon Cameron and Henry McCormick, of Harrisburg; Arthur Brock, of Lebanon; Morton McMichael, Charlemagne Tower, Jr., Henry C. Gibson, and W. W. Gibbs; C. H. Hart, of Philadelphia, and J. I. Platt, of Poughkeepsie. John S. Wilson, until lately general freight agent of the Pennsylvania Railroad, has been recently elected president.

The immediate, and for the present, most far reaching result of the completion of the Poughkeepsie Bridge will be the direct connection by an all-rail route of the Pennsylvania anthracite regions and New England. The reduction in the distance will be appreciated by the following figures, taking Scranton as an illustrative point :

	Via Albany.	Via Pough- keepsie.
Scranton to Springfield, Mass.	305	216
Hartford, Conn.	331	209
Boston, Mass.	408	314
Providence, R. I.	420	290

The possible connections of the Poughkeepsie Bridge on the east side of the Hudson River would be the Hartford and Western Railroad, the New York and New England from Hopewell Junction, the Central Massachusetts, the Boston and Albany, and the New York and Harlem from Brewster's Station. On the west side, the Walkill Valley and West Shore, the Lehigh and Hudson, the New York and Oswego Midland, and the coal roads. The Vanderbilt interest is now building connections with the bridge, the intention being to run the passenger cars from the New York Central depot via the New York and Harlem, thence to Hopewell Junction on the New York and New England, thence to Poughkeepsie, across the Hudson River, to a point on the Walkill Valley Railroad to Kingston, and from there on the West Shore to the Catskills and West. It is the intention further to send their large New England passenger traffic to the South from Boston via the Poughkeepsie Bridge and the West Shore Railroad to Jersey City, instead of to New York and ferry. By this new route, 1½ hours will be saved from Boston to Jersey City, and the annoying transfers will be avoided.

Concerning the technical details of the work we are indebted for the following data to a paper read by John F. O'Rourke before the American Society of Civil Engineers, which is about to be issued by that

THE POUGHKEEPSIE BRIDGE, BUILT BY THE UNION BRIDGE COMPANY.

society: In September, 1886, operations were begun. A line, practically the same as the old one, was adopted, surveys and borings were made and a profile obtained, from which the location of the piers was determined. The former design was for rectangular trusses of equal lengths. The location of the second span of the new design was fixed by the existing pier, and its length of 525 feet by the 500 feet of clear span and the 25 feet of mason required. The same length of span to the west would place Pier 1 in the West Shore Railway tracks. A pier on the east slope of the railway would be inadmissible. The most available site was on the bluffs west of the highway, and this was selected. By this time a cantilever design had been decided on, and the 530 feet center to center of end pins necessary to reach these bluffs was made common for all three cantilever spans. This clear span, with the half-widths of towers added, made the spans next the shores 548 feet and the center span 546 feet, which, with the two connecting ones of 525 feet, center to center of piers, located Pier 6 in the face of the rock on the east shore. The total length between anchorages was thus established at 3093 feet 9 inches, the total length, including viaducts, 6767 feet 3 inches. The charter fixed the bottom of trusses at 130 feet above high water, so the height of trusses proportionate to the spans required the adoption of 212 feet above high water as the grade of base of rail. The west approach has a rise of 66 feet per mile westward out of the valley of the Hudson, and the same grade was adopted on the viaducts, since it did not further limit the size of trains.

The borings showed the river bottom to be composed, for more than 100 feet below high water, of various combinations of mud, clay and fine sand, too soft for building upon. Underlying this pasty stuff was a very firm and hard stratum of rather coarse sand, beneath which was gravel, and, about 140 feet down, solid rock extending from shore to shore.

The general design of a pier is a crib and grillage, extending from the gravel to 10 feet below high water; on this is the masonry to 30 feet above high water, upon which is a steel tower 100 feet high to pedestals of trusses. The cribs are practically alike. The base is 60 x 100 feet, and the height 104 feet. It is built of 12 x 12 inch white hemlock, except the bottom course, which is of white oak.

The cribs were built for some height on ways and launched, building being continued alongside a wharf until the draft was nearly the depth of the river. It was then taken to the pier site, anchored, set, the weighting pockets loaded with gravel to keep the top at a convenient distance above the water and built upon until it was embodied in the mud. Weighting, building and dredging were then carried on with more or less continuity until the crib reached its final resting place. Then all the loose material was dredged out and the dredging chambers and pockets were filled with concrete until to within 2 feet of the top of the pockets, the remaining part being filled with brownstone and leveled by divers. A floating caisson was then towed to place over the crib, fastened with four anchors and the masonry began, to be followed by the stone towers.

For the erection of the two stone arms and for the two connecting spans false work was used, extending in the case of the latter to the bottom of the upper chord. A part of one of these is shown in our engraving, which is a reproduction of a photograph taken on August 31st of this year. Their noteworthy features were their great height and the permanent character of the framing and bolting masonry to secure stability. The depth of the water and the nature of the river bed

called for the use of compound piles 130 feet long, there being 528 piles for a span. The piles were 12 feet above high water and from them the trestle was extended to the bottom chord, an elevation of 130 feet.

The deck of the false work was occupied by four tracks. The two outer tracks were of 8-foot gauge, and upon these ran the large traveler for the erection of the span, which extended entirely across the space between these two outer tracks. The two rails next inside of these outer tracks were occupied by a hydraulic riveting apparatus, which spanned the space, 19 feet wide, between these two rails. A single track of 4 feet 8½-inch gauge at the center of the false work carried the cars conveying the material. Some of the pieces to be handled weighed more than 20 tons each, so the derricks and rigging of the false work and travelers had to be proportionately strong.

The hydraulic riveter was carried on a small traveler, so spanning the two middle tracks as not to interfere with the transportation of materials on them. The jaws were hung with differential pulleys from worm gear set upon projecting timbers of the deck, which revolved like a turn-table. By this means the jaws were readily adjusted to any rivet in the bottom chord. The towers at the ends of the span were first erected. Next, commencing at the fixed end, the bottom chord was laid along in place on camber blocks. The traveler then erected the span, commencing at the middle, and finishing each half successively. From the shore arms and connecting spans 160-foot cantilevers were erected by means of projecting travelers, almost identical with those used for erecting the cantilever bridge across the Niagara River. They were composed of two trusses, 118 feet long, of which the chords and vertical posts were of wood, and the ties and splice-plates of iron. These were supported on a heavy floor, extending from the rear end to within 50 feet of the other end, and were carried on 12 wheels, arranged in groups of 1, 2 and 3, respectively. Jack-screws bearing on the front floor beam relieved the wheels during the erection of a panel, and heavy hooks, under strong tension, clamped each end to the floor beams.

The 212-foot spans suspended from the ends of the cantilever arms were erected from the ends of the latter, and connected when they met at the center. The stiff bottom chord, except in the middle three panels, enabled each panel when finished to support the traveler during the erection of the next beyond. When the travelers met, the remaining three panels were completed. In connecting the center panel, the top opening was made a little long in order to let the chord section into place, and the bottom one a little short, that the pins might be driven easily into the eyebars. This was insured by adjustment struts between the arms and suspended span, which were shortened in the top chords and lengthened in the bottom by rollers separated with wedges. They were so arranged that by drawing them the ends of the top chord approached each other, and those of the bottom chord receded. After the span was connected, the wedges and rollers were removed and the trusses hung suspended.

According to the *Courier de la Meuse*, the Royal Gunpowder Factory, at Weteren, has succeeded in producing a variety of gunpowder equal in all respects to the Lebel powder, about which the French authorities maintain such a mystery. This new production has received the name of paper powder, and its ballistic properties are much superior to those of ordinary gunpowder, and there is, moreover, a complete absence of fouling.

NEW PUBLICATIONS.

PREPARING FOR INDICATION. By R. Grimshaw. Size, 5 x 7 inches; 56 pages. Published by the Practical Publishing Company. Price, \$1.

With the growing appreciation of the importance of the steam-engine indicator, and of its value to power users, the literature of the subject has naturally experienced a steady increase. The latest additions to it is in the shape of a small volume by Mr. Grimshaw, in which he has departed from his usual catechismal style and presents what he has to say in a straightforward, direct manner. As the title of his book implies, it gives instruction only so far as the preliminary operations are concerned, which must be carried out before the actual work of taking indicator cards can be commenced. These, as is generally known, embrace the making of cross head and ceiling attachments for the swinging levers and the piping, and in work before us an attempt has been made to take into account all possible conditions in practice. It is not infrequently the case that some ingenuity is required to make convenient and serviceable connections in testing an engine, the conditions often being of a temporarily perplexing nature, and where similar cases are already found worked out in a satisfactory manner there is no reason why one should not profit by them. It is here therefore that Mr. Grimshaw's book will probably be found useful. It is eminently practical in character, and contains nothing that an average engine attendant cannot easily understand and apply. We venture to say, however, that this book might have been offered to the public at a lower price. The subject itself does not cover a wide range; the book is consequently small, and while containing a fair number of illustrations these are comparatively poor specimens of the engraver's art.

The Lake Copper Product.—The following statement published by the Boston *Transcript* gives the product in "Mineral" carrying about 75 per cent. copper of the mines mentioned for October and for nine months of 1888, and a comparison with the outputs of the same mines in the preceding year, all in tons:

	—October, 1888.	1887.	Jan. 1 to Oct. 31, 1888.	1887.
Calumet & Hecla	3,914	3,057	26,299	25,845
Tamarack	625	501	6,226	3,449
Quincy	341	519	3,327	2,540
Atlantic	214	226	2,265	2,077

Copper Falls	80	...	642	360

Total 10 mines.. 5,867 4,901 45,018 39,615

The Copper Falls mill did not run during the second half of 1887.

The Ohio Valley *Manufacturer* reports that a conditional order was received by one of the iron mills of the Wheeling district from an eastern city, for 800 tons of steel sheets, No. 17, cut to shapes, for \$2.35 per 100 pounds, delivered at a point where the freight was 18 cents per 100, netting the company \$2.17. The purchaser stated that he could import it at even less figures and pay an ad valorem duty of 45 per cent., but preferred to give the order to an American mill, if it could be filled at those figures. After figuring closely on the order, it was found that it could not be filled without a loss of several thousand dollars, and that no mill in America could fill it with a profit, consequently it was rejected. The goods were to be used for the manufacture of skates.

The Southern Iron Industry.

Mr. James M. Swank, general manager of the American Iron and Steel Association, has contributed to the "Mineral Resources of the United States," for 1888, published by the Division of Mining Statistics and Technology of the Geological Survey, a paper from which is taken the following chapter on the recent rapid growth of the Southern iron industry:

The activity in the development of the Southern iron industry, which was so conspicuous in the latter half of 1885 and in 1886, was continued in 1887 and during the first half of 1888. This activity has been chiefly displayed in the erection of blast furnaces for the manufacture of pig iron. Since the beginning of 1886 there have been built in the States south of the Potomac and the Ohio rivers 21 large and well-equipped furnaces, and 14 furnaces were in course of erection in those States on July 1, 1888. Fifteen of the completed furnaces have been finished in 1888. Of the 21 completed furnaces 18 were built to use coke and 3 to use charcoal as fuel. Of the 14 building, 10 will use coke and 4 will use charcoal as fuel. These 35 new furnaces, built and building, are situated in the following States: Alabama, 13 coke furnaces built, and 10 coke and 3 charcoal furnaces building; Virginia, 3 coke furnaces built; Tennessee, 1 coke and 3 charcoal furnaces built; Kentucky, 1 coke furnace built; Georgia, 1 charcoal furnace building. Preparations are also being made to remove a coke furnace from Missouri to Kentucky. All of these new furnaces are of large capacity, and most of them rank among the best in the country.

Discarding all abandoned furnaces, the total number of completed furnaces in the States south of the Potomac and the Ohio, not including Missouri, which were in blast on July 1, 1888, or in a condition to be readily put in blast, was 109, and, as above stated, 14 furnaces were in course of erection in those States on that date. Of the completed furnaces, 57 use coke and 52 use charcoal as fuel. They are situated in the following States: Alabama, 23 coke and 10 charcoal furnaces; Virginia, 12 coke and 21 charcoal furnaces (and one of the charcoal furnaces is being changed to a coke furnace); Tennessee, 10 coke and 10 charcoal furnaces; West Virginia, 6 coke and 3 charcoal furnaces; Kentucky, 4 coke and 3 charcoal furnaces; Georgia, 2 coke and 2 charcoal furnaces; North Carolina, 2 charcoal furnaces; and Texas, 1 charcoal furnace. In the whole country there were on the 1st of January, 1888, 533 completed furnaces, not counting abandoned furnaces.

In addition to the foregoing enumeration, there are two entirely new and large coke furnaces now in course of erection at Sparrow's Point, on the Patapsco River, a few miles below Baltimore, Md., which may be classed among Southern iron enterprises. These furnaces will be completed this year. Two additional furnaces at the same place are contemplated.

A year ago there was much comment in Southern newspapers concerning the probable scarcity of a supply of good coke for the new Southern furnaces, the construction of which had then been completed or undertaken, and the prediction was freely made that some of the new furnaces would be compelled to remain idle until new coal fields could be found or fields already discovered could be developed. With the lapse of time it has been found that the supply of good coke from Southern coal fields has fairly, if not entirely, kept pace with the increasing demand for this fuel for furnace use. New coke ovens have been built in connection with newly-opened coal mines, and the quality of coke obtained from the coal of

some of the older mines has been improved by more careful methods of selecting the coal and making the coke. There is particularly no longer any apprehension of a scarcity of coke for the supply of the furnaces at Birmingham and its vicinity. There is still room, however, for further improvement in the quality of some Southern coke.

One of the most promising signs of an abundant supply of coke for Southern furnaces is seen in the success which has attended the coking of the celebrated New River coal in West Virginia and the no less celebrated Pocahontas coal in Virginia. The coke from these fields has been shipped to Carondelet, Mo., and Joliet and Chicago, Ill., at all of which places it has been used in blast furnaces in competition with Connellsville coke. New

Company, at Richmond, Va., made their first blow. They did not, however, continue in operation, as a necessity arose for changing the plans upon which they had been constructed. At Birmingham, Ala., the Henderson Steel and Mfg. Company built an experimental Henderson open-hearth steel furnace in 1887, to use pig iron made from native Alabama ores above the Bessemer limit in phosphorous, and on the 27th of February, 1888, the first steel ever produced in Alabama was successfully made at these works. The erection of a larger furnace is contemplated. But the manufacture of Bessemer steel by the basic process in the South has not yet been attempted.

In the manufacture into finished forms of the pig iron produced within her bor-

Fig. 1.—General View.

NUT-TAPPING MACHINE, DESIGNED BY MR. GEORGE W. BIGELOW,
NEW HAVEN, CONN.

River coke has also been shipped as far West as the silver mines of New Mexico. We stated a year ago that "railroad facilities in the South are being so perfected that but little inconvenience need be experienced in taking good coke from where it is made to where it is wanted, as, for instance, from Southwestern Virginia to Eastern Tennessee," and the shipping of New River and Pocahontas coke to the points above named illustrates the facilities and economy with which Southern coke may be taken long distances for furnace use.

During 1887 the South made some progress in the development of her steel industry, but not much. Two small Bessemer steel works were completed in the South in that year. The works of the Roane Iron Company, at Chattanooga, Tenn., made their first blow on May 7, 1887, and on that day the first Bessemer steel rail ever made in the South outside of Wheeling was successfully rolled at these works, which have since continued in operation. On October 10, 1887, the works of the Old Dominion Iron and Nail Works

ders the South has made considerable progress since we last referred to this subject. At Nashville, South Pittsburg, Chattanooga, Knoxville, Birmingham, Anniston and other points in the South may now be seen foundries, machine shops, and other reproductive iron enterprises which did not exist a year ago, and which would be creditable to any Northern State.

The Bigelow Nut-Tapping Machine.

We show on this page a sectional view of a nut-tapping machine designed a number of years ago by Mr. George W. Bigelow, New Haven, Conn., for the Joseph Hall Mfg. Company, of Oshawa, Ont., and built by them for their own use. The machine embraces a number of novel features, and an examination of the engravings will, therefore, not be without interest.

The sectional view, Fig. 2, shows all the essential details, and clearly explains the functions of the different parts, so that really very little description is neces-

sary. Power is transmitted from the horizontal cone shaft A to a vertical shaft, B, through the intervention of two bevel wheels, as shown. On the shaft B is mounted a large spur-wheel meshing with six spur-pinions, each of which is mounted on a spindle, *s*. Within each of these spindles is partially contained another spindle, *s'*, which is forced downward as far as the construction adopted will let it go by means of a coiled spring. The spindles *s'*, moreover, are slotted and furnished with keys which fit into slots in the small spur pinions. It is thus evident that

derstood, are fed down to the taps by a lever, D. The holders have openings, either square or hexagonal, according to the shape of the nut blank, and securely hold each blank while it is being tapped. A reservoir on top supplies the necessary oil. The machine has six spindles, as shown in Fig. 1, and was designed for tapping nuts, ranging from $\frac{1}{4}$ to $\frac{1}{2}$ inch. A spring brings the lever D back to its original position after having been forced down by the operator in feeding a nut blank. It will be understood that after a thread has been started in the blanks they

were six times as many boiler explosions in the United States last year as there were buildings burned, the advisability of insuring boilers at once becomes manifest.

The Denver Cable Road Castings.

It has been denied that the Denver Car Company let the contract for the manufacture of 5000 tons of cast-iron cable yokes to an English firm. The facts in the matter are these: Horace A. Keefer is a broker in Kansas City, who makes a business of bidding on such wares, and then filling his contracts with foreign goods, which, it appears, he can do at a good profit, and still underbid American manufacturers. Keefer bid \$38 per ton, delivered at Denver, in this case. The lowest domestic bid was \$38.90, which was considered a remarkably low figure for the work, and at which the prominent and responsible manufacturers of this country say it cannot be done without a loss. Keefer arranged with an English firm to fill the bill at \$33 per ton at Denver, thus leaving him a net profit of \$5 for his brokerage. It will be seen that while the company did not directly give the work to foreigners, the latter, through the ability of their agent, got the work, and English laborers will get the practical benefit of it, through the liberal margin of advantage which they have by reason of the cheap labor of that country. It has been denied that any contracts for cable railway material to be used in the United States have been placed in England. The following affidavit is convincing:

State of Missouri, County of Buchanan: J. M. Huffman, being duly sworn, deposes and says he is President of the Wyatt Park Railway of St. Joseph, Mo.. That said company did contract with Thalimer and Lighthall for all material and labor to build and equip about five miles of cable railway in said city of St. Joseph, and that said Thalimer and Lighthall did subcontract for engines, driving machinery, yokes and other castings to be used in construction of said cable railway with firms in England, and that there was sent to the city of St. Joseph a sample of said yokes for said cable railway that was cast in Bradford, England, on which was cast the following to-wit:

On one side: Thornton & Cribben, manufacturers, Bradford, England; on one side: A. H. Lighthall, 1888; and that there were stored in the United States bonded warehouses in the city of New York, July—, 1888, not less than 250 tons of said yokes awaiting shipment.

(Signed) J. M. HUFFMAN, President.
Subscribed and sworn to before me, a Notary Public, qualified and whose commission expires March 7, 1891, this 31st day of October, A. D. 1888.

(Signed) P. V. WISE,
(Seal.) Notary Public.
The above is a copy of original affidavit now in my office, 421 Olive street.

JAS. W. BELL,
President of Buck Stove and Range Company.

Fig. 2.—Vertical Section.

NUT-TAPPING MACHINE, DESIGNED BY MR. GEORGE W. BIGELOW, NEW HAVEN, CONN.

the motion of the shaft B is transmitted to all the spindles, *s*, and from these to sockets containing the taps *a a*. By means of a treadle, shown at the left of Fig. 2, operated by the foot of the attendant, the interior spindles *s'*, when at that side of the machine, can be forced upward against the pressure of the coiled spring. The spindles thus carry with them the keys fitted in the slots, and as a consequence the small pinions are allowed to run free on the spindles *s*, so that the taps *a a* remain stationary. A hand wheel, C, controlling a bevel pinion and circular rack, enables the attendant to hold the different taps at any point in their path, or to revolve them around to different positions, as desired.

The upper part of the frame of the machine proper is fitted with six holders for the nut blanks. These, it will be un-

derstood, are fed down to the taps by a lever, D. The holders have openings, either square or hexagonal, according to the shape of the nut blank, and securely hold each blank while it is being tapped. A reservoir on top supplies the necessary oil. The machine has six spindles, as shown in Fig. 1, and was designed for tapping nuts, ranging from $\frac{1}{4}$ to $\frac{1}{2}$ inch. A spring brings the lever D back to its original position after having been forced down by the operator in feeding a nut blank. It will be understood that after a thread has been started in the blanks they

There has been a steady and rapid growth in the boiler insurance in the United States in the past few years, says the *Investigator*. The necessity for such indemnity is constantly impressing itself upon the minds of the people, and the companies are preparing to meet all the demands made upon them. Three companies at present occupy the field, and they are sound institutions. Their aggregate assets January 1, 1888, were \$2,976,893.29; liabilities, \$1,193,849.06, and their surplus over all liabilities \$533,054.23. Thus it will be seen that the indemnity offered is of the strongest character, and when it is remembered that in comparison with the relative number of each there

A cylindrical pipe, flowing full, discharges less than the same pipe when only filled through a segment whose arc is 281° 30 minutes by 2–5 per cent., while the velocity is less by 9–5 per cent., the hydraulic inclination being the same. The full section discharges less, and also with less velocity, in other forms of pipes as well as in cylindrical. The scouring power of circular pipes flowing full is therefore less by nearly 10 per cent. than that of the same pipes filled through an arc of 281° 30 minutes, a new element to be considered in the arguments for and against circular pipe sewers.

The Committee of the Master Mechanics' Association appointed to consider the proper size for locomotive boilers has, in its report, given the following rule for cylinders with a stroke of 24 inch: $H=5.8 A$, where H = heating surface in square feet and A is the area of one piston in square inches.

THE WEEK.

The Treasury Department has authorized the allowance of drawback on exportations of so-called mattress fabric, manufactured at Hartford, Conn., wholly from wire made of imported steel rods, equal to the duty paid on the imported material, less 10 per cent. The Department declined, however, to allow drawback on completed wire mattress manufactured in part from domestic wood.

Sanitarians will consider a number of important subjects at the annual meeting of the American Public Health Association, to be held in Milwaukee, November 22-23. Reports from various committees will be presented.

The Haytian Republic is again on the verge of civil war, as Légitime, who at present fills the Presidential chair, is attempting to enforce the blockade of Cape Haytian, the headquarters to the opposition. Vessels entering or leaving are liable to seizure by the Government men-of-war. Cape Haytian is the only city of any importance along the entire northern coast of the island, and in bygone days was a rival of Port-au-Prince, the capital, in its wealth and society. Cape Haytian's reputation depends more upon what was once to be seen there before the earthquake and fire destroyed its buildings than what actually obtains at present. No steamers of the Clyde Steamship Company at this port will land at Hayti while the ports are blockaded.

The United States Minister to Japan, Gov. Hubbard, in a friendly chat with a correspondent, expresses confidence in the future of that interesting country. The advances the nation has made in the past two decades have no parallel in the history of civilization. The country has now railroads, telegraphs, a compulsory school system and a Government based on the plan of those of modern Europe. It is bringing machinery to the development of its industries and of its wonderful resources. Japan is a country of minerals, and its coal and iron will add to its national wealth. Agriculturally it is susceptible of great development, and only a small proportion of the land is now cultivated. The only American railroad in Japan is in Yezo, and it is intimated to me that the Government, in the extension of its railways there, will build them on the American plan. It is probable that American materials will be to a large extent used, and that, though the roads will be built under the direction of Japanese civil engineers, the materials and machinery may come from America.

A large quantity of firearms and ammunition were shipped from this city by the steamer Saginaw for San Domingo, and the Haytian minister, Preston, insists that they were intended for the use of the rebels in that country. The consignors were Hartley & Graham, of this city.

It now seems probable that four to six new States will be admitted to the American Union by the Fifty-first Congress.

The difficulty in making barrels fast enough is becoming serious in Minneapolis. With very little or no export trade the flouring mills have packed a very large proportion of their product in wood, and the coopers are pressed beyond their ability to supply the current demand.

The Lehigh Valley and Jersey Central Railroad companies are piling the South Cove channel in Jersey City, and are building docks above the piling. The increased depth of the channel will allow the largest vessels to come up to the docks. Tracks from the main lines of the railroads will be built to the end of the docks, and ships will be loaded from the cars direct.

Many of the large manufacturing companies at Fall River have recently held their annual meetings, at which full statements of business results have been made. From these accounts the following exhibit of capital, earnings for the past year and dividends declared is drawn:

	Capital.	Earnings.	Dividends.
Wampanoag..	\$750,000	\$157,550	\$86,250
Chace.....	500,000	115,000	37,500
Granite.....	400,000	136,000	64,000
Flint.....	580,000	102,858	58,000
Barnard.....	330,000	53,000	24,750
Merchants'...	800,000	125,720	60,000
Narragansett	400,000	67,143	32,000
King Philip..	1,000,000	137,105	60,000
Union.....	750,000	287,000	137,500
Sagamore....	600,000	133,000	78,000

To supplement these figures it may be added that at the annual meeting of the Amoskeag Mfg. Company, of Manchester, N. H., a month ago, it was stated that the company had cleared \$425,566 from their manufacturing operations during the year, out of which two 5 per cent. dividends had been declared, amounting to \$300,000, leaving over 4 per cent. surplus. During the year, moreover, a stock dividend of 33½ per cent. was made. These are, of course, exceptional statements, but they serve the purpose of showing that New England still leads in the cotton industry.

The new method of oil transportation by means of tank steamers is to some extent forcing stevedores and inspectors out of the business. Some idea of the expense that bulk transportation saves, and the consequent absence of work for the men, can be formed when it is stated that regular expenses to the extent of fully \$2300 are saved on every cargo of the tank steamers that leave this port, taking 20,000 barrels as the average size of each vessel. The agents of the bulk steamships will not admit that it is cheaper to carry the oil by the new method, though the fact that new vessels are being freely built is considered to be proof sufficient that there must be some money in it. The following statement shows the amount of money saved by the steamers in the way of outside charges. The calculations are made on the basis of the average-sized tank steamer, 20,000 barrels:

Inspection of stowage, 1c. per bbl.....	\$200
Inspection, oil and barrels, 2½c. per bbl.....	500
Stevedore's charges, 5c. per bbl.....	1,000
Dunnage, &c., \$30 per 1000 bbls.....	600
Total.....	\$2,300

Steamship men claim that the money saved in wharfage will easily cover the expenses of extra crew, coal and other items incidental to a steamer. It will consequently be seen that there is some reason to question the strict accuracy of the claims of the tank oil shippers to the effect that they do not save anything by shipping oil in bulk.

The National Exposition at Augusta, Ga., for which extensive preparations have been made, opened auspiciously on the 8th inst., and all the arrangements are now complete. The exposition building has a floor space of 7 acres, and is 900 feet long by 100 feet wide, with three cross sections, respectively 200, 300, and 400 feet deep. Besides space for exhibits it accommodates 15,000 visitors, and has over 2 miles of frontage in aisles. The oration was delivered by the Hon. James C. Black, a leading lawyer of Augusta. In the course of his address he called attention to the fact that Augusta had water-power equal to 14,000 horse-power; that her factories turn 200,000 spindles and employ 5000 hands; that they pay \$1,000,000 in annual wages, and that their product reaches \$5,000,000. He said the property of Georgia had increased in the last ten years over \$103,000,000, exclusive of railroad property, while railroad property had increased \$20,000,000, or 212

per cent. The property owned by colored people, he said, was in round numbers \$10,000,000, an increase in ten years of 85 per cent. At the conclusion of the addresses Mrs. Gordon, wife of the Governor, touched the electric key which started the engines and set the machinery in motion.

At a recent public meeting in Boston the statement was made that the manufacture of cotton is increasing much faster at the South than in New England. In 1879 the number of cotton factories in the Southern States was returned at 154; in 1887 the number had increased to 219, while now there are 235 mills in operation, 17 new ones almost ready to begin production and 40 more building. The inference to be drawn from these facts is, of course, that the cotton manufacturing industry has better prospects for growth at the South than at the North, so that the New England concerns are being severely crowded. Nevertheless, all of the important New England manufacturing companies have made money this year, and the stockholders of the Fall River Iron Works Company have just voted to erect four new mills, to have an aggregate of 186,000 spindles.

The Cincinnati Exposition, which closed a week ago, is said to have been a failure financially. The *Enquirer*, of that city, gives these figures: The deficit is between \$330,000 and \$340,000. This means an assessment of about 35 per cent. on the guarantee fund of \$1,050,000, and as there are about \$100,000 of the guarantee notes which are thought to be worthless, the guarantors may have to pay 40 per cent. The only assets of the exposition are the buildings, which will probably be sold at public auction.

The Cleveland Ship-Building Company launched the steel steam barge Transfer, built by the Michigan Central Railway Company, and is to be used as a railway ferry at Detroit. Her length over all is 280 feet, 45 feet 6-inch beam, 17 feet 3-inch hold and 75 feet from outside to outside of guards. It is estimated that she could break through ice 3 feet thick without injury, and could be sailed through ice 1 foot in thickness at a speed of seven miles per hour. Her screw wheel is 9 feet in diameter, and her side wheels are shod with heavy steel facings to assist in breaking ice. The power which is to push her through water or ice of above thickness is in four steel boilers 11 feet 6 inches, 16 feet long, or 4½ feet longer than the longest ordinary boilers on the lakes. These boilers have two domes 20 feet long and 48 inches in diameter, and one dome 10 feet long and 6 feet in diameter. These boilers will furnish steam for six cylinders; two 28 x 28 inches on each side for side-wheel engines, and two cylinders 28 x 36 inches for stern-wheel engine, each with separate condensers. Cylinders are double low pressure with horizontal engines. The latter have two steel spur gears 16 feet in diameter, all cut teeth, and two steel spur pinions 5 feet 6 inches in diameter, also all cut teeth. The whole cost of this remarkable steamship is \$325,000.

The United States Consul to Samoa, who left those islands last August, is about to represent at Washington the necessity for protecting the natives against German aggression. He returns to the United States in behalf of the people there, who number 35,000. The Germans, he says, had installed a clerk as a sort of premier to represent them and their interests, consisting chiefly of a mammoth trading store, kept by a firm with a long name, and a good deal of land acquired in trading operations. The islands, in his judgment, are the most valuable, beautiful and healthful in the Pacific, not even excepting the Sandwich Islands, and Germany is

fully awake to the fact. Cotton, coffee and dried cocoanut are exported in large quantities.

Work has commenced on the elevated railroads to be built in Jersey City for the Pennsylvania Railroad Company, and in 18 months it is probable the whole will be completed at a cost of about \$1,000,000. The plans call for a four-track railroad on a structure greatly resembling the Sixth avenue "L" road in this city. Owing to the fact that the burdens it will have to carry will be much more weighty than those carried on the "L" roads the iron used in the construction will be much heavier and stronger, and instead of having two supporting pillars this road will have three. The roadway is to be 44 feet wide, and to be supported by iron girders having a depth of 5½ feet. The new road will extend down Railroad avenue from Brunswick street to the ferry at the foot of Montgomery street, from which points boats run to Cortlandt and Desbrosses streets in New York.

The appointments of Hugh Grant, the Mayor elect of New York, will comprise a President of the Board of Health, a Commissioner of Public Works to succeed General Newton, a Dock Commissioner, a Park Commissioner, and several others of importance.

The Iron Steamboat Company, of New York, received during the last 12 months \$330,121, and have a balance of \$23,094 above their expenditures.

The San Francisco *Daily News* states that the present wheat crop of California will yield 30,000,000 bushels for export, while there were carried over from last year 7,300,000 bushels, making a total surplus for shipment of 37,300,000 bushels.

Colorado has 1,000,000 acres of coal lands within 60 miles of Pueblo with veins from 6 to 9 feet in thickness. The quality is bituminous.

The great national celebration in this city on April 29 and 30 next of the centennial of the inauguration of George Washington will be a notable event, attracting thousands of visitors to New York and taxing all modes of conveyance. Eldridge T. Gerry, Mayor Hewitt and other leaders of the committee in charge of the arrangements have been engaged since last summer devising the details. Gen. James M. Varnum and S. D. Babcock constitute the executive committee; Major Asa Bird Gardner and John J. Pierrepont the Committee on the Army and Navy; Gen. Louis Fitzgerald the Committee on Finance, and Secretary Clarence W. Bowen the Celebration Committee. The celebration will conform as exactly as possible to the procedure gone through with when Washington came to New York for the inauguration. President Harrison will come from Washington with his Cabinet officers, the Chief Justice of the United States and other high officials. A meeting in Wall street, a banquet in the evening and religious services in several of the churches are a part of the programme. There will also be a naval display in the harbor, with accompanying salutes.

The Secretary of the Treasury has instructed the Collector at San Francisco that Chinese merchants are not affected by the Exclusion act, and that those now resident in the United States, who visit foreign countries, may be admitted on their return upon any evidence of identity satisfactory to the Collector.

Dr. David Hostetter, of Pittsburgh, whose pet scheme was the construction of the South Pennsylvania Railroad, died in this city, 5th inst. He held stock in the road worth \$2,000,000. The total amount

of policies on his life is \$361,000. George H. Forster, President of the Board of Aldermen and also President-elect for the term of two years from the 1st of January next, died 8th inst. It is the duty of the present Board of Aldermen to elect a person to fill the vacancy.

Smooth iron steps are made safe during the winter season with a small soft rope woven up and down, to and fro, from top to bottom. The remedy is cheap and effectual.

The Eiffel tower at the Paris exposition is raised to the height of 200 m. It has already cost 3,550,000 francs, and 5,575,000 pounds of iron have been used. All the waste is saved and converted into odds and ends, such as ink bottles, paper weights, &c., to be sold as *souvenirs* at the tower during the exhibit.

The great Navarro Flats, at Fifty-eighth and Fifty-ninth streets and Seventh avenue, which are said to be the largest of their kind in the world, were sold under foreclosure on the Real Estate Exchange, 9th inst., for \$200,000. When the flats were finished the funds ran out, and John J. McComb loaned the company between \$2,000,000 and \$3,000,000, taking a second mortgage on the property as security. The total cost of the buildings was between \$5,000,000 and \$6,000,000. The foreclosure was on a partial mortgage of \$363,000, and Mr. McComb was the only bidder. He bid \$200,000, and at this price he gained control of the huge venture in real estate.

Within a radius of 40 miles of Rochester there are more than 1500 fruit evaporators, giving employment during the autumn and winter to about 30,000 hands. Last season the production of these evaporators was about 30,000,000 pounds, worth at first cost about \$2,000,000. A large proportion of the product is exported.

A coal mine explosion near Pittsburg, Kan., caused the death of no less than 160 men, who were entombed in the workings deeply below the surface.

An electrical fire engine, which can be tapped for service whenever wanted, is the latest invention. The advantages claimed are that it can be started at full speed; that it is much lighter than a steam fire engine of equal power; that it costs one-third less; that it is noiseless in its operation, makes no smoke, sparks nor ashes; that it is safer and easier to control and is economical.

The exhibitors at the National Exposition, in Augusta, Ga., organized an association on Saturday with the following officers: President, J. W. Cook, of the American Supply Company, Providence, R. I.; vice-presidents, S. H. Martin, of Fairbanks Scale Company; Henry O'Brien, of Freeman & Gillies, New York, and Joseph Day, of Augusta; secretary, Thos. P. Henry, of the *Chronicle*. A committee was appointed to formulate plans of procedure, composed of T. W. Carwile, of the Baldwin Fertilizer Company, of Savannah; E. H. Marble, of Curtis & Marble, textile machinery, Worcester, Mass., and E. H. Hickok, of the Pope Mfg. Company, of Philadelphia.

The new home of the New York Club, on Fifth avenue and Thirty-fifth street, is a gorgeous palace costing \$450,000. The architect was A. J. Manning, associated with R. H. Robertson.

The Central Vermont Railroad has just completed at Ticonderoga, on the Addison branch, a new drawbridge. Its draw is 800 feet long, 30 feet wide, with sides 12 feet high, and resembles somewhat in appearance a huge canal boat. It contains 250,000 feet of lumber, while its total weight is 400 tons. When navigation

closes the draw will be towed to "Ti," where it will replace the old draw which has been in use for the past 20 years.

The massive iron girders for the highway across the tracks of the Harlem Railroad, near the lower end of Melrose, were last week placed in position. It is the first of a number of bridges necessitated by the sinking of the roadbed from Mott Haven to Williams Bridge.

Keely, of motor fame, is in contempt of court at Philadelphia, for not obeying the order of the Court as to the exhibition of the Keely motor to the experts appointed by Court. The Court also refused to dissolve the injunction which forbids Mr. Keely dismantling or removing the motor.

The Boston Sugar Refinery closed during the past week, leaving the trust without representation in that city, and the fact is construed as a reaching out for larger profits. Respecting operations in New York, a reporter says the calculation is that the trust firms of Havemeyer & Elder, Matthiessen & Wiechers, the Brooklyn Sugar Refining Company, and Dick & Meyer will supply the New England market from now on. De Castro & Donner, Moller, Sierck & Co., and the North River and the Oxnard Companies, as well as the Havemeyer Sugar Refining Company, have to be supported from profits on the product of the four refineries named, and it is necessary to do a large business with wide margins of profits to secure satisfactory percentages. By another summer the new Greenpoint refinery of the Havemeyer Company, to take the place of the one burned two years ago, will be ready to add its product to that of the others in the trust.

Passengers over the Brooklyn Bridge number more than 3,000,000 a month.

Gen. Roger A. Pryor, counsel for the prosecution in the case of the State Attorney-General against the North River Sugar Refinery Company, to prove an illegal combination, claims to have elicited from reluctant witnesses a great deal of valuable information as to the origin, nature and composition of trusts. He discovered that 18 sugar refineries belonged to the sugar trust which had been incorporated last December under the name of the Sugar Refineries Company, and that the trust represented \$50,000,000 of capital and refines 3,000,000,000 pounds of sugar a year—about two-thirds of all the sugar refined in the United States. The president is Theodore A. Havemeyer, the head of the great Williamsburg sugar refinery, and John E. Searles, Jr., is the secretary.

The utility of bulkheads in steamships was again illustrated in the collision of the Cunard steamship Umbria with the French steamship Iberia during a dense fog off Long Island on Saturday afternoon. The latter was cut clean through, so that 20 feet of the stern dropped off. The only damage sustained by the Umbria was a jagged hole in her bow 5 feet above the water line and about 1 foot from the stem. On the starboard side it showed a ragged outline, while on the port side the steel plates had been punctured and driven outward. The Iberia floated 32 hours after the Umbria struck her. Her watertight compartment kept her afloat until 9 o'clock on Sunday night, when she sank in 80 feet of water while lying at anchor about 4 miles southeast of Long Beach Hotel.

A St. Petersburg dispatch says a powerful American syndicate is about to be formed for the purpose of building railroads in Siberia. Besides a large subsidy the Government will give 4,000,000 rubles yearly for the transportation of mails and convicts.

The Iron Age

New York, Thursday, November 15, 1888.

Nine Months' Imports.

A study of the last import statistics published by the Bureau of Statistics throws additional light upon the favorable situation in the steel trade. We noted lately that the falling off in imports is a very important factor—or, in other words, that the falling off in the demand for steel rails was nearly offset by a decline in the imports of raw material. During the first nine months of 1888, the imports of iron ore were only 474,482 tons, against 1,012,352 tons in 1887, a falling off of 537,870 tons. In pig iron the drop was from 377,781 tons to 139,639 tons, the greater part of the latter being manganiferous stock. In steel rails the decline is from 95,622 tons to 53,597 tons, while the imports of steel blooms, billets and slabs fell from 265,102 tons to 79,446 tons, a decline of not less than 185,656 tons. In wire rods the imports fell off from 122,264 tons gross to 82,098 tons. Steel sheets and plates declined from 19,078 tons to 15,432 tons.

Grouping together the four lines in which steel plays an overwhelmingly important part, so far as tonnage is concerned, we have the following:

Imports of Steel—Nine Months.

Gross tons.	1888.	1887	Decline.
Steel rails.....	53,597	95,622	42,025
Steel blooms, &c.....	79,446	265,102	185,656
Wire rods.....	82,098	122,264	40,266
Steel sheets, plates..	15,432	19,078	3,646
Total.....	230,573	502,066	271,593

Such a quantity of steel, say 275,000 gross tons, would represent about 325,000 tons of pig iron. Adding about 175,000 tons less of Bessemer pig imported out of the falling off of 238,142 tons of pig iron, we would reach a total of fully 500,000 tons of this class of raw material. Converting this into iron ore, it would be equal to about 800,000 tons, so that with the falling off in the imports of ore of 537,892 tons we would reach a total of 1,350,000 tons. This would represent the quantity of ore equivalent to our lessened imports. Our decline in the demand for rails was reckoned at 475,000 for the first nine months. Again figuring back to ore, we would have 550,000 tons of pig, or, say, 925,000 tons of ore. It is safe to state, therefore, that the decline in the consumption of rails has been compensated for, so far as the supply of raw materials is concerned, by a lessened importation of foreign stock.

From another standpoint the import statistics show another fact worthy of being attended to. The imports of old iron fell off in the first nine months from 259,454 tons in 1887 to 35,986 tons in 1888, and the receipts of old steel scrap declined from 24,282 tons to 8166 tons. The result has been a narrowing of the supply of old stock, which must have told favorably to

some extent on the demand for muck bar, and therefore for mill pig. The high prices for old rails have had a favorable effect, too, upon the quantity of new rails ordered. The difference between the high market value of the old material and the very low price at which rails are sold is so small that it must be very attractive to railroad managers. Sales of steel rails for 1889 delivery have been made, under exceptional circumstances, it is true, at \$26 at Pittsburgh, while old rails fetch there \$25. Paying freights both ways and even allowing a very good cost for labor and supplies in removal and relaying, railroads can put down steel at a very small outlay in cash.

Freight-Rate Problems.

The last few weeks have developed problems in the several sections of our country whose solution by the railroads must be of importance to all manufacturers and merchants. In the South the Richmond Terminal Company bid fair to acquire such power as will enable them to control the commerce of their territory to a greater or less extent. Already possessing the Richmond and Danville, or Piedmont system, and the East Tennessee, Virginia and Georgia, they bought the control of the roads owned and leased by the Central Railroad of Georgia. The gossips declare further extensions to be probable; the Atlantic Coast roads, the Georgia Pacific, the Norfolk and Western and even the Baltimore and Ohio are mentioned as possible acquisitions. The possible effect of such a centralization of railroad power is a grave subject. It is true that in our day great aggregations of capital seem necessary for the best results, and that often subdivision means waste, but the power for evil increases with the power for good. Even more than in mercantile affairs, trusts or great combinations of capital in transportation are capable of damaging commerce. When pressed, we often can use a substitute for something whose price is arbitrarily advanced, but if we trade at all we must use the railroad. A bad symptom in the present case is the large amount of water which the Richmond Terminal continue to pour into their stock and bonds as their several acquisitions are made one by one. An accurate calculation of this water is very difficult, but enough is known to make certain that the original values have been greatly exceeded. It is not to be supposed that the Terminal Company are philanthropic, rather they are organized to make money. Sooner or later such excessive capitalization will demand earnings, and the danger is that to obtain these earnings the traffic may be forced to pay "all it will bear," and that, too, when measured by a high standard. Forced rates would in various ways be brought down again in time, but meanwhile trade would suffer. It is to be hoped that the turn of events will not subject the South to any such unnatural tariff advances.

The suit of Coxie Bros. against the Lehigh Valley before the Interstate Commerce Commission means a more searching inquiry into an old and standing complaint than we have yet had. The great coal-carrying railroads are practically coal miners also. The law forbidding this is evaded by forming subsidiary companies

for the mining which are owned and controlled by the railroads. The result has always been that the railroads have had things their own way. Private owners of coal lands have in the past been compelled to sell out or have been silenced. In the present suit it is understood that two allegations are made. First, that the Lehigh Valley Railroad makes a lower rate to its own coal company than to the complainants; and, second, that the rates on an thracite are proportionally much higher than on bituminous coal. The first point involves the whole question of the relationship of the coal carrying to the mining companies and, incidentally, the good and bad features of combinations. The second point is a fine one. In England it has long been held that things which have a "competitive interest" in each other must be considered together in rate making. So far as the question has come up in America, the same ground has been taken, the Interstate Commission deciding in the case of a powder which competed with soap that the rates must be approximately alike. Just how far hard and soft coal compete, and just how far the public would use hard coal under certain conditions of price and supply are difficult questions, but ones which our railroads have not hitherto set themselves to answer fairly. The suit opens up the subject for discussion and also the means by which the present condition of things is maintained.

West of the great lakes the passing of the dividends and the losses of the railroads there are well known. It is probable that the exceptional profits of the past six or eight years will not soon be realized again, and those roads which are heavily bonded in aid of extensions not yet self-sustaining must continue to find difficulties in paying good dividends. Just now the center of attraction is the State of Iowa. In reply to a letter from the Railroad Commissioners asking for a valuation upon their road, the Rock Island said that it was not worth as much as it was four years ago and more than it would be four years hence if the State kept up its crusade against carriers. True enough; and yet the Rock Island is trying to pay dividends upon stock which was doubled in 1880 by the free gift of one additional share to each holder of one. Granting that the road was worth double in that year, the difficulty with all watering is that there is no way of registering a corresponding decline in value when such takes place. The doubled stock must stand at double in adversity and earn the doubled dividend if possible. Meanwhile the jobbers of that State are successful before the State Commissioners in their complaint that the tariffs are arranged to give the country trade to Chicago. It is the old question, and apparently as far from solution as ever. Assuming that no city owns any particular trade community by right, we see how difficult it is to arrive at any basis by which such questions can be decided. Shall we attempt to neutralize "push" on the one side or the advantages of neighborhood on the other? What shall we allow in rates to the interior jobber to offset the greater variety of stock in the large cities? To such questions no definite answers can be given, and yet without such information no lasting settlement of the problem is possible.

Jurisdiction of Corporations.

A decision of considerable interest to corporations was made on the 5th inst. in the United States Circuit Court at Chicago. It appears that under a recent Congressional enactment no suit can be brought in any United States Court against a person who is not an inhabitant of the district in which the court is held in cases in which the United States courts have original jurisdiction. As applied to individuals this provision of law doubtless acts and was intended to act as a safeguard against persons being called upon to plead in a suit brought against them probably maliciously in a locality distant from their place of residence. With respect to corporations, however, it operates in a manner hardly contemplated by those who favored its enactment. The specific case decided was that of the La France Fire Engine Company against the Fire Extinguisher Mfg. Company, of New York, whose manufactory, however, is in Chicago. The defendant filed a plea to the jurisdiction, setting up that it was a New York corporation having its office in New York and holding its board meetings in that city, and that, although it did business in Illinois, it was not subject to the jurisdiction of the United States courts there. Judge Blodgett decided that although the fact of a foreign corporation, having a factory and doing business in Illinois, presented a hardship if it could not be sued there, yet it was clear that under the provisions of the act of Congress of March, 1887, amended this year, he could not entertain jurisdiction of the suit. Being a New York corporation, the defendant would have to be sued in New York. Under the wide-spread custom now existing of granting liberal charters to corporations in nearly every State, whether they intend to do business in that State or wholly outside of it, this law, as interpreted, would seem to open the way to great inconvenience.

The Precious Metals in 1888.

Several financial and monetary events have favorably influenced the value of silver or are about to do so this year, and go to explain the rise which has taken place in the London market since May, and its firmness at present. The course of silver so far in 1888 has been as follows, giving the extreme range each month:

Pence.		Pence.	
January.....	44¼ to 44 9-16	June.....	42 to 42 3-16
February.....	44 to 44 5-16	July.....	42 to 42½
March.....	43¾ to 43	August.....	42 to 42½
April.....	42 to 42½	Sept.....	43 to 44 5-16
May.....	42½ to 41¾	October.....	43 to 43¾
November 10.....		43 1-16	

Early in June the Secretary of State for India published in London his prospectus of a 4 per cent. Indian loan of 300 lacs of rupees, equaling in value £2,000,000, for which subscriptions were taken at Calcutta, Bombay and Madras on July 3. This loan improved the exchange on India and the price of silver correspondingly. Simultaneously it was reported from Rio de Janeiro per cable that in consequence of the abolition of slavery in Brazil, by decree of May 13, some \$16,000,000 worth of paper money were to be withdrawn and replaced by silver coin, to enable the planters to pay freedmen's wages in specie, and that the said amount would have to be bought in the open market.

Toward the close of September it was announced from St. Petersburg that in order to transform the monetary basis of Russia, and be able to coin 400,000,000 rubles of fractional silver, the Government would have to buy in the open market 3,250,000 kg. of fine silver, equaling in value \$105,000,000 American. The moment for a partial return to specie payment seems to be a propitious one in Russia. Gold is pouring into the country for grain, and the Ural Government gold mines produce abundantly. Besides, in consequence of the momentarily peaceful outlook, Russian securities have commenced to improve in value rapidly. The mint is at the same time to turn out 211,000,000 rubles of gold, equaling in value \$170,000,000 American, and the amounts of paper rubles to be withdrawn from circulation and destroyed would be 97,000,000 rubles of 1-ruble, 139,000,000 rubles of 3-ruble and 145,000,000 rubles of 5-ruble notes, together 381,000,000 rubles, leaving 600,000,000 rubles in circulation, against which a reserve of 300,000,000 rubles in gold, specie or bullion, is to be held in the treasury. This is the plan, virtually restoring specie payment, as the 600,000,000 rubles, with a 50 per cent. gold reserve, would, of course, command par.

At the same time the Argentine Republic attracts a great deal of gold in consequence of the many national, provincial, municipal, railroad and other loans that have been floated in Europe so far this year, the end of which is not yet. Of course a goodly portion will be returning continually to pay interest in Europe on the enormous indebtedness the Argentines have been and are contracting. As London bankers have found that there is some profit in making gold shipments from New York to Buenos Ayres direct, instead of via London, a commencement was made last month, and \$500,000 in American eagles were shipped.

Silver shipments from London to India, China and the Straits from January 1 to October 18 have been as follows:

	1888.	1887.
To India.....	£3,425,852	£2,987,550
China.....	284,729	247,716
the Straits.....	404,780	475,570
Total.....	£4,115,361	£3,710,836
From Marseilles...	233,197	650,009
Totals.....	£4,348,558	£4,360,845

An increased output of gold is expected in 1888 in California, British Columbia, Brazil, Mexico, Venezuela, the Argentine Republic, Victoria, New South Wales, Queensland, Southern India and South Africa. The latter exported £69,543 in 1885; £133,534 in 1886 and £235,937 in 1887. During the first six months of 1888 it was £390,000. Later cables estimate this year's South African production at £1,000,000. The estimate of the world's gold production in 1888 is £21,000,000, which would slightly exceed even the large 1885 output, which proved to be £20,720,000. Consequently plenty of gold is likely to be produced as an offset against the growing demand for it alluded to. As for silver, we presume the United States production will be at least equal to the average of the last three years, which was \$52,000,000; in Mexico an increase may be looked for, and a decrease in Bolivia should the revolution there not be quelled soon. At any rate, both metals seem to be in good position.

The Ventilation of Petroleum Ships.

With the advent of the petroleum tank steamer the danger involved in the carrying of petroleum cargoes was, for a time, again made a topic of absorbing interest. The tank design, as compared with the old method of transporting the oil in barrels, suggested new risks, which, though at first receiving little attention, have, in the light of recent experience, grown considerably in importance. It was not so much the danger of fire, which is present both when carrying the oil in tanks and in barrels, but that of explosion of the gases in empty or partially filled tanks concerning which apprehension was felt, and with what good cause has been shown by the disastrous explosion a few weeks ago of the steamer Ville de Calais, at Calais, France. The amount of available energy in the mixture of petroleum vapors and air in a ship's hold under ordinary conditions has probably never even been guessed at. The Calais accident is, therefore, all the more instructive and suggestive of the fearful consequences which a slight neglect of precautionary measures may bring about.

The explosion was specially remarkable for its violence, of which a striking illustration is given in an account furnished to the *London Standard*. Briefly stated, the circumstances connected with the explosion appear to have been these: The vessel had discharged her cargo of petroleum, and to take its place and serve as ballast water was being pumped in. While this was going on one of the engineers entered the hold with a naked light, which at once communicated with the gas present. The effects of the explosion were visible in every part of the town. Windows were smashed in all directions, and the concussion was so great that people, believing an earthquake had occurred, left their houses in terror. The wreck of the steamer itself presented a remarkable appearance. The after-part of the vessel remained almost intact. The rest, with the exception of a small part of the fore-castle, had been blown into the air and scattered in all directions. The force of the explosion was so great that huge pieces of machinery were hoisted up in an extraordinary manner, and large pieces of iron plating were blown to almost incredible distances. In some houses, ¼ mile from the scene of the accident, the shock was so great that people were thrown down in their rooms.

The explosion is not the only one which has marked the introduction of the petroleum cargo steamer, and only emphasizes the requirements which have already been shown to exist for safer means of working such ships. In every instance thus far the explosions were brought about by the introduction of naked lights into an atmosphere charged with gases, or rather petroleum vapors in about the proportion necessary to form explosive mixtures, and the problem of insuring safety therefore presents no unusual difficulties. It is not necessary that petroleum steamers be given isolated anchorages for discharging their cargoes and taking in ballast or undergoing repairs, so as to protect what would otherwise be their surroundings; nor is it practicable, on having discharged the oil, to fill the tanks with water, as has been suggested, so as to prevent the formation of explosive mixtures, since by this method

all facilities for internal inspection and repairs would be cut off. Efficient ventilation, however, would fully secure the desired end and as a means of insuring safety is both the simplest and most satisfactory generally. With a good circulation of air there would be no time for dangerous mixtures to form, and absolute immunity from explosions would be assured. The cost of the necessary ventilating plant, moreover, would not be large, and ought not to weigh heavily against the adoption of a thoroughly well designed system. The latter, in fact, should be made compulsory. The amount of air to be supplied and the means of distributing it in every part of a vessel's hold are the points which should receive close attention. At present, so far as we know, with few exceptions only the crudest kind of ventilation is attempted, in which wind sails and open hatches play important parts. The insufficiency of such systems is beyond all doubt, and these should be condemned without waiting for further disastrous demonstrations.

Chimneys for Boiler Plants.

The 335-foot chimney of the Clark Thread Company, at Newark, N. J., which, of late, has been very widely noticed, being probably the tallest boiler chimney in the world, calls to mind the fact that a large number of chimneys now in existence are of much greater height than the requirements actually call for. There seems to be a prevailing notion that the greater the height the greater, in direct proportion, the draft-producing power of a chimney—a most natural error perhaps on the part of the average power men, but, at the same time, one which has been responsible for much unnecessary outlay in chimney construction. As a matter of fact the draft-producing capacities of chimneys, having flues of the same size, are in proportion to the square roots of their heights, so that if one was to have double the power of the other it would have to be four times as high. Attention has been more than once directed to the circumstance that beauty of design, from an architectural point of view, has had much to do with the unnecessarily great heights so frequently encountered, a much favored rule being to make the height of the chimney equal to about 25 times the diameter of the flue. A little consideration will show that by rigidly adhering to this ratio some rather peculiar results will be reached, chimneys for small plants turning out to be much lower, and those for larger boiler plants becoming much higher than is necessary. The area of cross section of the chimney flues in all cases should be made to depend upon the combined areas of the boiler flues, and this, with a height of stack of 100 feet, shown by extended experience to be a very satisfactory figure, will furnish ample draft to burn any of the commonly used fuels. Applying the 25 to 1 ratio to two plants of, say two and ten boilers, respectively, all of the same size, and proportioning the flue areas of the chimneys in the way we have just indicated, will afford a very striking illustration of the shortcomings of the rule. One hundred and fifty feet represent what has on good authority been given as the maximum height of chimney necessary in

any case for producing the requisite draft, always providing, however, that the flue area has been properly proportioned. Proprietors of steam plants boasting of chimneys which must exceed this figure in height may indulge in some profitable reflections as to the money needlessly spent in having such structures raised.

The sudden declaration of hostilities among the trunk lines is a matter likely to seriously influence the general business situation, which has been steadily tending in the direction of improvement. Looking back upon the record of 1888, it seems amazing that the business community has been able to resist so easily shock after shock. Again and again we have suffered from setbacks, and yet, on the whole, prosperity has increased. It seems almost impossible to resist the conclusion that, at no distant date, the impetus we have been gathering must sweep aside all minor obstacles. Our farmers, on the whole, have been blessed with good crops, and are getting good prices. Our railroads are carrying an enormous tonnage, taxing their capacity. Our manufacturers have been crowded with work. Consumption has been liberal, the financial situation is without any signs of immediate danger. Commercial disasters are not unduly numerous nor indicative of widespread rottenness, and labor is generally content and quiet. Producers and traders generally are doing quite well, although many complain of narrow margins. In spite of all these facts, unfavorable news crops up with amazing frequency. The last, the trunk line war, presents the spectacle of two great interests cutting into one another's revenue, when, confessedly, one at least has as much business as it can handle possibly with its equipment. Under the circumstances, it would seem likely that so disastrous a policy could not long continue. If it does the indirect influence upon the business interests of the country cannot help being unfavorable and stay the rising tide of prosperity.

A curious plea made in behalf of the American Bell Telephone Company, in the litigation over the patent, has just been brushed aside by the United States Supreme Court. On the ground that the Bell telephone patent had been fraudulently secured, the officers of the Government entered suit to have it declared void. The suit was first dismissed in Ohio, on the decision that the court that it had no jurisdiction. It was carried before the United States Circuit Court, at Boston, and there the demurrer of the Bell company was sustained. On appeal to the Supreme Court this latter decision is now overruled, and the question can now be argued on its merits. This preliminary skirmishing has, however, settled one interesting point which should be noted by manufacturers and inventors. The Bell company claimed that the United States had no right, in the absence of a specific statute granting that power, to bring a suit to cancel a patent, and that such a suit could only be brought by a private party and not by the Government. In other words, a privilege once secured, even fraudulently, from the Government, cannot be recovered by it by process of law, a right never denied an individual. The directness and force with

which this claim is characterized as contrary to all ideas of justice is a severe rebuke to the lower court and puts at rest the claim that there is no remedy against fraud once successfully practiced when a patent for an invention is at stake and the Government itself seeks to break a monopoly.

OBITUARY.

WILLIAM DEAN, SR.

William Dean, Sr., one of the best known and highly respected citizens of Mingo Junction, Ohio, died at his home in that place, on Monday, the 5th inst., aged 63 years. For the past ten years Mr. Dean's health had been slowly failing, and on the Sunday evening preceeding his death he was stricken with an acute pain in the stomach, which increased until death relieved his sufferings. Mr. Dean was a native of England, where he was born on October 2, 1825, but came to this country at an early age and settled in Phoenixville, Pa., where, for a time, he worked at his trade as a stone-mason. While living at that place he married Isabella Griffin, a native of New York City. About 1850 he left Phoenixville and came to Wheeling, W. Va., where he soon became associated with David Spaulding, C. B. Doty, S. H. Woodward, John McClinton and W. H. Wallace, and joined with them in the formation of the La Belle Iron Works, and afterward became identified with the Jefferson Iron Works, of Steubenville, Ohio. He was actively connected with the iron business, and with Andrew Glass formed the Mingo Iron Works, about 16 years ago. Mr. Glass was president, and Mr. Dean vice-president, and his son, Geo. A. Dean, subsequently became secretary. About the time of the starting of the Mingo Works he removed to Mingo, where he resided until his death. The Mingo Iron Works failed about 1877, since which time he has not been actively engaged in any business, although maintaining his keen and intelligent interest in the progress of Mingo. He took the failure of the old works very much to heart, and his failing health dates from that time. Mr. Geo. A. Dean, the secretary and superintendent of the Junction Iron Company, of Mingo Junction, Ohio, is a son of the deceased.

DAVID HOSTETTER.

Dr. David Hostetter, one of the best known and wealthiest citizens of Pittsburgh, died in this city on Monday, the 5th inst. He was here for the purpose of being treated for kidney trouble, and underwent a surgical operation, which resulted in his death. Dr. Hostetter was connected with a number of enterprises in Pittsburgh, being a large stockholder in several natural gas companies, and was also a heavy stockholder in the proposed South Penn Railroad. His funeral took place from his residence in Allegheny City, on Friday, the 9th inst.

FREDERIC A. POTTS.

Frederic A. Potts, the head of the coal firm of Frederic A. Potts & Co., and one of the most prominent men in the coal trade in the country, died on Friday night, at his residence, 39 East Thirty-ninth street. He had been sick only two weeks with cancer of the stomach. Mr. Potts was born 52 years ago, in Pottsville, Pa., and was the son of George H. Potts, late president of the National Park Bank. He was educated in Pottsville, and when about 20 years of age he became a salesman for Auden Reid & Co., of this city. In 1866 he became a member of the firm, and on the death of Mr. Reid, in 1874, succeeded

to the business, which he conducted alone until 1883, when the firm of F. A. Potts & Co. was formed. Mr. Potts was well-known in the coal trade and in railroad circles. He was president of the Coal Exchange, vice-president of the Park Bank, president of the New York and Susquehanna Railroad, a director in the Mutual Benefit Life Insurance Company, of Newark, N. J., and also held other offices of importance. He was once the Republican candidate for Governor of New Jersey, and was widely known in that State, as well as in this city. He leaves a widow, two daughters and three sons.

The Charcoal Furnaces November 1.

As will be observed from the details printed below an increase has taken place in the current output of charcoal iron, the principal improvement having taken place in Michigan.

Charcoal Furnaces in Blast November 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New England.....	14	8	605	6	495
New York.....	10	4	511	6	480

Total Nov. 1.....	169	73	12,724	96	8,941
Total Oct. 1.....	175	71	11,619	104	9,083
Total Sept. 1.....	178	67	11,243	109	10,004
Total Aug. 1.....	176	65	11,137	111	10,085

In New York Copake resumed on the 19th ult., and Millerton was banked for three weeks for repairs. In Maryland two Stickney and one Maryland furnace are running, while no changes have taken place in Virginia. In Kentucky both Bellefonte and Hunnewell continue at work, while in Ohio, Bloom went out of blast in October. In Michigan Detroit and Elk Rapids again began to make iron, the total product of the State being estimated at 17,814 tons in October, against 16,171 tons in November. In Wisconsin, the capacity has been reduced by the destruction by fire of the Appleton furnace, which will not be rebuilt before next year. This leaves Hinkle, Fond du Lac, Minneapolis and National as the producers, their combined output in October having been 6166 tons. In Missouri Midland and Sligo are running. In Tennessee the one Nashville furnace is running on coke. The second new furnace will probably make its first cast of charcoal pig early in December. In Alabama Round Mountain furnace was banked at the time reported on account of labor troubles. In Texas the Old Alcalde furnace is making good yield, while on the Pacific Coast Oswego in Oregon and Irondale in Washington Territory are running. The former, a new stack, was blown in on the 30th ult., and is making 50 tons a day.

The Charcoal Iron Workers.—The death of Mr. Samuel Noble, the president of the United States Association of Charcoal Iron Workers, has led to the abandonment of the proposed meeting at Anniston, Ala. A meeting will be held at the Oriental Hotel, Thirty-ninth street and Broadway, New York, commencing

Wednesday, December 5th. The International Navigation Company have tendered a complimentary luncheon on board one of their ocean steamers, and Thursday is to be spent at the laboratory of T. A. Edison, at Llewellyn Park, Orange, N. J.

Washington News.

(From Our Regular Correspondent.)
WASHINGTON, D. C., November 13, 1888.

The results of the election of last Tuesday for the executive and legislative branches of the Government put an entirely new phase on the tariff question. It is no longer an issue before the people, but a problem to be solved in accordance with their verdict. Had the elections resulted in a Republican President and Senate with an opposition House, the industries of the country might have been subjected to another long period of agitation and doubt. With every branch of the Government in the hands of the Republicans, it is a guarantee that whatever may be done in revising the tariff and reducing the surplus, it will be in accordance with the policy of protection to home industries. There will be no partisan antagonisms, but the work will be done in a spirit of harmony. Whether it be done promptly through the avenue of an extra session called to assemble immediately after the inauguration of the new President, or whether it be delayed until the time of meeting of the regular session nine months after, the industries of the country can go ahead with the confident knowledge that whatever is done, and whenever it is done, it will not be with the disturbing tendencies of antagonism to established and long-tried doctrines. The prospective President, whatever might be his personal views as to the details of tariff revision, is thoroughly in line with his party on the general theory, and, therefore, will not antagonize any measure which may emanate from the majority in Congress.

The organization of the House in the election of Speaker will be diametrically opposed to the impulse which led to the selection of Mr. Carlisle for the chair of the present body. It is more than probable the choice will fall upon either Reed, of Maine, or McKinley, of Ohio, both of whom are members of the Republican branch of the present Committee on Ways and Means, and whose views on tariff are well known. There is a disposition on the part of the Republican leaders to retire Judge Kelley, who has had a monopoly of the chairmanship of the Committee on Ways and Means, of late years, whenever the wheel of political fortune has turned up a Republican majority in the House. He is at present the senior member of the Republican wing of the present committee, but he is so more on account of length of service and public notoriety as an ultra-protectionist than from any really superior knowledge of the subject in all its diversified bearings as to details. If the selection should be made by the line of numerical succession, Col. Tom Browne, of Indiana, would come next, but, as he never pretended to be a tariff expert, he would doubtless be very well satisfied to take some important chairmanship in the next House, of which he will be a member. This will then leave Reed and McKinley in that order on the list. The former having the prestige of the vote of his party when it was an empty compliment, his friends will now push him when it means success. His elevation to the chair would open the way to Colonel McKinley to reach the chairmanship of the committee.

It is very generally proposed by Republican Senators who have arrived here to go ahead with the Senate Tariff bill and pass it, sending it over to the House to be dis-

posed of as the majority there may think best, but without any aggressive action on the part of the Republicans in the direction of passing it, thus placing upon the Democratic majority before the control passes out of their hands the responsibility of non-action. This they claim will then give the Republicans a clear field in the next House.

It is now, of course, established that the whole responsibility for economic legislation for the next two years at least will rest upon the Republicans. It may now be settled in the public mind that so far as the reduction of the surplus, if any, shall be involved the repeal of the internal taxes, except upon whisky, which may be modified, will contribute with sugar, the bulk if not the entire reduction. The changes in the Customs schedules will therefore be more with reference to adjustment and equalization than interference with existing rates. It may be regarded also as settled in cases where necessary to the interests of any branch of industry that the rates will be raised.

TREASURY DECISIONS.

The following decisions have been rendered by the Secretary of the Treasury :

Diminutive knives which are intended for use as "charms" for watch-chains, and are incapable for use as pocket-knives or for any useful purpose whatever, are held to be dutiable at the rate of 25 per cent. ad valorem, for "jewelry of all kinds."

So-called pocket-books or cases containing needles of different designs and varieties are held to be dutiable at the rate of 25 per cent. ad valorem, for "needles, sewing, darning, knitting, and all others not specially enumerated or provided for," it being ascertained that the so-called pocket-books or cases are simply the usual coverings of such merchandise.

Pocket-knife blades fully finished and ready for hafting, and which upon investigation were found to be commercially known and designated as cutlery, are held to be dutiable at the rate of 35 per cent. ad valorem for "cutlery."

There is trouble in Corea. Owen N. Denny, formerly United States Consul-General at Shanghai, but of late royal adviser of the King of Corea, has rendered himself obnoxious to the Viceroy of China, Li Hung Chang, who demands his dismissal. The State Department authorities, however, do not believe Li Hung Chang will request the United States to interfere in this matter, but regard the demand referred to as simply an order to the King of Corea to dismiss the American from his official position. Mr. Denny is charged with offensive meddling with Chinese politics, also with having used his position to ingratiate himself with the Russian Government, for whom he has secured an important trading concession along the northern frontier of Corea. The relations sustained by Mr. Denny to the King of Corea seem to have closely resembled those so long held by Mr. Gibson to the Hawaiian King, but from which he was summarily removed by a popular uprising. Americans are not always successful in the rôle of aids to foreign potentates. In the case of Mr. Denny, he may be regarded as the first victim of Chinese retaliation.

The completion of the great 36-inch gas main in Pittsburgh is an occasion for rejoicing. The job is called the largest of its kind known. The line is formed of 22,700 feet of cast-iron pipe and 400 feet of wrought-iron pipe. The inside diameter of the pipe is 36 inches. The cast-iron pipe weighs 485 pounds to the foot, and 1½ inches in thickness. The wrought-iron pipe is ¾ inch in thickness, and weighs 190 pounds to the foot. The cast-

iron pipe has lead and asphaltum joints, with double escapes. The wrought-iron pipe has an asbestos flange joint. They are all calked from the inside of the pipe, so that the pressure of the gas will only serve to make the joint tighter, instead of weakening it. The pipe, when tested at the works, stood 300 pounds pressure, and an 80-pound pressure when laid.

American Tin Plates.

During the past week an interview has been widely quoted with W. C. Cronemeyer, chairman of the United States Iron and Tin Plate Company, Limited, of Demmler Station, Pa., granted to a reporter of the *Pittsburgh Dispatch*. In one important particular Mr. Cronemeyer's statement was incorrectly repeated, hinging as it does on the introduction of the small word "if." We reproduce the interview with the preface that American tin plates are to reappear in our markets "if the Senate bill is passed, amended so as to bring tin and terne plates under the same clause with galvanized iron."

This means the shutting out of foreign tin plates, the renewal of the industry in this country, and the employment of 100,000 men who are now idle. Within six weeks after the time the Senate bill is passed we will begin the manufacture of tin plates, and will make additions to our works filling the 5 acres of vacant ground, and inside of two years we will have 1000 men in our employ, instead of 200. Of course we will have to import block tin for a few years, as there is not a developed tin mine in this country. There are large quantities of tin in Virginia and other parts of the country, and mines will be developed as soon as there are assurances that there will be a protective tariff on the tin-plate industry. The American Tin Plate Association has not held a meeting or done any business for a year or two, but it is likely they will meet in a short time. When I say that 100,000 additional men will be employed I do not mean in the tin-plate industry. Only 30,000 skilled workmen will be needed to make the tin plates necessary for the consumption of this country. The other 70,000 will be employed in the manufacture of lead, boxes and other articles necessary.

High-Pressure Boiler Joints.—Mr. F. W. Dean, in a recent communication on locomotive boiler explosions, remarks: "Many of the boilers (especially the high-pressure boilers) of to-day have their longitudinal joints formed by a lap and an inside bent covering plate. This is one of the worst examples of unmechanical construction to be commonly found in engineering practice. It has been my good fortune to test this form of joint experimentally on a large scale in the Watertown testing machine, and it behaved very badly. After the lapped part of the joint was utterly ruined the bent welt proceeded to straighten out, and finally sheared off its rivets, reminding one of locking the stable door after the horse is stolen. It will always behave in this way, and is, therefore, a death trap. The strength percentage of this joint is very low, in spite of the fact that some tests of such joints have shown, when made under exceptional conditions, a high percentage. Nobody would think of making a bent tension member if he could avoid it anywhere else than in a boiler."

A. H. King has leased for a term of years the extensive grounds and shops of the Pennsylvania Railroad Company, at Bordentown, N. J., and has remodeled the buildings to suit the requirements of a railroad equipment depot, where a stock of second-hand cars and locomotives will be kept. The New York office is at 11 Wall street.

The population of Alaska is 49,850, of whom 6500 are whites.

MANUFACTURING.

Iron and Steel.

Charlotte Furnace, of the Charlotte Iron Works, Rochester, N. Y., blew in on the 8th inst., after an idleness of five months. A large number of orders are already in hand.

The Missouri Valley Bridge and Iron Works, of Leavenworth, Kan., manufacture all classes of iron and steel bridges, roofs and other structural iron and steel work. They employ from 100 to 150 hands in their shops and yards and an equal number in erecting when fully employed. They have found work somewhat scarce the past summer, but were very busy the previous two to three years. Contracts now on hand to be completed this year aggregate \$120,000, being the residue of orders taken in 1887. Their usual volume of business is from \$500,000 to \$600,000, but this year will not reach more than half as much. The buildings and yards belonging to these works occupy about 5 acres, but as their accommodations are somewhat cramped the proprietors contemplate the erection of buildings where they will have more room. Their machinery is of the latest and most improved pattern. Their iron and steel are obtained in Pittsburgh, Philadelphia and Trenton.

We are advised that No. 1 furnace of the Stewart Iron Company, Limited, at Sharon, Pa., which has recently been relined and repaired, has not yet resumed operations, and the date of its resumption is uncertain. The reason of this is the inability of the railroad companies to furnish the necessary coke transportation.

For some weeks past a bitter conflict has been going on between Dilworth, Porter & Co., proprietors of the Glendon Rolling Mill, at Pittsburgh, and the Amalgamated Association of Iron and Steel Workers. The trouble dates back to the time of the lockout in July last, when the firm refused to sign the Amalgamated scale, and have since firmly adhered to that determination. No attempts were made by the firm to operate their works until about a month ago, when announcement was made that all the employees who wished to return to work could do so, but not as members of the Amalgamated Association, as the firm proposed in the future to employ only non-union men, but would pay as high wages as are called for by the scale of that organization. The old workmen refused to return to work under these conditions, and the firm have since been engaged in importing workmen from different parts of the country, and have succeeded in obtaining a sufficient number of men to operate the greater part of their establishment, and in a short time expect to have their entire plant in full operation. The firm manufactures railroad and marine spikes exclusively, and have a capacity of turning out 30,000 net tons per year when the works are fully employed.

The report that the Ohio-Valley Foundry Company, of Bellaire, Ohio, whose foundry was completely destroyed by fire some weeks since, had decided to rebuild without foundation. As yet no arrangements have been made to rebuild the plant.

Phillips & Davies have just completed the erection of a plant at Wampum, Pa., and will engage exclusively in the manufacture of railroad spikes. The works are already in operation, and the firm reports a large number of orders on hand.

McKee, Fuller & Co., proprietors of the Lehigh Car-Wheel and Axle Works, at Catasauqua, Pa., are building a temporary erecting shop, 50 x 132 feet, to be used during the winter, as the one the firm have been using is not suitable for cold weather.

The various works of this firm are being operated to their full capacity, with plenty of orders on hand.

On Thursday, the 1st inst., the forge and machine shops of the Columbus Bridge Company, at Columbus, Ohio, were destroyed by fire. The company will continue in the bridge business, and expect to have the burned buildings rebuilt within 90 days. They have already contracted for completion of contracts on hand.

All the puddling furnaces of the Etna Iron Works, Limited, at New Castle, Pa., together with the rolling mill, are now in operation. The guide mill is working double turn. The nail factory has been changed into a pipe mill.

No. 1 Furnace of the Isabella Furnace Company, at Etna, Pa., for the four weeks ending on October 27, produced 6702 tons of No. 1 foundry iron, or an average of 1675 tons per week. This is the largest output in the same length of time in the history of the furnace.

The McAuley Cyclone Pulverizer heating appliance is working most successfully at the rolling mill of the Warren Rolling Mill Company, at Warren, Ohio. In one day recently No. 1 Furnace produced 4300 pounds of iron with 1360 pounds of coal dust, while on the same day No. 2 Furnace turned out 4400 pounds of iron, using only 1840 pounds of fuel. This is regarded as extraordinary, when it is considered that 1½ tons of coal is necessary to produce a ton of iron by the old process. The device is to be experimented with in heating a battery of boilers.

During the month of October, just closed, the steel department of the Bellaire Nail Works, of Bellaire, Ohio, produced 6779 tons of steel, while the blast furnace turned out 4033 gross tons of Bessemer pig iron.

D. W. C. Carroll & Co., Limited, proprietors of the Fort Pitt Boiler Works, at Pittsburgh, have contracted to furnish the St. Paul and Northwest Railroad with 60 iron station water tanks of 450 barrels each. The contract amounts to nearly \$40,000.

Frederick Prime has been made president of the Clifton Iron Company, owning and operating the furnaces at Jenifer and Ironaton, Ala.

The Richmond Standard Spike Works, a new concern recently established at Richmond, Va., have contracted with M. V. Smith of Pittsburgh for the construction of a small rolling mill, spike machines and a regenerative gas furnace, with a capacity for melting 40 tons of steel per day. The firm will make all the iron used in the manufacture of their spikes. Work on the contract has already been commenced.

No. 2 Furnace, of the Spearman Iron Company, at Sharpsville, Pa., was blown out on Wednesday, the 31st ult., for the purpose of being relined and repaired. No. 1 Furnace of this company was blown in on Wednesday, the 7th inst. after undergoing extensive repairs.

Under date of the 9th inst. the Tyrone Iron Company, of Tyrone, Pa., write us as follows: "We shut down our entire plant on Saturday morning, November 3rd, 1888, for the purpose of rebuilding two regenerative gas furnaces. We are also putting up a new building, 60 x 35 feet, over the gas producers and building an entire new wing to our dam, 120 feet long.

Fred Sloss, of Birmingham, Ala., has purchased the Baxter Stove Works, and will build at once a 60-ton furnace. He already has a rolling mill, and will build another for making structural iron. He

intends that these mills with his stove works shall consume the product of his furnaces.

The large No. 2 Keystone furnace of the E. & G. Brooke Iron Company, at Birdsboro, Pa., which has been idle since last January, went into operation on the 12th inst.

Carnegie, Phipps & Co., Limited, of Pittsburgh, have purchased a lot adjoining their Twenty-ninth street mill, between Twenty-seventh and Twenty-eighth streets, and will use it for a bumper-shop. The present bumper-shop department connected with the rolling mill will be removed and in its place 20 double puddling furnaces will be built, making it equal to 40 single, or the whole mill to 82 furnaces. The finishing capacity is nearly 200 tons per day, but at present the facility for making raw material is less than 100 tons.

The managers of the Spearman Douglass and Mabel and Claire Furnaces, in the Shenango Valley, Pa., have raised the wages of their employees 15 cents per day. The prospects are that all the furnaces will be in blast all winter. The Henderson Furnace will resume next week after a long idleness.

The new blast furnace at Oswego, Ore., made its first cast October 21, and on the fourth day after turned out 50 tons of No. 1 foundry pig iron on 82 hours' run. It is owned by the Oregon Iron and Steel Company, was built by E. C. Darley, of Pittsburgh, who has a contract from the company to make iron for a year. The size of furnace is 13 x 60 feet. It has three Siemens, Cowper, Cochrane hot-blast stoves, 15 x 70, being the only charcoal furnace in the United States with three stoves. The Weimer engine has a 42 x 48 inch steam cylinder, and a 48 x 84 inch blowing cylinder. The two batteries of boilers were built by J. P. Witherow. The furnace has a Crane hoist, a Gates crusher, and 36 charcoal kilns. It is claimed by experts who examined it to be the most complete charcoal furnace plant in the United States. The company also have a pipe foundry in successful operation.

The Merion Iron Company, at Conshohocken, Pa., will blow in one furnace at an early date.

The Scranton Steel Company, of Scranton, Pa., on November 12, made 464 tons of ingots in 73 heats in 12 hours, rolling 428 tons of rails in the same time.

Machinery.

The Link-Belt Machinery Company, of Chicago, have begun the erection of their new foundry to be located on their 54-acre tract at Thirty-ninth street and Stewart avenue, Chicago. The structure will be 286 feet long by 87 feet wide, and will probably be completed before spring.

The Cookson Iron Works Company, of Kansas City, Mo., are manufacturers of steam and hydraulic elevators, and dealers in steam engines, boilers, pumps, &c. They are just completing new works, to which they will remove as soon as the buildings are ready for occupancy. They have recently had a great deal of work in cable fittings. A new safety arm for elevators, patented by Manager C. L. Cookson, is being brought out by this company.

The Great Western Mfg. Company, of Leavenworth, Kan., are manufacturers of steam engines, steam pumps and mill supplies generally, their specialty being the equipment of flour mills. They have enjoyed an unusually good run of orders during the past summer and fall for their special machinery for grinding flour. Through the improvements now being made in this class of machinery a reduced

number of break rolls is now being used, the proportion being three or four pairs, instead of five to six. The works of this company were established in 1858, but the present company were incorporated February 1, 1886. They have issued a very handsome catalogue of 188 pages, illustrating and describing their specialties and containing full price lists.

John Seaton, of Atchison, Kan., is building up an extensive and diversified business. He employs about 130 men in the several departments of his works, making automatic grain scales, architectural work, shafting and pulleys, and doing general jobbing. In addition, he makes a line of cannon stoves especially adapted to the use of railroads.

The Union Pacific Railway Company have just purchased 50 locomotives, dividing the order between the Schenectady and the Rhode Island Companies.

The Kansas City Elevator Mfg. Company, 1601 and 1603 Main street, Kansas City, Mo., manufacture a full line of hydraulic, steam and hand elevators for passenger and freight use. Their worm-power elevator is made with tools specially designed by the company, the various parts being made to a standard. The worm-wheel is accurately milled to the proper size and form needed to work correctly with the worm, which is threaded in a lathe. They are not put into use in the condition in which they came from the foundry. To take the end thrust of the worm shaft, a special steel pin and hardened steel buttons are provided, which run in a separate oil chamber, greatly reducing the friction. The safety brake is adjusted by a set-screw and lock nut. Each machine has an automatic stop. Their hand elevators are furnished with Turner's improved patent anti-friction boxes, the invention of A. Turner, manager. This box consists of a combination of six brass rollers with a steel shaft through each, with sufficient play to reduce the friction, thus making the elevators work with ease. The company have issued a catalogue illustrating and describing their system of building elevators.

James Clarke & Co. are operating a well-appointed factory at 1049 and 1051 St. Louis Avenue, Kansas City, Mo., under the name of Kansas City Brass Foundry and Electroplating Works, making anti-friction and babbitt metals, car bearings, locomotive work, &c. They make a specialty of headlight and car work.

Although mainly confined to local work, the Industrial Iron Works, of Kansas City, Mo., are steadily improving in business and growing in importance. They consist of a foundry and machine shop, making railroad, building and machinery castings and taking contracts for machinery for flour mills, coal mines, cable roads and elevators. J. H. & C. A. Burton are proprietors, and the establishment is located at 1212 and 1214 West Eighth street.

Snell & Meharg, manufacturers of vertical engines, at Reading, Pa., report that their works are in full operation, with plenty of orders on hand. Staver & Walker, of Portland, Ore., are the agents of this firm for the Pacific Coast, and are making large sales for the firm in that territory.

The Hill Friction Clutch Pulley Company, of Cleveland, Ohio, are increasing the capacity of their works considerably by the introduction of new machinery.

The Wilson-Snyder Mfg. Company, of Pittsburgh, manufacturers of pumping machinery, have purchased the old Siemens-Anderson Steel Works property on Ross street, in that city, the consideration being \$85,000. The purchasers have already commenced the erection of a new plant on

the ground, the foundation being about completed and the brickwork commenced. It is the intention to erect three new buildings. The main building, fronting on Ross street, is to be of brick, 160 x 50 feet, and three stories in height. It will be used as a warehouse, pattern shops and drawing-rooms, and will also contain the offices. A wing, also of brick, 60 x 60 feet, two stories in height and facing on Water street, will contain the pipe-fitting shop, brass foundry and brass-fitting shop. Running from the rear end of the Ross street building to the Panhandle road a brick building, 200 x 80 feet, and 45 feet in height, will be built. This is to be used in the manufacture of direct acting and duplex steam pumps for all purposes. It will be equipped with a large traveling crane and the latest improved machinery. These buildings are expected to be under roof by January 1, and be ready for occupancy by March. About 800 men will be employed in the new works. The firm also contemplates the erection of an iron foundry on the same lot in about a year.

The Harrison Machine Company, of Belleville, Ill., have elected the following officers for the ensuing year: President, W. C. Buchanan; vice-president, Lee Harrison; treasurer, Cyrus Thompson; secretary, Hugh W. Harrison.

William Fisher, proprietor of the Fisher Foundry, Engine and Machine Works, at Pittsburgh, has received the contract for the 10-inch mill, and the finishing shears to be erected at the new plant of the Minnesota Car Company, at Duluth, Minn., while the Lloyd-Booth Company, of Youngstown, Ohio, have received the contract for the erection of the 18-inch mill and the rail shears.

The Jeffrey Mfg. Company, of Columbus, Ohio, report an active business and increased demand for their elevating and conveying machinery.

The Hussey Re-Heater and Steam Plant Improvement Company, of 15 Cortlandt street, New York, report recent orders for their reheaters for some 20 different firms. One of these orders is from the Sewall & Day Cordage Company, of Boston, for both a Hussey reheater and a compound, automatic, low-pressure, feed-water heater for use in their new factory at Brighton, Mass. The waste gases from the boiler will first pass the reheater to heat the exhaust steam, and the water heater will then utilize the remaining heat in the gases. The heaters, taken together, weigh about 24,000 pounds.

Mr. Stephen Hopkins, of the Novelty Glass Mold Works, of Martin's Ferry, Ohio, has invented an improved taper reamer. The new tool, it is claimed, will bring a straight inch hole, 12 inches deep, to a $\frac{1}{4}$ -inch taper in a little less than one-third the time consumed in the old way. The tool is very simple, and is said to cost no more than the ordinary fluted taper reamer.

The Ranken & Fritsch Foundry and Machine Company, of St. Louis, Mo., have purchased the entire plant of the Smith, Beggs & Ranken Machine Company, and, as their successors, are prepared to furnish Corliss piston and slide-valve engines, steam and hydraulic elevators, and all other work in this line. Numerous improvements in building and machinery have been made, and they have added several large planers and lathes of latest pattern, thus forming one of the largest and most complete establishments of the kind in the West.

Messrs. Curtis & Curtis, of Bridgeport, Conn., write us, under recent date, that they are having some difficulty in supplying the demand for their improved die stocks and pipe-threading machines. They

have been running overtime with all the men they can work in their new factory for two months past, notwithstanding which they were compelled recently to add three hours more to the overtime, and expect soon to be obliged to enlarge their plant.

A screw-power testing machine, of large capacity, with all the recent improvements, has been erected at the United States Navy Yard, Boston, Mass. It was built by Messrs. Riehle Bros., Philadelphia, who supplied the testing machines to the United States Navy Yard at Mare Island, Cal., also at the Naval Academy at Annapolis, and the United States Military Academy at West Point. Messrs. Riehle Bros. have furnished in all nearly 30 of their testing machines to the United States Government alone. The machine at the Boston Navy Yard, above referred to, was examined and favorably reported upon by a special board of naval engineers, appointed by C. W. Melville, Chief of the Bureau of Steam Engineering. Com. W. S. Schley, Chief of the Bureau of Equipments and Recruiting, ordered this machine for the Boston Navy Yard. Another testing machine will be shipped shortly to the Thompson Electric Welding Company, of Lynn, Mass.; one to the Herreshoff Mfg. Company, of Bristol, R. I., and one to the Dennis Long Company, of Louisville, Ky.

C. A. Brackett & Co., 800 Delaware street, Kansas City, Mo., are manufacturers of Brackett's well auger and artesian well drilling machinery, for which they have built up an excellent trade. They have issued a catalogue descriptive of their specialties and giving full information how to operate well-drilling machinery. The Brackett well auger will not only bore through all kinds of earth, sandstone, magnesian limestone, coal, slate, boulders and hardpan, but is also claimed to work successfully in driving through heavy beds of quicksand. The size best adapted to general use is 11 inches in diameter and 6½ feet in length, and is composed of 12 sections of worm-shaped twists extending around the shaft, so connected by a lap joint as to form a continuous worm. The shaft has a reamer point. Two semi-circular grooves extend the full length of the shaft, forming, with corresponding grooves in the worm sections, two perfect air chambers from the top to the bottom of the auger, preventing suction and enabling the auger to be raised readily when full of dirt.

Hardware.

The Iron City Mfg. Company, who recently purchased the business of Geo. G. McMurtry, manufacturer of hot-pressed nuts, at Pittsburgh, have awarded a contract for the erection of new works, to be built on Forty-sixth street, in that city. The new building will be of corrugated iron, and will be 65 x 200 feet. It will be equipped with the latest and best improved machinery, and when completed will almost double the present capacity. It will be ready for occupancy about the first of the year.

The Bryden Horseshoe Company, of Catasauqua, Pa., last month shipped 102 tons of finished horseshoes to different parts, the largest month's business since the establishment of the works. The firm report that the demand for their goods is large and increasing rapidly, and that they are making all possible haste to occupy their new and enlarged plant, which will be ready during the next month.

It is reported that the Pacific Iron and Nail Company, of Oakland, Cal., will shortly begin the erection of a \$60,000 wire plant.

At the American Institute Fair there is an extensive exhibit of Lorrillard Refrigerators and Freezers, the articles being shown

in all sizes and styles. The space occupied is at the right-hand side of the main hall entering from Third avenue.

The entire plant of the Diamond Wrench Company, Portland, Me., has been purchased by Portland parties, who, besides the wrench, will manufacture a line of bit braces, screw-drivers, hammers, cutting nippers and padlocks. The new firm will be known as the Diamond Wrench and Tool Company. They have already commenced making important changes in their factory, adding new machinery for their specialties and remodeling the forge shop in the wrench department. The Diamond wrench is referred to as having steadily grown in favor with the trade, and especially with the exporters, and the new firm are regarded as starting under favorable conditions with orders ahead. The manufacturing will be under the direct supervision of E. C. Libby, who has received many complimentary letters both here and from abroad upon the finish and workmanship of the wrench, and he intimates that with the changes that are being made he can still improve the quality and reduce the cost of manufacture.

The Leffingwell Automatic Ash Sieve is one of several devices of the kind exhibited at the American Institute Fair, their allotted space being at the north side of the center of the hall. The patentee of these sieves is Charles Leffingwell, 55 Eighth avenue, Newark, N. J., while the other manufacturers and agents are Towel Rack and Novelty Mfg. Company, 52 Aborn street, Providence, R. I.; J. T. Hammond, 4628 Hedge street, Philadelphia, Pa., and Tiffin Union Churn Company, Tiffin, Ohio.

The Wyeth Hardware Company, of St. Joseph, Mo., are manufacturers and jobbers of hardware. In a recent interview with a representative of *The Iron Age* they stated that with them business was improving, although the summer had been dull on account of drought and the hot winds which injured vegetation in Western Kansas. The past two months have been better than the corresponding months of last year. They manufacture japanned ware, coal hods, tea caddies, oil tanks and cans of all kinds, and have enjoyed a continuously good trade in this line. They claim to be the largest manufacturers of harness and saddlery goods west of Chicago and St. Louis, and their business in that department has been well sustained, even heavier than last year. They make and sell annually about 6000 collars, between 4000 and 5000 saddles, and between 4000 and 5000 sets of light and heavy harness. They have in preparation a new catalogue, which will be out in December. Referring to the condition of general trade, they state that competition has cut the profit on staples to a very narrow margin. The political campaign has had no perceptible influence on their sales.

Silver & Co., 59 Warren street, New York, have a large variety of goods which they manufacture exhibited at the American Institute Fair. On entering the Fair building from Third avenue, the exhibit of Silver & Co. is noticed by the visitor immediately at the right-hand corner of the large room. We cannot enumerate the several articles which they show, many of which have been brought to the notice of our readers in the columns of *The Iron Age* as they appeared. Their well-known Potato Masher, Egg Poacher and Lemon Squeezer, occupy prominent positions.

E. C. Stearns & Co., Syracuse, N. Y., have been manufacturing the Stuart Window and Door Screen for the past two years, during which time the industry has grown to very large proportions. The increase in their sales during the first year

necessitated, they advise us, an almost immediate revolution in their modes of manufacture, demanding new machinery of the most approved pattern, many times doubling the number of workmen first employed and requiring new and larger buildings and quicker methods. Concerning this line of their business they give us the following facts, which are deduced from their books showing sales to October 1, 1888:

The sales of the screen frames (as of every article in our line) are recorded in books, especially gotten up for the purpose, and they will show sales of each day during the year, they being posted daily, so the accuracy of the foregoing is vouched for by us. The number sold to date mentioned, of the Stuart Window Screen, is 386,230 sets, which would supply 64,370 dwellings, allowing six screens to each; and of the Stuart Doors the number sold is 75,768 sets, which would provide screen doors for 37,884 dwellings, allowing 2 doors each. In lineal feet the molding used for windows amounts to 12,081,840 feet, and of the doors the molding measures 3,077,088 lineal feet—in miles the total is something more than 287½, and being laid end to end would reach from New York City to San Francisco or from Victoria, B. C., to the City of Mexico. We have made for use on the same of the Stuart door and window corners 214,889 pounds, or 107 tons of castings, and, taken together with the frames, make a total weight of 2,771,129 pounds, or 138½ tons, to move which would require 138 freight cars of 10 tons capacity, that amount being an average carload, on account of the bulky nature of the goods. The windows are packed in cases containing three dozen each, size 44 inches x 18 inches x 18 inches, requiring 10,728 cases. The doors are packed in cases of 1 dozen each, size, 96 inches x 9 inches x 15 inches, requiring 6814 cases for the doors, making together 135,861 cubic feet, from which a column 25 feet square and over 200 feet high could be made; all of finished frames ready for shipment. Indications point to a vigorous increase of business the coming season, and, our present space being inadequate, we are taking steps to provide for it, and have in course of construction large and commodious warehouses especially arranged for this branch of our industry.

Among the exhibits of Refrigerators at the American Institute Fair is that of B. A. Kroenke, 703 East Eleventh street, New York, who shows several styles of patent Refrigerators, his exhibit being at the west end of the main hall.

The Union Indurated Fibre Company exhibit a large and varied assortment of their manufactures at the American Institute Fair, their goods occupying a very prominent position to the left of the main hall, entering from Third avenue. Tubs, Buckets, Pails and Measures, in almost endless variety, are shown, but a special feature of the exhibit is their Water Filter, which they are just putting on the market. The beds of these Filters are made under the Gould system, now owned by the Indurated Fibre Company, and the filtering bed is inclosed in a box of Indurated Fibre, so arranged that the water in the Cooler passes down the sides of the box, entering the bottom, from which it rises to the top of the Filter Box and finally discharges through a central pipe into the reservoir below. It will be understood that by the use of Indurated Fibre all metal is avoided, and consequently there is nothing to contaminate the water. While they are intended for use in Coolers made of Indurated Fibre, they are of such size and construction as to be adapted for use in any of the ordinary Coolers in the market. As an evidence of the success that these Filters have already achieved, we are informed that the New York Central Railroad have contracted to have them put in all their Wagner cars.

S. Sudlow & Son, 559 Grand street, Brooklyn, N. Y., exhibit at the American Institute Fair Sudlow's Improved Novelty Ash Sifter, for which several advantages are claimed. By an inspection of the Sifters the visitor can gain a perfect idea of their construction and operation.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., November 13, 1888.

Pig Iron.—Business during the past week has been more or less unsettled owing to the election, and active operations have not yet been fully inaugurated. A good deal of interest and some little uncertainty is still felt in regard to the course of the market in the immediate future. Still, consumers are not likely to jump into the market on that account as if this was their only chance. The market will be here next week and next month and next year. The only difference is that the natural course of business will not be interfered with, and whatever is done will be with a feeling of confidence which could not exist while the political outlook was unsettled. Hence there should be no disappointment, because there is "no boom," neither should there be despondency if there is a little dullness and possibly some weakness in prices. Quite a number of furnaces are reported to be blowing in, which, in the face of very nearly the largest production ever known, seems to be somewhat premature and may cause an over supply if not a glut in the market just at the time when there might otherwise have been a healthy movement toward a higher range of prices. Of course there may be such a movement yet, but it will not be immediately, if all the furnaces blow in that are preparing to do so. This is probably the only unfavorable feature in the entire outlook, but it has already developed a slight hesitancy among buyers, and may lead to some weakness until supply and demand are properly adjusted. At the moment the market is neither firmer nor weaker than it was a week ago. There are some who ask a little more for their mill Irons, there are others that are meeting the demand at unchanged prices, and a few probably (whose ideas were a little inflated) might abate something to secure a desirable customer. Taking everything into consideration, there is not likely to be much change for the present either way. Furnaces are well sold up, and stocks are very light, so that there is no necessity for lowering quotations, while, on the other hand, the output and capacity for output is so large that buyers have no fears of scarcity, and are therefore waiting to see what sort of demand there is going to be for the finished product before they commit themselves to large purchases. Meanwhile the usual quotations for tidewater deliveries remain at \$16 @ \$16.25 for Mill Irons, \$17.50 @ \$18 for No. 2 Foundry and \$18 @ \$19 for No. 1, some brands being a little more than we have quoted, others a trifle less. All depends on character of brand, quantity, delivery, terms of settlement, &c.

Blooms.—The demand is fair and prices steady at about the following quotations: Steel Nail Slabs, \$29 @ \$29.50, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 @ "bloom" ton of 2464 lb.

Muck Bars.—The market is a little mixed, some quoting firm at last week's prices, while others are more disposed to meet the market. Probably \$29 @ \$30, at mill, covers both ends of the market, with the majority of sales at medium figures.

Bar Iron.—The market is a little unsettled, and in spots weaker. There are some mills that are beginning to run short of orders, and, until they are filled up,

there is not much chance of better prices. Consumption is very large, and seems likely to continue so, but there is an enormous capacity in operation, and without a constant inflow of orders there is always danger of some one cutting in so as to fill up. This appears to be the position to-day. Many leading mills have all the work they can take care of to the end of the year, but there are others, less favorably situated, who are not as firm as they would otherwise be. Buyers are quick to see this, and bid but very little over the low prices prevailing six or eight weeks ago, and while these extreme figures are not likely to be accepted, there is a willingness to compromise the matter, so that 1.8¢ @ 1.85¢ is nearer to selling prices than are the asking rates, 1.9¢ @ 2¢. On large lots for such purposes as car-building it is said that 1.75¢ has been accepted, but a good deal depends on circumstances. Prices may be better after a while, but there are a good many vacancies to be filled up before that can be accomplished. Skelp Iron is fairly steady, although, as in Bars, buyers expect to do a little better, say 1.9¢, as against 1.95¢ asked.

Plate and Tank Iron.—The demand is possibly a shade better, but not more than enough to keep prices steady. Mills, as a rule, are fully employed for the present, and the outlook is favorable for continued activity, although competition keeps prices pretty well down to the inside quotations. The market, however, is in a position to show an immediate response to anything like a heavy business, and manufacturers are carefully watching the course of events, so as to take advantage of any changes that may seem likely to occur. Meanwhile, prices remain as before—viz.: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.3¢ @ 2.4¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—There is a considerable amount of small work coming in, but apart from that there is not much demand. On the whole, mills have hard work to hold their own, as many of the large orders are about completed without much prospect of them being renewed until toward spring. Prices are irregular, and on large orders rather easier, but quotations remain, nominally, as follows: 2.05¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—Thin Sheets are still in good demand, but the low numbers are neglected and difficult to move in quantity. Prices for the best makes, in small lots, are quoted as follows:

Best Refined, Nos. 26, 27 and 28....	3½¢ @ 3½¢
Best Refined, Nos. 18 to 25....	3¢ @ 3½¢
Common, ¼¢ less than the above.	
Best Bloom Sheets, Nos. 26 to 28....	4½¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....	4¢ @ 4½¢
Best Bloom Sheets, Nos. 16 to 21....	3½¢ @ 3½¢
Blue Annealed.....	2.8¢ @ 3¢
Best Bloom, Galvanized, discount.....	62½¢
Common, discount.....	67½¢

Merchant Steel.—The demand is well maintained at prices as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—A better feeling seems to prevail in this market. There are inquiries for large quantities, including 50,000 tons for the Pennsylvania. Such buyers want to place their orders at inside figures, but manufacturers on that line of road are not disposed to meet the prices said to have been made by certain parties a week or two ago. For the present, therefore, there may be a "stand off," as

those who sold at low prices are filled up, while those who are in a position to take the business are satisfied to wait a few weeks longer rather than tie themselves up at what may prove to be unnecessarily low figures. Orders for small lots are frequently taken at from \$28.50 to \$29 at mill, and it is claimed to be doubtful whether anything below \$28 would be accepted for even the most desirable class of business.

Old Rails.—The market seemed to be a little duller a few days ago, but holders gave no indication of weakening, so that those needing Rails for prompt delivery finally acceded to sellers' terms. One lot of 500 tons T's sold at \$24.50, delivered at mill near Philadelphia, and lots in store are still quoted at \$24. The demand, however, is a little uncertain, and another period of dullness may follow this transaction.

Scrap Iron.—Prices unchanged. Sales chiefly at prices as follows: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought Iron Pipe.—The demand is hardly as brisk as it was, but mills for the present are well supplied with orders and discounts are steady as quoted last week, viz.: Black Butt-Welded, 52½¢; Galvanized do., 42½¢; Black Lap-Welded, 62½¢; Galvanized do., 52½¢; Boiler Tubes, 60¢.

Nails.—There is a somewhat steadier feeling, but there is no quotable change in prices, which range from \$1.90 to \$2.00, according to circumstances. Standard brands are very firm; the irregularity is more in inferior or unknown brands.

Chicago.

Office of *The Iron Age*, 96 and 97 Washington street, CHICAGO, November 12, 1888.

The result of the Presidential and Congressional elections is almost universally interpreted to mean a maintenance of present values, if not an advance. A feeling of decided confidence pervades all circles. Even those who supported the defeated candidates take this view of the situation, not because they are pleased, but because they do not now expect a decided reduction in the tariff.

Pig Iron.—Consumers have purchased to some extent, but not sufficiently to make the market active. It is noticeable, however, that among the recorded transactions are a few that can be traced to a belief on the part of buyers that under existing conditions and at present prices Pig Iron is a purchase. This view is strengthened by a knowledge of several circumstances. Chief among these is the condition of the Lake Superior Iron Ore trade. A shortage of Ore at lower lake ports is anticipated this winter in consequence of the increasing production of Coke Pig Iron and the non-accumulation of sufficient stocks during the season of navigation to meet it. It is reported that arrangements are already being made for the shipment of Ore by rail to Mahoning Valley points during the winter. Under such circumstances lower prices for Lake Superior Coke Pig Iron can hardly be expected. The furnaces in Jackson County, Ohio, making a high grade of Soft Coke Pig, have entered into a mutual compact to make their prices uniform, and have advanced their rates 50¢ @ ton, making the price of No. 1 at Chicago \$18.60, cash, or \$19.10, four months. Other furnace-men, including Southern manufacturers, are writing to their agents not only to maintain prices firmly, but to withdraw all

offers left open. The demand for Lake Superior Charcoal Pig from the Car-Wheel makers causes continued scarcity of high numbers, for which few furnace companies are willing to contract separately. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, Nos. 1 and 2, \$20; Nos. 3 to 6, \$20.50 @ \$21.50; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18.60; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband), No. 1, \$20 @ \$21; other Ohio Soft Irons, No. 1, \$17 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$18; No. 3, \$16 @ \$17; Southern Coke, No. 1 Foundry, \$17.50; No. 2 Foundry and No. 1 Soft, \$17; No. 3 Foundry and No. 2 Soft, \$16.25; Gray Forge, \$15.50.

Bar Iron.—Orders for Car Iron continue to make their appearance, and the inquiry from the general trade is also increasing. In view of the large amount of work now in sight it is deemed very probable that the mills which have recently been lowering their quotations will be able to fill up again, making the market firmer. Some of the Mahoning Valley mills have already advanced their quotations \$1 per ton. Carload lots of Common Bar Iron are now quoted at 1.72¢ @ 1.75¢, f.o.b. Chicago, half extras, but good specifications have been placed at slightly lower figures. Small lots from store are quoted at 1.90¢ @ 2¢, according to quantity and quality.

Structural Iron.—There is some demand for bridge work, but generally speaking the market is quiet. Prices continue about as last reported, except that Angles are a little easier. Mill orders are quoted as follows, f.o.b. Chicago: Angles, 2.20¢ @ 2.25¢; Universal Plates, 2.25¢ @ 2.35; Tees, 2.55¢ @ 2.65¢; Beams and Channels, 3.40¢. Small lots from store are quoted as follows: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Business is running along in very satisfactory shape, but without special feature. Prices are well maintained, but some of the Western mills are looking a little more sharply for orders. Tubes are firm and local stocks very light. Store prices are as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60¢ off.

Sheet Iron.—The weather has continued to be unusually mild, affecting this branch of trade quite unfavorably. Stocks are now abundant, and store prices are lower, No. 24 being quoted at 3.10¢, Nos. 25 and 26 at 3.20¢, and No. 27 at 3.30¢. For mill lots manufacturers' agents still quote 3¢ at mill, but are not in receipt of many inquiries, owing to the light business being done by distributors.

Galvanized Iron.—Another influx of orders from all classes of consumers is reported by mill representatives, who have, consequently, done a heavy business during the week. No change has been made in prices, small lots still being quoted at 60¢ and 5¢ off for Juniata and 60¢ and 10¢ off for Charcoal.

Merchant Steel.—A quiet week has been experienced in this branch of trade, but inquiries for cheap Steel are increasing and a good trade is looked for soon in such specialties. Since the break in the price of Open-Hearth Spring Steel quite a number of orders have been placed quietly and consumers are now pretty well supplied. It is quoted at 2.60¢ @ 2.70¢, in a jobbing way, but the large orders referred to were, of course, taken at a considerably lower figure. Crucible Spring Steel has been reduced to 3.75¢.

Other quotations are as follows: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 4.40¢; Open-Hearth Machinery, 2.75¢ @ 3¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Considerably under 10,000 tons were sold by local mills during the week, including orders for delivery this year and in 1889. Some of the large orders recently in the market, and which gave much encouragement to manufacturers, have dwindled to very insignificant proportions when the contracts came to be closed. Makers still quote \$30 on general business.

Old Rails and Wheels.—So far as can be ascertained but one sale of Old Iron Rails occurred in this vicinity during the past week. The price realized was \$22.60. An offer of \$24, delivered in the Mahoning Valley, was refused for a lot of several hundred tons, the holder expecting to obtain from \$22.50 to \$23 here. A small quantity of 35-pound Rails was offered at \$24, Chicago, without takers, and for another lot of Light Rails \$24, East St. Louis, was asked. Old Car-Wheels are nominally quoted at \$19.50 @ \$20.

Scrap.—Actual business has been very light, but inquiries are increasing and an early movement is looked for, especially in No. 1. Wrought Mill Scrap is neglected for the time, and Cast is not much better. Mixed Country Scrap is worth \$14 @ \$15. Selling prices of carefully selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$21; Track Scrap, \$20; Horseshoes, \$20; Axles, \$26; No. 1 Mill, \$15 @ \$16; Pipes and Tank, \$13; Light Wrought, \$11; Cast Machinery, \$14 @ \$14.50; Stove Plate, \$12; Cast Borings, \$9 @ \$9.50; Wrought Turnings, \$12 @ \$12.50; Axle Turnings, \$14; Coil Steel, \$14.50; Leaf Steel, \$15.50; Locomotive Tires, \$15.50. While city dealers name these prices, consumers are not yet disposed to meet them, and assert their ability to get a supply from outside at lower figures.

Hardware.—The demand for Shelf Hardware is back again to the large proportions reached before the election, a falling off having been experienced early in the week. A full month of great activity is now confidently expected. Wholesale merchants report a very encouraging outlook for next year, based on advices from their traveling salesmen of an enormous amount of building contemplated all over the Northwest. In Heavy Hardware business has been rather quiet, but an improvement is expected shortly.

Nails.—Manufacturers' agents report a light business in Cut Nails. Large buyers, however, are beginning to look around with a view to laying in stocks, and heavy orders may soon be placed if prices are made to suit them. Continued weakness prevails in Steel Nails, and they are now quoted at \$2 from store. In carload lots they are sold at \$1.90 on track here. Wire Nails are firm, notwithstanding the weakness in the Steel Cut Nails, and are still held at \$2.60 for small lots.

Barb Wire.—A steady increase is reported in the demand, and jobbers note the receipt of inquiries for carload lots as an encouraging indication for the future. The impression prevails that a very heavy demand from all classes of dealers will be experienced before the year closes, as stocks can be laid in at the present low prices without much fear of a decline and the trade will then be prepared for the usual spring demand for consumption. Small lots are quoted at 2.90¢ for Painted and 3.60¢ @ 3.65¢ for Galvanized, with the usual difference for carloads.

Pig Lead.—On limited transactions the market receded during the week from 3.70¢ asked at the beginning to 3.60¢ at the close.

The Union Pacific Railroad Company opened bids at Omaha on the 10th inst., for 2500 cars, principally freight cars, but including some passenger and refrigerator cars. The successful bidders were the Peninsular Car Company and the Michigan Car Company, of Detroit, and the Pullman Palace Car Company and the Wells & French Company, of Chicago. Other car orders are on the market, which will probably be placed this week.

The Clark Fuel Saving and Smokeless Furnace Company, of Chicago, have been incorporated, with a capital of \$150,000, by J. W. Thatcher, G. A. Clark and W. S. Gibbs.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. (CINCINNATI, November 12, 1888.)

Pig Iron.—Confidence is now the feature of prominence in the Iron interest, and there is some indulgence in talk of higher prices, but there is no evidence of appreciation in the near future. There is, however, a more active inquiry, and some transactions of moment have been made which may eventually result in strengthening the market to such a point that an advance may be obtained. The prospect which is more apparent is that the prices prevailing before the election may now be maintained, and not suffer the decline which was believed to be in store should the country have given its sanction to a radical change in tariff and other revenue laws. The aggregate sales of both Foundry and Forge Iron since the election have been encouraging, but these have been made on the basis previously quoted. The Pipe works "across the river" from Cincinnati are reported to have contracted for over 5000 tons of Iron during the past few days, but the details of the transaction have not been made public. Jackson County furnaces are reported to have advanced prices 50¢ per ton, but no sales are reported as having been made at the advance. There is quite an active inquiry for iron to be delivered during the next year, but the feeling is not enough settled yet to bring about harmony between buyers and sellers. It is reported that there is an unusual shortage in the supply of Lake Ores, which fact has a sustaining influence upon the price of Iron made from such Ore. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Hot-Blast Foundry.

Southern Coke, No. 1	16.50 @ 17.00
Southern Coke, No. 2	15.75 @ 16.00
Southern Coke, No. 3	15.50 @ 15.75
Ohio Soft Stone Coal, No. 1	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2	15.50 @ 16.00
Mahoning and Shenango Valley	17.50 @ 18.50
Hanging Rock Charcoal, No. 1	20.50 @ 22.50
Hanging Rock Charcoal, No. 2	19.50 @ 22.00
Tennessee and Alabama Charcoal, No. 1	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2	17.00 @ 18.00

Forge.

Strong Neutral Coke	14.75 @ 15.00
Mottled Neutral Coke	13.75 @ 14.00
Gray Forge	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel	20.00 @ 25.00
Hanging Rock, Cold Blast	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable	20.50 @ 21.50

Nails.—The market remained steady, with a moderate jobbing trade. Jobbing prices are based upon 12d @ 40d, which sell at \$2.10 per keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$2.10 and Steel Wire Nails at \$2.75 per keg.

Manufactured Iron.—The market for Manufactured Iron for the time being remains quiet; machine shops and other moderate consumers are making small purchases from day to day, but carriage builders and other large interests are not yet ready to contract for supplies, and probably will buy but little until after the first of the year. The easier feeling noted

a short time ago has given place to a steady and confident tone. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ @ lb.

Old Material.—There have been moderate sales of Old Wheels, one lot of 200 tons selling at a little less than \$19, cash, here. Old Rails have been quiet and a little easier in tone, but are not quotable under \$28, spot cash.

Cleveland.

CLEVELAND, November 12, 1888.

Iron Ore.—Producers have drawn so many lake carriers into service since October 1 that last season's record of total shipments has been overhauled and passed. Up to Saturday, November 10, 4,279,227 tons of Ore had been sent down from the Upper Lake region by lake vessels, against 4,142,899 tons at a corresponding period last year. During the past week 140,000 tons were shipped, that amount being 20,000 tons in excess of the shipments for the same week in 1887. Of the 4,279,227 tons sent down this year the Marquette Range has contributed 1,661,153 tons; the Gogebic Range, 1,172,589 tons; the Menominee Range, 1,036,666 tons, and the Vermillion Range, 408,819 tons. The market maintains all of the firmness that has characterized it during the past two months. Although very little Ore remains to be sold, buyers have made liberal inquiries, and many odd lots of non-Bessemer have been sold at prices ranging all the way from \$4.50 to \$5.25 @ ton. The mine owners are now awaiting statistics relative to the Ore consumption for the year in order to arrange their estimate of output and prices for 1889. At present everything seems to warrant the producers in making all possible arrangements for increasing their output for next season to its greatest possible proportions. The railway interests promise a better demand for Steel Rails, and there is every indication of a liberal buying movement in every direction.

Pig Iron.—Buyers and sellers have been giving too much attention to the election and its results to warrant any activity in the Pig Iron market. The outcome of the great contest has given the market a buoyant tone, and big business is expected to succeed the quietness now prevailing. The consumption of all grades of Pig Iron continues very large, and furnacemen report themselves crowded to the uttermost to fill their orders. Prices are very firm at the same quotations furnished for the past three weeks, and the tendency seems decidedly in the direction of advances.

Old Rails.—Several round lots of Old Americans have been sold during the week at \$24 @ \$24.25. No. 1 Choice Scrap is worth \$23.

Coke.—Prices are slowly advancing, and the rate at the ovens at the beginning of the new year will probably be \$1.50 @ ton.

Nails.—Steel Nails have dropped to \$1.95, but common Iron Nails are still quoted at \$1.90.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, November 12, 1888.

Pig Iron.—We note a little better feeling in the trade, both with producers and buyers. The question of the future policy of the Government, for a few years at least, being apparently settled, the opinion prevails that Iron will not recede any in price, but will probably advance in the near future. Prices have as yet undergone no change, but the disposition of the fur-

naces is to sell as little as they can and keep their yards clear of Iron. This they are doing without much, if any, effort to sell. Some large consumers are showing a disposition to contract for their supply for the coming year, but so far as can be ascertained but few such contracts have been made. The new stacks that will soon blow in are apprehending no trouble in being able to sell their output as fast as produced, and, taking all things into consideration, the situation, as a general thing, is satisfactory. Prices are ruling about the same; quotations unchanged.

Louisville.

LOUISVILLE, KY., November 12, 1888.

Pig Iron.—The market is in a very excited condition, and offers have been made for large quantities of Iron, resulting in sales for delivery through six to eight months. Furnaces, however, have only accepted a portion of the offers made, and are not willing at present to book orders at old prices, but prefer to wait until they can judge of the extent of the advance before effecting sales for large blocks of Iron. We will not revise quotations, as the market is so unsettled it is impossible to tell what is the price of Iron to-day. We quote as follows:

Southern Coke, No. 1 Foundry	16.75 @	17.75
" " " " " "	15.75 @	16.25
" " " " " "	15.25 @	15.75
Hanging Rock Coke, No. 1 Foundry	17.00 @	17.50
Hanging Rock Charcoal, No. 1 Foundry	20.75 @	22.00
Southern Charcoal, No. 1 Foundry	17.75 @	18.25
Silver Gray, different grades	14.25 @	15.00
Southern Coke, No. 1 Mill, Neutral	14.50 @	15.00
" " " " " "	13.50 @	14.50
" " " " " "	14.00 @	14.50
" " " " " "	15.50 @	16.25
White and Mottled, different grades	13.25 @	13.50
Southern Car-Wheel, standard brands	22.75 @	23.75
Southern Car-Wheel, other brands	19.00 @	21.00
Hanging Rock, Cold Blast	22.00 @	25.00
Hanging Rock, Warm Blast	19.00 @	20.00

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, November 13, 1888.

Now that the election is over and the excitement incident thereto has subsided, an improvement in the iron and steel business is expected. There is no disguising the fact that manufacturers generally are well satisfied with the result, and many of them did what they could in bringing it about. Certainly a better feeling obtains, as confidence has been re-established and the outlook for the winter is encouraging.

Owing to continued shipments of coal for almost two months, the down-river markets are all overstocked and prices are down lower than they have been for a number of years. At Cincinnati, Pittsburgh Coal is being sold at 5½¢ per bushel by the barge, which scarcely covers cost laid down at that point. At New Orleans, the price was reduced a few weeks ago, and still further reduction at all points south is not improbable. There is continued complaint on the part of many manufacturers in regard to the enhanced cost of natural gas as fuel, and some of them threaten to go back to coal.

Pig Iron.—There has been no important change in the general position of the market during the week under review, with the exception that, as already noted, a better feeling obtains in view of the result of the Presidential election. There was a good deal of business pending on the result of the election; extensive improvements will now be pushed forward, which would not have been had the result been otherwise. An increased demand for Pig Iron is looked for, and already some of the larger consumers are buying more freely. The outlook, therefore, is very encouraging, and the indications for a good trade throughout the winter are

promising. Consumption, which has been large all this year, will probably be increased, and furnacemen here and elsewhere will probably have about all they can do. It is thought that consumers will now be more disposed to anticipate future events. It is felt that the price of the finished products will have to go up before there can be much improvement in the price of Pig, although there is sometimes an upward move in the latter, which is followed by the former. The furnaces not only here but throughout this district are pretty well sold up—some of them a month or two ahead, and with the demand likely to be increased, there is every indication for a healthy and active market for some time to come. Quotations may be fairly given as follows:

Neutral Gray Forge	\$15.75 @	\$16.25 cash.
All Ore Mill	16.75 @	17.25 "
White and Mottled	14.50 @	15.25 "
No. 1 Foundry	17.50 @	18.00 "
No. 2 Foundry	16.75 @	17.00 "
No. 1 Charcoal Foundry	24.00 @	24.50 "
No. 2 Charcoal Foundry	21.50 @	22.50 "
Mill Charcoal	19.00 @	20.00 "
Cold Blast Charcoal	25.00 @	28.00 "
Bessemer Iron	17.50 @	18.00 "

Sales of some 4500 to 5000 tons Gray Forge reported at \$16 @ \$16.25 cash, mostly at inside quotations.

Manganese.—Sales of 80 % Ferro at \$56 @ \$56.50, cash; Spiegel quoted at \$28 @ \$28.50 for 20 %.

Muck Bar.—There is, as noted in our last, more inquiry, and the market is firmer; may be fairly quoted at \$29 @ \$29.50, cash, with a sale of 1000 tons reported at \$29. It appears that those mills making a specialty of Muck are well sold up, and this accounts for the limited offerings.

Manufactured Iron.—The demand was curtailed somewhat by the election excitement, but now that is over and the result very generally satisfactory to those engaged in the business, an increased business is looked for. Bars, 1.70¢ @ 1.85; No. 24 Sheet, 2.85¢ @ 2.90¢; Plates, 2.15¢ @ 2.25¢; Skelp, 1.80¢ @ 1.85¢ for Grooved and 2.10 @ 2.12½¢ for Sheared; all 60 days, 2 % off for cash.

Nails.—There is no change to report in the general situation. Dullness is still the order of the day, as is to be expected at this particular time, and no improvement can reasonably be looked for until the spring trade opens up. We continue to quote at \$1.90 for 12d to 40d, 60 days, 2 % off for cash.

Wrought Iron Pipe.—The demand has commenced to fall off, as it usually does at this season of the year, and there is not likely to be any improvement until the spring trade opens up. Manufacturers do not expect to do much during the winter season. Prices remain unchanged. Discounts on Black Butt-Welded Pipe, 52½ %; on Galvanized do., 45 %; on Black Lap-Welded, 62½ %; on Galvanized do., 52½ %; Boiler Tubes, 60 % off regular list; Two-inch Tubing, 13¢ per foot, net; 5½-inch Casing, 40¢ per foot, net.

Old Rails.—American Tees are still quoted at \$25 @ \$25.25, cash. As the work of lifting will be suspended with the advent of colder weather, the market is likely to stiffen, as there will, no doubt, be a falling off in the offerings within the next few weeks.

Billets, &c.—There is a fair demand for Billets, but at unchanged prices—\$29 @ \$29.50, cash, at maker's mill; Nail Slabs, \$28.50 @ \$29; Domestic Bloom and Rail Ends quoted at \$19 @ \$19.50.

Steel Rails.—There is more inquiry. The Allegheny Bessemer Steel Company, of that city, is reported as having taken an order from the New York Central and Hudson River Railroad for 1000 tons, but the firm decline to give the price. The mill of the Allegheny Steel Company is

new, has not yet been started up, but it is understood that it will be in January, if not before. In addition to the sale in question another of 5000 tons was reported.

Railway Track Supplies.—Spikes are higher, and we now quote at 2.20¢, 30 days, delivered; although we did hear of an offer to deliver 2500 kegs at Chicago at 2.25¢, which, with a 15¢ freight rate, would only be 2.10¢ here. Splice Bars, remain unchanged at 1.85¢ @ 1.90¢; and Track Bolts at 2.85¢ with square and 2.95¢ with Hexagon Nuts.

Merchant Steel.—There is a fair business at unchanged prices. Best Brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth do., 2½¢.

Old Material.—We can report sales of No. 1 Wrought Scrap at \$21, net ton; Old Car Axles at \$15; Wrought Turnings, \$14.50; Cast Scrap, \$15.50 gross ton; Old Car-Wheels, in absence of sales, quoted at \$20, gross. Sale short pieces Old Steel Rails at \$18.50, gross ton.

New York.

Office of *The Iron Age*, 66 and 68 Duane street.
New York, November 14, 1888.

American Pig.—Current business is small, consumers being supplied and furnaces being filled with orders. Interest in next year's business is beginning to be manifested. Founders are feeling the market on the one hand, and on the other some furnaces, among which a few Southern companies are prominent, are endeavoring to sell pretty far ahead into 1889. It is reported that some transactions of this character have been closed at \$17.50 for No. 1. Southern for 1889 delivery. We understand that an Eastern Rail mill, now idle, will soon be in the market with Foundry Iron. We continue to quote Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is very quiet, with prices remaining: Coltness, \$21, @ 21.50, nominally; Shotts, \$20.75 @ \$21; Langloan, \$21, and Dalmellington, \$20 @ \$20.25.

Spiegeleisen.—No business has been done and prices remain nominally \$27 for German 20 %.

Bessemer Pig.—We note one recent sale, to a New England mill, of 1000 tons Domestic Bessemer at private terms.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.5¢ @ 2.55¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢.

Bar Iron.—The market is quiet. On a specification for the Pacific Coast the Flats went abroad, while on the Rounds a Pittsburgh mill bid 1.67½¢. We quote: Carload lots, half extras, 1.67½¢ @ 1.7¢ for Common; 1.7¢ @ 1.8¢ for Medium, and 1.8¢ @ 1.9¢ for Re-fined, with prices for fancy brands running up to 2.4¢ @ 2.5¢.

Steel Rails.—So far as reported, the sales of the two Eastern mills, which have taken the majority of the contracts lately, foot up to 47,000 tons, of which 20,000 tons have gone to a trunk line, and the bulk of the balance to Southern roads, although it is reported that there is a hitch in the one transaction involving 14,000 tons. Thus far, the greater part of the business done by Eastern mills has been with old roads who have bought for re-

newal work exclusively. With the exception of a few, all the leading New England lines have purchased their 1889 requirements. When the Pennsylvania order for 40,000 tons, now pending, is closed, the principal trunk lines will be supplied. The South has ordered to a considerable extent, so that soon the greater part of the regular yearly work for the Eastern mills will be closed. The bulk of it has undoubtedly gone to the two mills alluded to above. Prices are still unsettled, and while nothing definite is known it is the prevailing opinion in the trade that \$27 has been shaded in closing some of the business. In Pittsburgh \$26 has been done in at least one instance, and \$26.50 has probably been accepted for other orders, the reports of \$28.50 there by local newspapers being incorrect. This would be equal to \$29.50 at Chicago, which there is reason to believe has been shaded by local mills there. The Chicago price of \$26.50 would not net Eastern mills which might attempt to enter that market more than \$25.50, so that any competition on their part west of the Allegheny Mountains is impossible. The Eastern market is therefore narrowed down to Eastern and Southern business, to be handled practically by four mills, of which one has quoted above the prevailing price for some time past, while another has not followed it closely, leaving the other two to book considerably ahead. There are signs of the possible early withdrawal of one or both for the present at least, so that it seems likely that the bottom has been reached and that a moderate stiffening may come at an early date. Indeed, we know of one contract closed this week for delivery over the first half of 1889 on which \$28 was realized. Relatively the Eastern mills have taken far more business than those of the West, though some fair contracts have been placed there during the past week. It is probable, however, that the center of interest in the Rail market will be transferred west of the Allegheny Mountains for some time to come, the situation being complicated by the possible aggressiveness of the new Pittsburgh mill, intensifying the struggle between that center of production and Chicago. We quote \$27 @ \$28 at Eastern mill. It is reported that the Oregon order repeatedly referred to has been withdrawn for the present.

Billets and Blooms.—A large New England Wire mill is reported to have placed lately a contract for 50,000 tons of Wire Billets abroad, for delivery in 1889, at the rate of 4000 tons a month, freight contracts having been closed for its shipment from this port to Providence. Simultaneously they placed large orders with two Eastern mills for earlier delivery at private terms. Nail Slabs are being held quite firmly by mills in Central Pennsylvania at \$28.75 @ \$29, at Steel works, and that only for early delivery, 1889 orders being quoted higher. A few of the Nail mills state that they cannot pay such prices and sell the Nails at \$1.65 @ \$1.75, at mill, as they have been doing.

Wire Rods.—The market for foreign Rods is very dull at \$39, nominally, for Basic. Acid Rods can be purchased at \$38.25 and possibly less.

Old Rails.—We note a sale of a 2000-ton lot, delivered on the Hudson River, for a Western mill, at private terms, and a sale of a 500-ton lot from a road debouching on the Hudson River at the reported price of \$22.50 on cars at Jersey City. The condition of the market remains peculiar, small lots cropping up, which are disposed of at \$22.50, while larger lots could probably not be bought at less than \$23, which holders claim they are offered.

Track Material.—An active business is reported in Spikes, which are selling at

\$2.20 @ \$2.30, delivered. Angle Bars are quoted at 1.80¢ @ 1.90¢, at mill.

Financial.

Railroad troubles for the moment absorb a large share of attention on the part of financiers and the mercantile classes generally, the "pool" seemingly having gone to pieces. All the trunk lines, long under the supervision of Commissioner Fink, are engaged in a desperate warfare, with prices recklessly cut. West-bound freights to Chicago and Missouri River on Monday suddenly dropped about 50 % on all classes. A Chicago dispatch says the new west-bound rates are: First class, 50¢; second, 40¢; third, 35¢; fourth, 30¢; fifth, 25¢; sixth, 20¢. The old rates on the several classes were 75, 65, 50, 35, 30 and 25¢. The schedule was advanced only a few weeks ago by a general agreement of the trunk line presidents. All rates now drop back to the old war basis. East-bound commodity rates were advanced by easy stages until they were about to reach a remunerative basis, when something gave way and down they tumbled. The slump in west-bound rates makes the demoralization nearly complete. The Burlington on Monday announced a cut of 25 % on freight rates from the seaboard to St. Paul, to take effect immediately. Following are the rates: First class, 85¢; second, 74¢; third, 62¢; fourth, 46¢; fifth, 39¢, and sixth, 31¢. As to the provocation for this new outbreak there is much crimination, some alleging that Erie is at fault, while the New York Central openly charges the Pennsylvania with being the principal aggressor. All the parties directly concerned were represented at a general meeting of freight agents on Monday, at which time the New York Central announced that rates from New York to Chicago would be lowered from 75¢ to 50¢ per 100 lb on first-class, and corresponding to 40¢, 35¢, 30¢, 25¢ and 20¢ on other classes. To Missouri River points they would carry freight on the Chicago basis for 45¢, 36¢, 32¢, 28¢, 24¢ and 19¢. The Pennsylvania and others represented signified their intention to meet these rates. The Erie insists on its differential rate, and has put in force rates from New York to Chicago ranging from 45¢ to 19¢, or from 5¢ to 1¢ per 100 lb below the rate by the New York Central. President Roberts, of the Pennsylvania, says in self-justification: "The Pennsylvania has reduced its rates because others have done so. We have all the business we can properly handle, but if other roads reduce their tariffs the Pennsylvania must do so, too." He regards the present situation as serious. From all quarters come reports of a heavy tonnage to be hauled for months to come and a scarcity of rolling stock on the more important systems. These conditions are not reflected in the earnings, however, because at the rates now ruling the old roads can make little if any profit. Lake and canal rates for October were scarcely half as high as a year ago, owing to the wheat corner in Chicago, which checked the forward movement. The returns of yield of corn, made to the Department of Agriculture, indicate a yield per acre larger than any crop since that of 1880, the aggregate being very close to 2,000,000,000 bushels.

The Stock Exchange markets have been dull and weak. In London on Thursday there was some selling at a decline, and there was a fall in Reading. On Friday stocks were steady after an opening break, with foreign houses free sellers. On Saturday the business in railroad bonds was large and well distributed. In usually well-informed circles it was stated that nothing of importance would be done until next month in connection with the Oregon Transcontinental Company. The report

of Western rate cutting operated to hold the market in check to some degree. On Monday news that the trunk lines had cut rates from the seaboard to Chicago about 33 % started free selling of these properties, but the declines were only fractional. Western Union was especially affected by the decision against the Bell Telephone, and this naturally affected all Boston properties. On Tuesday the market was unsettled, with the trunk lines weakest, in consequence of the cut on west-bound rates, and Reading and other coal was unfavorably affected by raids.

United States bonds were firm and 4s advanced. Up to date the Department has purchased, under the April circular, \$51,392,000 4s and \$43,422,250 4½s. The purchases during the past week have been \$2,654,400 4½s—all at 108½—against \$2,412,500 the previous week. Sales as follows:

U. S. 4½s, 1891, registered.....	107½
U. S. 4½s, 1891, coupon.....	108½
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	127½

The weekly statement of the New York City banks shows a loss of \$2,893,800 in cash in consequence of the overflow of currency to the West and South. The reduction of \$1,043,500 in circulation attracted more attention than other changes. Although the surplus reserve is reduced to \$11,558,600, a decrease of \$2,172,650 for the week, it is still higher than in 1887 and 1886, the excess then having been, respectively, \$8,587,400 and \$7,891,350. The demand for commercial paper is good, the supply limited. Rates for 60 @ 90 days' indorsed bills, are 4½ @ 5 %; longer dates, 5 @ 6½ %.

The market for sterling was steady, but without much activity. Posted rates were \$4.85 for 60 days, and \$4.88½ for demand. By reason of a plentiful supply of commercial bills drawn against cotton, the movement of which is very free just now, the foreign exchange market had an easier tendency. There is a general expectation of lower rates in the near future.

The quickened movement in business is less than some had predicted, but the tendency is in the right direction. This is true of the dry goods jobbers, the tone being firm. Should wool advance manufacturers hope to get last year's prices at the opening of the new season. Some very fair orders for spring fabrics have been received from the West and South. Holiday goods receive special attention. Cotton was in lessened demand at unchanged prices, except at Norfolk and New York, which declined ½¢. Among grocery jobbers sales are slow but values are preserved. Raw sugars are stronger. A special feature is the importation of some 25,000 bags of sugar from Bremen, Hamburg and Copenhagen. In ocean freights the export movement to South America and the United Kingdom is embarrassed by the scarcity of suitable tonnage. Cotton freights are easy. A reduction of 50 % in the Portuguese import duties on wheat enabled exporters to sell something like 200,000 bushels of wheat for shipment to Lisbon; otherwise the export trade has not improved. Wheat is about 1¢ per bushel higher; flour has advanced a little and corn is ¾¢ higher.

The imports of merchandise at this port during October were very large, amounting to \$41,262,000, or nearly \$2,000,000 above the large total for the corresponding month last year, when the imports included \$11,000,000 in specie. Omitting this last item from the calculations, October is the banner month in the history of the trade, excepting October, 1882. The exports for the month, exclusive of specie, make a total of \$27,954,657. The total for the whole country for nine months, ending August 31, shows an excess of imports equal to \$65,418,000. It is possible that the demand for our produce during the ensuing two months may make up

this deficiency, but, from the present outlook this will be the smallest year's exports of produce and merchandise for a very considerable period.

The imports of merchandise at this port during the week were valued at \$7,133,000, of which \$1,729,000 represented dry goods. Since January 1 the total is \$102,542,000, against \$406,809,000 for the same time last year and \$370,033,000 in 1886. Exports were valued at \$6,081,000. The failures during the last week throughout the United States and Canada aggregated 226, a decrease of 49 from the total of the preceding week.

To provide for the celebration next April of the 100th anniversary of the first inauguration of General Washington as President of the United States, the Legislature made the 30th of April next a legal holiday. As many persons are now signing notes and drafts maturing during the first four months of the ensuing year, it may be well for them to take note of the fact.

According to the Boston Post, the total bank clearances last week in 38 cities showed a decrease of 6.6 %, compared with the corresponding week last year, due chiefly to the heavy falling off in New York, which was 10.4 % less than last year, for the cities outside of New York showed an increase of 0.6 %. The election holiday had a restricting influence.

Metal Market.

Copper.—The London market gave way during the week with spot Chili Bars from £78. 5/ to £78. 2/6, futures remaining steady, £79, while good merchantable brands also lost 2/6, closing at £78. 2/6, and Best Selected remained sustained at £83. Sales 775 tons. Here the market has been inactive and featureless, speculation being extinct and the syndicate supplying on private terms the moderate amounts consumers may stand in need of. The price of Lake is 17.50¢ nominally, and 16¢ @ 16½¢ is the quotation for Casting brands. On 'Change the bids have been 17¢, spot, and 17.30¢, November and December, with sellers at 17.60¢ the later deliveries. Messrs. James Lewis & Son, November 1, write from Liverpool about the syndicate: "To pay the producing companies a higher price means the giving up of the very moderate profit (probably not more than £5 per ton) at present realized by the syndicate on the Copper they sell, or the further advancement of prices, which will still further tend to reduce consumption and stimulate production. They are therefore in a dilemma from which it is difficult to see how they can extricate themselves." The import of American Copper into Liverpool and Swansea the first ten months has been 20,555 tons Fine, against 11,329 tons same time last year.

Tin.—A decline has taken place in the London market since our last report from £102, spot, Straits, to £100. 15/, and in futures from £102. 12/6 to £101. 10/; sales, 170 tons. Here the tendency has also been downward, with sales of 70 tons January at 22.50¢ @ 22.60¢ and 40 tons February at 22.55¢ @ 22.65¢. Spot rules nominally at 22.60¢, in small lots; for spot and November 22.30¢ @ 22.35¢ may be quoted, and December, 22.30¢ @ 22.50¢. The consumptive demand is very moderate, consumers only operating from hand to mouth, expecting a sudden important drop.

Tin Plates.—The demand has been very quiet during the week, and prices generally have been a shade lower. There has been a small amount of business done for forward delivery, but the bulk of that offering is still held back for lower prices. We quote at the close, large lines, 3 box: Siemens-Martin Steel, Charcoal Finish, \$5 @ \$5.75; Coke Finish, \$4.70; Ternes,

\$4.10 @ \$4.25; Bessemer Cokes, \$4.85 @ \$4.45; and Wasters, \$4.20. Cokes are 13/3 @ 13/6 at Liverpool.

Lead.—About 1000 tons Common Domestic have been sold in the open market at 3.70¢ @ 3.75¢, most of it, but the last at 3.75¢, which is the nominal spot value to-day, but with a downward tendency, stocks in store being larger and the season at an end, while production is known to be large. On the Exchange 200 tons changed hands during the entire week, sales of about 150 tons January having been made to-day at 3.75¢. St. Louis is 3.50¢ @ 3.55¢, and weak. London quotes Soft Spanish £13. 7/6, and English Pig £13. 15/-. On 'Change 48 tons January brought 3¼¢.

Spelter.—Has developed no new features, but remained only very moderately active at 5¼¢ @ 5½¢ Common Domestic, but for the dullness it would be higher, and Silesian at 6¢; the London quotation for the latter being 5/ off—£18. 12/6.

Antimony.—Hallett is unaltered at London, £48, and here, with a fair demand, 10¼¢ @ 10½¢, while Cookson remains steady at 12¼¢ @ 13¢.

New York Metal Exchange.

The following sales are reported:

THURSDAY, November 8.	
16 tons Lead, December.....	3.72½¢
10 tons Tin, January.....	22.60¢
20 tons Tin, January.....	22.55¢
MONDAY, November 12.	
30 tons Tin, January.....	22.50¢
10 tons Tin, February.....	22.55¢
10 tons Tin, February.....	22.60¢
20 tons Tin, February.....	22.65¢
32 tons Lead, January.....	3.77½¢
TUESDAY, November 13.	
10 tons Tin, January.....	22.50¢
48 tons Lead, spot.....	3.70¢
16 tons Lead, November.....	3.70¢
16 tons Lead, January.....	3.75¢
240 tons Lead, January.....	3.75¢
WEDNESDAY, November 14.	
144 tons Lead, January.....	3.75¢

Coal Market.

The Anthracite Coal trade is dull, and prices are weak under excessive production. The line trade is an exception to this remark, orders of some magnitude having been placed during the week for furnace and mill consumption, but in these instances it is said that some concession was granted. Operators in the Scranton region are now working on three-quarter time, and the effect is seen in the reduced tonnage. The total production for the week ending November 10 was 775,107 tons, which is only 45,000 tons more than for the corresponding week in 1887. Since January 1 the aggregate is 32,927,210, as compared with 29,714,677 for the same time last year, an increase of about 3,000,000 tons. It is said the Schuylkill Canal will be closed this year on November 30, no matter what the weather is at the time. It has been usual to keep navigation open, but in past years, and especially last year, this has resulted in many boats being frozen up. The Reading officials say it is better economy to close the canal early.

The Bituminous trade is moderately active, but the interior demand has fallen off. Cumberland reports 60,000 tons for the week, and Clearfield 50,000 tons, which, in each instance, is a decrease of 10,000 to 12,000 tons compared with the corresponding week last year.

The report of the Geological Survey of the United States for the year 1887, about to be issued, shows that the total number of short tons of Coal mined last year was 129,975,557, and the value at the mines was \$182,556,837, an increase of \$27,956,604. During 1887 Pennsylvania produced 31,516,856 short tons of Bituminous Coal, an increase of 4,398,725

tons. The production of Anthracite Coal in that State in 1887 amounted to 29,506,255 short tons, and the value at the mines was \$79,865,244.

A scheme to open up a direct line from the Pennsylvania Coal regions to the manufacturing centers of New England has been initiated by the leasing of the Newburg, Dutchess and Columbia Railroad to the New York and Massachusetts Railway Company. Contracts have also been made with the Lehigh and other companies on the west side of the Hudson which have access to the Coal fields.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from November 2 to November 9, inclusive, and from January 1 to November 9, inclusive, were as follows:

Iron and Steel.

	Nov. 2 to Nov. 9. Tons.	Jan. 1 to Nov. 9. Tons.
Pig Iron: Crocker Bros	795	11,792
G. T. Carter	500	630
G. W. Stetson & Co.	400	14,050

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, NOV. 14, 1888.

Speculative interest in the Copper market has been comparatively moderate the past week. Operators are hesitant pending some new move on the part of the "syndicate" agents that would serve as a cue to future operations, and the masters of the situation afford no gratification to the desire for new features. Their doings in the open market are of a commonplace character at the present time and nothing new is divulged regarding the latest negotiations with the mining companies. Meanwhile prices for Chili Bar and G.M.B. contracts are maintained, while those of furnace material have been advanced 6d. Anaconda Matte is now held at 16/ at Liverpool.

Block Tin has been devoid of speculative animation. Purchases are restrained in some degree by a fear that heavy shipments from the East may be started suddenly and, on the other hand, the position of supplies here causes more than ordinary caution in "bear" operations.

The market for Tin Plates has under-
gone no decided change. Buyers and

sellers are still considerably apart on prices, and, while concessions have been made in some instances, the reduction was not great enough to stimulate business. The stock at British shipping ports is estimated at 193,000 boxes, against 156,000 a year ago and 191,000 boxes last month. The exports to the United States during October were 24,492 boxes, against 25,483 the previous month. The Burry Tin Plate Company's Works are enlarged.

Speculation in Pig Iron "warrants" has moderated, both "bulls" and "bears" having temporarily suspended aggressive work, pending new developments. There is a fairly good consumptive demand, but the foreign demand has fallen off considerably. Prices have undergone but slight changes the past week. In the Manufactured Iron and Steel branches the situation is practically the same as a week ago. The exports of Pig Iron to the United States last month were 11,000 tons, against 12,400 tons in September. There have been more inquiries for Old Iron Rails, but holders ask higher prices, and that checks business.

Scotch Pig.—The market has been rather quiet and prices show only slight change, although rather weak.

No. 1 Coltness, f.o.b. Glasgow	49/
No. 1 Summerlee, "	49 1/2
No. 1 Gartsherrie, "	47/
No. 1 Langloan, "	48 1/2
No. 1 Carnbroe, "	43 1/2
No. 1 Shotts, " at Leith	48 1/2
No. 1 Glengarnock, " Ardrossan	47 1/2
No. 1 Dalmellington, "	47 1/2
No. 1 Eglinton, "	41 3/4

Steamer freights, Glasgow to New York, 6/6
Liverpool to New York, 10/.

Cleveland Pig.—A moderate business the past week, and prices barely steady. No. 1 Middleboro', G.M.B., 37/; No. 3 do., 34/8 @ 34/6.

Bessemer Pig.—Buyers are taking hold indifferently and prices are merely steady. West Coast brands, mixed numbers, 45/, f.o.b. shipping point.

Spiegelstein.—There is still a fairly active demand and prices are firm. English 20% quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—The demand continues quite brisk and the market very firm. Standard English sections quoted at £3. 18/9, and light sections £4. 2/6 @ £4. 7/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—Demand continues moderate, but makers are very firm on prices. We quote £4 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—For these there is still a good demand and former prices prevail. Bessemer, 2 1/2 x 2 1/2 inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—The demand is moderate, but makers offer indifferently and are very firm on prices. Bessemer, £4, f.o.b. at N. W. England shipping point.

Scrap Iron.—Demand continues moderate and prices are unchanged. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Old Rails.—The demand fair. Holders very firm and too high for business. Tees quoted at £3. 5/, and Double Heads £3. 10/, c.i.f. New York.

Crop Ends.—The market quiet and prices unchanged. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—There has been a fair business, but prices are irregular. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/	@ 15/
IC Bessemer steel, Coke finish.....	13/8	@ 14/
IC Siemens.....	13/8	@ 14/
IC Coke, B. V. grade.....	13/8	@ 13/
Charcoal Terne, Dean grade.....	12/	@ 12/

Manufactured Iron.—The volume of business is satisfactory, and prices are very firm. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d.	£ s. d.
Common.....	@ 8 2 6	
Staff. Bk Sheet, singles.....	@ 5 10 0	
Welsh Bars (f.o.b. Wales).....	5 0 0	@ 5 2 6

Tin.—A fairly active business at somewhat lower prices. Straits quoted at £101, spot, and £101. 15/ for three months' futures.

Copper.—The market quiet and prices without material change. Chili Bars, £78. 7/6, spot, and £79, three months' futures. Best Selected, £82.

Lead.—A quiet market, and prices rather weaker. Soft Spanish, £13.

Spelter.—Prices quite steady, but the market very quiet. Silesian, ordinary, £18. 15/.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, October 12, 1888.—*Asphaltum.*—The demand has continued steady at \$14.04, Boiled, 3/ ton, and \$6.84, Crude, f.o.b., inclusive of export duty. Exportation from January 1 to date has reached 42,947 tons, against 34,041 last year and 32,175 in 1886. *Exchange*, 90 days' sight, on London, \$4.80 @ \$4.86.—*E. P. Masson.*

BRAZIL.

PARA, November 9, 1888.—*India Rubber.*—Our market has been stiffening, with no accumulation of supplies. There are now afloat hence for the United States altogether 490 tons, and the next steamer will leave toward the close of the month.—*Per cable direct.*

EAST INDIES.

MANILA, November 5, 1888.—*Hemp.*—Has been quiet during the week at \$11.12 1/2 3/4 picul, against \$10 same time last year, equaling 3/ ton cost and freight £38. 7/6, against £38. 7/; the clearances for the United States since last cable have been none, against 32,000 bales last year; since January 1, 184,000, against 222,000; loading for do. 42,000, against 24,000; cleared for England since January 1, 285,000 bales, against 185,000; loading for do., 9000, against 13,000; cleared for other countries, 61,000, against 56,000; receipts at all ports since last cable, 24,000, against 9000, and since January 1, 556,000 bales, against 452,000 last year and 343,000 in 1886. *Freight*, \$7, against \$5.50. *Exchange*, 3/7, against 3/8 1/2. —*Ker & Co. to Mr. Charles Nordhaus, their agent, 89 Water street, New York, per cable direct.*

SINGAPORE, November 19, 1888.—*Tin.*—The shipments from the Straits Settlements to the United States in October have amounted to 750 tons, against 100 same month last year, and to England to 2000, against 2500; since January 1 they were, respectively, 2950, against 4100, and 15,700, against 12,500, aggregating during the ten months 16,650, against 16,600.—*Giffilan, Wood & Co., to Mr. Charles Nordhaus, 89 Water street, New York, their agent.*

COLOMBO, CEYLON, October 20, 1888.—*Plumbago.*—There is a continued scarcity of prime quality, which still tends upward. We quote at the close, in rupees, 3/ ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 40 @ 65. Shipments for the twelvemonth to October 1, 1888, have been distributed as follows: To England, 78,066 cwt.; to Marseilles, 38; to Trieste, 523; to Hamburg, 12,594; to Antwerp, 6248; to Bremen, 2012; to India, 82, and to the United States, 154,469, together 254,027, against last year 238,820; 196,153 in

1886, and 197,221 in 1885. *Coir Yarn.*—Nos. 1 to 4 have been steady at 7 @ 12 rupees 3/ cwt. *Exchange*, six months' sight, 1/4 1/2.—*Volkart Brothers, represented by Mr. John W. Greene, 82 Wall street, New York.*

SOUTH AFRICA.

CAPE TOWN, CAPE OF GOOD HOPE, October 1, 1888.—*Diamonds.*—The five diamond mines' output in 1887 has been as follows:

	Carats.	
Kimberley.....	1,333,833	£1,420,207
De Beer.....	1,014,048	1,022,878
Dutoitspan.....	696,576	987,284
Bultfontein.....	602,246	612,963
St. Augustine.....	194	250

Totals..... 3,646,897 £4,033,582
Being an increase of.. 463,869 737,714

over 1886. The export has been as follows:

	1887.	
Carats.....	3,598,980	£4,242,470
	1886.	
Carats.....	3,135,061	£3,504,756
Increase carats.....	463,869	737,714

or 20 %.—*Argus.*

SWEDEN.

STOCKHOLM, November 1, 1888.—*Iron Ore.*—Up to October 19, 32 steamers had loaded at the Lulea mines 57,700 tons of ore, and 4 were still loading, probably the last this year. Mining has been slackening; the weather has become so cold that miners have left in great numbers, both Lulea and Gellivara. The Lulea-Ofoten Railroad Company has been compelled to pay the full duty on its imported rolling stock.—*Dagbladet.*

GERMANY.

HAMBURG, November 3, 1888.—*Iron.*—A livelier demand for Pig is noticeable in Rhenish-Westphalia; the September output in Germany and Luxembourg is shown to have been 353,812 tons, against 337,638 in 1887, 172,028 tons being Forge and Spiegel, 34,745 Bessemer, 102,900 Thomas and 44,139 Foundry. During the first nine months the output was 3,168,641 tons, against 2,849,491 last year. The American and other demand for Spiegel has been very active, and prices remain firm at 53 marks 3/ ton for 10 to 12 % Manganese. Forge Pig has been moderately active at 47 @ 48 at Siegen; Thomas is as much wanted as before; Bessemer neglected; Foundry has remained steady at 53 @ 59; English do. is quoted 44/6 or the West Coast; Luxembourg is weak, because stock accumulates; White is quoted 37.25 and Gray 43.50; Merchant is neglected for domestic use, but more saleable for export. There are orders to be filled for the last quarter of the year. The general outlook in the German Iron trade is looked upon as encouraging; it is a good sign that the South German makers cling to the Rhenish-Westphalian syndicate. Hoop Iron, while selling more readily at home, is but little inquired for for export. Boiler Plates move off even more rapidly than before; Thin Sheets are looking up but slowly. The Wire branch is still partially unsettled since the dissolution of the Wire Nail syndicate. Foundries, machine shops and car works still report favorably. The closing quotations at Dortmund are: Merchant Iron, 125 @ 127.50; Hoop Iron, 127.50; Boiler Plates, 170; Tank Sheets, 150; Thin do., 147 @ 150; Steel do., 160; Axles, Complete, 315; Loose do., 230; Hoops, 215 @ 230; Steel Rails for mines, 115. In Upper Silesia there is no abatement in the Pig Iron demand, nor in that for Steel Bessemer and Martin Billets; this relates equally as much to Plates and Sheets and the Wire branch for spring delivery. Higher prices are insisted upon for forward delivery. *Metals*—are sustained as follows: Lead, German, 14.50 @ 15 marks 3/ 50 kg; Copper, Lake, 79 @ 80; Spelter, 18 @ 19; Zinc, Gray, 20 @ 22; do., White, 21 @ 22, and Tin Salt, 50 @ 85d. the 1/2 kg.—*Borsenhalle.*

SPAIN.

BILBAO, October 27, 1888.—*Iron Ore.*—Sales for the week have been limited to a few single cargoes at 7/ @ 7/3 Rubicos, and 8/ @ 8/3 Campanil. Steamers continue scarce, but soon navigation in the North of Europe will close and they will not be wanting. Stocks of Ores are liberal. The shipments since January 1 aggregate 3,081,443 tons, against 3,620,657 in 1887. *Pig Iron.*—Exportation during the week amounted to 1351 tons, and coastwise shipments to 1322 tons.—*Bilbao Maritimo y Comercial.*

The report that the new pipe mill of the Reading Iron Works, at Reading, Pa., had closed down for an indefinite period is without foundation. The mill was shut down on Wednesday, the 7th inst., and on account of the lack of certain sizes of iron.

The same has since been received, and the mill started up on the morning of the 12th inst., with a full complement.

The Gilbert Plow Company, of Wichita, Kan., have recently completed and put in operation a very large plow factory. The organization of the company dates back but a year. Their capital is \$200,000, and their factory is one of the best-equipped in the country. Most of the heavy machinery was made by Williams, White & Co., of Moline, Ill., and is of the latest and most approved designs. The buildings are of brick and one story in height. The main building is 70 x 300 feet, containing the forges, bending machines and wood-working machinery. The main warehouse is 70 x 200 feet. Smaller buildings have been erected for special purposes. The whole arrangement is upon a plan which permits of enlargement whenever that may be deemed necessary. The entire machinery is operated by a 150 horse-power Cooper-Corliss engine, built at Mount Vernon, Ohio. The boiler is capable of 200 horse-power. The superintendent of the works is Isaac R. Gilbert, who has had long experience in the manufacture of plows, having been superintendent of the Avery Plow Works, at Louisville, Ky., for five years, as well as similarly employed at other factories. The new company are making a specialty of a plow which Mr. Gilbert has invented and for which he claims many advantages not only over other inventors' plows but over designs which he has himself put forth that met with popular favor. The new plow has three wheels. The mold board share and land side are made of wrought steel, and can be lifted entirely clear of the ground in transportation, having a raise of 8 inches when not in use and a depth of 14 inches in the furrow. The clevises are constructed so that the depth of cut can be regulated without separating the team from the plow. A short corner can also be turned with this plow without its leaving the ground. The favor with which this plow has been received is proved by the large orders which have been sent in for it.

The Dominion Government awarded the contract for the construction of the Sault Ste. Marie Canal, amounting to \$1,200,000. Associated with the Canadian contractors is a firm at Watertown, N. Y. The Canadian Government will be entirely independent of the canal built by the United States at the same place.

The Springfield Glue and Emery Wheel Company, Springfield, Mass., have recently received, they advise us, 40 tons of garnet and have 50 tons more on the road. This substance is brought from a mine in Minerva, N. Y., that the company recently bought, about eight miles from the Adirondack railroad. The purchase covers 32 acres, and as the strip is bounded on one side by the public highway it is easily accessible. The rock is described as very hard, and when crushed each particle has very sharp edges, so that for cutting it is superior to ordinary sandpaper. As the mine is a large one and will last for years it is regarded as an important find for the company and will largely increase their facilities.

The extensive works of the Steam Gauge and Lantern Company, in Rochester, N. Y., were destroyed by fire on Friday night, and at least 20 persons lost their lives, quite a number having leaped from the windows of the building, which was a seven-story brick structure, owned by W. H. Gorsline. The pecuniary loss is placed at \$250,000.

Hardware.

Our advices indicate an improved condition of business, which promises to be fair during the remainder of the season. There is very little revision of quotations, and prices remain exceptionally steady. Collections are generally reported fair.

Cut Nails.

This market is less demoralized. During the past few weeks spasmodic efforts have been made by weak sellers to market goods, and \$1.75 has been named. It is claimed that the mills referred to are not longer pressing. We quote \$1.80 to \$1.90 for carload lots of Nails, and \$1.90 to \$1.95 for small lots from store.

Wire Nails.

The general situation remains as before, quotations continuing steady at \$2.65 for small lots and \$2.55 for carloads.

Barb Wire.

Considering the season, there is a fair demand and prices continue without material change. The Eastern market is in a better condition than the Western, though there is some irregularity in quotations. The following are the regular New York quotations for Four-Point Galvanized, with delivery: Carloads, 3.6 cents; 3-ton lots, 3.7 cents; less than 3 tons, 3.9 cents. It is to be observed that the quotations given in our last issue were for Wire in this city without delivery, and hence were lower than those given above.

Sandpaper.

As the trade have from time to time been advised in these columns, there has been during the last year or two a good deal of irregularity in the Sandpaper combination, and the goods have been sold in a covert way at prices lower than the arrangements between the manufacturers contemplated. In consequence of this condition of things Herman Behr & Co., 75 Beekman street, New York, have withdrawn from the combination, as per the following announcement, which was made on Tuesday:

We take pleasure in informing our customers and the trade generally that we have severed our connection with the Association of Sandpaper Manufacturers of the United States, and shall be pleased to quote prices and discounts upon application.

The trade will recognize the importance of this action, Herman Behr & Co. being an influential house of high standing, largely engaged in the manufacture of Ruby, Sand and Emery Papers, Glue, &c., and Mr. Behr having been the president of the association. They are intending to give increased attention to the manufacture of goods required by the Hardware trade, which, in connection with their other lines, they are prepared to manufacture to advantage. They announce a discount of 35 to 40 per cent. to the general trade, which will be recognized as a material concession beyond prices which have heretofore been within the reach of retail buyers.

In this condition of things the Sandpaper market is in an unsettled state. There appears to be no prospect of an immediate restoration of prices recently ruling, and it is thought not unlikely that somewhat lower quotations will be developed in the course of the competition for business which is likely to follow the breaking up of the combination.

Miscellaneous Prices.

The advanced prices for Rope which we have referred to as likely to be announced are now ruling, an advance of $\frac{1}{4}$ cent per pound having been made since our last issue. This advance applies to both Manila and Sisal, the market being firm and regular at the new prices. Manufacturers' prices for good lots are as follows, subject to a discount of $1\frac{1}{2}$ per cent. for cash in ten days:

Manila, $\frac{1}{8}$ inch and larger.....	12	cents per lb
Manila, $\frac{3}{8}$ inch.....	12 $\frac{1}{2}$	" "
Manila, $\frac{1}{2}$ and 5-16 inch.....	13	" "
Manila Tarred Rope.....	11 $\frac{1}{2}$	" "
Manila Hay Rope.....	12	" "
Sisal, $\frac{1}{8}$ inch and larger.....	10	" "
Sisal, $\frac{3}{8}$ inch.....	10 $\frac{1}{2}$	" "
Sisal, $\frac{1}{2}$ and 5-16 inch.....	11	" "
Sisal Hay Rope.....	10	" "
Sisal Tarred Rope.....	9 $\frac{1}{2}$	" "
Sisal Medium Lath Yarn.....	9	" "

The recent advance made on Skates by P. Lowentraut, Newark, N. J., for whom James Forsyth, 116 Chambers street, New York, is agent, was 20 cents on Nos. 1 to 8, and 25 cents on all other numbers.

The following is the price list of Foster Bros., Fulton, N. Y., manufacturers of Butcher Knives, Cleavers, &c. The list prices given on Knives are subject to a discount of 40 per cent., and those on Cleavers to a discount of 30 per cent.

In the description given in our last issue of King's Sash Support and Bolt the address of the manufacturers was not given. This article is made by the Palmer Hardware Mfg. Company, Troy, N. Y., who are also putting on the market King's Bit Gauge.		
--	--	--

Items.		
The George Worthington Company, Cleveland, Ohio, have issued their circular of fall and winter goods. It is devoted to Stove Boards, Coal Hods, Elbows, Vases, Sleigh Bells, Skates, Snow Shovels, Fire Irons, Lamps and a variety of other seasonable articles, of which an interesting line is shown. The catalogue is well and compactly arranged, showing a varied line in comparatively small space. Their Gun catalogue illustrates some leading Arms and Ammunition, with Gun Implements and specialties in this line. It also calls attention to the completeness of their stock of General Hardware, Tinnery's Supplies, &c.		

The following changes have recently been made in the management of The Union Hardware Company, Torrington, Conn. George B. Farrell, for many years president, has resigned, and A. F. Midgeon, who organized the company in 1864, has been elected in his place. Thomas W. Bryant becomes secretary and agent. Improvements to the plant have already commenced and the new manager announces that they propose to add to the business as rapidly as possible.		
--	--	--

Horton, Gilmore, McWilliams & Co., Chicago, Ill., under date of November 10, issue a price current in which Sleigh Bells, Chimes, &c., are given a prominent place. Skates, Snow Shovels, Hand Sleds, with Decorated Pearl Agate Ware, Clocks, Coal Vases and various specialties, are shown.		
---	--	--

Silver & Co., 56 Warren street, New York, issue a sheet in which their household specialties are represented. It includes a variety of new and ingenious articles.		
--	--	--

Blish, Mize & Silliman, of Atchison, Kan., wholesale Hardware merchants, are contemplating the abandonment of Cut Nails as part of their regular stock. They state that for some considerable time two-thirds of their Nail sales have consisted of Wire Nails. This firm employ six travel-		
--	--	--

ing men, and report a much more active demand during the past 30 days than earlier in the year. Their business was to some extent affected by the failure of crops in Central and Western Kansas. The trade of their territory is briskly competed for by the Chicago, St. Louis, Kansas City and St. Joseph wholesale merchants. In addition to their wholesale business this firm have a very large retail trade.

The catalogue of the Hulbert Fence and Wire Company, St. Louis, Mo., represents a variety of Fencing and Wire Goods. A description is given also of Hulbert's Patent Wire Netting and Picket Fence Field Loom.

E. N. Hatcher, Columbus, Ohio, issues a catalogue of the Columbus Steel Thimble Skein Works, which are referred to as the largest and most complete in the world for the manufacture of Thimble Skeins. The plant covers 4 acres of ground. The different patterns are represented and list prices given.

The circular of Ice Creepers manufactured by L. A. Sayre, Newark, N. J., illustrates the Rival, the Climax, the Security, the Eclipse, the Instep and the Sure Foot.

The Iron City Mfg. Company, South Pittsburgh, Tenn., announce that they have purchased the plant for manufacturing Hot-Pressed Nuts, also the entire stock of manufactured goods, from George C. McMurtry. In continuing the manufacture they intimate that they propose to maintain the high standard of quality on this brand of Nuts, and further state that they will give the lowest prices consistent with good quality and quantity.

H. H. Mansfield, at 36 Pine street, New York, has engaged in the business of furnishing Railway, Mill and Manufacturers' Supplies, new and second-hand. Mr. Mansfield was with Barrows & Co., a well-known supply house, for a number of years. On Mr. Barrows' death the business of the firm was discontinued, and Mr. Mansfield has now started for himself as above.

H. S. Jackson & Co., Nashville, Tenn., have recently completed arrangements by which they are granted exclusive sales agency for the output of the Sequachee Hoe and Tool Company, at South Pittsburgh, Tenn., manufacturers of Eye Hoes, Picks, Mattocks, Grub Hoes, &c. They make special reference to the quality of their Eye Hoe, and intimate that they are prepared to meet prices from other manufacturers.

The Scranton Mfg. Company, Chicago, Ill., announce that the appointment of the Moore Mfg. Company as general selling agents for their line of Hangers has been withdrawn, and that hereafter the trade will be supplied direct from the factory. They also state that they are in better condition now than ever to give prompt delivery and to quote close prices, and allude also to the merit of their Hangers.

On page 68, in the announcement of F. A. Tyler, 128 W. Dominick street, Rome, N. Y., an illustration is given of his Patent Flour Receptacle and Sifter. This article is shown in two positions, one indicating the manner of its use, and the other explaining its construction and the way especially in which the Sieve is attached. This Receptacle and Sifter is referred to as exceedingly convenient for household use, and is made in two sizes, to hold a 25 or a 50 pound sack of flour.

The St. Louis Expanded Metal Company, St. Louis, Mo., issue an interesting pamphlet explaining what their Expanded Metal is and the uses to which it is put. The pamphlet is copiously illustrated with cuts showing the different meshes in which the Expanded Metal is offered and

its adaptation for fences, aviaries, screens and many uses for which netting is generally utilized. It is interesting as showing the extent to which this new line of manufacture is being developed.

In the description which was given in our issue of November 1, the address of the Lowell Wrench Company was incorrectly given as Lowell, Mass., instead of Worcester, Mass. The trade will please note the correction.

A. J. Harwi, of Atchison, Kan., is a wholesale and retail heavy Hardware merchant. He carries a full stock of Farming Implements, from Threshing Machines to the simplest Tools, Wagons, Wagon Materials, Chains, Shelf Goods, and Bar Iron and Steel. He has excellent ideas as to the arrangement of stock. His manner of handling Rope is as follows: The spools of Rope are placed on a hanging shelf in the basement of the store. The ends are then drawn up through holes in the floor and hung over hooks in the adjoining wall. When a customer calls for a piece of Rope the required length is drawn up, measured, cut off, and the end again hung on the hook, thus saving space in the store-room, as well as securing other obvious advantages.

Charles Monk, 190 Sixteenth street, Brooklyn, N. Y., issues a neat and convenient descriptive price list of the line of Molder's Tools, of which he is manufacturer. Cuts are given of the Tools with dimensions and list prices.

Louis Ernst & Son, Rochester, N. Y., dealers in Mechanics' Tools and Builders' Hardware, announce that soon after January 1, 1889, they will remove to Nos. 129 and 131 East Main street.

Owing to the recent death of Martin Fechtman, the copartnership heretofore existing under the firm name of Fechtman & Gade is dissolved. William F. Gade, surviving partner, will continue the business at the old stand, 205 Canal street, New York, where he will carry a line of Cabinet Hardware, Tools, &c., as heretofore.

The Joliet Iron and Brass Foundry Company, Joliet, Ill., manufacturers of patent malleable iron Furniture Casters, have appointed John H. Graham & Co., 113 Chambers street, New York, general agents for the sale of these goods, who will carry a stock for the convenience of the trade, and will be prepared to fill orders promptly at the lowest market prices.

Through the daily papers the trade have learned of the disastrous fire in the factory of the Steam Gauge and Lantern Company, Rochester, N. Y., on the 9th inst. In spite of the efforts that were made to check the fire and rescue the occupants the factory and its contents were totally destroyed, and with a lamentable loss of life. The company announce that rebuilding and equipping of the new factory will commence at once, and they state that the stocks of goods in their New York and Chicago stores will enable them to fill orders with promptness. They solicit the further orders of the trade, with the suggestion that as much time as possible be allowed for their execution.

Wire Goods Company, Worcester, Mass., are about to issue to the trade a new and very complete catalogue of their large and increasing line. It is probably the largest and most complete line of strictly Wire Hardware that is offered to the trade. The company have four different factories located in different sections of the city, and their products are divided into the Wire Nail department, General Hardware department, House-Furnishing Hardware and Novelties and Tack and Staple de-

partment. They have largely increased their plant from time to time and have bought up and absorbed a number of concerns, including Caswell, Converse & Co., Taunton, Mass., the Worcester Tack and Staple Company and the Ayres Mfg. Company, together with several other smaller houses. The catalogue, which contains 122 large, well printed pages, relates to Bright Wire Goods, Staples, miscellaneous household specialties, Mouse Traps, Muzzles, Tacks and Staples, Escutcheon Pins and standard and miscellaneous Wire Nails. It is to be observed that the catalogue puts several lines of Hardware and Wire into better and more systematic shape than that in which they are usually presented, with such arrangement and description of the goods as regards numbers and classification as will tend to obviate the confusion that has sometimes resulted. The company have recently added the Universal Chain, which is described on page 52, to which they refer as so thoroughly flexible and universal that it is adapted to a large variety of uses, and it is thought by them that it will meet with a large sale. The whole catalogue is very complete and will be appreciated by the trade.

Peter Gerlach & Co., Cleveland, Ohio, issue a price list showing an exceptionally large and complete line of Ice Tools, of which more than 50 articles are represented. In their circular relating to their manufactures they refer to their experience of 14 years, the extent of their plant, and its equipment with requisite machinery for the manufacture of their goods. The excellence of the material used and the quality of the workmanship are emphasized.

Business Tendencies.

We print below extracts from a number of letters from Hardwaremen in the localities indicated, in which they discuss the question as to the tendency of the trade toward direct dealings with the manufacturer. It will be seen that many of our correspondents refer to the important position occupied by the jobbers, and the advantage for the small dealer in purchasing from them on account of being able to procure the goods promptly and in such quantities as are required by their trade. The disposition on the part of the larger retailers to purchase direct from the manufacturers is also referred to, as well as the increased activity and enterprise of the manufacturers in seeking this class of trade.

Helena, Mont.—We find it to our interest to deal directly with manufacturers, and are gradually placing our trade in that way. We think other houses here are doing the same.

Amsterdam, N. Y.—It is our opinion that the table of Fred. P. Straub & Co. is a fair indication of the drift of trade. We think, however, that the smaller dealers are more loyal to the jobbers and will continue to be so, than the larger dealers, and that a table furnished by the small dealer would make an opposite showing, which would be in favor of the jobber. It is evident that if the jobbers are not holding their own it is the desire of the manufacturer that they should not, for reasons that are best understood between jobber and manufacturer. It has occurred to us that the manufacturers are uneasy and are desirous of and court direct dealings, and if this is so and they make it agreeable to the retailer, as they do, the retailer will give the manufacturer the preference. We speak only in a general way and will allow exceptions.

Watertown, N. Y.—I never have kept a record of my purchases as to proportions bought from jobber or manufacturer, but my purchases are now and always have been mostly from the manufacturer.

Shakopee, Minn.—If manufacturers would sell goods without protecting the jobber it would be good policy to buy of them if they would always be willing to sell in quantities to suit. But they will not. Then another thing; where is the manufacturer that makes a full line of Hardware? I think that the jobber is a necessity to the small purchaser. He can get all goods necessary in one stock by buying from the jobber. By buying of the jobber we give

employment to a large number of men. I believe in living and let live. If a retail buyer is large enough he might make a saving to some extent by buying direct.

Perham, Minn.—Regarding the purchase of goods from manufacturer and jobber, we can safely say 80 per cent. of the goods used in central and northern Minnesota are bought from Western Jobbers.

Wellington, Kansas.—The general tendency of the retail trade is toward buying direct from the manufacturer, and the only reason why more goods are not bought direct is because it takes so long to get them.

Stillwater, Minn.—We do not believe the jobber is gaining on the maker. We are visited every year by more and more agents of manufacturers in lines in which we have heretofore dealt only with jobbers, and when we can swing the requisite number of goods we find it to our advantage to deal direct, and the manufacturer often makes it so, even if we do not need half the jobbing quantity. There are several lines that we have dropped buying of the jobbers for years, and our trade is growing more direct, especially with the manufacturer's agent, who carries a stock where we can get them within 50 hours after ordering them. On seasonable goods we find it best to contract with manufacturers for the amounts we want. We can at least buy them on as good terms as from the jobbers, and then we are more certain of the quality and the time we will receive them.

Ft. Madison, Iowa.—We are of the opinion that the bulk of Hardware is sold through the jobber, at least, in our own case. We prefer to buy from the jobber—firstly, because we can buy in such quantities as our trade demands, and, secondly, a good buyer if he wants a round lot of a certain line of goods has only to state it to his jobber and a satisfactory price will at once be made to him, and when Eastern freights are taken into consideration the jobber has done him the most good. As regards buying from manufacturers' agents, there is very little of that done among the retailers. The facts are that the retailer does not receive one call from the manufacturer or his agents where he receives 25 from the jobber. Hence he gets out of the habit of thinking of buying from first hands, and it is well he does, for he would be forever overstocking himself from the manufacturer, while from the jobber he buys just what he wants. In our opinion the jobbing business is on the increase and the manufacturers' business is being more closely confined to the wholesale trade.

Washington, D. C.—We do more business direct now than ever before, and think, so far as our city is concerned, this is general.

Indianapolis, Ind.—Our impression is that manufacturers are gradually undermining the jobbers, and, although our business is larger than ever before, it is only kept so by constant attention, and by having the advantages of a large line.

Princeton, Ill.—Of late years we have in our business found that we can do as well with the jobber, and at times better, than we can with the manufacturer, whose goods are represented and handled by jobbers. There are some lines in which we can get concessions from manufacturers by taking case lots and buying for long future, but we believe the delay in getting goods from manufacturers, the necessity of buying in larger quantities and extra freight more than equal the difference in price made us by manufacturer and jobber. Our rule is to favor the jobber when we can, though we have to buy some goods of manufacturers.

Washington, D. C.—We believe the general tendency is to buy direct from the manufacturer. This is particularly true of large and cash buyers, but, on the other hand, we believe the number of jobbers is increasing from year to year, because the smaller trade find it a great advantage to be able to buy an assortment of goods from one dealer, thereby saving them a great amount of freight. Furthermore, the small dealers do not always know where an article they want is made, and, by ordering it from their jobber, they generally succeed in obtaining what they want.

Fremont, Neb.—I carefully read the table prepared by Fred. P. Straub & Co. I have never taken pains to keep such a record, and am too busy now to look further into the matter than to say, with me, there has been increased direct dealings with the manufacturers from year to year. This, in my case, is caused principally by the desire to get the quantity discount in some cases, and the fact that the manufacturers are pushing out their salesmen, visiting trade they formerly did not call on or solicit.

Stanton, Mich.—In our opinion the general tendency is not toward increased trade direct with manufacturers, except in some special

lines of goods like Axes, Scythes or Nails. The average retail dealer securing a good assortment and prices ranging as low, if not lower, from jobber. The gain of securing goods in cleaner and more perfect shape is usually counterbalanced by carrying a larger

The store is on the street floor of a new two-story and basement brick building, specially erected for the Hardware business. The exterior is of red pressed brick and white sandstone trimmings, with gal-

Fig. 294.—Congdon & Henry Hardware Co.'s Store, Rapid City, Dakota.

stock than necessary in buying direct and in original packages.

Doland, Dak.—We are buying two-thirds of our goods from jobbers.

Morrilton, Ark.—We buy more from manufacturers than formerly.

Canal Fulton, Ohio.—We should say the tendency was in favor of manufacturers. Such has been our experience within the last three years.

Cadiz, Ohio.—We buy more of late years of jobbers than we did 15 years since. We, of

vanized iron cornice. A general view of the store is given in Fig. 740, from which it will be seen that on either side of the wide entrance there are handsome show windows. The entrance is 10 feet in the clear, as shown in the plan, the dimensions of the store being 40 x 100 feet. It is entirely finished in Black Hills yellow pine, natural colors in oil and varnish, with trimmings of cherry, the projections being touched with jet black. The ceiling is

Fig. 295.—Second Floor.

course, buy heavy goods from the manufacturers, same as we have always done. We think our neighbors do about the same.

Wellington, Ohio.—I do not think in this section of the State that Hardware dealers, except very large dealers and jobbers, buy to any large extent direct from the manufacturers. As I buy my goods for cash, should avail myself of manufacturers' prices if it were to my advantage.

Arrangement of Stores.

The illustrations herewith given, Figs. 294 to 300, represent the complete and attractive store of Congdon & Henry Hard-

also of yellow pine, and is painted a light bluish tint.

The show windows are heavy plate glass and extend back into the store 6 feet. The floor of the show window is 13 feet front, and at the rear, or in line with the doors, it is 15 feet 3 inches, and is raised 18 inches above the floor of the store. This window space is not separated from the store in any manner whatever, and its depth allows a deep entrance, forming a vestibule, as shown on the plan with a cast-iron plate in front raised 3 inches above the sidewalk and extending

Fig. 296.—Basement.

ware Company, Rapid City, Dak. Besides indicating the general arrangement, it also explains some of the methods adopted for accommodating certain lines of goods, and suggestions will be found which will be of interest to the trade.

back 2 feet 6 inches. The other 3 feet 6 inches is an extension of the main floor, making an entrance in which it is very easy to handle all kinds of heavy goods, and is safe to walk on in all kinds of weather. It will also be observed that a

very large glass frontage is obtained by making the side lights in the entrance so deep (5 foot glass) and full height in one light, making a total frontage of six lights, or 575 square feet, while by allowing the glass to run so low, it is possible to see goods the full length of the store from the street.

The floor plan also indicates the general arrangement of the store, showing the location of shelving, counters, cases and racks, with a designation also of the goods to which they are devoted. On either side of the building next the show window is a large sample card against the wall, 14 feet 6 inches by 6 feet, which extends to the ceiling, which is 16 feet in the clear from the store floor.

The office is situated on the left side of the storeroom as you enter, 26 feet from the front. It is inclosed with railing of the same color and trimming as the shelving and fixtures, and has connected with

Fig. 297.—Section of Shelving.

it a fire-proof vault with double fire-proof doors built in the main wall of the building. This vault is 4 feet wide by 14 feet deep, with the safe located in the back end, leaving space for rack and pigeon-holes 9 feet long and 9 feet high, for circulars, quotations and papers of all descriptions, classified and arranged so as to be convenient at all times.

There is a satisfactory arrangement of shelving for Tinware, commencing at the vault and extending back. This shelving is flush with the vault, and at the ledge is 34 inches wide. The shelving is adjustable, and can be arranged to suit any size or style of Tinware, and is 27 inches wide. Under the ledge is a large space fitted for Hollow-Ware.

The counters on this side of the store are 3 feet 2 inches in the clear from the ledge or shelving, making room for two persons to pass each other easily. They are finished in the same style as shelving with cherry tops and round ends, and are built with panels in center, allowing the top to project, making it possible to stand up to the counter and yet not mar it at the base. There is an A-shaped iron rack in the center of the rear of the store with open space entirely around it for handling iron. The rack is so arranged that all iron shall be on end, as the ceiling is high enough to admit the longest Bars kept in stock. The rack is spaced off on all sides to separate different sizes and quantities, the front side being devoted to Pick and Tool Steel.

An inclosed stairway leads from the rear of the store around the elevator to

upper story, Fig. 295, where are tinshop and a large, well-lighted showroom with ceiling 14 feet in the clear. It will be noticed that the inclosed stairway leading from the rear of the store back of the elevator is lighted by a large window at the head of the stairway and runs to the base-

Fig. 298.—Rack for Bolts, Nuts and Washers.

ment, Fig. 296, which is full size of the building, 40 x 100 feet. This basement is floored with 2-inch plank and is 8 feet in the clear from floor to ceiling. It is lighted at front with four large windows and has a door for passage under the sidewalk, where there is additional storage room, 10 x 40 feet, lighted through the sidewalk. There are also three large windows in the rear.

Referring to some of the arrangements in use in this well-equipped establishment, Fig. 297 shows a section of the shelving on the right-hand side of the store with interchangeable sample boxes. The shelving is 14 inches deep, with a ledge 30 inches deep, or an extension of 16 inches from shelving. Under the ledge are two deep shelves for carrying goods too heavy for sample boxes, such as Grindstone Fixtures, Barn-Door Hangers, Strap and T Hinges, Bench Screws, &c.

Fig. 298 shows a portion of the Bolt rack, which, from the small amount of space it occupies, 8 feet by 22 inches, and the

Fig. 299.—Bird-Cage Rack.

quantity of Bolts it is capable of holding, is referred to as exceedingly complete and satisfactory. As will be seen from the cut, the rack will carry a full line of Carriage Bolts, with the Washers necessary, on the one side; also a line of Threaded and Blank Nuts. On the opposite side is a small line of Norway, Machine, T-head and Tire Bolts and Lag Screws, all arranged according to size. As indicated in the engraving, the rack is built up square, 22 inches by 8 feet, with a flat top to carry extra stock, and has 168 pigeon-holes on each side. It is divided diagonally from end to end, admitting a Bolt 4 inches long in the shortest hole and 18

inches long in the longest hole. It will also be noticed that the rack is made to take in a full list of common Carriage Bolts made on the one line, so that it is only necessary to mark the thickness of wire on the frame at the end of the line and the length of the Bolt at the top of the pigeon-hole.

Fig. 299 is a Bird Cage Rack, attached to iron column in the center of the store, or it could, if desired, be hung from the ceiling. It is 7 feet in diameter, made of 4-inch round iron, braced with strap iron, and hangs from a fastening above on the post. It will hold three dozen common size Bird Cages.

Fig. 300 is a portion of Nail Counter. It is 2 feet 6 inches wide and 2 feet 9 inches high. These Counters are made in the same style as the other counters in the store, with round ends and cherry tops. They are, it will be seen, double-deck counters, the Nail bins being 18 inches

Fig. 300.—Nail Counter.

wide in the clear and will hold about 200 pounds each. They are so built that the Nails can be drawn from either side of the Counter.

Exports.

PER SHIP SOUTHERN CROSS, OCTOBER 26, 1888,
FOR SYDNEY, N. S. W.

By H. W. Peabody & Co.—600 pieces Staves.
By F. B. Wheeler & Co.—300 dozen Brooms,
7½ dozen Brushes.
By T. Basanta.—550 dozen Handles, 44 dozen Saws, 20 dozen Handles, 34 dozen Saws and Files, 20 dozen Shovels, 40 dozen Clocks, 1 dozen Toy Blocks, 1 gross Toy Guns, 50 gross Paper Caps, ½ dozen Air Guns, 1 dozen Lanterns, 1 dozen Refrigerators, 2 1-6 dozen Bird Cages, ½ dozen Air Guns, 27 dozen Lamp Goods, 8½ dozen Lamp Goods, 2 dozen Lamp Goods, 30 dozen Ice Chests, 1500 Wheels and Axles, 12 Clocks, 40 Step-Ladders.
By Leaycraft & Co.—25,393 pieces Roofing Slate.
By Hsley, Doubleday & Co.—4 Carts, 15 gross Axle Grease, 13 dozen Castings, 3 barrels Castings, 2½ gross Axle Grease, 181 pounds Glue, 5 gross Toys, 6720 pounds Axle Grease.
By Coombs, Crosby & Eddy.—1200 pounds Nails, 6 dozen Hatchets, 30 dozen Axes, 1 dozen Mangles, 42 Wringers, 1 dozen Churns, 3 dozen Pumps, 16 dozen Rakes, 70 dozen House-Furnishing Goods, 4 dozen Tools, 13 gross Hardware, 3 gross House-Furnishing Goods, 7 dozen Tools, 4 gross House-Furnishing Goods.
By R. W. Cameron & Co.—40,000 pieces Slate, 49 packages Machinery, 6 boxes Pumps, 5418 pounds Tires, 10,270 pounds Bolts.
By Healy & Earl.—12 boxes Saw Mills, 9 cases Pumps, 1 Planing Machine, 2 Saw Frames, 16 cases Wood-Working Machinery.
By Peters & Calhoun Company.—2 cases Saddlery.
By W. & B. Douglas.—50 Pumps.

By *R. W. Cameron & Co.*.—5 cases Nuts and Bolts, 4 cases Whip Handles, 10 cases Axes, 6 cases Sandpaper, 1 case Hardware, 16 cases Axle Grease, 1 case Brushes, 2 cases Whips.
 By *Coombs, Crosby & Eddy*.—24 dozen Handles, 4 dozen Rakes, 1 dozen Plated-Ware, 42 Blocks, 3 dozen Handles, 5 dozen Carpenters' Tools, 6 Cash Boxes, 24 dozen Shovels, 6 Lawn Mowers, 12 dozen Combs, 157 dozen Hardware, 37 dozen Carpenters' Tools, 7 dozen Axes, 3 dozen Iron Hooks, 21 dozen Garden Tools, 6 dozen Axes, 120 cases Skates, 500 gross Crayons, 2 Printing Presses, 30 gross Lead Pencils, 6 gross Glue.
 By *Strong & Trowbridge*.—20 cases Axes, 3 cases Hammers, &c., 6 cases Handles, 2 cases Pumps, 1 case Shade Rollers, 2 cases Lampware, &c., 6 cases Hardware, 30 cases Axes, 3 cases Saws, &c., 28 kegs Nails, 2 cases Lampware, &c., 3 cases Hardware, 14 cases Cartridges, 1 case Nails, 1 case Hardware, 1 case Choppers, 1 case Hay Forks, 1 case Hammers, 35 cases Axes, 4 cases Hatchets, 1 case Hardware, 20 cases Axes, 2 cases Hatchets, 4 cases Hardware, 1 case Rivets, 1 case Traps, 6 cases Nails, 45 Kegs Nails, 1 case Nails, 100 Boxes Clothes Pins, 8 packages Hardware, 3 cases Tools, 3 cases Wringers, 1 barrel Blocks, 3 cases Hardware, 12 cases Emery Wheels, 2 cases Locks, &c., 1 case Twine, 1 case Rakes, 1 case Hardware, 2 cases Hardware.
 By *A. S. Lascelles & Co.*.—39 cases Handles.
 By *Meriden Britannia Company*.—2 boxes Plated-Ware, 5 packages Plated-Ware.

Business Methods.

We have from time to time published information in regard to matters relating to the details of business, with suggestions as to new and improved methods. Among enterprising and progressive business men there is a constant change, as old methods are superseded by others which secure a saving of time with better system and greater accuracy and convenience in despatch of business. While the plans that are found adapted to the exigencies of certain houses may not be suited to the business of others, information in regard to them is notwithstanding stimulating and serviceable and often leads to the devising of new and better methods. We shall therefore value suggestions from our readers in regard to desirable methods relating to any of the many details connected with the carrying on of business. While information in regard to bookkeeping in any of its departments will be of general interest, specific advices in regard to methods of buying, keeping accounts, recording prices, classification of Hardware in price books, or otherwise, suggestions in regard to taking stock and many other similar topics will be of especial service to our readers.

From Elsworth & Dudley, Poughkeepsie, N. Y., we have received a card, reproduced below, which they use in sending remittances. They refer to having found it very satisfactory after a use of several years. The card is as follows, printed in red ink:

Check on Fallkill National Bank, Poughkeepsie, N. Y.

No. Dated 188

To

For account

Amount \$

Please return this card, after receipting on the back.

*Elsworth & Dudley,
260 Main Street, Poughkeepsie, N. Y.*

The back of the card contains simply a line for the date, the words "Received the check sent herewith" and a line for the signature. The fact that the card, which, it will be observed, is returned receipted, as per the form printed on the back, gives, it will be seen, a complete memorandum of the payment.

Effects of Rolling and Wire-Drawing Upon Mild Steel.

An interesting paper has been contributed to the Institution of Civil Engineers by Mr. Horace Allen, which is summarized by the *Ironmonger*. That gentleman made a series of tests in order to prove that the manipulation of steel, during its formation into wire, had greatly increased its tensile strength. He selected a mild-steel billet, 2 inches square in section, and having the following chemical composition: Carbon, 0.115; silicon, 0.009; sulphur, 0.068; phosphorus, 0.072; manganese, 0.410, and iron, 99.326. A portion of this billet was turned down for testing, and sustained a breaking-load of 28.08 tons per square inch, with an elongation of 28.1 per cent. Another portion of the billet was rolled into wire rod. In this case the rods were

found to have increased in elastic limit by from 17 tons in the billet to 25 tons in a No. 5 wire rod, or an increase of 47 per cent. The breaking-stress was raised in all cases, a No. 1 rod increasing from 28 to 32 tons. The reduction of area at the point of fracture was increased in all the specimens, being from 54 per cent. in the billet to 67 per cent. in No. 5 rod. The specific gravity was increased by rolling from 7.826 in the original billet to 7.865 in the rolled wire rod and 7.852 in the annealed wire rod.

The author of the paper says it is evident that the density of the steel is considerably and permanently affected by the effect of rolling the iron. Although the billets were strongly heated before the commencement of rolling, the temperature fell rapidly during the operation, on account of the sectional area becoming very much reduced; and the temperature of the finished rod, on leaving the rolls at a red heat, continued to fall rapidly, consequent on the relatively large surface of the rod, the molecules of which had not time to rearrange themselves in the same manner as they probably had done in the billet, in which case the section of the rolled steel was comparatively large, and the rate of cooling much slower. The alteration in the physical properties of the wire rod, compared with the original billet, as shown by the increased elasticity and tenacity and diminished elongation of the rod, is doubtless due in some measure to the effect of rapid cooling in the process of manufacture. This is proved

by the fact that after annealing the wire rod, by placing it between pieces of white-hot steel and allowing them to cool slowly together, the results of tensile tests showed that the steel was brought a little nearer to the condition of the original billet. Rolling the steel down to such small sizes at a high temperature induces absolute molecular contact, closing up any microscopic cavities left in the steel when in the form of a billet. This probably accounts, to some extent, for the increase of the elastic limit and breaking-stress; because the continuity of the molecules is less broken than in steel which has had less work upon it. Mr. Allen deems remarkable the increased contraction of area in the wire rod. Generally, the effect of putting mechanical work upon steel is the production of increased tenacity, accompanied by a diminished contraction of area, yet in wire rod the tenacity and the contraction of area are greater.

Puget Sound, in Washington Territory, exported during the first six months of 1888 lumber to the value of \$705,500, nearly all of it to Australia, and considerably in excess of the trade last year.

Sperry's Hog Scalders.

D. R. Sperry & Co., of Batavia, Ill., have just brought out a new article of seasonable interest. It is a heavy cast-iron

Sperry's Hog Scalders.

kettle intended for use in scalding hogs. Its shape and general appearance are shown in the accompanying cut. Its inside dimensions are as follows: 5 feet 4 inches long, 2 feet 6 inches wide and 2 feet deep. The manufacturers state that the shape and dimensions were furnished them by a practical butcher and are just what is required, being amply large enough to take in the largest hog. It is in-

point is made that in this way all the teeth are given exactly the same set. Special attention is also called to the fact that as this saw-set is made the hood, bed plate or anvil, and die-bar are so arranged as to give the operator full view of the saw teeth while setting. The pressure is

with which it can be used, as well as its simplicity and effectiveness, are alluded to.

Marlin Repeating Rifle, Model 1888.

This arm, which has recently been put on the market, is manufactured by the

The Practical Saw Jointer.

referred to as easy and directly downward on the teeth, without liability of bending or twisting the saw or saw blade, or break-

Marlin Fire Arms Company, New Haven, Conn. The accompanying illustration represents the weapon open, and indicates

Marlin Repeating Rifle, Model 1888.

tended to be set in a low brick arch, so arranged that the hog may be immersed directly in the kettle.

The Superior Saw-Set.

The American Tool Company, Canton, Ohio, are manufacturing the saw-set shown in the accompanying illustration. It is de-

ing the teeth. The manufacturers also call attention to the excellence of material and workmanship.

The Practical Saw Jointer.

The above article is put on the market by Danforth & Pike, 114 Washington street, Boston, Mass. It is used on the saw as shown in the cut. The file in the

in a general way the method of its operation. Its different parts are designated as follows: A, the lever; B, the breech bolt; C, the extractor; D, the carrier block; E, the locking bolt; F, the hammer; G, the trigger. The lock mechanism is referred to as simple, having but few pieces, and these so constructed as not to be liable to get out of order. The breech bolt, which is of steel, comes up solidly against the end of the barrel, and is locked in its place by a square locking bolt of tempered steel, which slides up and down in grooves in the frame on the same plan as the breech block in the well-known Sharp's rifle, and has also as a backing the solid part of the frame. This arrangement is to do away with all weak devices which are liable to break or get out of order. This locking bolt is operated directly by the lever without the aid of any links or other pieces. The firing pin is drawn back by the locking bolt, and is held by it until the cartridge is placed in the chamber of the barrel and the bolt firmly locked in its place, by this means making the premature explosion of a cartridge impossible. The gun is so constructed that in operating it the cartridges do not jump back into the carrier block, as in many rifles of this kind, but slide back with the opening of the bolt, thus avoiding the danger of having a cartridge explode in the magazine tube by the sudden jumping of the whole column of cartridges in the tube. The manipulation is referred to as exceedingly easy and almost noiseless. It is

The Superior Saw-Set.

signated as the Superior. In the use of this saw-set the gauge is set over the die-bar to the length of the saw-teeth, and the set for the teeth is regulated by lowering or raising the gauge screw, locking it with the small lock nut, which can be used above or below the hood. The

slot is adjustable so that the full width of the file may be utilized on one side, then the file reversed and used in the same way until it is all worn out. This tool is referred to as making a great saving in time, and insuring accuracy in jointing the teeth to an equal length. The ease and facility

sometimes desirable to cut off the supply of cartridges from the magazine, and this can be accomplished by pressing in very slightly the spring cover over the loading hole in the side of the frame. Doing this holds back the cartridges, so that none can enter the carrier, but the rifle may still be operated as usual, and thus used as a single-loader while the cartridges in the magazine are held in reserve. It also provides an additional means of safety when

is permitted to escape into the glass. The point is made that in this way the pulp and seeds are left in the strainer, permitting only the clear juice to escape.

Little Giant Wheel-Holding Attachment.

The illustration represents this article, which is simply an extra tail-block to their

Little Giant Wheel-Holding Attachment.

the rifle is carried while hunting or otherwise, because by this provision the barrel may be left entirely empty. If the magazine be not cut off after firing one or more shots, there will always be either the last exploded shell or a loaded cartridge in the barrel. This rifle is designed to use 32, 38 and 44 caliber cartridges of the Win-

Little Giant drilling machines, which is put on the market by Wells Bros. & Co., Greenfield, Mass. It is used for drilling the tire while on the wheel. This tail-block slides up and down in the ways of the machine, so as to overcome the difference in the size of wheels. Two tail-blocks are thus furnished with the machine, one to drill flat work upon the table of the machine and the other to drill tires, as shown in the cut.

The Novelty See-Saw and Merry-Go-Round.

The Canton Saw Works, Canton, Ohio, are putting this article on the market. It

Lemon Reamer and Strainer.

chester 1873 model. The rifle is now offered in 24, 26 and 28 inch octagon barrel, 38 and 44 caliber. The 32 caliber and round barrels of the various sizes will be put on the market at an early date.

Lemon Reamer and Strainer.

Silver & Co., 56 Warren Street, New York, are putting on the market this article, a cut of which is given herewith. It is made of glass, fits on top of a tumbler or goblet and has openings by which the juice which is extracted by the reamer

is illustrated in the cut given below, which indicates in a general way its construction and use. It is made in two sizes: The standard size for lawn and playroom is 8 feet long, and has seats to comfortably accommodate grown persons; the size for parlor or nursery use is 6 feet long, with seats adapted for children only. The board

on which the seats are placed rests upon a standard or support of the form shown, which is so arranged that it can be raised to different heights to suit the comfort of the persons riding, and also folds up compactly so as to permit of its being put away in a small space. The socket on the under side of the board, into which the

Fig. 1.—The Eclipse Ice Creeper.

round top of the support fits, can readily be moved so as to balance persons of different weights, and the construction is such as to permit a motion up and down as a see-saw, or around in a circle, or both combined. The manner in which seats are attached permits their being placed in any desired position, either straight or sideways at an angle. The attractiveness of this article and the pleasure with which it is used by children, together with its simplicity of construction and durability, and the fact that there is no place about the bearings that the children can be pinched while the machine is in use, and

Fig. 2.—Ice Creeper Attached to Rubber.

the moderate price at which it is offered, are points made by the manufacturers in regard to it.

The Eclipse Ice Creeper.

This article is made by L. A. Sayre, Newark, N. J., and is designed especially for ladies' use on rubbers. It is fastened

Novelty See-Saw and Merry-Go-Round.

securely through the shank of the arctic or rubber shoe by clamping the points on the inside. It is claimed that if properly clinched no water can penetrate where the points pass through the rubber. It is also stated that it can be fastened on by any one, no separate rivets or washers or special machine being required.

THE IRON AGE

THURSDAY, NOVEMBER 22, 1888.

Improved Pipe Cutting and Threading Machinery.

Every one who has ever done any cutting or threading of large sizes of pipe with the old style of die stock, with its long handles, knows of the difficulties with which the work is attended. The improvements which have more recently been effected in machinery of this class by Messrs. Curtis & Curtis, of Bridgeport,

should not be exactly standard. To operate the machine, the pipe is placed in the vise at the back, with the end to be cut against the back of the dies, and is clamped by turning a hand-wheel at the top, which brings it central. Then, having loosened the thumb-screws on the face plate, it is turned to the mark corresponding to the size of the pipe, which brings the dies to standard size. A very slight pressure on the lever on the top forces the gear back into the shell and the dies on the pipe,

gear revolves it runs back into the ring and the dies are brought on to the pipe. Both jaws work on one screw, the top half of the screw being right-hand and the lower half left-hand. By turning the hand-wheel on top of the machine it not only clamps the pipe but brings it central with the dies as well. The Nos. 2 and 3 machines are also made much heavier in some places than in the old style and the pitch of the gear is heavier. The machines thread and cut off all sizes

Fig. 1.—Power Pipe Cutter and Threader.

PIPE CUTTING AND THREADING MACHINERY, BUILT BY MESSRS. CURTIS & CURTIS, BRIDGEPORT, CONN.

Conn., are, therefore, of some interest. In their Forbes die stock, the customary long handles have been replaced by gearing, by which compactness and power are gained. The No. 1 stock has a range from $\frac{1}{4}$ to 2 inch, inclusive, both right and left hand threads, and weighs only 60 pounds complete, thus making it very handy to carry around from place to place. The gear that carries the dies fits into the main casting or shell and is supported on the outside of the teeth, while the pinion is imbedded in the side, and the pipe to be cut is held stationary in a self-centering vise at the back. The bits or dies are adjustable and are drawn forward or backward by cams behind them, thus bringing them to standard size, or allow the pipe to be cut over or under size in case the fittings

while the gear is revolved by the crank on the pinion. A change from right to left hand threads, or left to right, is made by simply changing the dies and reversing the motion of the crank. This size of machine is made without a cut-off, as it is found that a three-wheel roller cut-off will do more work than it is possible for any hand machine to do on small pipe. Six-inch nipples can be made on this machine, and by using the ordinary nipple holders a short or close nipple can be cut.

The No. 2 machine works on the same principle as the No. 1, except that a lead screw is used for forcing the dies on to the pipe instead of a lever. It is placed on the back of the gear and screws into a brass ring which has the same number of threads to the inch as the pipe. As the

from 2 to 6 inches, inclusive. They are arranged for power by the addition of a cast-iron base and a worm and gear attached at the back of the pinion.

The power machine which we show on this page is like the Nos. 2 and 3 hand machines, excepting that it is much larger and heavier, and, unlike them, and like the No. 1, only two sets of bits are used for all sizes. Speed and power are thus coupled with cheapness and durability. The No. 3 $\frac{1}{2}$ power pipe machine cuts off and threads all sizes from 2 $\frac{1}{4}$ to 6 inch, inclusive; the No. 4, from 4 to 8 inch, and the No. 5, from 8 to 12 inch.

The H. C. Frick Coke Company, of Pittsburgh, have purchased the Clinton Coke Works on the Mount Pleasant branch

of the Baltimore and Ohio Railroad, one mile above Scottdale, from B. F. Keister & Co. The plant consists of 110 acres of surface, about 80 acres of coal, and 44 ovens, including the old workings of ribs which may possibly be recovered. It is stated that the price paid for the property was \$90,000. Work has already been commenced, firing the ovens and mining coal.

Manufacture of Wood Screws.

A recent visit to an extensive works, manufacturing wood screws, afforded us an interesting opportunity of witnessing the successive stages of development of a finished wood screw from the rough, raw material in the shape of steel wire rods. Though in a general way the method of manufacture is familiar to many, a brief review of the various processes may not be without interest. The wire rods, which

next blank. The finished blanks, having gone through a rattler, are then taken to the threading machine. In this also the entire operation is automatic. The blanks pass along a slide, one by one, in the same way, are properly gripped and presented horizontally to a cutting tool secured in a movable tool block. This has the necessary amount of longitudinal feed to give the desired pitch to the thread, and has a quick return motion, several cuts being taken before a finished thread is secured. Soda water is used as a lubricant. The finished screws are here also dropped into a receptacle underneath the machine and are then ready for packing and shipment.

From the nature of the operations it is apparent that a large number of machines can be handled by one attendant. All that is necessary is to see that the feed hoppers are kept supplied. The capacity of the machines, of course, depends upon the size of the screw to be made—that is,

Improved Corrugated Steel Tires.

A year or two ago we referred to the corrugated rolled steel tires, invented by Mr. William Fox, of Leeds. At that time these corrugations ran in parallel lines—that is to say, the depressions and projections of the wavy line occurred alternately on opposite sides of the tire. Experience has, however, shown that by making the projections to correspond on opposite sides the tire was materially improved, and by this slight alteration in the design Mr. Fox gets over an æsthetic difficulty, for, while the old type of tire was acknowledged to be of immense service on the tram lines, it had the general appearance of being caked or thickly encrusted with road dirt, and this, taken in conjunction with its unsightly, serpentine configuration when in motion, has been probably the main drawback to its general adoption. By the adoption of this tire, which is suit-

Fig. 2.—Back View of No. 2 Die Stock.

Fig. 3.—Front View.

PIPE CUTTING AND THREADING MACHINERY, BUILT BY MESSRS. CURTIS & CURTIS, BRIDGEPORT, CONN.

to a great extent are imported, are first cleaned and drawn into wire of desired gauge for the different sizes, or rather diameters, of screws to be turned out. This wire on reels is next fed into what are known as heading machines, in which the screw blanks are partially formed, the proper length of wire for a screw being cut off and a head being formed by one or more blows from a header. These rude blanks are then dumped into a form of hopper attached to a machine for cutting the slots in the heads and shaving off the latter so as to present a finished appearance. The necessity of this latter operation becomes apparent when it is considered that the beveled heads as formed in the heading machine are not sufficiently smooth to meet the requirements of practical work, the metal flowing more or less irregularly. The rough blanks are fed along a slide automatically, each one in turn being held firmly by suitable gripping dies, presented to the milling cutter for cutting the slot in the head, and the tool for turning the circumference of the head and the beveled surface on the under side, and is then released, falling into a receptacle underneath to make room for the

the length and diameter—the amount of metal to be removed varying in each case. The work throughout is of an exceedingly interesting character, and furnishes a striking illustration of the perfection to which automatic mechanism has been carried.

Mr. Michael Longridge suggests the use of the following formula for the safe-working pressure for cylindrical furnaces and flues, as applicable to all cases likely to occur in practice:

$$\text{Safe working pressure} = \frac{50t^2}{\sqrt{LD}} - \frac{D}{L}$$

t , the thickness of the plates being taken in thirty-seconds inch; if t be taken in sixteenths, the No. 200 should be used instead of 50.

D = diameter in inches.

L = length in feet.

The Hughes Steam Pump Company, of Cleveland, Ohio, have been awarded the contract for all the pumps—five in number—for the new *Pioneer Press* building in St. Paul. One of the pumps is to be of the compound, duplex type, the balance being high-pressure duplex pumps.

able for the wheels of all classes of vehicles, the constant violent and injurious skidding of the wheels of vehicles when endeavoring to cross, and coming in contact with the edges and grooves of street car tracks is entirely avoided, to show how inventions such as these are worthy the appreciation of the public. The frequent lateral projections on the edges of the tire instantly cause the vehicle to mount the rails. Safety and economy are thus effected—safety because the risk of the occupants of the vehicles being thrown out or shaken is avoided; economy because there is no shock to the wheels, the life of the nave, the spokes, and the felloes is prolonged, the paint is preserved, the springs, pins, and other parts of the vehicle are not twisted or contorted, and consequently last a much longer time without needing repairs.

The Hill Clutch Works, of Cleveland, Ohio, have just made a contract with the Jenney Electric Light Company, of Fort Wayne, Ind., to furnish them a complete plant of power transmission machinery for a station they are putting in that city, to be put in according to their designs.

Natural Gas in Iron Making *

The prominence which natural gas has recently attained as a fuel in the manufacture of iron and steel in the United States naturally directs attention to its relation to other kinds of fuel which are used in this great American industry. It may be premised that no other country, not even Great Britain, is so richly endowed as this country with fuel adapted to the various processes used in the manufacture of iron and steel, in both their crude and finished forms. We have in some sections extensive forests for the supply of charcoal; in others there is an abundance of bituminous coal, much of which makes excellent coke; in Eastern Pennsylvania are extensive fields of anthracite coal; and in Western Pennsylvania and neighboring territory is the natural-gas region. As iron ore is also widely distributed in the United States, no natural obstacles exist to prevent this country from becoming in all respects the most conspicuous leader in the world's iron and steel industries, and this position it is rapidly attaining, as the figures already given abundantly show; in many respects it has already attained this distinction.

Originally all our iron and steel was made with charcoal, which remained our principal fuel for making iron and steel for many years. In the last century bituminous coal was sparingly used in heating furnaces; in the early part of this century it began to be used in puddling furnaces; in 1839 we commenced to make pig iron with bituminous coal in the form of coke, and in 1845 we successfully introduced the use of raw coal in the blast furnace. To-day most of our pig iron is made with coke, either alone or as a mixture with anthracite or raw bituminous coal. In the early part of this century we began to use anthracite coal in the heating furnace, and subsequently in the puddling furnace.

A few years before 1840 we successfully experimented with the use of anthracite coal in the blast furnace, and in that year its use in the manufacture of pig iron was fully established. Anthracite coal is no longer used in puddling furnaces, except in very rare instances, and its use in heating furnaces is rapidly yielding to the encroachments of bituminous coal. Except where natural gas is used, bituminous coal is generally used in our puddling and heating furnaces. Charcoal is still used in the manufacture of "charcoal" blooms, whether made from ore or pig iron and scrap, and it is used in the manufacture of our very small annual product of cemented steel, but it is not used in the manufacture of any other finished forms of iron or steel. In the production of gas for use in Siemens and other regenerative heating furnaces our dependence was chiefly upon bituminous coal and very slightly upon anthracite coal until the advent of natural gas.

In 1854 the United States made more pig iron with charcoal than with anthracite coal. The next year charcoal was passed by anthracite coal, and in 1869 it was passed by bituminous coal. Anthracite continued, however, to be the leading fuel until 1875, when it too was passed by bituminous coal, which has since continued to be the favorite blast-furnace fuel. In the following table the production of pig iron in 1883, 1886 and 1887, classified according to the fuel used, is given in tons of 2000 pounds:

Fuel used. Net tons.	1883.	1886.	1887.
Bituminous.....	2,690,660	3,806,174	4,270,635
Anthracite and coke	920,142	1,655,851	1,919,640
Anthracite alone....	965,254	443,746	418,749
Charcoal.....	571,726	456,567	578,182
Total.....	5,146,972	6,365,328	7,187,206

* From a paper by James M. Swank, printed in the "Mineral Resources of the United States," published by David T. Day, Chief of Bureau of Statistics and Technology, United States Geological Survey.

The development of natural gas in this country as a fuel in the manufacture of the finished forms of iron and steel dates from 1874. (It is scarcely necessary to say that natural gas is not used in the manufacture of pig iron.) At the Siberian rolling mill of Rogers & Burchfield, at Leechburg, in Armstrong Co., Pa, natural gas, taken from a well 1200 feet deep, was first used as a fuel in connection with our iron and steel industries. In the fall of 1874 it was announced that during the preceding six months the gas had furnished all the fuel required for puddling heating, and making steam at these works, not one bushel of coal having been used. Between 1874 and 1881 natural gas for puddling was successfully used at the same rolling mill; at the mills of Spang, Chalfant & Co. and Graff, Bennett & Co., in Allegheny County, Pa., and at the rolling mill of the Kittanning Iron Company, at Kittanning, Pa. In each instance the gas used at these works was obtained from wells that were sunk for oil but were found to produce only gas. In 1883 the substitution of natural gas for bituminous coal in rolling mills and steel works received much attention at Pittsburgh, owing to the discovery of natural gas in large quantities at the neighboring town of Murrysville, in Westmoreland County, Pa., but as late as September, 1884, there were in all only six rolling mills and steel works in the United States which were using the new fuel. During the next two years the use of natural gas in the manufacture of iron and steel made rapid progress. In August, 1886, there were 68 rolling mills and steel works which used the new fuel. During the next 15 months still further progress was made. In November, 1887, there were 96 rolling mills and steel works which wholly or in part used natural gas as fuel, and over 100 are now using it. The whole number of rolling mills and steel works in the United States in November, 1887, completed or in course of erection, was 445, of which, as will be seen from the above figures, nearly one-fourth used natural gas as fuel.

Of the total number of rolling mills and steel works which were using natural gas in November, 1887, 57 were located at Pittsburgh and elsewhere in Allegheny County, Pa., 15 were in the western district of Pennsylvania outside of Allegheny County, 7 were in Wheeling or its vicinity in West Virginia, and 17 were in Ohio. The territory in which are located the iron and steel works which use natural gas for fuel extends as far east as Johnstown, Pa., 79 miles east of Pittsburgh. In Ohio natural gas is used in the mills at Youngstown, in the northeastern section of the State, piped from wells in Pennsylvania, and at Findlay and Bowling Green, in the northwestern section of the State, obtained from local wells. In the intervening country between Youngstown and Findlay, which contains many large iron and steel works, including those at Cleveland, natural gas is not used. At Steubenville, Bridgeport, Bellaire, Martin's Ferry, and a few neighboring places on the Ohio side of the Ohio River, natural gas, piped from wells in Pennsylvania, is used in iron and steel works. Natural gas has been found at a few points in the central and eastern parts of Indiana, but at the end of 1887 the supply was so small that no rolling mill or steel works in that State was using this fuel. The gas used in West Virginia is obtained from wells in Washington County, Pennsylvania. Natural gas not having been found in the anthracite coal region or its vicinity, its use has not interfered with that of anthracite coal in rolling mills and steel works, but wherever it is used it displaces bituminous coal. It displaces no other fuel.

Nor has the use of natural gas as a fuel reduced the production of bituminous coal

in any State, not even in Pennsylvania, where natural gas is most used. On the contrary, the production and consumption of bituminous coal in this country have steadily increased in recent years. In nearly every State and Territory, including Pennsylvania, the production of bituminous coal in 1887, according to Mr. Ashburner, was greater than in 1886, while the aggregate for the country at large was much greater. The greatly increased production in 1887 of pig iron manufactured with coke and with coke mixed with anthracite will account for a large part of the increased production of bituminous coal in that year. In 1888 the consumption of bituminous coal for this purpose will be less than 1887. We do not think that the consumption of natural gas in our iron and steel works will increase in 1888. It did not increase in 1887 as much as in 1886.

The remarkable increase in our production of iron and steel in 1886 and 1887 was, of course, possible without the possession of natural gas, but the cheapness and abundance of this new fuel, and the temptation which it offered to enlarge old plants and construct new ones, are influences which have certainly had much to do with the present tendency to glut the market with finished iron and steel products. Natural gas is, however, not now supplied at as cheap rates as a few years ago.

The possession of natural gas, desirable and valuable as it is, does not insure any of the localities which use it in the manufacture of iron and steel against the sharp competition of other localities which do not have it, but which possess other advantages, as, for instance, proximity to markets of large consumption. This fact is well illustrated by a comparison which we recently made of the production of Bessemer steel in Allegheny County, Pa., which includes Pittsburgh, and in Cook County, Ill., which includes Chicago—the former possessing natural gas and the latter lacking it entirely. Chicago made more tons of Bessemer steel ingots in 1887 than Allegheny County, Pa. And it made many more tons of Bessemer steel rails. The figures are as follows: Chicago—ingots, 531,054 gross tons; rails, 439,345 tons. Allegheny County—ingots, 518,694 gross tons; rails, 287,363 tons. Joliet is a near neighbor of Chicago, in the same State, and Johnstown, Pa., is a near neighbor of Allegheny County, the former lacking natural gas and the latter possessing it. Adding the production of Bessemer ingots and rails at Joliet in 1887 to the figures for Chicago, and adding the production of Johnstown to that of Allegheny County, we have the following totals: Chicago and Joliet—ingots, 748,271 gross tons; rails, 642,580 tons. Allegheny County and Johnstown—ingots, 728,797 gross tons; rails, 414,027 tons. Who would have predicted ten years ago that Chicago would make more Bessemer steel in 1887 than Allegheny County, Pa.?

But natural gas, strange as it may appear, has a rival as a cheap and cleanly fuel in water-oil gas produced from petroleum, which is steadily growing in popularity among our iron and steel and a few other manufacturers. It is claimed that this fuel is cheaper than coal or than gas made from it, and that it possesses all the desirable qualities of natural gas, and is far safer. This new fuel possesses also the advantage that it can be produced and used where natural gas cannot be obtained, and even where the cost of coal may be too expensive to justify the use of the latter fuel.

No section of our country possesses a monopoly of all the advantages for producing iron and steel. Pittsburgh has natural gas for its rolling mills and steel works, and is close to the Connellsville coke field,

but it brings its ores long distances. Chicago is nearer than Pittsburgh to Lake Superior ores, but it is hundreds of miles away from Connellsville coke, and it lacks natural gas as a substitute for raw bituminous coal. In Alabama and Tennessee ores and fuel are found in close proximity, and unskilled labor is cheaper than in the North, but much of the pig iron made in these States must be hauled to distant markets at great expense. In New England but little iron and steel in their crude forms is now made, but the skill in their manipulation which has been accumulated in 200 years yet remains. The iron industry of the Rocky Mountain region will always have the stimulus of a home market remote from destructive competition. There is room in almost every section of this great country for the iron and steel industries which we have in late years so wonderfully developed, and which are destined to expand still further as the years roll on.

Triple-Expansion vs. Compound Engines.

Speaking of the adoption of triple-expansion engines by the Union Steamship Company, *Engineering* remarks:

There are now ten steamers of the fleet fitted with the improved engines, and the saving in consumption of coal varies from 16 per cent to 32 per cent., according to the age and character of the ship at the time of alteration. For instance, one of the newest mail steamers only shows a saving at present of 16 per cent, while the Anglian in the intercolonial service shows an increase of 32 per cent. The average saving on the whole fleet is about 21 per cent. of actual consumption. As the bunkers only admit of a part—say two-thirds or three-fourths—of the coal needed on the voyage being taken from England, the saving is on the fuel shipped on the voyage, so that the monetary gain becomes even greater. One of the last vessels converted was the Tartar, which has recently made the "record" passage from Algoa Bay, South Africa, to Plymouth, her gross time being 17 days 6 hours and 15 minutes, and net time 17 days and 52 minutes, and it may be interesting to note the results of coal consumption. Her engines during the passage, we are officially informed, developed 3830 indicated horse-power, the revolutions per minute averaging 64, and the average speed per hour $14\frac{1}{2}$ knots. The coal consumption was equal to 1.6 pound per indicated horse-power per hour. The old engines used to require 1.99 pound per hour per indicated horse-power, and even then the speed was not so great. This is a saving of 20 per cent. on the actual coal consumed.

The Colonel Scranton, a locomotive recently rebuilt from a wood-burner to a culm-burner at the Delaware and Lackawanna shops, at Scranton, has, according to the *National Car and Locomotive Builder*, a new feature that will be a decided convenience to the enginemen. Heretofore the engineer and fireman of locomotives of this make have had difficulty in conversing with each other, owing to the fact that they are so far apart, but this trouble has been obviated in the Colonel Scranton by the introduction of an alarm bell and speaking tube, which render prompt communication possible. The important improvement was introduced by the master mechanic, Mr. Charles Graham, and this is the only engine in the country that has such an outfit.

One of the most successful cable roads in the West is the Olive street branch of Missouri Railroad Company, St. Louis,

Mo. This line has been in operation continuously for the past nine months, and the inspectors report the cable as being in perfect condition and not a strand broken. The entire length of the cable is 24,250 feet, and was made by the Broderick & Bascom Rope Company, St. Louis, Mo.

The Burton Stock Car Works.

The Burton Stock Car Company have an extensive establishment at Wichita, Kan., for the construction of their improved cars for the transportation of animals. These cars are so arranged that their dumb passengers are carried with proper provision for their comfort, and are thus not only treated humanely, but are delivered in good condition at the end of their journey, which is an important consideration, even if they are only consigned to the slaughter house. These cars are covered by a number of patents, issued at intervals from 1880-87, with others pending. The company have a capital of \$2,000,000, and maintain offices at Boston, Chicago, Portland, Me., Washington, D. C., and Kansas City, Mo. J. T. Chamberlain is superintendent of the works, at Wichita, and W. A. Caswell is assistant superintendent. The plant comprises a number of buildings, the most important of which are as follows:

1. The wood-working shop, one-story brick, 125 x 300 feet, iron truss roof, supplied with a great variety of machinery of the most improved pattern; all lumber delivered at the works mill-sawed; 220 horse-power engine, built by the Fitchburg Steam Engine Company; Thomson-Houston electric light plant; will shortly put in an exhaust fan for carrying away shavings, &c.

2. The blacksmith and machine shops, occupying one brick building, 125 x 300 feet, cut into two parts by a partition; 20 forges, one Bement & Miles double shear, one 500-pound Bradley trip hammer, a bolt furnace and bolt-cutting machine, a "bull dozer" and furnace for shaping iron built by Williams, White & Co., of Moline, Ill., a horizontal drill, double-acting Bement & Miles lathe, Bignall & Keeler Mfg. Company's pipe cutter, together with the usual lathes, planers and punches, most of which were made by Bement & Miles; foundations have been laid for a brick addition, 80 x 120 feet.

3. Iron foundry, built of brick, 75 x 300 feet, containing two cupolas. Other buildings comprise a corerom, a brass foundry, a tin shop and a storeroom, each 50 x 60 feet. The tin shop is needed to manufacture watering troughs, with which each car of this system is supplied. No foundry-work, either in iron or brass, has yet been done, but these departments will probably be in operation by January. The force employed at present numbers 175 men, which will soon be enlarged. The capacity of the works is now 10 cars per day. Refrigerator cars are to be added to the line now made and probably street cars will be undertaken later.

Bearing Plates for Rails.—In consequence of the enormous consumption of timber for railroad ties various methods have been experimented with for increasing the life of the ties by reducing the wear close to the rail, and thus enabling softer and cheaper timber to be used. The most promising of these methods is the use of the Servis tie plate, which has been tried on a number of roads since 1886, and which has given satisfactory results. The plate consists of an iron or steel plate, of channel form; this is put on the tie under the rail and hammered down, and the first heavy train brings it to a solid bearing. The flanges cut into the timber and prevent the shifting of the plate. In some

cases it is made narrow, and the spikes are driven at the side; in other cases it is wider, and has holes for the spikes. It has been urged that with one metal rail on a metal plate there would be liability for the former to shift, causing extra strain on the spikes. This objection, however, does not seem to be experienced in practice, as testimonials state that the line is kept in better line and gauge with these plates than when the rails rest directly on cedar ties. These plates are used on the Canadian railways, Maine Central, Fitchburg, New York and New England, West Shore, Manhattan (Elevated) and other railroads.

The Niedringhaus Memorial Building.

Messrs. W. F. and Frederick G. Niedringhaus have at present in process of erection on the northwest corner of Cass avenue and Seventh street, St. Louis, Mo., a structure which will be known as the Niedringhaus Memorial Building. This structure is being erected as a place of instruction and amusement for the employees of the company, and as a fitting tribute to the memory of Walter, son of William F. Niedringhaus, secretary of the St. Louis Stamping Company, whose death occurred about two years ago. The building, which is at present in course of construction, is designed to have a frontage of 65 feet, with a depth of 110 feet, and will be two stories in height, with a French gabled mansard roof. The plans call for a front of pressed brick, with stone trimmings, and wide stone steps leading to the main entrance. The windows are of the Gothic style of architecture, and are sufficiently numerous to render the interior light and pleasant.

In the arrangement of the rooms, an apartment 15 x 20 feet at the right of the main entrance is set apart for the use of the directors; to the left of the main entrance is a library and reading-room, 28 x 20 feet in size, both having high ceilings and windows extending from the floor almost to the ceiling. On either side of these rooms are wide stairs leading to the gallery and basement. In the rear is the lecture-room, an apartment 60 x 69 feet in size, and of an elongated semi-circular shape. The stage, which is planned to occupy a space 25 x 18 feet in size, has on each side class-rooms, which are each 12 x 17 feet in dimensions, and which can be utilized as dressing-rooms in case the lecture-room is being used for amateur theatricals or entertainments of a similar nature. The seating capacity of the lecture-room is 1300. The second story is practically a gallery, with a seating capacity of 400. The front portion of the basement is designed for a dining-room, with accommodations for feeding from 300 to 400 people at a time. It is 50 x 81 feet in size, perfectly lighted by English basement windows. In the rear is a kitchen 22 x 18 feet in size, and along one side adjoining the kitchen and dining-room is a bowling-alley.

It is the purpose of the projectors of this enterprise to erect a gymnasium in the rear of the main structure. The plans, we understand, are not yet completed, but they contemplate everything necessary to a perfectly equipped gymnasium, including baths. It is estimated that the total cost of the building and furnishings, exclusive of the library, will approximate \$20,000. While the building is designed primarily for the use of the employees of the St. Louis Stamping Company, we understand that its privileges may be enjoyed by any eligible person residing in the city. It will be absolutely free to those for whose benefit it is being erected, the running expenses being borne by the Messrs. Niedringhaus.

New Two-Spindle Milling Machine.

We show, on this page, a milling machine of new design, recently built by the E. W. Bliss Co., of Brooklyn, N. Y., for use in their own works.

As will be seen, the general arrangement is that of a planer, but, in the place of ordinary planer tools are substituted vertical spindles for butt milling. The table has a longitudinal travel of 36 inches, and is fed by a screw, which may be operated by the hand-wheel shown at the right side of the bed, or fed by power, in either direction. Four speeds for feed for the table are provided, and, in addition, there is a power "rapid transit" motion, which is operated to run the table in either direction, by means of the hand-lever shown at the right of the bed. The quick motion is especially intended for

required, and the builders are now filling several orders for machines with 5 to 6 foot lengths of table. The driving-shaft, carried by the cross-head, is spindled its length between bearings, to allow for the lateral motion of the saddles, and is driven from the floor counter-shaft by the familiar arrangement of belting shown, which dispenses with the necessity of a tightener to make up for the vertical adjustment of the cross-head. In some of the machines now in course of construction the arrangement is such as to allow the floor counter-shaft to be dispensed with, and one at the top of the machine to be substituted, which, in some cases, might be considered preferable. By the use of the two spindles on the work for which this machine was designed, and with special attachments to facilitate the setting, this tool is now doing work that heretofore required the use of

Depew on Rates.

Respecting competitive rates on railroad lines, which are causing so much disturbance among shippers of merchandise, more than counterbalancing any advantage arising from temporary reductions, President Depew, of the New York Central, says: "The differential rate is all wrong in theory undoubtedly, but, after several disastrous wars to get rid of the system, ninety-nine one-hundredths of the railroad men of the country believe that there is no other way of promoting staple rates or of protecting railroad investors. A railroad tariff between two points should be as well known and as staple as the postage rate." "I believe," he says again, "that in time the theory to which the country is now committed, that the Government, through an Interstate commission, shall prevent

TWO-SPINDLE MILLING MACHINE, BUILT BY THE E. W. BLISS CO., BROOKLYN, N. Y.

running the table back after the cut is finished, and, being entirely independent of the cone feed, both can be in operation at one and the same time, thus saving the trouble of throwing off the cone feed in order to run the table back for starting a new cut. The cross-head is raised and lowered by power, much in the same manner as in a planer, and, in addition, each spindle has an independent vertical adjustment of 2 inches, operated by the hand-cranks shown at the upper boxes on the saddles. Each saddle is capable of independent lateral motion, operated by the large hand-wheel at the front, and has also a power attachment for feeding, supplied with four changes of speed. As in the case of the table, the saddles may be moved independently from the power feed while the latter is in operation. The cross-head is made of sufficient length to allow the saddles to be run out far enough to bring the milling cutters outside of the housings, between which the distance is 54 inches.

The machine illustrated was built for special work not requiring a long table, but the latter can be made of any length

five planers, thus proving itself a most valuable addition to the equipment of a machine shop.

Sometimes the fastenings of crown gear wheel on the upper end of a turbine water-wheel shaft are neglected, and allowed to get loose, and the wheel to slip down and out of gear. It does it gradually until when nearly out of gear, and then if the cogs are pretty well worn the points unable to stand the strain give way, and the whole wheel is stripped.

General Dumont, Supervising Inspector-General of Steam Vessels, reports inspecting 6425 vessels last year, an increase of 305 vessels over the year previous. Nearly 30,000 licenses were issued. There were 202 lives lost by accidents to vessels during the year, a lower number than in any previous year. There were 50,000,000 passengers carried during the year. The expenses of the bureau were \$257,000. He recommends that ferryboats be limited in the number of passengers carried, and that yachts and all small steam craft be inspected.

railroad abuses and extortions and discriminations upon one line, will be extended to legalize a pool, by which method alone precisely the same evils can be stopped when practiced by competing lines against one another. So far as the public is concerned, all routes from one point to another are one, and a system which simply prevents one line from discriminating in favor of one of its own customers as against one another, and on the destruction of the pool promotes still more violent discriminations to one shipper as against others by different lines, has enormously exaggerated the evils which it was created to remedy. The whole of the existing trouble is the impossibility of railroads legally forming a pool. A recognition of a proper system will settle the whole difficulty in 24 hours."

The Interstate Commerce Commission has addressed the New York Central Railroad asking for information regarding the illegal cutting of rates which has been alleged against its competitors. Chairman Cooley is desirous of proving the facts with a view to ascertaining if there is sufficient ground for proceedings by the

Federal Commission. It is understood that the Central has replied that it can furnish no specific evidence from the nature of the case, but has been satisfied, from the course of its traffic, that the tariff was not being lived up to by its rivals.

Calumet and Hecla Stamp Mills.

We are indebted to the *Houghton Mining Gazette* for the following description of this plant.

The Calumet and Hecla stamp mills, at which the immense product of the mine is stamped and made ready for smelting, are situated at the village of Lake Linden. The site occupied consists of lot No. 4, comprising about 25 acres of land, which is occupied with their buildings, docks, yards, &c. There are two separate stamp mills, the Calumet and the Hecla, into which, however, the rock from the mine is put indiscriminately. The Calumet Mill is said to be the largest single dressing plant in the world, covering as it does 1½ acres of ground. It was very much enlarged last season, its total length now being 460 feet, with a width of 105 feet, its height being 66 feet. Connected with the mill on the east side are three annexes 100 feet wide, in which is the slime plant for this mill, two of them being 75 feet deep and the other 50 feet deep. Its stamping plant consists of eight head of stamps now running, with three new stamps in process of erection, making 11 in all. There are 272 jigs now in operation and when the three new head of stamps are completed 374 jigs will be employed. There are 28 slime tables in use and with the three additional heads there will be 44. There are also two Heberle mills for recrushing a coarse gangue, discharged from the rough sieves and rejiggers. The Hecla Mill building is 300 feet long, 105 feet wide and 66 feet high, with two annexes 100 feet wide by 70 feet deep, one of them being erected during the past season and will contain the slime plant. The mill operates seven head of stamps, 238 jigs and will have 28 slime tables, which will probably be running before the close of 1888. The slime tables are all double deckers without a dead head and have been shown to yield 60 per cent. more ingot from the same amount of slime than tables using a dead head. The mill also contains two Heberle mills similar to those in use at the Calumet Mill.

During the last year the whole method of handling the mineral in the matter of sending to smelting works has been changed; where it was formerly sent in barrels it is now sent in cars, the first cars being sent from the Hecla mill in December, 1887, and from the Calumet mill in July, 1888. There are now 10 cars employed in carrying the mineral from the Hecla mill and 15 from the Calumet; cars hold about 5 tons each. The cars are loaded in the mills and run directly into the mineral storehouse at the smelting works over an elevated track, dumping their load into bins for its reception. In the old method of sending the mineral in barrels about 4000 barrels were used each month. This new system was originated by the Calumet and Hecla Company, and as yet is used nowhere else. The cars bringing the rock to the mills from the mine to be stamped run into the upper story of the mill over an elevated track and dump their load into the rock bins, the bin capacity of the two mills being 10,000 tons.

The stamps used at the mills are the Leavitt stamp. The present capacity of the stamping plant is about 3200 tons rock per day, and when the three additional heads are working the total capacity of the two mills will be about 3900 tons rock per day. Recently, as a matter of experiment, a solid anvil has been placed under No. 1 Calumet head, the anvil weighing

about 57 tons, resting on the main foundation. So far this solid anvil is working very satisfactorily and is crushing 260 tons per day without an increase in the consumption of steam. This shows a gain of from 100 to 120 tons over the old style of "Ball" stamps and an increase of about 40 tons over the same head when using spring timbers as a foundation for the anvil. In addition to the driving engine Wabeek, which will be mentioned later, each mill has its own driving engine. So if any accident should happen to the driving engine Wabeek or to the wire rope transmission, the small driving engine could be at once started and a stoppage of the mill avoided. The stamp mill boiler house is a building 210 feet long by 70 feet wide and contains 10 fire-box boilers, with a capacity for 14. The steam is conveyed to each mill through a 24-inch pipe running through a 7 foot tunnel. The feed plant is comprised of two Worthington feed pumps, 12 x 6 x 10, and one Hyatt 8-foot filter, which filters 200,000 gallons of water each 24 hours, that being the amount the boilers are now evaporating. The chimney for these boilers is of wrought iron, brick lined, 12 feet in diameter on the inside and 185 feet high.

There are two sand-wheel buildings, each about 60 feet square, in which are sand-wheels 43 feet in diameter with a bucket width of 6 feet. These sand-wheels lift all the water and sand passing through the mills to a height of 35 feet into a launder 4 feet wide which conveys it to the lake. The electric light plant consists of two No. 7 Brush dynamos supplying power for 60 odd lamps. Another is soon to be placed to be used on an outside circuit.

The water-works building contains three pumping engines—"Ontario," which is a vertical double-expansion compound pumping engine with a nominal capacity of 20,000,000 gallons, but is now pumping 23,000,000 gallons; "Erie" pumping engine, same type as the "Ontario," with a capacity of 10,000,000 gallons, and "Huron," a horizontal pump geared back on to a horizontal engine with a capacity of 20,000,000 gallons, used as an auxiliary engine. The aggregate capacity of the present water-works is 50,000,000 gallons every 24 hours, of which the mills are now using about 33,000,000 gallons. The addition to the water-works, for which the piles are now being driven, is designed for two vertical, triple-expansion compound pumping engines with a pumping capacity of 40,000,000 gallons each per 24 hours; only one, however, will be placed the coming season. These engines are to be called the Winnipeg and Michigan, the latter to be the one first set up, part of it being already on the ground. The foundation of the building will be laid as early in the spring as practicable. The aggregate capacity of all the pumps will be 130,000,000 gallons every 24 hours; the mills, however, will probably not need much over 60,000,000 gallons, the plant being duplicated for the sake of safety. In the present water works building is also the driving engine Wabeek, mentioned previously, of the same general type as the Ontario. The engines, stamps, boilers and sand-wheels were all designed by Mr. E. D. Leavitt, Jr., the company's consulting engineer. The boiler plant for the water works consists, for the present, of two 90-inch fire-box boilers 34 feet long, carrying a pressure of 120 pounds. Two more boilers of the same size, but to carry a pressure of 180 pounds, are to be added, one of which is to be placed this fall. The addition for which the piles are now being driven is to be 70 x 64 feet, and will be built of iron as far as practicable. The building will be supplied with a 30-ton traveling crane, for the purpose of erecting the heavy machinery. Mr. F. G. Coggin, the superintendent in charge, has

held his position with the Calumet and Hecla Company nine years, during which the entire stamp mill plant, as at present arranged, has been set up under his supervision and largely in accordance with his plans.

The World's Wheat Crop of 1888.

The *Paris Echo Agricole* presents the following estimate of the production, exports and imports of wheat of the world for the current crop year:

Countries.	Probable production, bushels.	Probable imports, bushels.	Probable exports, bushels.
Russia.....	248,060,000	109,780,000
France.....	244,216,000	68,600,000
Austria.....
Hungary.....	156,408,000	16,464,000
Spain.....	115,088,000	6,860,000
Italy.....	101,528,000	38,418,000
Germany.....	82,520,000	30,184,000
United Kingdom.....	62,632,000	150,920,000
Turkey.....	39,046,000	5,495,200
Roumania.....	21,952,000	13,720,000
Bulgaria.....	13,720,000	13,720,000
Portugal.....	6,860,000	1,920,000
Greece.....	4,684,000	2,744,000
Servia.....	4,390,400	1,372,000
Holland.....	4,116,000	12,348,000
Denmark.....	3,567,200
Sweden and Norway.....	2,744,000	2,744,000
Switzerland.....	1,646,400	11,732,000
Total bushels.	1,111,868,000	340,250,000	146,811,200
United States and Canada.....	409,320,000	96,040,000
Chili and Arg. Republic.....	27,440,000	10,968,200
Totals...	1,548,628,000	340,250,000	253,824,400
India.....	260,680,000	27,440,000
Asia Minor.....	37,044,000	2,744,000
Persia.....	21,952,000	2,744,000
Syria.....	13,720,000	1,372,000
S. E. Asia.....	8,252,000	1,372,000
Totals...	1,306,256,000	340,250,000	289,506,400
Australia.....	38,416,000	12,348,000
Algeria.....	19,208,000	2,744,000
Egypt.....	13,720,000	4,116,000
Grand totals..	1,977,600,000	340,250,000	308,714,400

The deficit is only 31,535,600 bushels, according to the foregoing statement. An English estimate makes the deficit 71,618,400 bushels. The continent of Europe in 1887 had a good wheat crop, both as regards quantity and quality. The visible and invisible stocks August 1, 1888, were in excess of any deficit yet established. There was in France alone, exclusive of flour, on August 1, 1888, 32,728,000 bushels of wheat, according to the author of the French estimates.

Walston Coke in Cleveland.—It is stated that the Connellsville coke operators have recently encountered a rival for their product in the market at Cleveland, Ohio. The coke manufactured by the Rochester and Pittsburgh Coal and Iron Company has recently been introduced into that market. An analysis of their coke shows a decidedly good average. The headquarters and mines of the company are at Walston, Jefferson County, Pa. They control about 20,000 acres of coal lands. The lower Freeport, which in many localities is worthless, here thickens, giving not less than 6 feet of clean coal. The capacity of the mines at Walston and Adrian is about 7000 tons a day. There are over 700 ovens at Walston and 450 at Adrian. The coke reaches Cleveland by way of Salamanca and the New York, Pennsylvania and Ohio.

The number of locomotives in use in German railroads was 12,450 in the year 1885-86, the average age being 12.49 years. Fifty engines built previous to the year 1850 were still in use at the date referred to, the oldest of which dated from 1845.

Combination Machine.

Messrs. George C. Keene & Co., of Cincinnati, Ohio, are offering the trade a combined shear, punch, band-iron former and bending machine adapted to the use of sheet-metal workers. A general idea of the appearance of this machine may be gained from an inspection of the engraving presented herewith. By means of the lower lever, shown at the left of the engraving, the shear attachment placed directly forward of it at the lower side of the body is readily operated, as is also the punch attachment, shown at the right. By means of compound levers fitted with links and steel pins having a relative bearing to each other all unnecessary strain on the parts is avoided. The punch and shear attachments work in unison, the latter being so arranged as to enable the operator to slit iron if desired. The second lever handle shown in the cut operates the band-iron bending attachment placed above it. The forming attachment consists of three steel rolls 3 inches in diameter, adjustable by means of large thumb-

COMBINATION MACHINE, BUILT BY GEORGE C. KEENE & CO.

screws placed above and operated by a geared crank.

The machine is made in one size only, weighing 250 pounds. The body measures 24 x 24 x 6 inches, and is adapted to cut, form and punch from $\frac{3}{8}$ inch to the lightest bar iron 2 inches wide, the working parts being concealed from view. It is kept free from obstruction, works with perfect ease, and, taken as a whole, constitutes a convenient and durable combination machine.

Ohio's Workshops.—The fifth annual report of Henry Dorn, chief inspector of shops and factories, was filed with the Governor recently. Mr. Dorn recommends among other things that stationary engineers be compelled to pass a thorough examination as to their fitness, and that owners of steam boilers be compelled to insure them; that the child labor law be so amended as to prohibit the employment of children under 14 years of age. A summary of the statistics of the report shows that there are 164,675 employees engaged at work in 3271 shops inspected, in which there were 1386 changes for bettering the condition of the workmen ordered. In the five largest cities of the State there is a total of 95,888 employees in the shops inspected. Of these, 36,681 are in 730 shops in Cleveland, 29,133 being males, 4686 females, and 2862 minors. In Cincinnati there are 33,788 employees in 717 shops, 24,340 being males, 7032 females, and 2416 minors. Columbus has 8802

employees in 228 shops, of whom 7260 are males, 1240 females, and 302 minors. Toledo's 7560 employees are in 159 shops, the males being 5791, females 1225, minors 544. Dayton, with 129 shops, has 9057 employees, of whom 6404 are males, 1736 females, and 917 minors. It must be understood, however, that the above figures are only for the shops inspected, and do not include a large number in each of the cities that the inspectors were unable to visit.

Sheffield Cutlery.

Prince Krotapkin, writing in the *Nineteenth Century*, says: "The Sheffield cutlery—one of the glories of England—is not made by machinery; it is chiefly made by hand. There are at Sheffield a few firms which manufacture cutlery right through from the making of steel to the finishing of tools, and employ wage-workers, and yet even these firms—I am told by my friend, E. Carpenter, who kindly gathered for me information about the Sheffield trade—let out some part of the work to the small

masters. But by far the greatest number of the cutlers work in their homes, with their relatives, or in small workshops supplied with wheel power, which they rent for a few shillings a week. Immense yards are covered with buildings, which are subdivided into series of small workshops. Some of them cover only a few square yards, and there I saw smiths hammering, all the day long, blades of knives on a small anvil, close by the blaze of their fires. Occasionally the smith may have one help or two. In the upper stories scores of small workshops are supplied with wheel power, and in each of them three, four or five workers and a master fabricator, with the occasional aid of a few plain machines, every description of tools—files, saws, blades of knives, razors and so on. Grinding and glazing are done in other small workshops, and even steel is cast in a small foundry, the working staff of which consists only of five or six men. When walking through these workshops I easily imagined myself in a Russian cutlery village, like Pavlovo or Vorskma. The Sheffield cutlery has thus maintained its olden organization, and the fact is the more remarkable as the earnings of the cutlers are very low as a rule; but, even when reduced to a few shillings a week, the cutler prefers to vegetate on his small earnings than to go as a wage laborer in a house. The spirit of the old trade organizations, which were so much spoken of 25 years ago, is thus still alive."

The Tamarack-Osceola Copper Mfg. Company.

A little over a year ago the parties interested in the Tamarack and Osceola mines on Lake Superior began the erection of a rolling mill for manufacturing copper under the name of the Tamarack-Osceola Copper Mfg. Company. The *Houghton Mining Gazette* in a recent issue gives the following details of the present status of the enterprise:

At the rolling mill a shipment has just been made of 150 tons wire rod. The sheet mill is kept very busy. A new furnace has just been added for the 108-inch rolls and a set of 20 x 60 cold rolls is being erected. Much of the machinery for the new wire mill has already arrived on the ground. The engines are expected daily. Steam will be supplied from the rolling-mill boilers, to be conveyed through an overhead pipe. It looks now as if it would only be a matter of a short time when the wire mill will be ready to start up for active work.

The work of erecting the walls for the new smelting buildings is completed, and the roof, which is to be of iron, is being erected. The buildings, of which there are two, set back from the shore of the lake some little distance, the nearest one being about 250 feet distant from the projected dock line and parallel to the same, leaving plenty of room for a third building. They are built of stone taken from the quarry west of Hancock, their dimensions being 80 x 130 with a height of 20 feet to the eaves. At present they will contain five furnaces, three being placed in the one next to the lake and two in the other. The furnaces, boiler plant and steam pipes will be placed during the winter, the furnaces being somewhat larger than any heretofore used in the Lake Superior district. The cupola building will not be erected until spring. Stone for the building of the same is, however, on the ground. The works are so arranged that they may be duplicated at any time upon the opposite side of the spur track, which runs from the main line of the Hancock and Calumet Railroad to the rolling mill, which allows for the lay-out of six furnace buildings in all. The smelting department of the company will be under the charge of Mr. W. F. Robertson, of Montreal, formerly in the employ of the Orford Copper Company, of New York, and later engaged upon furnaces in Spain. The company started in on the work of erecting their new buildings late in the season, but have been particularly fortunate as to weather.

Gem Furnace.—John W. Hoffman, Philadelphia, receiver of the Shenandoah Iron Company, who built the Gem Furnace at Milnes, Va., has issued a well-written description of the ore property of the company, which is now being offered for sale. A letter is also printed from A. C. Kroman, manager of the furnace, who suggests certain improvements chiefly in the direction of washing the ore from certain banks, and in the direction of lowering the bosh of the furnace. With the improvements thus suggested carried out, he states that iron can be made at the following figures:

$\frac{1}{2}$ ton purchased ore @ \$2.75.....	\$1.37
$\frac{1}{4}$ ton own ore @ \$1.75.....	3.06
$\frac{1}{4}$ ton coke @ \$3.....	3.37
1 ton limestone @ 50¢.....	.50
Labor.....	2.00
Oil, grease, waste, tools and lamps.....	.50
Management, office expenses.....	.37

Total cost at furnace.....\$11.17

He states that the furnace would average 125 tons of iron daily.

The Lake Erie Iron Company, of Cleveland, Ohio, will erect a furnace with working hearth 7 x 14 feet, for heating iron for the 9-inch train.

Legal Decisions.

WATER COURSES.—DEFECTIVE SUPPLY FOR MILLS.

H. in operating his mill had a full supply of water from the stream it was on for nine months in the year, but for the remaining three months there was a great scarcity, and he had constructed a reservoir which could not be filled except by the flowing of the stream for three or four days. In the dry season H. would use the water from the reservoir when it was full, and then resort to the steam-power he had until the reservoir became again full. By taking this course H. deprived the mill-owners below him on the stream of the accustomed flow whenever he turned the water into his reservoir; and when he used the water the ponds below, being small ones, were quickly filled, and much water was wasted over the dams. The previous owners of H.'s mill used both steam and water in the dry season, and so permitted the stream to run undisturbed. M., one of the mill-owners below, being unable to get any redress from H., brought a suit to enjoin him from preventing the usual flow of the stream, and the Supreme Court of Errors of Connecticut, in deciding the case—*Mason vs. Hoyle*—on appeal, in favor of M., through Judge Loomis, said: "The rule that now obtains in all jurisdictions, as recognized by all the authorities, is that the use made by mill-owners of a stream must, in relation to other mill-owners on the same stream, be a reasonable use. Whether the use be reasonable must depend less upon any general rule than upon the particular circumstances of the case. But there are certain conditions essential to a reasonable use so long recognized by common consent, or so obviously just, that we may safely generalize with regard to them. The use must be as near as possible an equal use, or rather an equal opportunity to use. Every owner improving a mill privilege has a right to consider the law as protecting him against any unfair use by any other owner who may establish a mill above him. The term 'unfair use' is the equivalent of 'unreasonable use.' The defendant insists that we cannot consider the fact that he has steam power in his mill in determining this controversy, but we differ from him, as we are of the opinion that with the proper use of this power he can get a reasonably advantageous use of the water-power, and let the stream run on. Besides, the immemorial local custom down to H.'s time to let the water go on unimpeded to the mills below has an important bearing upon the question here. And there remains the further significant element in the case, that the benefit to defendant is much less than the damage to plaintiff in stopping the usual flow; for while a full reservoir will run the former's mill but five hours, the latter is interrupted in the use of his mill for about as many days. The injunction must be granted; otherwise the whole beneficial use of the stream will be absorbed by the defendant."

SUNDAY LAWS.

H. was indicted and convicted for working on Sunday, in violation of the statute forbidding any labor on Sunday. His offense was operating his ice factory on the first day of the week. It appeared on the trial that the closing of the factory from midnight on Saturday to midnight on Sunday would require, on Monday, the reduction of the temperature throughout the entire day (24 hours) before any ice could be drawn, and that then the first ice drawn from the molds would be spongy and unvaluable. The machinery is very sensitive to the heat of the sun, and, during the heat of the summer, the temperature in the brine-vats will rise from 16° to 20° in a day, and it requires more time and labor

to recover a degree above 10° than below. The case on appeal—*Hennersdorf vs. State*—was decided, by the Court of Appeals of Texas, in favor of the defendant below, on the ground that he could work the factory on Sunday as a work necessity, which was provided for under the law. Judge Hart, in the opinion, said: "It will not do to limit the word 'necessity' to those cases of danger to life, health or property, which are beyond human foresight or control. On the contrary, the necessity may grow out of—or, indeed, be incident to, a particular trade or calling, and yet be a case of necessity within the meaning of the act; for it is no part of the design of the act to destroy or impose onerous restrictions upon any lawful trade or business, and hence it has been held, in a sister State, under a statute like our own, that it is lawful to keep a blast furnace at work on Sunday, because it is a work of necessity. It is evident that the work of the defendant here was a work of necessity, and the conviction must be reversed."

SALE—TENDER OF GREATER AMOUNT OF GOODS.

An iron company offered P. some nut and bolt shop scraps, saying that they had 30 or 40 tons to sell, and he offered 87½ cents per hundred for the iron delivered at his wharf. This offer was accepted a day later, and immediately the company carried to the wharf 58½ tons, and tendered the cargo to P., who declined to take the amount bought, on two grounds: first, that it was not iron contracted for; second, that a tender of 53½ was not a tender in fulfillment of a contract for 30 or 40 tons. A judgment was recovered by the company, the court below having instructed the jury in their favor. The case—*Perry vs. Mount Hope Iron Company*—on appeal to the Supreme Court of Rhode Island, was adjudged in favor of the defendant below—*Perry*. The Court, in the opinion, said: "The contract for the sale of 30 or 40 tons of iron would naturally be understood to mean a contract between 30 and 40 tons, or at most for a quantity not much exceeding 40 tons. Fifty-three tons is so much more than 40 tons that we do not think the jury were warranted in finding that Perry agreed to purchase that amount. The cases cited by the defendant (*Perry*) show that, as a general rule, the buyer is entitled to refuse the whole of the goods tendered if they exceed the quantity agreed on, and the vendor has no right to insist upon the buyer's acceptance of all of the goods tendered, or upon the buyer selecting his purchase out of a larger quantity delivered."

Copper Stocks in France.—The London *Economist* prints the following table showing the accumulation of copper in tons since the commencement of the year, the returns being those for the end of each month:

	Havre.	Rouen.	Dunkirk.	Paris.	Other places.	Totals.
January.....	22	1,016	362	1,400
February.....	28	965	463	1,454
March.....	712	968	1,678
April.....	1,144	968	2,110
May.....	1,144	968	26	2,136
June.....	3,531	1,021	26	4,578
July.....	6,731	4,500	1,169	498	26	12,924
August.....	10,805	5,312	1,169	1,001	102	18,389
September....	18,265	5,312	1,169	1,000	107	25,852

It will be observed that a considerable part of the growing copper stocks is being transferred to France.

The total tonnage launched on the Clyde for the past ten months was 223,053 tons, exceeding greatly the total for the same period in the three preceding years, although it falls short of the production of

the years when shipbuilding was at its greatest prosperity. This year's total is 60,000 tons in excess of 1887, over 75,000 tons in excess of 1886, and 71,000 tons in excess of 1885. And it exceeds the total output for these three years by 38,600 tons, 51,500 tons and 31,500 tons respectively. The total production for the present year is estimated at 260,000 tons.

A Great Silver Mine.

The Granite Mountain mine, of Montana, ranks among the great silver mines. The total gross product of the property from 1885 to July 31, 1888, has been 7,606,515 ounces of fine silver, 3185 ounces of fine gold, and 537 tons of ore shipped to smelter, from all of which \$7,776,840 have been realized. To July 31 the expenditures were as follows:

For mills, buildings, roads and other permanent improvements, lands, ranches, and lode claims and water rights, say.....	\$562,500
For unconsumed supplies, as per inventory.....	185,000
For labor and supplies consumed, say.....	1,464,264
For bullion and smelting ore, freight, and refining charges, say.....	214,167
For miscellaneous expenses, including home department, say.....	108,000
For 43 dividends returned to stockholders.....	4,800,000
Total disbursements, say.....	\$7,368,931
Cash on hand in St. Louis and in Montana, and bullion en route and sold, July 31.....	412,409

From the above it will be seen that the dividends returned to stockholders are about 62 per cent. of the gross output, leaving as an extra asset the value of the plant and unconsumed supplies, which were taken in inventory July 31 at \$581,579. In the spring the new 90-stamp mill will be in operation. It is intended to utilize in three mills (aggregating 160 stamps) a larger proportion of low-grade ore than heretofore, and hence the increased output of bullion will not be in proportion to the increased milling capacity. By second-class or low-grade ore is meant ore assaying under 75 ounces per ton, of which there are large quantities.

Carriers and Shippers.

Each of the European Continental powers has provided for some form of advisory railroad commission through which the railway managers and representatives of the commercial, industrial and agricultural interests are brought together for purposes of conference on disputed questions affecting rates and service. Arguing in favor of the adoption of a like system in the United States, the *Commercial Bulletin* says: "The Interstate Commerce law has discouraged conferences between carriers and individual shippers. Never before have such consultations been so difficult or so unproductive of good results. The law aims at the establishment of general principles and inflexible rules, and leaves as little room as possible for discretionary action by the carrier in deference to the necessities of individual shippers or localities. By discouraging this individual correspondence and consultation the law has increased the necessity for conferences on a broader scale. It has compelled commercial bodies throughout the country to take up freight-rate questions, to study the transportation situation and to champion the cause of shippers. It has had the effect of bringing new commercial bodies into existence for this very purpose. A large proportion of the cases brought before the Interstate Commerce Commission originate with such bodies, and railroad managers have been compelled to recognize the necessity for dealing with such organizations as they previously did with individuals under the old system of secret agreements, &c."

THE WEEK.

The National Board of Trade, President Frederick Fraley, of Philadelphia, in the chair, held a two-days' session in Chicago last week and adopted resolutions in favor of the suspension of silver coinage, granting subsidies to American steamships for carrying the mails, strengthening our coast defenses and favoring the restriction of immigration. The next annual convention will be held in Louisville.

The associated taxpayers up town are solidly arrayed against building the proposed Quaker Bridge dam, which they say would cost \$100,000,000 and prove worthless.

Progress is now being made on the abutments and piers of a large suspension bridge, which will cross the Hudson River from Anthony's Nose, above Peekskill, to Fort Clinton. The bridge is being built by the Hudson Suspension Bridge and New England Railway Company, and is intended to form a connecting link between the New England Railway system and that of the West, with the purpose of opening up to a greater degree the New England market for the coal fields of Southern New York and of Pennsylvania. The direct connection will be with the New York, Lake Erie and Western and indirectly with the Lehigh Valley and other roads and the Pennsylvania system. General Serell is the engineer-in-chief of the bridge, which, it is claimed, will be larger than the Brooklyn Bridge. The span of the latter will be exceeded by 25 feet, according to statements of representatives of the company. The wire to be used in the manufacture of the cables, it is said, will be of greater strength, individually, in proportion to their section, than any heretofore used, being equal to a strain of 5400 pounds each. Sixty-one of these strands will be combined in a cable. The cables are said to be of Roebling & Sons' manufacture.

The Detroit Tunnel Company has been incorporated, with a capital of \$1,500,000, with the object of building a tunnel beneath the Detroit River for railroad purposes, the expense for the entire work to be divided equally with a Canadian company, each organization to build up to the intermediate national boundary line. Tracks will run from the tunnel to the northern end of the city and there connect with every railroad entering Detroit. The company will lease its tracks and tunnel privileges to the railroad companies.

Mr. Eastman, whose shipments of live cattle from New York to ports in the United Kingdom amount to several millions of dollars annually, is about to retire from business with a handsome fortune. He is a native of New Hampshire and commenced as a 'longshoreman.

Chief Engineer Green of the Dock Department has made an examination of the shore line on the North River side, with the object of extending piers to adapt them to the increased length of steamships in the European trade, and has decided to apply to the Legislature for such a modification of the water-front as will permit the addition of 50 to 100 feet to many of the piers between Castle Garden and pier No. 47, near Christopher street. By this means the department hopes to retain such a portion of the commerce and business of the harbor as naturally belongs to it as the business center.

The Silk Association of America estimates the annual value of the silk goods manufactured in the United States at \$45,000,000. The invoice value of the manufactures of silk imported last year was \$33,350,928, which, with the duty added, would be about equal to the value of the

domestic manufactures. Consul Seymour, at Canton, China, reports that the silk production will, this year, fall off over 50 per cent. owing to the floods, and that Europe and America will not get more than 10,000 bales, instead of 21,000 usually sent.

A struggle between the New Jersey Central and Lehigh Valley Railroad Companies for right of way in Jersey City at a point known as "the Gap" has caused the interposition of the local authorities. One of the contestants sunk several stone-laden canal boats, as a foundation for the road-bed.

A State commission to consider the project of establishing industrial schools in Pennsylvania met in Pittsburgh last week. Dr. Atherton, the president, who has made a tour in Europe to gather information respecting the workings of the system there, said the commission will resist any measure looking toward the teaching of trades in the public schools, but it will insist that the State incorporate manual training as an integral part of the common school system and provide for a teaching force. After discussion, resolutions were adopted in harmony with these views.

A violent explosion of gas occurred on Friday morning in the large dry goods store of Waller & Welsh, in Yonkers, caused by a defective main in the street. The gas was ignited by a lamp introduced by plumbers in their search for the leak, and instantly the store was in flames. The damage is estimated at \$14,000.

The Treasury Department has authorized the allowance of drawback on exported Hungarian nails manufactured at South Haver, Mass., wholly from imported steel shearings or steel plate scraps. The drawback is to be equal in amount to the duty paid on the imported material, less the legal retention of 10 per cent.

The flouring mills at Minneapolis are shutting down on account of the unprofitable relative position of the flour and wheat market, there being a tendency to a glut of the former, while the prices of grain are supposed to be abnormally high. St. Louis and Milwaukee mills are taking like action.

The Baltimore and Ohio Railroad Company are said to have formed a new scheme for getting through to New York by means of connections with the North Pennsylvania Railroad and the Reading's New York line.

The first annual report of the first railway in China has been issued. The line runs from Tongsan to Yungchong, in the province of Chihli, in North China. Its length is about 27 miles, and it owes its existence to the Kaiping coal mines. The net profits were \$24,500. A branch is being constructed to Tientsin, and it will soon be extended to Peking.

The State Department has been informed of the passage of a law by Ecuador allowing foreign vessels to enter their coasting trade.

Congress convenes on Monday, December 3—ten days hence.

A cable will be substituted for horsepower by the Third Avenue Railroad Company, a majority of property owners on the line of the road having approved of the change. The proposed cable road to extend south to the City Hall from 125th street is promised within a year.

In the United States Circuit Court at Boston, 14th inst., the patent safety-valve suits against the cities of Haverhill, Lynn, Salem, Newburyport, Chelsea, Somerville, Lawrence, Cambridge, Fall River, Taunton and New Bedford, brought by Ruel C. Philbrook and others, were decided in

favor of the defendants under instructions by Judge Colt. The decision was rendered on the ground that the State statute of limitation applied to patent suits. In these cases action was brought more than six years after the time when the right to do so began.

The Boston boot and shoe trade had a banquet last week at which addresses were delivered by ex-Governor Claflin and others, showing that notwithstanding the large increase in shoe manufacturing in the West there has been a steady gain in the East. There are about 160,000,000 pairs of shoes made annually in the United States, and of these 100,000,000 pairs are made in New England. The shoe jobbing business has increased about fivefold in 30 years. Sales in Boston in 1887 amounted to \$16,000,000.

The expediency, not to say necessity, for fostering the export trade in manufactured cottons is being pressed upon public attention in some quarters in prospect of a glut in the home market when manufacturing in the South shall have become more fully developed. Last year there were 60,000 bales of sheetings, worth \$3,000,000, and 30,000 bales of drillings, worth \$1,350,000 exported to China, and to the other countries nearly as much more, and this in the face of active competition with England and Germany in the same lines of goods and in the face of obstacles to transportation, exchange and insurance that no other manufacturing country had to contend with. Just now the export trade in cottons is rather dull owing to the high prices prevailing in the domestic market. But for the absence of direct lines of transportation this trade would be very much greater, particularly to South America.

The Seward bronze statue, one-half larger than life size, was cast at Chicopee, Mass., and was unveiled at Auburn on the 15th inst.

Startling figures respecting the sugar trust are given "by a prominent member of the trade," to the effect that the people of this country must pay \$30,000,000 more a year than formerly for their sugar, and that just that much more money goes into the coffers of the 11 millionaires who constitute the sugar trust. The very first month the sugar trust was in full working order—in January last—it arbitrarily advanced the price of refined sugar nearly 1½ cents a pound. For instance, in January, 1887, granulated sugar was selling at 5½ cents a pound, and in January last, the corresponding month, the sugar trust had forced it up to 7½, a raise of 1½ cents. The following table from a recognized authority, the trade bulletins of Willett & Hamlin, gives the figures which prevailed during each month, as reported from week to week:

1887. Cents.	1888. Cents.
January 5 11-16	January 7½
Feb'y 5 11-16 to ¾	Feb'y 6½ to 7 1-16
March 5 11-16	March 6½
April 5½	April 6½
May 5 11-16	May 6½
June 5 13-16	June 6½ to 13-16
July 5 13-16 to 15-16	July 7 1-16 to 13-16
August 5 15-16 to 6½	August 7½ to 6½
Sept 6 7-16	Sept 7½ to ¾
October 5½ to 6½	October 7½
Nov. 6½ to 11-16	Nov. 7½

It is seen from the foregoing that the average advance in the price made by the sugar trust has been more than 1 cent a pound.

The Manhattan Elevated Railroad last year earned \$8,673,871, and the net earnings were \$3,472,821—increase, \$340,609. Passengers carried, 171,529,789—increase, 12,500,000.

The Minnesota State Board of Prison Inspectors are seeking work for convicts, and "were thinking somewhat seriously of

manufacturing bolts, but found upon investigation that the price of that article is regulated by a trust, with headquarters in New York, and no individual or firm can purchase bolts of the corporation without stating that they have bought of no outside concern since ordering their last consignment." The desire is to avoid antagonism with the products of free labor.

It is claimed that the Pacific Mail Steamship Company stand very little chance of getting any subsidy from the incoming Administration. The fact that the company are building one or more boats in foreign ports will, it is said, prejudice their case.

The latest war-ship launched for the Italian navy is in size larger than the Duilio, hitherto the most formidable in the fleet, being 387 feet in length, over 13,000 tons register and 19,500 horsepower. She is expected to attain a maximum speed of 19 knots.

The total cost of the postal service of the United States during the last fiscal year was a little more than \$58,000,000, or about \$5,500,000 in excess of the receipts. This deficiency is owing mainly, it is said, to the great extension of the free-delivery service under a modification of the old law and the increase of railway mail transportation. Statistics are given showing that in the cheapness of postage, the number of post offices, extent of mail routes, miles of service performed, postal revenue and postal expenditure, and number of letters and other pieces of mail matter transmitted in the mails, the United States is now conspicuously ahead of every other nation in the world. The statistics of letters, &c., transmitted during the year, which are the first accurate statistics of the character ever published by the Department, are as follows:

Letters mailed.....	1,769,800,000
Postal cards mailed.....	372,200,000
Newspapers and periodicals mailed.....	1,062,100,000
Pieces of third and fourth-class matter.....	372,900,000
Total.....	3,578,000,000

The number of pieces mailed per capita upon the basis of population shown by the last census is 71.

Land speculation rages in Australia, but is discouraged by banking institutions. Transactions were pending in Melbourne at last advices involving an aggregate of at least \$60,000,000.

Hon. Arthur A. Brigham, of Marlboro, Mass., has accepted the professorship of Agriculture in the Imperial Agricultural College at Sapporo, Japan.

Everything in the Argentine Republic is booming at a rate that dazzles even those who are accustomed to extraordinary buoyancy in business affairs. Buenos Ayres papers speak of a wool clip that will exceed that of last year by at least 50,000 bales, and the wheat farmers are expecting a gigantic crop. Contemplating the situation the *Standard* says: "What with the expectations of an extraordinary clip and crop, and the great improvement in prices in the European consuming markets, it need not be wondered at if people in the Plata are preparing for a golden year in 1889; and, verily, everything promises such development at the present moment that we wonder what magical turn we shall see in River Plata affairs next year. We may witness exchange at 48½d and a steady flow of gold from Europe, and on its heels a steady appreciation of paper and gradual return to specie payments. While we mention the possibility of a return to specie payments on the strength of a good season and a rising exchange market, the great majority of financial authorities in this city are convinced that gold will go to 200 next year, in view of the sweeping

avalanche of paper money that is expected in 1889. In this respect, we may add that 60,000,000 more paper money will be issued next year under the provisions of the free banking law of Dr. Pacheco." At present paper money in the Argentine Republic is steadily depreciating, and at the same time the credit of the country is suffering in Belgium and Paris to such an extent that further loans are negotiated with extreme difficulty, or fail altogether.

The Nicaragua Canal Company have been incorporated by a special act of the Vermont Legislature. The representatives of the company stated to a committee that all the necessary concessions had been granted by the Costa Rica and Nicaraguan Governments, and that the work of building the canal will commence at once. Two expeditions sent out by the United States Government have already surveyed the route, and the cost of construction is estimated at \$65,000,000. Three hundred thousand dollars have already been spent in the preliminary work. The president of the company is Hiram Hitchcock, one of the proprietors of the Fifth Avenue Hotel. Judge Charles P. Daly is one of the incorporators, and H. L. Hotchkiss, the Wall street broker, is treasurer and the active man in the enterprise.

Iron shipbuilders are receiving more encouragement, although their yards are already well occupied. The United States and Brazil Line are preparing plans and specifications for building two fine steamships at once, and the Mallory Line have contracted for a new steamship, a four-decker over 300 feet long, for the Gulf and coastwise service.

The Adams Express Company promptly reimbursed the United States Treasury for the amount of \$1400 in silver coin abstracted from a shipment of \$12,000,000 while in transit from New Orleans to Washington City.

The big cities of Japan are in the Island of Hondo, which lies south of the Yezo, and which is several hundreds of miles long and at places 200 miles wide. Here are the chief agricultural regions, the manufacturing districts and in short Japan. Tokio itself has 1,000,000 inhabitants and it lies in the center of the empire. Its distances are more magnificent than those of Washington and its size is about that of Philadelphia. Three hundred miles west of Tokio is Osaka, which has about as many inhabitants as Chicago, and a very few miles off from this is Kiota, which was formerly the capital of the empire, and which boasts as many people as Washington, Kansas City or Cleveland. Osaka is now the New York of Japan and Kiota, with its temples, may be called the Mecca of the empire. Nagoya and Kanazawa are cities each having over 100,000 population, and there are a dozen other cities in Japan, each of which contains from 40,000 to 80,000 people.

The Wells College Building, at Aurora, N. Y., recently destroyed by fire, will be rebuilt at a cost of \$100,000. The building will surround a court containing a fountain and a tower, which latter consolidates the plumbing of the entire structure.

James R. Hosmer, United States Consul-General to Guatemala, reports that Guatemala is enjoying greater commercial prosperity than for ten years past. The coffee crop this year will amount to 500,000 quintals, or 50,000,000 pounds. He recommends a treaty with Guatemala like that with the Hawaiian Islands regarding the duty on sugar.

Haytian commerce is temporarily destroyed by the revolution now in progress. All the ports are completely blockaded, so that merchants in New York can neither receive nor fill an orders until the blockade

is raised. The ports referred to are Cape Haytien, Port de Paix, Gonaives and Saint Marc. A letter received in this city from Port au Prince, where the wildest confusion prevails, says: "Both parties are partial to assassination. General Télémaque was basely assassinated. Were it not for this he certainly would have been elected, and there is no doubt but that he would have served the people faithfully. Port au Prince, Petit Gôave, Léogane, Jeremie, Aux Cayes and Miragoane alone are in favor of General Légitime, the rest of the country having declared for General Hippolyte." At least two American vessels have been seized, and such as are permitted to sail are compelled to leave without cargoes.

Perry Belmont has been appointed Minister to Spain to succeed Jabez Curry. Mr. Belmont, as chairman of the Committee on Foreign Relations in the House, has had much experience.

The well-known suit of J. H. Chandler vs. the Calumet and Hecla Mining Company was decided in the United States Court on 15th inst. against the plaintiff, Judge Severense holding that the mining company's title is good.

The Dominion Cabinet is stirring itself in furtherance of the proposed Pacific cable from New Zealand to British Columbia.

A royal car for the King of Portugal, to be reconstructed on arrival at destination, has been built at the car works in Springfield, Mass.

The annual report of the United States naval constructor shows that \$885,349 was expended during the last fiscal year in the purchase of tools, repair of ships, &c. Tools are now being delivered to the New York and Norfolk yards, and the chief constructor says that we will soon be in possession of two yards well equipped for building steel and iron vessels of war of every size and type. The payments made on account of vessels building under contract up to October 31 last aggregate \$3,266,195. Five vessels were condemned and sold during the year. The present strength of the navy and condition of the vessels is stated as follows: Five double-turreted monitors, awaiting completion; two belted cruisers, preparing ways; 13 single-turreted monitors, in ordinary; 23 unarmored steel and iron vessels, four of which are in commission, 11 building, two repairing, five on station and one in ordinary; 28 wooden steam vessels, nearly all on station or undergoing repairs, and 11 iron and wood steam tugboats. The report of Chief Wilson shows that the expenses of the navy for the past year were \$46,662,000. The estimated expenses for the next year are \$46,364,525, of which \$3,540,000 is for new cruisers.

The greatest railroad enterprise now in progress or in contemplation is the Mexican Pacific Railroad, from San Diego, Cal., along the coast to Mazatlan, and thence to the City of Mexico. The line will be 1900 miles in length, and, when completed, it will begin a new era of development for the great region it is designed to traverse. To San Diego it will be of especial importance, enabling that city to draw upon the rich mines of semi-anthracite coal in Sonora, and upon other natural wealth in the interior of Mexico. From San Diego to Mazatlan the road will run along the coast through a well-peopled country, abounding in ebony, mahogany and other valuable woods. The first part of the railroad to be completed is from Mazatlan to Guadalajara, a distance of 375 miles, and thence direct to the City of Mexico, a further distance of 280 miles. Guadalajara has now more than 100,000 inhabitants, and Mazatlan 25,000.

MANUFACTURING.

Iron and Steel.

Claire Furnace, owned and operated by the Claire Furnace Company, Limited, at Sharpsville, Pa., is at present turning out more iron than ever before in its history. For the week ending November 11th, its output was 1006 tons Bessemer iron, an average of nearly 144 tons per day, or 6 tons per hour. This is certainly a good record for a furnace which measures 15 feet at the bosh and 75 feet in height. The consumption of fuel was 2075 pounds of coke for a gross ton of iron made. Number of hands average about 89 per day. Its maximum output was 310 tons in 48 hours.

No. 2 blast furnace of the E. & G. Brooke Iron Company, Limited, at Birdsboro, Pa., which has been idle since January last, was put in blast on the morning of the 14th inst.

P. L. Kimberly & Co., proprietors of the Atlantic Iron Works, at Sharon, Pa., have recently voluntarily advanced the wages of their laborers 10 cents per day, while the fillers at the blast furnace received an advance of 15 cents per day.

Mount Laurel Furnace, of the Clymer Iron Company, at Temple, Berks County, Pa., which has been idle for some months, was blown in on Friday, the 16th inst.

All departments of the plant of the Belmont Nail Company, at Wheeling, W. Va., are in successful operation with the exception of the tack factory, which is idle for an indefinite period.

During the month of October, just closed, the plant of the Wheeling Steel Works, at Wheeling, W. Va., produced 6834 gross tons of Bessemer steel.

A number of the mills in Pittsburgh suffered no little inconvenience last week by a shortage in the supply of natural gas. The shortage was only at the mills supplied by the Philadelphia Company, and was caused by the delay in laying the 36-inch connection with the Grapeville field, where the company have 12 new wells anchored, ready to be turned on as soon as the necessary connections can be made, which will probably be during the present week. The American Iron Works of Jones & Laughlins, Limited, were partially closed down for a few days owing to the insufficient supply of gas, but have since resumed operations in all departments.

The rumor that Mr. John Walker, who recently resigned the chairmanship of Carnegie, Phipps & Co., Limited, at Pittsburgh, would purchase and put in operation the Clinton Rolling Mill of Graff, Bennett & Co., in that city, is pronounced by that gentleman to be without foundation.

M. V. Smith, metallurgical engineer, of Pittsburgh, is placing a number of Smith gas-producers in the works of the Hartman Steel Company, Limited, at Beaver Falls, Pa. As soon as the producers are completed the firm will manufacture fuel gas and will give up the use of natural gas entirely.

A press dispatch from Youngstown, Ohio, under date of the 15th inst., says: "Sheriff Walker to-day levied on the entire plant of Brown, Bonnell & Co., to satisfy 54 executions in favor of as many creditors. The executions were issued five years ago, but no levy was ever made, an arrangement being made with the creditors to allow the concern to run in the hands of a receiver. It is not the present intention to force a sale of the property. The levy was made simply to prevent the executions from becoming dormant. The

total amount of the executions is \$800,000, distributed among many individuals, firms and banks and other corporations. The levy will not interfere in the least with the operation of the big mills, the proceeding being merely a formal matter.

The new blast furnace of the Moorhead-McCleane Company, of Pittsburgh, was put in blast on Friday, the 16th inst. This furnace was erected to take the place of their old furnace, and will turn out about 260 tons of pig iron per day.

All departments of the steel plant of the Bethlehem Iron Company, of Bethlehem, Pa., which have been idle for several weeks, resumed operations on Wednesday, the 14th inst.

The adjourned auction sale of the Fort Pitt Boiler Works, of D. W. C. Carrol & Co., Limited, of Pittsburgh, was held in that city on Tuesday, the 13th inst. The property is situated at the corner of Short street, Liberty and Third avenue, and is covered by a mortgage, which, with taxes and interest in arrears, will amount to \$37,000. It was bought for Carnegie, Phipps & Co. for \$21,000. By the terms of the sale the purchasers assumed the debt of \$37,000 against the property, which, with the \$21,000, brings the price up to \$58,000. The property, two years ago, was appraised at \$150,000. A member of the firm that purchased the plant stated that it had been bought to satisfy a claim they had against it, but that the firm had no idea of operating the works.

Zug & Co., Limited, proprietors of the Sable Iron and Nail Works, at Pittsburgh, will shortly commence the erection of 12 new puddling furnaces at their plant.

The 32-inch beam mill of Carnegie, Phipps & Co., Limited, at Homestead, Pa., has been placed on single turn and will remain in that condition until enough orders are received to place in on double-turn. The large slabbing mill is at present employed to its utmost capacity.

The Prospect Rolling Mill Company, of Cleveland, were organized August 1, L. Levi being treasurer; A. A. Fuller, secretary and manager; W. F. Loyd, superintendent. They will make merchant bar iron, and are putting in six puddling furnaces. These will run double turn, November 20, and will make 40 tons finished iron per day.

It is rumored that negotiations have been concluded for the erection of a furnace at Leeds, Ala., with 120 tons daily capacity. Henry Ellen coke is to be used as fuel. H. F. DeBardeleben, B. F. Roden and J. F. Johnson are said to be at the head of the enterprise.

Furnace No. 2 of the Lehigh Iron Company, at Aineyville, Pa., is being prepared for blast, and will be blown in shortly. No. 1 furnace, of this company, resumed operations a short time since.

The Reading Iron Works' steam forge on North Eighth street is a busy establishment just now. A 3-ton hammer, which has not been in operation for about a year, will be started up next week. This will give employment to eight men who are now on the night turn. Four hammers will then be in full operation, with every indication that they will be kept going for months to come.—*Reading (Pa.) Times.*

The Bethlehem Iron Company, of Bethlehem, Pa., have called a meeting of the stockholders to be held on the 28th inst., for the purpose of voting on the question of accepting the provisions of the Constitution of Pennsylvania, of 1874, and also of accepting the provisions of the Act of Assembly, entitled, "An Act to Pro-

vide for the Incorporation and Regulation of Certain Corporations." The main object of the proposed acceptance of the constitution and corporation act, at this time, is to enable the company to increase their capital stock under the provisions of said act.

No. 6 furnace of the Crane Iron Company, at Catasauqua, Pa., was put in blast on Wednesday, the 14th inst., after an idleness of several months, during which time it has undergone thorough repairs. All the furnaces of the above company, five in number, are in successful operation.

Mr. B. G. Clarke, president of the Thomas Iron Company, in the Lehigh Valley, states that the improvements in fuel consumption and by the use of richer ores have brought about a saving in the cost of \$1.70 per ton.

Machinery.

L. S. Allison, proprietor of the Hazleton Iron Works, at Hazleton, Pa., has recently purchased and put in operation the plant of the Minersville Iron Works, at Minersville, Pa. The plant is composed of a machine shop 155 feet long and 70 feet wide, a foundry 70 x 80 feet, containing two cupolas, a forge 150 x 50 feet, and a boiler shop 70 x 35 feet. The works will be run on furnace machinery, castings, rolling mill machinery, mine locomotives, mine pumps, hoisting engines and steam shovels, and all kinds of mine machinery and castings with structural work and forgings. Employment will be given to about 150 men.

William Tod & Co., engine builders, of Youngstown, Ohio, have among new orders the ironwork for the new blast furnace of the Brier Hill Iron and Coal Company at that place, and also have an order for a 200-horse-power Porter-Hamilton engine for R. Glover & Sons, of Vincennes, Ind.

The Kansas City Radiator and Iron Foundry Company have their office in the Bayard building, Kansas City, Mo., and their works are located at Argentine, Kan. Their foundry, machine shop and store-rooms cover about 2 acres. The buildings are frame, covered with corrugated iron, and the works are well equipped with the most improved machinery, much of it designed specially for making the Askins patent radiator. The company publish some very satisfactory tests of the efficiency of this radiator, resulting from recent trials in competition with radiators made by other parties. The corporation was formed November 6, 1887, to operate the plant, which was removed about the same time from Lima, Ohio. It was put in operation in its new location last May. The working force now consists of 85 men, who are engaged daily until 10 o'clock p. m., to keep up with orders received. The general character of their business is shown by the points to which the company have recently shipped radiators. These embrace Philadelphia, to which regular shipments have been made for some time; Seattle, Wash. Ter., to which a carload was sent last week; Ogden, Utah Ter., which also took a carload, &c. The foundry now melts about 5 tons of iron daily. Robert P. McGeehan is president and Joseph Askins manager. The company have a capital of \$200,000.

The Anson G. Wood Mower and Reaper Works, which moved to Chattanooga, Tenn., from Youngstown, Ohio, turned on steam November 1 for the first time. Their buildings, covering 2½ acres, are completed, and the machinery all in. They will employ 150 hands.

In answer to a report that Russell & Co., builders of agricultural machinery, at Massillon, Ohio, had recently made a general reduction in wages, we received the

following advices from the firm under date of the 13th inst.:

There is no truth in this statement. We have not made a cut in the wages of men in any department of our works, and have no intention of so doing. It has been our custom toward the close of every year for the past eight or ten years to readjust prices paid piece workmen. During the past few years we have brought out quite a number of new designs and sizes of engines, both in the stationary and portable line. In our engine department we aim to have our men work on piece work as much as possible. We are unable to put our new work during the first of the year on piece-work basis, as we find it necessary to work for some considerable length of time on this class of work by day before we are enabled to establish a rate. We then establish a rate which we consider fair, but in many cases find we are paying too much or too little, and in order to equalize these matters make it a rule to go through all our piece work (especially in our engine department) toward the close of each year and readjust prices. In many instances we have raised the prices that were paid to the same extent that we have reduced in other cases. We can only add, in conclusion, that none of our men have made any complaint, nor do I believe one could be found that is disposed to make any complaint of the adjustment we have made as to the price to be paid on this class of work.

The Kansas City Car and Wheel Company are operating their new works at Birmingham, Mo., 10 miles from Kansas City, in which they have their main office, located in the Beals Building. Their grounds comprise a tract of 36 acres. Their foundry is quite extensive, being 600 feet long by 100 feet wide, with a melting capacity of 200 tons per day. They employ about 500 men and at present have about 1000 cars under contract, which they are building at the rate of 15 a day. A heavy demand is anticipated next season. C. E. Barrett, formerly of Chicago, is now general manager, having taken charge on the 1st of September. The company is a branch of the Missouri Car and Foundry Company, of St. Louis.

The Kilby Mfg. Company, of Cleveland, Ohio, have the contract for the machinery of the Cable Railway Company, of Los Angeles, Cal. Three of the wheels have the following dimensions: One is 26 feet in diameter, with 56-inch face, one 20 feet in diameter, with 50-inch face, its weight being 60,000 pounds, and one 24 feet in diameter, 60-inch face, weighing 80,000 pounds. The Kilby Mfg. Company are crowded with engine orders, are working day and night force, employing 400 men.

The Diamond Machine Company, of Providence, R. I., received at the Cincinnati Centennial Exposition a silver and bronze medal, both the highest awards for different classes of grinding machines. They inform us that they also received the highest premium on their Galloway die stock.

The City Machine Company, Providence, R. I., have discontinued business permanently and are now offering their plant and machinery for sale.

W. C. Jones, late superintendent of the Universal Radial Drill Company, of Cincinnati, and W. S. Rogers, formerly consulting engineer for the same firm, have associated themselves in business in that city as mechanical engineers, with Jno. G. D. Mack, of Terra Haute, as junior member of the firm. They will make a specialty of designing and building special machinery and machine tools, and assisting inventors in patent office work. Messrs. Jones & Rogers were the original inventors and constructors of the universal thread-chasing device and gearing that attracted such attention at the late exposition in Cincinnati. They will eventually have their own shops.

The foundry and machine department of the Harrisburg Car Mfg. Company, of Harrisburg, Pa., report a large number of sales within the last six weeks. Among

these the Ide engine takes a prominent place, the sizes which were sold ranging from 30 to 150 horse-power. Gas plants, Weitmyer furnace settings and ordinary tubular boilers also are well represented in the list of sales.

The Davenport Foundry and Machine Company, of Davenport, Iowa, are quite busy getting out ten fly-wheels, 14 feet diameter, weighing each about 18,000 pounds; ten large disk cranks and couplings, &c., for the Davenport Water Company; also a large lot of castings for the Hawkeye Electric Mfg. Company, who are locating at that place. They will have their works in operation December 1.

The new works of the St. Joseph Pump Company, St. Joseph, Mo., consists of a factory building 50 x 120 feet, three stories high, with a two-story addition, 75 x 50 feet; warehouse, three stories, 50 x 100 feet, dryhouse, varnishing and galvanizing buildings, engine-house and other structures.

Messrs. Warren Webster & Co., 491 North Third street, Philadelphia, Pa., report a large number of orders for their Vacuum feed-water heater and purifier.

The St. Joseph Pump Company, of St. Joseph, Mo., now occupy a new brick building, 50 x 120 feet, consisting of three stories and a basement, which they erected this year. The first floor is devoted to office purposes and the wood-working and iron-working machinery and the shipping department. The second and third floors are used for painting, finishing and storage. The first floor is heated by overhead steam-pipes, and the second and third floors are supplied with steam radiators. The machinery is operated by a 60 horse-power cut-off Ide engine. An elevator runs from the basement to the top floor. The company have a galvanizing department in a separate building, 25 x 60 feet, built of frame. In this department they not only do their own galvanizing, but take work for outside parties. They claim to have the largest dipping kettle west of Chicago, and galvanize plain black sheets, coal hods, light castings, &c. They employ about 35 men. Most of their pump-work is done by special machinery, designed and adapted to meet their requirements. Their special product is the Perfection water elevator and purifying pump. This is a modification of the chain pump, the water being hoisted by small buckets attached to an endless belt made of flat steel links. It is very simple in construction and can be put up in a very minutes, having no wooden or iron tubing to connect and no valves or cylinder plungers. The buckets are made by double seam flanging and require no soldering, their form of construction making them more rigid and less liable to split open than if made in the usual way. The cup is also fastened to the wire link by the double flange, so that the link cannot spring open. The complete chain and bucket are galvanized after construction. Three sizes of elevators are made, with cups of different sizes to correspond. The smallest, for family use, draws a $\frac{1}{4}$ -pint stream, while the largest is of 125 per cent. greater capacity.

Hardware.

F. H. Foster Mfg. Company, Florence, Ala., are making preparations to manufacture an extensive line of builders' hardware. Their factory which is now being constructed will consist of nine buildings, 40 x 100, 32 x 30, 40 x 100, 30 x 50, 50 x 150 and 40 x 60 feet, and three small buildings. It is estimated that they will employ from 200 to 300 hands.

The Newcastle Wire Nail Company, of Newcastle, Pa., are building a large ware-

house adjacent to their works in which to store nails.

A license to incorporate under the laws of Illinois has been granted to the Leroy Crucible Steel Horse and Mule Shoe Company, East St. Louis. The authorized capital is \$200,000. The incorporators are J. Leroy, Selma Watson, William Willis and W. C. Morgan.

The W. S. Tyler Wire Company, of Cleveland, Ohio, have completed their new storage warehouse 52 x 102, four stories. This company are making a specialty of galvanized poultry netting.

W. G. Avery, manager of the W. G. Avery Mfg. Company, Cleveland, Ohio, and patentee of the Avery Seamless Elevator Bucket, has just had another patent granted him for an elevator bucket which will cost less to manufacture while being, it is claimed, equally good.

Miscellaneous.

The new works of the Minnesota Car Company, at Duluth, Minn., are being pushed to completion as fast as possible. Construction will not be suspended during the winter, and the works will be ready for operation by spring. The company propose to begin the delivery of completed cars by July next. The first building east of Central avenue is the paint shop, 56 x 360 feet. To the east of the paint shop is the main erecting car shop, 93 x 526 feet. Fifty-six feet further east is the foundry, 60 x 300 feet. This building will be of solid stone and brick. On its south end will be a wheel pit, 50 x 60 feet, and on the north end the pattern-room, 30 x 60 feet. On the west side will be the boiler-room, 26 x 35 feet. South is a lean-to, which forms part of the foundry building, 18 x 100 feet. Connected with this lean-to is the brass foundry, 18 x 20 feet. On the east side of the foundry, both at the north and south ends, are core-rooms, each 18 x 20 feet. East of the foundry is the rolling mill, 80 x 161 feet. North of the rolling mill will be the forge building, 70 x 100 feet, and 20 feet away will be the gas producers and boilers, in a building 40 x 100 feet. Through the property tracks connect with the St. Paul and Duluth Railroad.

Perkins & Son, of St. Joseph, Mo., recently closed out their hardware and stove business and purchased the St. Joseph Novelty Works, combining with it their business in the manufacture of Perkins' patent corrugated iron fire-proof shutter. They have added a foundry to make light castings, and will soon begin the manufacture of iron fencing, fire-escapes, cresting and other specialties. They will carry in stock corrugated iron roofing, conductor pipe, &c.

The Topeka Wind Mill Mfg. Company, of Topeka, Kan., make the Topeka automatic self-regulating solid and sectional windmills. They began work March 1st of the present year and have already put out over 200 of their mills, for which they control the territory west of the Mississippi river. The machinery of their plant is operated by a 20 horse-power automatic cut-off engine, and the total capacity of their works is 200 windmills per month. All sizes are manufactured, from 300-barrel tanks down to 5 gallons, and they are either for tops of buildings or towers.

The Cambria Iron Company, of Johnstown, Pa., have purchased the plant of the Dunbar Coke Company, in Fayette County. The property consists of 50 acres of Connelville coking coal under water level, with 10 acres of surface, on which are erected 80 ovens, having a capacity of 50,000 tons a year. There are also dwelling houses for employees on the premises, and engine and boiler house, office, blacksmith shop, tipple and water bank in good order.

The Iron Age

New York, Thursday, November 22, 1888.

The Denver Castings Contract.

We print elsewhere a letter relating to Denver cable road contract, written by John H. Piper, addressed to the editor of the *Evening Post*, and the reply which flowed from that fountain head of wisdom. It will be noted that the real issue is dodged. As we stated when first we referred to the matter, it is evident, by even a superficial computation, that at a rate of duty of $1\frac{1}{2}$ cents per pound the contract cannot be filled at the delivery price named from England. We may note incidentally that even this superficial computation, when carried out by the *Evening Post*, was marred by the unfortunate mistake of assuming the ton in this case to be the long ton of 2240 pounds. The price was distinctly named as referring to a ton of 2000 pounds. The $1\frac{1}{2}$ -cent rate of duty would therefore be \$25 a ton, not \$28 per ton, as our afternoon contemporary has it.

Now, let us do a little superficial figuring on our own account, but on the basis of a 45 per cent. ad valorem rate, which the *Evening Post* does not even deign to consider. Assuming that the English price delivered at Denver was, after deducting commissions, &c., \$37.50; deduct \$7 for freight from Liverpool to Denver and 50 cents from foundry to Liverpool, and we reach \$30 at foundry as the price plus 45 per cent. duty. The price would therefore be \$20.69 at works, the duty being \$9.31 instead of \$25 at the specific rate.

Based on a \$16 cost of stock and shading \$30 on the castings, the difference to represent cost of fuel, labor, sand, &c., would be, say, \$14 full for Chicago. In England the cost of stock would certainly not be more than \$9 per ton—not \$10, as the *Post* has it—since a lower grade than Scotch pig would be used, leaving \$11.69 to cover the same costs. We would then have only a difference of less than \$2.31 to compensate for lower English fuel and labor and cheaper capital. The *Evening Post* makes the ridiculous mistake of assuming blast furnace and foundry labor to be of the same class. American molders would quickly resent any attempt to pay them only double the wages which the average furnaceman receives. Coke in Chicago costs more than double the English price.

We repeat that we do not profess to give the exact figures in this computation. We merely want to show, giving the other sideliberal allowances, that it may happen, when there are added to the actual advantages of lower labor, fuel and stock, a lower freight rate, that a duty of 45 per cent. ad valorem is inadequate.

Our mystified contemporary befogs its readers when it stumbles blindly into other subjects, like the sales abroad by Americans of locomotives, and their taking contracts for bridges, &c. So far as the latter are concerned we may state that

the bulk of the material is foreign stock shipped direct from foreign workshops to the country in which it is to be used. Our locomotives are better liked in new countries where the conditions of road-bed, &c., are very much like our own. Railroad managers in South America and Australia are willing to pay us more, especially since English makers have not yet overcome their prejudice sufficiently to copy our designs or our methods of manufacture.

There was no necessity to go so far afield. We leave our contemporary to puzzle itself and its readers over the fact that English founders can beat American on the price of yoke castings in Denver, while we can sell stoves under their noses in some common markets.

The Knights of Labor.

The pretentious attempt to unite all wage-workers in this country under one grand organization has proved a dismal failure. It would be idle to deny that a great many fair-minded men regarded with lively satisfaction the early career of the Knights of Labor. Their hope that the disastrous conflicts, under which all suffer alike, would become less frequent and less injurious was soon destroyed, however. The professions of the recognized leaders of the order and the acts of the more turbulent members, who soon developed as the real rulers, could not be reconciled. Every accession to power seemed to feed the mania for striking. Every week brought fresh reports of wanton disregard of common sense and justice. Rushing blindly into one ill-advised battle after another, success increased the irritation, and defeat failed to gain the sympathy of the public. Relatively few in numbers, victories only led to courting of failure by emboldening to later more reckless attacks. Rival factions struggling for supremacy weakened the power of the best element for good. The rank and file were as loyal as workmen always are to their organizations, but the officers soon proved deficient in generalship. They were routed in every pitched battle, and the great army, swelled to hundreds of thousands, melted away almost as quickly as it gathered.

At Richmond two years ago the order had an aggregate membership of 800,000, and claimed to be 1,000,000 strong, whereas now, as reported by Secretary Hayes, there are not more than about 280,000 members in good standing, and receipts have fallen off in a still larger ratio, and fail to meet the necessary expenditures.

Mr. Powderly, however, is not alarmed, and suggests a reorganization on a more substantial basis, with an Executive Board reduced to four members—the General Master Workman to have full power. The annual address of Mr. Powderly, whose influence in the order seems to have been little impaired by the intrigues of ambitious rivals, refers to the lack of harmony in the Executive Board, “the unwise strikes which were entered upon against the laws and principles of the Knights of Labor,” and which swept thousands into poverty. Mr. Powderly says: “I do not blame men for striking. I blame them for making fools of themselves in not knowing how to strike. They always strike at the top leaf on the tree,

because it appears plainest to the vision; but they always leave the root undisturbed, to grow other and more powerful shoots. On many an occasion I have almost lost patience with prominent men in the labor movement, men who have lived in the past so long that they cannot see that the agencies of this generation are entirely different from those of any other, and from their point of view the strike has the same power as of old. We must teach men what it is that creates a necessity for a strike. They must be taught how to strike effectively against the system which permits gambling in money, in land, in railways and in the very food which is withheld from the mouths of millions at the sound of the stockbroker's ticker.”

Mr. Powderly proceeds to define the future scope and limitations of the order. Trade matters, he says, should be left to the national trade assemblies, and attention be directed to the more important questions of “finance, land and transportation.” In conclusion, he directs his lance with special vim against “the designing knaves” who have “secretly and untiringly worked for the ruin of this order.” He makes no allusion, however, to the rise of the American Federation of Labor, now boasting of a membership approximating 700,000, and which thus far seems to have studiously avoided the rocks upon which the Knights have so furiously dashed themselves—namely, strikes, dissension and extravagance. Altogether the outlook for the Knights of Labor is rather gloomy. Their purposes are too indefinite, if not chimerical, and within the order itself there is too much that is intractable, explosive and irreconcilable. If we mistake not, the period of the decadence of the Knights dates from the time of the attempted enforcement of the boycott and the inevitable conflict that ensued in the courts of justice. Affiliation with the enemies of law and order or any course tending in that direction must in the end bring self-destruction. A radical departure in this respect may bring a more hopeful future.

It has been a favorite argument of those who have undertaken to dictate the price of copper for many years to come that a value of some 15 to 17 cents a pound represented far more closely the range at which the mines of the world could supply its requirements at a fair profit than 11 to 13 cents. We know that so far as this country is concerned, the claim is not true. We know that the three leading Lake mines, the Calumet and Hecla, Tamarack and Quincy, alone could supply between 75,000,000 and 80,000,000 pounds annually at a good profit at 11 cents, and that Arizona can furnish 15,000,000 pounds at $10\frac{1}{2}$ cents, and make fair money on investment. But we have thus far few, if any, data to guide in an estimation of the capacity of the Butte mines. We know that the Parrott made a little money even in the dullest times, but of the others no indication of their financial results have come to the surface except lately. The Boston and Montana Company are now, by an official statement, shown to be able to place copper on the market at a little less than $8\frac{1}{2}$ cents. The Anaconda and the Parrott may have lower or slightly higher costs, but it is evident that 10 cents would not be ruinous to any of them. At that

price the three could certainly produce 100,000,000 pounds per annum. They are doing more now. Here we have nine concerns, three in each of the leading districts, which could supply close upon 200,000,000 pounds of refined copper per annum at the range for the different qualities of 10 to 11 cents, and make a fair profit. Such a product would be far in excess of our consumptive requirements even on the basis of the heaviest business we ever have had. Not the most sanguine in the copper trade has placed our consumption above 150,000,000 pounds. It borders on the ridiculous to point back to the prices of past decades. They have nothing to do with values as determined with natural conditions as they exist now. The question is how much of the metal can be put on the market at a given price, plus a fair profit. We hold that 11 to 12 cents for lake copper is a fair figure, considering cost, supply and demand. Every cent wrung from consumers above that is the tribute paid to the French speculators and their allies, the American copper companies. There may be some consolation in the fact that the latter have by far the better end of the bargain, that European consumers are probably contributing to their dividends on the quantities exported larger amounts than the profits which the syndicate is reaping from American consumers. Boston investors have had losses enough in other directions to entitle them to some relief.

Late Developments in Cuba.

Cuba has again had to contend with a good many difficulties this year. Politically, the island has been quiet, but brigandage and incendiarism became so frequent and widespread, coupled with the occasional kidnapping of wealthy merchants and planters, that in April Captain-General Sabas Marin issued a decree declaring martial law in five provinces. This measure to suppress crime has proved most beneficial. Bands of robbers have been broken up completely and fugitive members captured daily. On September 4 and 5 a destructive cyclone swept the island through its entire length, from Point Maisí to Cape San Antonio, its greatest violence being exercised in the province of Santa Clara. The damage done to property was counted by millions, and 1000 people lost their lives. It was at first apprehended that the growing sugar crop had suffered to the extent of 25 per cent.; fortunately, these fears were disproved afterward. Abundant rains followed, and the canes have been in fine condition ever since; so much so that there is promise at present of even a larger yield than the one of 1888, good as it was. Mining for gold and for iron ore has been active; titles were granted for the working of two quick-silver and one antimony mine; and, by royal order, the island has been divided into an Eastern and Western mineral district, each district to be placed in charge of a special mine inspector. The strike of cigar-makers has been repeated this year, and for over a month brought this important industry to a standstill. Early in October work was resumed. The completion of the Cuban railroads has been going on steadily; the Caibarien and Sancti Spiritus railway is to be extended to Santa Clara,

with a new branch line from Placetas to Hernandez. Seldom has the laying of private portable railways on sugar estates been so extensive as this year. The Government has also regulated telephone enterprise in Cuba, Porto Rico and the Philippine Archipelago. The State is to receive 6 per cent. of the gross receipts, the concessions are to last 20 years, at the end of which period everything passes to the State. The finances are also getting into better shape. The first thing Captain-General Sabas Marin did when he came into office last year was to thoroughly purify the Custom House service; since then the revenue from that source has been a great deal more bountiful than before his accession to power. The budget of the island for 1888-89 estimates the income at \$25,622,968, and the outlay at \$25,614,494. In October offers were made to the home Government by Spanish and foreign bankers to convert the indebtedness of Cuba, bonded and floating. The plan is to reduce the 6½ per cent. interest and sinking fund of the \$124,000,000 1886 loan to 4½ per cent; and give the new bonds 75 years to run instead of 50.

Since the rise in sugar took place in the world's markets, last spring and summer, the Cuban planting interest has become more prosperous, centrifugals bringing, this summer on an average 5½ reals in the Cuban markets, instead of 4½ reals, as during the corresponding period of last year. The crops have yielded in sugar, and molasses reduced to sugar, the following amounts:

	Tons.		Tons.
1879	816,566	1884	674,539
1880	644,432	1885	778,951
1881	590,511	1886	918,787
1882	727,061	1887	799,503
1883	560,689	1888	777,504
Totals	3,339,259		3,949,464

This is an increase of 610,205 tons, or about 20 per cent.

Field hands are scarce and receive \$20 per month and found. It is reported from Ottawa, Ontario, that Sir Charles Tupper is actively engaged in negotiating a treaty of commerce between the Dominion of Canada and Spain, and that Sir Charles proposes to secure for Canadian products the advantages in Cuba and Porto Rico that were granted to the United States by the treaty rejected in 1885. Among the articles to be admitted duty free into the United States were horses, cocoa, coffee, fresh fruits, hemp, flax, hides, palm oil, sugar not above No. 16, Dutch standard, molasses, woods, sponges, guano and coin. On cigars and cigarettes the duty was to be 12½ per cent. ad valorem; fine tobacco, with stems, 37 cents per pound; without stems, 50 cents per pound; other tobacco, 17½ cents; snuff, 25 cents; manufactured tobacco, 20 cents, and not manufactured, 15 cents. Among the American articles to be admitted duty free into the Spanish colonies were beer, fresh meats, bacon, fish, grain and other cereals, except rice, flour of cereals except rice, lard, cheese, cattle, sheep and hogs, clay, tiles, bricks, minerals, useful tools, agricultural implements, crude petroleum, tar, pitch, rosin, coal, seeds, building stones, ice, cast-iron in pigs and tubes, malleable iron and steel, wire, nails, screws, wrought-iron tubes, substances used in chemical industries and drugs. The Canadian Government is stated to have been engaged for a year or

two in trying to secure the West India trade, but with seemingly little success.

None of the treaties negotiated on a similar basis by Mr. Frelinghuysen, during the administration of President Arthur, has become operative, President Cleveland's administration evidently not feeling disposed to push our commercial policy in that direction. What the views of the incoming administration on this subject of the treaties with Mexico, Spain and Santo Domingo may be is as yet doubtful. There is an impression, however, that an effort will be made to revive them all. American trade with Cuba has been as follows:

Fiscal year.	Import.	Domestic export to Cuba.
1888	\$49,319,087	\$9,724,124
1887	49,515,434	10,138,930

More than ever we are absorbing nearly the entire Cuban sugar and molasses crops, hence the fiscal policy of the United States to be adopted in the future, especially as bearing on those articles, is vital for Cuban planters and merchants.

Strong pleas are made every now and then in favor of the vertical boiler in some of its various forms, and it has by some been warmly advocated even as a substitute for all other types of stationary steam generators. The first cost of the boiler, it is generally claimed, is moderate, it requires no setting, is easily repaired, compact, and, on the whole, efficient. This is a reasonable string of arguments, well entitled to consideration; but a moment's reflection will show that, after all, these inducements which it offers are not specially remarkable. Some of the boilers already in common use—the well-known return tubular, for example—meet these claims equally well, and besides have none of the drawbacks with which the vertical design can be justly saddled. Superior economy and safety, which have frequently been added to the other claims for the latter, have but a slight, if any, foundation in fact, and should properly be viewed in the light of all the attending circumstances. In the matter of freedom from danger from low water, cheapness as regards setting and small floor space necessary, the vertical boiler finds, no doubt, its strongest supports, the advantages which it affords in these respects being fully admitted and well recognized. It may also be held with some reason that the steam which it furnishes is slightly superheated and consequently dry, the upper ends of the tubes acting as superheating surface. Beyond this, however, generally speaking, the comparison with other types becomes less favorable. In point of evaporative power the vertical boiler is certainly not remarkable—in fact, generally below the average. Comparing the performances of ordinary horizontal brick-set boilers and of uprights, the relative capacities have been found to show a heavy balance in favor of the former. Thus in two given plants a set of vertical boilers with shells 87 per cent. as large as the horizontals had only one-third the capacity. As to freedom from danger in upright boilers, this, as in many other forms, with the exception of the low water danger to which we have already referred, is maintained only by judicious management, and finally, as regards durability and lightness of repairs, experience shows that these items cannot be advanced as

favoring the type. Extending, as they do, above the water line, the upper ends of the flues cannot be counted upon as heating surface, and furthermore frequently leak where they are expanded into the upper tube sheet, the unprotected ends rapidly succumbing to the high heat of the gases of combustion. Those who think, therefore, that they must have an upright boiler for many purposes where a horizontal tubular could be used to much better advantage, will do well to keep some of these points in mind. They bear directly upon what most concerns the steam user—the return of power for a certain expenditure of money.

That Denver City Contract.

To the Editor of the Evening Post:—
SIR: A few days prior to election you quoted from a Western paper an article referring to the fact that an English concern had entered into competition with a large number of American foundries for 5000 tons of castings for a cable railroad in Denver, Col., and that this English concern had underbid its American rivals, and had received the contract. You finally dismissed it with the remark that you believed the story was a campaign falsehood. I admit I was of that opinion myself, but *The Iron Age* (November 1) gives a full statement of this affair, and I think it is probably correct in its statement; at least, as *The Iron Age* puts it, the story seems to bear the evidence of truth. While its version differs considerably from that given by the Western paper, the substance of both is that an English foundry has underbid the lowest American bidder for this work, and is to ship to this country 5000 tons of castings (on which there is a duty of 45 per cent. ad valorem), and deliver them in Denver for less money than our Chicago foundries were able (or willing) to do. I must admit that this is a remarkable instance of what our high-tariff friends call foreign competition.

I wish you would tell your readers, of whom I am one, how this competition is possible, with our 45 per cent. tariff, and what we might expect under a lower tariff. The Mills bill makes 5 per cent. reduction on this class of goods. Yours respectfully,
JOHN H. PIPER.

November 12.

[It is not the Mills bill, but the Senate substitute, that makes a reduction of the duty on iron castings, and herein we think that the Senate bill is preferable to the Mills bill.]

We said that if the Chicago foundrymen could not compete at Denver with English foundrymen, who are handicapped with a duty of 45 per cent. ad valorem, or of \$28 per ton, as the case may be, they were greater slovens than we had taken them for. The basis of the cost of castings is the cost of pig iron, which *The Iron Age* puts at \$16 per ton in Chicago. The cost in Glasgow, Scotland, is 41/8 per ton, equal to \$10. Therefore, the disadvantage of the Chicago foundryman at the outset is \$6 per ton, against which he has the advantage of \$28 per ton duty, a net protection of \$22 per ton. Now, where does all this bonus go to? Not to labor. We have not the figures of comparative wages in English and American foundry work before us, but we have those of blast-furnace work, in a recent consular report (No. 49, Department of State), from which it appears that the labor cost of pig iron in Middlesboro', England, is 79 cents per ton, and in Eastern Pennsylvania \$1.25 per ton; difference, 48 cents per ton. The difference between the two countries in the labor cost of castings cannot be very much greater, but we will suppose that it

is \$1 per ton. Then we have \$6 difference in pig iron and \$1 difference in labor, total \$7, against a duty of \$28. What becomes of the other \$21 of net protection? *The Iron Age* says that the English foundrymen got a freight rate of \$7 per ton from Liverpool to Denver via Galveston, while the railroad charge from Chicago to Denver was \$9 per ton. That is a question which evidently has no relation to the tariff, but if we count it in it subtracts \$2 more from the net protection, leaving \$19 per ton bonus, or considerably more than the total cost of the raw material, pig iron.

There is some mystery about this affair which we do not attempt to penetrate, and the mystery deepens when we read in the trade journals almost every day that American firms have been awarded contracts for iron bridges and for locomotives in Australia, Chili and other foreign countries, where they are obliged to compete with English contractors on equal terms. We should say that if our foundrymen could not compete with English firms in the interior of the United States under the present duty, in the second century of the republic, it was the best possible evidence that protection was a failure as to that particular branch of industry, and that it was high time to try some other system; for is not the buyer of castings also an American citizen and entitled to some consideration? Even the Denver Cable Railway Company have some rights which white men are bound to respect.—*Ed. Evening Post.*

We comment on this reply editorially.—
Editor Iron Age.

The Grindstone Decision.

We print below in full the letter of Hugh O. Thompson, acting Secretary of the Treasury, to the collection of customs, at Suspension Bridge, relating to the duty on grindstones:

SIR: The Department duly received your letter of the 11th ult., transmitting the appeal (9438 s) of J. J. McIntyre from your assessment of duty at the rate of 20 per cent. ad valorem on certain so-called "grindstones" imported, per Michigan Central Railway, August 7, and returned for duty as an unenumerated manufactured article, under section 2513 of the Revised Statutes, and in accordance with the Department's decision of March 17, 1887 (Synopsis 8120). The sample submitted with your letter was forwarded to the collector at Boston, with the request for a report of the practice at this port on importations of such articles, it having been stated in the appeal of the importer that this class of stone is being passed at that port as grindstones, at a duty of \$1.75 per ton, under T. I., 438; and reports from the collector and appraiser at that port have been received, from which it would appear that Department's decision above mentioned was based on a misunderstanding of the character of this class of merchandise.

The appraiser states that these stones are imported at that port in an unfinished condition, and subsequently brought to a finished state, according to the use to which they are to be applied—that is, when the stones are to be used for grinding wood into pulp they are made in sizes varying in thickness from 8 inches to 26 inches, but when they are to be used for grinding metal, smaller sizes are made. This appears from the report of the appraiser to be the only difference between the stones used for grinding wood-pulp and those used for grinding metal, both being mounted or hung upon their axes, and being used in the same manner, there being no difference in the hardness or other characteristics of the stones, the same stone being in fact suitable for grinding either metal or wood.

Regarding the resemblance to burr-stone, referred to in Department's decision, the appraiser states that the Department is undoubtedly misinformed, inasmuch as the burr-stone is a remarkably hard, silicious stone, well known by its cellular structure and process of manufacture for the purposes required of it, and also that all burr-stones have a centripetal action, while the grindstones in use for producing wood-pulp or reducing metals revolve upon their axes, the wood being pressed against the outer surface or face of the stone in the same manner as metal is pressed when being ground.

It therefore appearing that these stones have every characteristic of common grindstones,

and are in fact such grindstones, the decision first above mentioned will be modified accordingly, and these stones admitted to duty at the rate applicable, under T. I., 438, for "grindstones, finished or unfinished." You will accordingly reliquidate the entry at the rate last mentioned, and take the necessary steps for refunding any excess of duty that may have been exacted on this importation. The same course may also be followed as to any prior importations, where duty has been erroneously assessed as in this case, provided the provisions of section 2931, Revised Statutes, as to protest, appeal and suit, have been duly complied with.

Big Steel Record in 1877.

The achievements of the past decade in increasing the output of Bessemer steel works are greater than the majority of those not directly connected with the industry have any idea of. Consulting the files of *The Iron Age* for the year 1877 we found the following record of work in March at the Edgar Thomson Works. As a "milestone of progress" it is interesting. Suffice it to say that the day is not very far off when the works will do three times the amount of work pointed to with pride as a great record in 1877.

The American Bessemer works have become famous the world over for their large product, surpassing in this respect the works of any other country. Before the Centennial brought so many foreign engineers to see for themselves, the reports of the large runs made had been received with incredulity, and if courtesy had permitted it they would have been disbelieved. But "seeing is believing," and we can tell the story of the run at the Edgar Thomson Steel Works, at Pittsburgh, without any fear that it will not be accepted as true. The report is as follows:

Product of the Edgar Thomson Steel Works for the month of March, 1877.

	Tons.	Lbs.
Total product of converting works, gross tons.....	8,002	1,560
Best 12-hours' work.....	204	40
Best 24-hours' work.....	407	1,180
Greatest speed accomplished, 8 heats in 1 hour 50 minutes, making....	52	1,060
Total product of blooming mill....	8,029	1,730
Best 12-hours' work.....	209	2,060
Best 24-hours' work.....	410	1,630
Total product of rail mill on rails..	5,355	469
Best 12 hours, 644 rails.....	172	480
Best 24 hours, 1286 rails.....	344	...
Greatest speed accomplished, 120 rails in 1 hour 52 minutes, making, gross tons.....	32	320
In addition, product of rail mill on billets.....	216	948
Number of blows.....	1,216	
Number of ingots.....	8,302 1/2	
Number of rails rolled.....	21,572	
Percentage of second-class rails.....	0.50	

There are, besides the large total product, two most surprising features in the above report. The first is the small percentage of second-class rails—one-half of 1 per cent.—a most convincing proof that quality was not sacrificed to quantity; the other is the rapidity of rail making. It seems almost incredible, even to one acquainted with the process, that during 12 hours' run the average time occupied in rolling each rail was but a very small fraction over 1 minute 7 seconds; that 120 consecutive rails were rolled in an average of 56 seconds each, and that, notwithstanding this, the second quality rails were only one-half of 1 per cent. The managers of these works can certainly be congratulated on the excellent results indicated in the above report.

The Avery Elevator Bucket Company, Cleveland, Ohio, will occupy their new building in a few days. It is 80 x 264 feet, the engine and boiler house 50 x 55 feet. They will add several new stamping presses. The capacity will be doubled.

Pittsburgh editors remind their readers that \$380,000 are still needed to finish the exposition buildings and open the doors.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., November 20, 1888.

As the Republican Senators come together and confer with each other as to their probable course on tariff legislation, now that the control of public affairs is prospectively in their hands, they show some indecision. It is their present plan to call a caucus early after their meeting, to determine this important question, with others which will require their attention, in order to facilitate the business of the coming session, which will be brief by Constitutional limitation. The prevailing sentiment is to adopt one of two lines of action; the first, to renew the consideration of the bill immediately after the re-assembling of Congress, and taking a vote, so that it may go to the House to be disposed of as they see fit, and the other is to let the bill rest and have the House prepare a new one, based upon the Senate bill, with certain additional articles, like tin plate, placed on an absolutely protective rate. The Senate bill will receive early attention when that body is not overrun with business. A few days will determine to what extent the opposition will antagonize it.

The officers in charge of the steel inspection are now engaged in compiling a tabulated exhibit of the results of their tests and experiments in connection with the material used in the construction of the new ships of the navy. They have accumulated in the past two years' reports of the officers assigned to the different establishments employed under contracts with the Navy Department a vast amount of data in steel manufacture, showing the tensile strength and other physical properties of armor plates and forms. Much of the data used goes further into the details of composition than they feel authorized to communicate on account of the confidential nature of much of the information placed at their disposal by the manufacturers. The results, it is claimed, have been compiled for the private use of the Department, and for the benefit of officers assigned to duty under the Board of Steel Inspection. They are also engaged in collating the record of results which, when completed, may not be treated in the same confidence, as it will deal only with the statement of tests.

It appears that the board has become possessed of much valuable information in the nature of formulas for mixing metals to produce certain properties which they are not at liberty to make general without the consent of the parties furnishing it. The theoretical results of the labor of the board are a great advance upon the knowledge of steel manufacture when these valuable tests and experiments were commenced with the first products of steel under the contracts for the first ships. In a general way the officers say that our American steel producers can now compete in the best works in the world in the character of material they turn out. The studies made within the past two years have been unexpectedly great, and with the even more liberal appropriations which may now be expected for the construction of additional ships and armored seacoast defenses this important work will be carried to even greater perfection.

The movement inaugurated by Secretary Whitney in the reconstruction of the navy, and the intelligent manner in which he has officially forwarded this great work, will be an enduring tribute to his statesmanship and patriotism while at the head of the civil administration of that much-abused Department of the Navy. It is not improbable that the Department may authorize the preparation of a tabu-

lated exhibit of the results of the tests for general information, and possibly this valuable contribution to our knowledge of steel in structural forms may be extended so as to make it of practical use. Secretary Whitney, in speaking of the work accomplished under his administration of naval affairs, said: "I do not think that I would be assuming too much in saying that the navy and its prospects of steady and intelligent expansion are better today than they were four years ago. I believe that the reconstruction of the navy on modern principles is now an established fact, and that from year to year the work will go on until the flag of the United States will wave over the finest navy of any nation in the world. The ships we already have afloat and those which are rapidly nearing completion are the best of their class. It is quite possible within a few years the nations of the world will be studying steel naval architecture from us, instead of our going to foreign countries for models and ideas." The Secretary continued: "I have no doubt but that the new Administration will go on with this work. The present Administration has made a good record in this branch of national advancement. The vessels already finished or under construction will give us a fleet of 20 steel vessels of all kinds. This in itself will make a very creditable showing. Besides all this, the Government will have at its command plants which will be prepared to turn out the largest castings and forgings required for shipbuilding. We also can now manufacture the best steel in the world, so that our ships are being constructed not only on the best-known models, but of the best materials. If nothing else were done to characterize the present control of public affairs, the condition and prospects of the navy would be an evidence of progress."

A Montana Copper Company.—The Boston and Montana Consolidated Copper and Silver Mining Company have issued a statement showing that the product of matte was 14,565,867 pounds, yielding 59.44 per cent., and the product of shipping ore was 354,417 pounds, yielding 44.44 per cent., or a total of 8,815,987 pounds of refined copper, from which has been realized the gross sum of \$1,015,762.55. The costs have been:

Interest.....	\$671.52
Expense account at New York and Boston.....	15,848.08
Copper charges.....	22,513.71
Refining charges.....	19,832.97
Transportation.....	84,709.16
Mining expense, 12 months.....	597,138.88
Total.....	\$740,714.32

This left a mining profit of \$275,048.23, the cost per pound of copper sold being 8.4 cents. The company spent \$153,453.16 for construction at the mine and works, and \$37,500 on mine and smelting plant, leaving a balance of \$84,095.07.

From the Marquette (Mich.) *Mining Journal*, of the 10 inst., we take the following table, showing the shipments by ports up to date this season, in comparison with shipments for the corresponding portion of the two preceding years:

Port.	1888.	1887.	1886.
Marquette.....	779,648	784,953	817,428
Escanaba.....	2,002,458	1,962,766	1,447,053

While at Providence, R. I., last week we had occasion to see the new Strong locomotive recently turned out of the shops of the Hinkley Locomotive Company for the Atchison, Topeka and Santa Fé

Railroad. The engine was stationed at the roundhouse of the Boston and Providence road, preliminary to making its first trial run with a freight train on that line between Providence and Stonington. The first trip was made during Friday night, and the engine will be kept at work there for a week or ten days before going West. The locomotive is four-coupled and has 19 x 24-inch cylinders and 5 foot 8 inch drivers, the total weight being 60 tons. Of this 72,000 pounds come on the drivers. Mr. Strong has designed for this engine a new wheel, having spokes of rectangular section. A striking feature about them is the absence of counterweights, so far as appearance is concerned, the counterweighting being accomplished by filling the desired number of spokes, which are hollow, with lead. The engine has been named A. G. Darwin, after the president of the Strong Locomotive Company.

Southern Furnaces and Rail Freights.

Under date of November 19, T. H. Carter, Commissioner of the Southern Railway and Steamship Association, has issued the following circular relating to pig-iron contracts:

The agreement in regard to pig-iron rates and contracts, provides as follows: "Should any of the furnace companies sell iron during any month for future delivery, to which they desire that rates in effect at date of sale shall apply, they shall report such sales to the commissioner, giving date of sale, consignee, destination and duration of contract; stating, approximately, the month in which shipments will be made; provided that the rates of freight shall not be guaranteed on sales made after more than 12 months from date of sale." It was clearly the intention that the furnace companies should report promptly contracts for which they desired protection at rates in effect when sales were made, and I must advise you that, in future, no billing orders will be issued for sales which are not promptly reported (say within three days from dates of sales). Sales should be reported by the furnace companies, or their regularly authorized agents, as I understand delays have sometimes occurred by reason of furnace companies having depended on commission merchants to report sales, while the commission merchants thought the furnace companies had reported. In addition to sales for which contract rates are requested, and which, as above stated, should be reported promptly when sales are made, each of the furnace companies should, in accordance with the agreement, report on the 15th day of each month all iron sold during the preceding 30 days for shipment to points on and beyond the Ohio River, but for which contract rates are not desired, stating to whom sold, destination, quantity sold, and price for which sold; as this information is necessary in making the monthly adjustment of rates. The furnace companies have been very negligent in regard to the reports required on the 15th day of each month, and considerable difficulty has been encountered from time to time on account of a lack of proper information on which to fix the rates in accordance with the agreement. Your co-operation is earnestly requested, and I trust that less difficulties will be encountered in the future.

The export duty on pine logs has been increased 50 per cent. by the Canadian Government, thereby hastening the destruction of American forests.

London *Industries* gives some interesting figures showing the growth of the operations of the London Hydraulic Power Company. In the last week in October, 1887, there were 570 consumers, using a total of 1,942,000 gallons of water. In the last week of October, 1888, the number of consumers was 780, and the consumption of water exceeded 3,000,000 gallons. The company have completed contracts for supplying another 120 consumers, which will bring the number of consumers up to a total of 900. Nearly 30 miles of hydraulic mains are at present laid in London. The power is available day and night and on Sunday all the year round at a pressure of 700 pounds per square inch.

Range and Position Finding in Coast Defense.

The object of "range and position-finding" is to ascertain the distance and location of the enemy's ships. In this way guns can be directed without the target being visible to the gunners. As the smoke very quickly obscures the direct field of view, this arrangement becomes essential to an efficient military defense. It may sound strange mention of the fact that experimental firing made with the assistance of such a system, the gunners in laying their guns not seeing the target, has given better results than when the guns were sighted directly on the target. This has been the case to a conspicuous degree where the target was in motion. The system is necessary for the operation of fixed submarine mines when they are exploded at the will of an operator.

This is how it is done: In all cases the distances are plotted on maps divided into numbered squares. Tables are provided for each gun, giving the horizontal and vertical angles necessary to attain the middle of each square. The traverse circles are divided for the horizontal angles, the meridian line being usually taken as the zero line. The number of the square into which the target is likely to move being telegraphed to the gun, it can be pointed very quickly, and the instant of firing indicated afterward from the observing stations. In this way a very large number of guns can be concentrated from different batteries on a single vessel or group of vessels.

Electrical communication is utilized for range and position finding of various systems. Two general methods are in use—one having two observers at the extremities of a horizontal base line, and another with a single observer placed at some height above the general level. In the two-observer method the angles are measured, and either plotted directly or are transmitted to a central station for plotting. It is essential that this work shall be done very rapidly and accurately. To read the angles and then transmit and plot them involves loss of time and chance of errors in each step of the operation. Efforts have therefore been made to eliminate the necessity of reading the angles and to transmit and plot them automatically. The Siemens apparatus is considered a typical arrangement for this purpose. It consists of two parts used at what may be called the plotting and the auxiliary station.

A plain table, divided into squares, has a map of the harbor thereon. On this table is a telescope with cross lines, carrying an alidade or straight-edge. At a point representing on the map the other observing station is a "step-by-step" electrical mechanism carrying a very light aluminium alidade, which is operated by impulses received from the auxiliary station. At the auxiliary station a box is placed containing a small hand dynamo and a telescope with cross lines. The hand dynamo being worked the telescope is moved to bear upon the target. If the instrument is in adjustment, the aluminium alidade at the other station will move with the auxiliary telescope, keeping parallel to it. The cross lines at the observing station being brought upon the target, the location of the target will be at the intersection of the straight-edge attached to the telescope, with the aluminium alidade operated in parallelism to the telescope of the auxiliary station.

The track of a vessel can thus be continuously traced, the two observers simply keeping the cross lines of their telescopes directed upon the vessel. It is necessary, of course, to make sure that both instruments are directed on the same point of the target. To this end it is necessary to have suitable means of communication between observers.

The method where one station and observer only is required is essentially a method of obtaining a location by polar coordinates. It presents many advantages over the two-station system. It involves having the observer at a known height above the sea level, which should, if possible, not be less than 100 feet, although fair work has been done with only 50 feet. The less the height the more important is it to know and apply for correction the height of the tide. It consists of a telescope mounted somewhat like a theodolite, with a device for multiplying the movement in the vertical plane as the angles to be read are very small. It also has adjustment for different heights, so that the range is obtained by direct readings upon the cross lines being brought to the intersection of the target with the water. Having the horizontal angle from the horizontal limb and the range from the vertical angle, the position of the target is accurately located on the map.

Major Watkins of the Royal Artillery has invented one of this form of range finders where the horizontal angle or direction of the target, as well as its distance, are automatically transmitted as many points as may be desired. The details of this apparatus are kept a secret, the English Government having paid the inventor £25,000 and £1,000 annually for 10 years. The value attached to an efficient method of range and position finding is thus tangibly indicated. While not wishing to belittle the ingenuity of the feat accomplished by Major Watkins Capt. Zalsky is of the opinion that some American electrician could produce apparatus quite as efficient. He regards it as a problem not to be lightly approached.

Lieut. Bradley Fiske, of the United States Navy has recently devised an electrical range finder which has much that is novel in that line and promises excellent results. Judged by preliminary experiments it will be of particular value for naval purposes, filling a place entirely unique and heretofore unattainable.

The Navy Department will soon issue proposals for the construction of a floating battery for coast and harbor defense, authorized by the last Congress. It will be a steel ship of the monitor class of 4200 tons burden, double turreted, and will be fitted with all the latest improved appliances. The designs for the ship were made in the Bureau of Construction and Repair. She will have a battery of four guns—two 16-inch and two 12-inch—the largest ever made in this country. The amount originally appropriated was \$1,000,000, but by a provision of the bill the final cost of the ship, exclusive of armor, should not exceed \$2,000,000, and the material used in the structure shall be, so far as practicable, of American production, and furnished and manufactured in the United States. The turrets in which the heavy guns are will be fitted with an improved deflecting armor.

Some months since Abram Reese, one of the oldest practical iron and steel workers in Pittsburgh, procured a patent on a process of re-rolling steel rails from standard sizes to those of small gauge. He at once tried to interest some of the capitalists of Pittsburgh in his invention with an idea of locating a plant in that city, but was unsuccessful. The next step of the inventor was to advertise his prospectus in the press of Chicago, with very satisfactory results. On Monday, the 12th inst., a company was organized in that city for the purpose of erecting a plant to utilize the invention. The company is composed of Abram Reese, Harry Reese, William Haslage and Thomas W. Davis, of Pittsburgh, and five capitalists of Chicago. The capital stock of the organization is \$200,000, all of which is

paid up. The site selected for the new plant is at Hartford City, Blackford County, Ind., a city of about 3000 population and located 167 miles east of Chicago. As an inducement to locate the new plant in that place the authorities offered 100 acres of ground in fee simple, which includes a natural-gas well with a capacity of 350 pounds pressure. In addition to this other liberal inducements were offered and accepted. Work will be commenced at once on the main building, which will be 80 x 160 feet. The railroad facilities are excellent and could hardly be improved upon. The object of the company is to roll old rails into smaller rails and also to manufacture splice bars and bolts for small rails, as well as spikes of proper sizes for small rails.

The Ohio and Western Coal and Iron Company blew in one of their new furnaces, at Floodwood, Ohio, on the 4th inst. Coke is used for fuel and the ores are a mixture of Lake Superior and native. They will make both a strong foundry and an open soft pig iron. The furnace is now running very successfully. The constructors guaranteed 125 tons of iron daily, and the indications are that the output will be much above that, using these materials. The furnace plant at Floodwood consists of two stacks, but it has not yet been determined when the other one will be blown in. These furnaces are 75 feet high and 17 feet in diameter at bosh, and have four Mackintosh & Hemphill blast engines, with 48 x 84-inch blowing cylinders. One furnace is equipped with fire-brick stoves and the other with iron-pipe stoves. The company also own the Helen Furnace, at Orbiston, and the XX Furnace, at Shawnee. The four stacks combined will have a capacity of 300 to 350 tons of pig iron daily. Pickands, Brown & Co., of Chicago, and Pickands, Mather & Co., of Cleveland, Ohio, are agents for the sale of the entire product now being made, which it is believed will find a ready market owing to its excellent quality. The Ohio and Western Coal and Iron Company is virtually a Boston institution, with some of the most energetic and capable business men in that city in its management. They have an excellent outlook before them, and it is to be hoped that they will be amply compensated for their large investments in this property, of which they secured possession 18 months since.

Bids were opened on Tuesday at the Treasury Department for the construction of a supply steamer for the lighthouse service, to be named the America, as follows: Neafie & Levy, of Philadelphia, \$194,000; Pusey & Jones, of Wilmington, \$174,000; Columbian Iron Works, of Baltimore, \$198,000; John H. Dialogue, of Camden, N. J., \$171,000. The last-named bidder also submitted alternative propositions to build the vessel with compound engines at \$163,000 and with triple expansion engines at \$171,000. There is an appropriation of \$175,000 for this vessel.

Last week the United States Rolling Stock Company, of Anniston, Ala., did a remarkably quick piece of work, concerning which the *Tradesman* gives the following details. "The bell at Woodstock Furnace No. 2 having fallen in, another had to be made. At 2 o'clock p. m. the metal was still in the shape of pig iron, and the large casting was made, taken to the machine shop and turned, and then drilled and delivered to the Woodstock Company at their furnaces before 4 o'clock a. m. Considering the size and shape of the casting, and the difficulty of handling and fastening it to the lathe, much credit is due for the exceedingly short time required to do the work."

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., November 20, 1888.

Pig Iron.—The market shows considerable steadiness considering the apathy manifested by a large proportion of consumers. The enormous furnace output is regarded as a protection against any material advance in prices, so that there is a general indisposition to do anything beyond covering requirements for 30 or 60 days ahead. Sellers are equally indifferent in regard to forward contracts, as they find their entire output taken for immediate consumption; and while this continues it is not worth while to bother about the future. The scarcity of Ores is another reason for the firmness in Pig metal, and until there is some prospect for lower cost makers are not likely to force their product on unwilling buyers. The market may, therefore, be considered quiet, but stubbornly firm, and for the present gives no indication of change in either direction. Consumption keeps up remarkably, but the season is at hand when curtailments may be expected, which fact, in connection with an increasing output at furnace, may lead to a little softening in prices toward the close of the year, although that will depend a good deal on the outlook for business during the early portion of 1889. As yet there is nothing in sight beyond the usual run of a good healthy demand. There is no large work on the market of any importance, without which it will be no easy matter to maintain prices on their present level. Elevated railway work is not likely to be important, although there is still a good deal of work to finish on old contracts. Architectural work on a large scale is not specially promising, but car building, bridge building and ship building promise considerable activity. All these important interests are in fairly good condition, but to secure a demand for the enormous capacity of mills and furnaces requires more than a moderate demand, and that is just where the uncertainty comes in. It is not that business is dull or likely to be so, but it is the immense capacity and the determination to utilize that capacity to its fullest extent that causes the uneasy feeling. Yet there may be business enough to satisfy everybody. In the meantime the work is not definitely in hand, and for that reason buyers are acting with the utmost caution until the outlook becomes more settled. Good brands of Iron are scarce, so that prices of such are naturally firm, and, while other descriptions are not in large supply, the offerings are large enough to prevent, for the present, any movement toward higher figures. Quotations, therefore, remain same as last week, say \$18 @ \$19 at tide for No. 1 Foundry, \$17 @ \$17.50 for No. 2, and \$16 @ \$16.75 for Gray Forge. There are a few special brands that command higher prices than here quoted, but the average for standard brands would be within the limits named.

Blooms.—A fair movement is reported, but without change in prices, which are about as follows: Steel Nail Slabs, \$29 @ \$29.50, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 @ "bloom" ton of 2464 lb.

Muck Bars.—The supply is somewhat limited, and although the demand is less urgent than it was some time ago, prices have been well maintained at from \$29 to \$30 at mill, according to quality, delivery, &c.

Bar Iron.—There is but little change to notice in the market since date of our last report. As a rule, there is plenty of business around, but irregularity in prices continues, as noticed during the past two or three weeks. It is, therefore, difficult to determine whether the market is shaping toward improvement, or the reverse. There are some indications of a favorable character, and the general sentiment inclines to that view of the market, but the irregularity in prices is rather discouraging to those who are looking for uniformity and firmness. A slight easiness in prices, and possibly some little falling off in the demand, may be met with during the next few weeks, but it may be preliminary to greater firmness and greater activity after the turn of the year. But it is impossible for any one to say with certainty what the outcome will be. There is plenty of business for the present, and there is no apparent reason why it should not continue. In many respects the position is peculiarly favorable, and it would be no surprise to many in the trade to meet with an extraordinary demand during the coming year. Meanwhile developments are carefully watched, and, while slight concessions may be obtained from those who are beginning to feel the necessity for new business, there is not enough in it to warrant the idea of a permanently lower range of prices. It is difficult to give exact quotations, but from 1.8¢ to 1.9¢ probably covers both ends of the market, although there are some mills in the vicinity that quote 1.95¢ @ 2¢, but they are full of work to the end of the year, which doubtless accounts for the difference in prices. Skelp Iron is not quite so much in demand, but mills are full of work for some time to come, and, it is said, could easily secure large additional orders at from 1.87½¢ to 1.9¢, but, in the meantime, 1.95¢ is asked without securing business.

Plate and Tank Iron.—There is a good demand for Plates, but competition is so very close that prices have not been fully maintained. As a matter of fact it is claimed that prices have been seriously cut in one or two specially desirable orders, and the same feeling prevails to some extent even among the smaller trade. In Steel Plates Pittsburgh is a sharp competitor, a good many important contracts having gone in that direction, including one for 2000 tons, a day or two ago, for one of the shipyards. Still, the local mills are nearly all busy, and if work comes out as expected it will not take long to stiffen prices back to the old figures. Meanwhile asking prices are about as follows, concessions being made according to quantity and class of material required: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.25¢ @ 2.3¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—New business comes in rather slowly, although the outlook is said to be very encouraging. Bridge material and ship material are likely to be in good demand during the winter and spring; and many manufacturers are feeling decidedly hopeful, although at the moment some of their departments are not fully employed. Prices are a little irregular, but in most cases about as follows: 2.05¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand has fallen off considerably, and although stocks are pretty well exhausted there is no difficulty in securing prompt deliveries on all new business. Small lots, best makes, are quoted as follows:

Best Refined, Nos. 26, 27 and 28.... 3¼ @ 3¼¢
Best Refined, Nos. 18 to 25.... 3 @ 3¼¢
Common, ¼¢ less than the above.

Best Bloom Sheets, Nos. 26 to 28.... 4¼ @ 4¼¢
Best Bloom Sheets, Nos. 22 to 25.... 4 @ 4¼¢
Best Bloom Sheets, Nos. 16 to 21.... 3½ @ 3½¢
Blue Annealed..... 2.8 @ 3 ¢
Best Bloom, Galvanized, discount..... 62½ ¢
Common, discount..... 67½ ¢

Merchant Steel.—The demand is about as usual, at prices as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—Reports from this market cannot be made to harmonize with those from other points. The usual asking price has been \$28.50 @ \$29 at mill, and it is doubtful if less than \$28 has been accepted at any time. It is stated on the highest authority that an order for 40,000 to 50,000 tons was offered to three mills at \$27.50 and by them declined. It looks, therefore, as if \$28 would be a rock-bottom quotation, and some well-informed parties are talking \$29 @ \$30 as likely to be ruling quotations before the end of the year.

Since writing the above we learn that the Pennsylvania order for 45,000 tons has been placed at \$28 at mill, divided between the Pennsylvania Steel Company, the Cambria Iron Company and the Carnegie Company.

Old Rails.—The offerings are very light, and as there is still a fair demand prices are steady at \$24, Philadelphia, for T's. Buyers offer \$23.50 for moderate quantities, but have not been able to secure supplies at less than \$24, which was the price on last sale reported.

Scrap Iron.—There is more disposition to buy, and prices are somewhat firmer, although usually quoted as follows: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought-Iron Pipe.—The demand has fallen off considerably, although there is still a great deal of business to be placed before the close of the year. Prices are irregular, and in some cases discounts have been increased, but as a rule they are quoted as before—viz.: Black Butt-Welded, 52½ ¢; Galvanized do., 42½ ¢; Black Lap-Welded, 62½ ¢; Galvanized do., 52½ ¢; Boiler Tubes, 60 ¢.

Nails.—The feeling is improving, but there is no change in prices as yet. Good brands are steady at from \$1.90 to \$2, and others at low prices seem to be less frequently mentioned than was the case some time ago.

Messrs. Amos H. Sheetz and Harry Stephen, the former having been selling for the past six years for McLanahan, Smith & Co., Limited, and the latter formerly of Stephen, Jones & Co., and long connected with Morris Wheeler & Co., have formed a partnership under the style of Sheetz & Stephen, as manufacturers' agents for Iron, Steel and Nails. They now represent McLanahan, Smith & Co. for their J. B. brand of Bar, Bolt and Nut Iron, and the Milton Mfg. Company, Nuts and Washers. Their office is at 206 Walnut place, to be removed after December 1 to the Drexel Building.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, November 19, 1888.

Pig Iron.—The condition of the market appears to be without any particular animation whatever, but still very firm and conservative. The demand is of a very healthy character, and contracts are being

made for round lots on a basis of prices that have been ruling for the past month or two. There is no disposition at all on the part of the producers to force sales, as their entire products are being taken away about as fast as made. The only trouble at the present time is the want of cars, and this, at times, is quite a serious obstacle in filling orders promptly, and, as yet, there appears to be no remedy in sight. The Eastern market now is the most eligible one, and shipments to the East are assuming large proportions, mostly via Savannah, Charleston and Brunswick. The output of the Southern stacks has been gradually increasing during the year, and furnaces that a year ago registered 80 and 90 tons are now producing 100 to 110, and in quality considerably improved. Besides this, there some four or five new stacks of large capacity that will soon go in blast, so that '89 may be looked upon as a year that will far excel any previous year in the history of the Southern Iron producing industry. Contrary to expectations Southern foundries are calling for more Pig than usual at this season of the year, which can only be accounted for by increased demand for their work.

The Southern Railway and Steamship Association have issued a circular, under date of 17th inst., clearly setting forth the conditions and requirements that govern shippers who make large contracts for future deliveries, and expect the same to go forward at the rates of freight ruling at the time such contracts are made.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, November 19, 1888.

Pig Iron.—A very firm feeling is apparent in everything except Bessemer Pig Iron, and possibly Southern Coke. Makers of Bessemer Pig are disturbed over the low prices at which Steel Rails are being sold, and cannot resist the conclusion that they may have to bear their share of the depression in that branch of trade, which it now seems certain will extend over at least a considerable portion of next year. With the advance in Coke and dearer Ore, the outlook is decidedly discouraging for profits in the manufacture of Bessemer Pig. Although most sellers of Southern Coke Iron have adhered firmly to established prices, it has been found possible to secure a concession of 25¢ per ton from one of them during the week, and the further maintenance of current quotations will depend to a great extent upon the additional quantity of Iron available from that source. Furnacemen generally are not pushing sales at present, partly because they look for better prices soon and partly because they are fully aware that November and the early days of December are almost always very dull. Some of them are even now endeavoring to anticipate the future by marking prices up 50¢ per ton, but this movement is not general, and they may be obliged to reconsider their action later. Stocks are very light, however, and if the heavy buying expected in December materializes, they will be credited with the possession of remarkable foresight and good judgment. A few consumers are being influenced by the evident strength of the market to provide to some extent for their future requirements, but the volume of business has not been large, except in Lake Superior Charcoal. Of this Iron some 3000 tons were sold at full prices. The greater part of this was taken by Car-wheel manufacturers, who find their business improving through the demand for new cars, and who will require much more Iron, if appearances are not

very deceptive. We quote as follows for cash, f.o.b. Chicago: Lake Superior Charcoal, Nos. 1 and 2, \$20; Nos. 3 to 6, \$20.50 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, No. 1, \$18.60; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband), No. 1, \$20 @ \$21; other Ohio Soft Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$18; No. 3, \$16 @ \$17; Southern Coke, No. 1 Foundry, \$17.50; No. 2 Foundry and No. 1 Soft, \$17; No. 3 Foundry and No. 2 Soft, \$16.25; Gray Forge, \$15.50.

Bar Iron.—Orders for Car Iron have been placed during the week at 1.72½¢ @ 1.75¢, flat, f.o.b. Chicago, the slightly higher prizes realized over last week indicating a better tone. A local railroad will place an order for 1000 Cars this week, the Iron for which will be bought subsequently. Miscellaneous specifications are now quoted at 1.75¢, half-extras, f.o.b. Chicago, for mill lots of Common Iron, but only a moderate business is reported in Iron for the general trade, the upward tendency in prices having probably checked purchases until a higher rate is thoroughly established. Manufacturers are notifying their agents to withdraw offers and to submit all propositions to them before closing contracts. Small lots are quoted from store at 1.85¢ @ 2¢, according to quantity and quality. Stocks are small.

Structural Iron.—The contract for Beams for a large office building is to be let this week, and the competition for it will probably be very keen. The outlook for Bridge work is better, as a number of projects in this line are maturing. About 1400 tons of such material will be contracted for this week. Mill orders are quoted as follows, f.o.b. Chicago: Angles, 2.15¢ @ 2.20¢; Universal Plates, 2.25¢ @ 2.30; Tees, 2.55¢ @ 2.65¢; Beams and Channels, 3.40¢. Small lots from store are quoted as follows: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Business in Plates has been confined to small lots. Manufacturers who had long since forsaken this market are now soliciting here for Plates and Heavy Sheets, but those who regularly supply the local trade are apparently as busy as ever, deliveries being anything but prompt and options for even a reasonable length of time being refused. A novel feature in this market is an order for 25 tank cars, to be used in distributing oil from this point. From 25 to 50 more will probably be needed soon. Bids are now being received for the Iron. Tubes are nominally unchanged, but there are rumors of concessions by some of the manufacturers. Store prices are unchanged, as follows: Heavy Sheets, Nos. 10 to 14, 2.65¢ @ 2.70¢; Tank Iron, 2.55¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron and Steel, 4¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢; Boiler Tubes, 60¢ off.

Sheet Iron.—The sudden change to cold weather during the week brought with it the long-expected demand on the jobbers for Black Sheets, and stocks have been run off rapidly. They quote small lots of No. 24 at 3.10¢, Nos. 25 and 26 at 3.20¢, and No. 27 at 3.30¢. Manufacturers' agents quote mill lots at 3¢ at mill, but this can probably be shaded for favorable deliveries.

Galvanized Iron.—The demand has been so good, and the mills are so far behind in their deliveries, that manufacturers' agents have in some cases been obliged to purchase lots from outside parties in order to meet the most pressing wants of their customers. Yet no change is reported in prices, small lots being still

quoted at 60¢ and 5¢ off for Juniata, and 60¢ and 10¢ off for Charcoal.

Merchant Steel.—Contracts have been placed for several hundred tons of Open-Hearth Spring Steel at about 2.40¢, f.o.b. Chicago. It is now quoted from stock at 2.50¢. Tire and Sleigh-Shoe Steel have also been in good demand, and consumers generally are disposed to take hold. Open-Hearth Machinery Steel is sympathizing to some extent with Spring Steel, but makers of choice qualities are adhering firmly to old quotations. We quote as follows from stock: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8½¢ @ 9½¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Machinery, 2.50¢ @ 2.75¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Less than 1000 tons appears to be the aggregate of the business done during the week. Very few more Rails will be needed this year, and inquiries for next year's delivery are discouragingly small at present. Local manufacturers continue to quote \$30 on Western business.

Old Rails and Wheels.—In this line nothing seems to be doing for lack of agreement between buyers and sellers. Sellers of Old Rails ask \$23.25, but buyers are not disposed to pay this price. They offer about \$1 per ton less. Consumers are stocked for the present in this vicinity, and the Mahoning Valley mills seem to be able to buy on better terms in other quarters. In Old Car-Wheels the market is stagnant, but dealers continue to quote \$19.50 @ \$20 as the rates at which business could probably be done.

Scrap.—More inquiry is noted, but sales have been limited, as consumers are not disposed to pay more than they have been giving. An occasional lot of 100 tons of No. 1 Forge is disposed of at \$20, but the local dealers generally ask from \$1 to \$2 more. Mixed Country Scrap is selling at \$14 @ \$15. Selling prices of carefully selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$21; Track Scrap, \$20; Horseshoes, \$20; Axles, \$26; No. 1 Mill, \$15 @ \$16; Pipes and Tank, \$13; Light Wrought, \$11; Cast Machinery, \$14 @ \$14.50; Stove Plate, \$12; Cast Borings, \$9 @ \$9.50; Wrought Turnings, \$12 @ \$12.50; Axle Turnings, \$14.50; Coil Steel, \$15; Leaf Steel, \$16.50; Locomotive Tires, \$16 @ \$17.

Hardware.—The cold weather of the past week has greatly stimulated the demand for some lines of Shelf Hardware, and merchants would be pleased to see it continue. Trade in Holiday Goods has opened up well, and large quantities are being shipped of such goods as Skates, Sleds, Cutlery and other articles adapted to this particular demand. Staple Goods are heavy and moving but slowly. Collections are fair.

Nails.—Manufacturers' agents have not been favored with much actual business, but they are now receiving inquiries which promise to develop into orders shortly if terms can be arranged. Large buyers are anxious to negotiate at present prices for deliveries in January, February and March, when they will need good stocks of Steel Nails to meet the large demand usually experienced in those months. Manufacturers are not entering into such agreements with much enthusiasm, as the prices which would have to be made are anything but tempting to them. Another reason is also suggested. Although the great national pooling scheme has fallen through, and Steel Nails have apparently dropped into a condition of hopeless demoralization, there are indications that the manufacturers are not disposed to abandon all efforts to control the trade. They expect to be able to accomplish something through which the price of Nails will be advanced considerably before the 1st of

January. To make contracts for large quantities for future delivery would defeat the very object toward which their plans are directed. Wire Nails are understood to be firmly held, but they also are not moving freely. Steel Nails continue to be quoted at \$2 from store, \$1.90 for carloads on track, and less for large lots. Wire Nails are sold at \$2.60 from store and \$2.55 for carload lots on track.

Barb Wire.—A fair movement is in progress both in small lots and carloads. Large buyers are looking about sharply for bargains, but some of the manufacturers are holding off at present in the belief that better prices can be obtained after the cheap sellers have loaded up. Small lots are still quoted at 2.90¢ for Painted, and 3.60¢ @ 3.65 for Galvanized, with the usual difference for carloads.

Pig Lead.—Early in the week small quantities were sold at 3.60¢, but afterward bids of 3.55¢ were successfully made for 200 to 300 tons of Common, considerable sales of Refined also taking place. At the close 3.50¢ was bid, 3.55¢ asked.

Pickands, Brown & Co., of Chicago, and Pickands, Mather & Co., of Cleveland, are the selling agents for the Ohio and Western Coal and Iron Company, one of whose new furnaces, at Floodwood, Ohio, has just been blown in.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts., CINCINNATI, November 19, 1888.

Pig Iron.—During the week under review the local market for Pig Iron has been full of vitality, strong, and at times even buoyant, if not excited. The volume of business has been large, numerous sales being made, both large and small. While there has been a general revival in the demand, the Iron most urgently sought for has been Forge grades. There has been scarcely a mill along the Ohio River and within the territory of Cincinnati which has not figured in the market during the week, if not as buyers at least as applicants. Car builders as well as Pipe manufacturers, and mills as well as machine shops, have contributed something to make evident the confidence prevailing. Mottled, Bright and off grades of Iron are wanted, as well as the better brands and grades, but the offerings are generally small. Several thousand tons of Car-Wheel Iron have been sold on basis of quotations, and also several thousand tons of Foundry grades, supplemented by a number of scattering transactions for various kinds for both present and future delivery, but by far the bulk of the sales have been of Forge Irons, the product of both Ohio and Southern furnaces, the latter stacks taking the lion's share. The aggregate sales of Mill Irons made during the week are estimated at 40,000 tons, one house alone booking orders for over 20,000 tons. These transactions were mostly for long delivery, and factors assert their ability to obtain 25¢ @ 50¢ per ton more for future than for present or near-by delivery. Prices of several grades are higher; a further advance is anticipated. The following are the approximate quotations for the local market cash, f.o.b. Cincinnati:

Hot-Blast Foundry.		
Southern Coke, No. 1 (new classification).....	\$16.25 @	\$16.75
Southern Coke, No. 2 (new classification).....	15.50 @	16.00
Southern Coke, No. 3 (new classification).....	15.25 @	15.50
Ohio Soft Stone Coal, No. 1.....	17.00 @	17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @	16.00
Mahoning and Shenango Valley.....	18.00 @	18.50
Hanging Rock Charcoal, No. 1.....	21.00 @	22.50
Hanging Rock Charcoal, No. 2.....	19.00 @	22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @	19.50
Tennessee and Alabama Charcoal, No. 2.....	17.50 @	18.00
Forge.		
Strong Neutral Coke.....	15.00 @	15.25
Mottled Neutral Coke.....	14.00 @	14.25
Gray Forge.....	14.50 @	14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @	25.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @	22.00

Manufactured Iron.—There has been some increase in the volume of business, the activity in Pig Iron and the hardening tendency spurring buyers to increased purchases, but prices of the manufactured product have changed but little. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ @ lb.

Old Material.—There has been some increase in the demand here for both Old Rails and Wheels, but the offerings have been fair; 400 tons Old Rails sold here at \$23, cash, and about an equal amount of Old Wheels at \$19, spot cash.

Nails.—The trading has been on a lower basis during the week, but there is a fair demand and a better feeling at the close. Jobbing prices are based upon 12d @ 40d, which sell at \$1.95 @ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$1.95 and Steel Wire Nails at \$2.65 @ keg.

Cleveland.

CLEVELAND, November 19, 1888.

Iron Ore.—During the past week 131,687 tons of Ore were shipped from the Upper Lake ports, bringing the total shipments for the season up to 4,572,913 tons. This amount is 71,741 tons in excess of the total shipments up to a corresponding period last year and 1,016,113 tons in advance of the record for 1886. The shipping season will practically close on December 1. Nearly all of the wooden vessels are already tied up for the winter, leaving only the steel steamers in commission. Two or three cargoes of unsold Ore were unloaded at this port during the week just closed and more will be brought down within the next ten days. But the total amount of Ore not disposed of on the docks at the close of navigation this year is likely to be less than 150,000 tons, as compared with 750,000 tons at the beginning of last winter. When it is taken into account that the last-mentioned stock of Ore has been disposed of during the past season, in addition to the 4,752,913 tons shipped, it can be readily seen that all records have been beaten, despite the depressing influence of a late opening and an uncertain and fluctuating market for Pig Iron. Although the Iron Ore market is far from dull, the activity noticeable is confined to the anxiety of buyers to secure odd lots of non-Bessemer, for nearly all of which fancy prices are secured. Special grades of non-Bessemer Ores have been bought as high as \$5.25, f.o.b. vessels, lower Lake ports, while less valuable brands, which sold in July for \$3.75, are commanding from \$4.25 to \$4.50 @ ton. It would be superfluous to quote prices for Bessemer Ores, for there are, practically, none to be had at any price. An odd lot of Gogebic Bessemer, not particularly rich in Iron, is said to have sold during the week just closed for \$5.85. Lake freights have not advanced, and Ore is still brought from Escanaba for \$1.25, from Marquette at \$1.55 and from Ashland and Two Harbors at \$1.70, rates which, at this season of the year, are considered reasonable.

Pig Iron.—If the result of the election has had any appreciable effect upon the Pig Iron market it has been in the direction of more active inquiry and of firmer quotations. There seems to exist no lack of confidence in the stability of the market. The furnaces are now so overwhelmed with orders that active buying is not expected to begin for 30 days. The foundry and mill men will then come forward for their supplies, and dealers look for

a volume of business with but few precedents. But little Iron is now being sold for delivery in 1889, and furnacemen seem willing to await the opening of the new year, and to trust present indications.

Manufactured Iron.—The mills are running full time in order to fill contracts, but there is little surplus Iron to sell. Bar Iron is firm at 1.70¢, but the stores are unable to obtain stocks, the mills shipping directly to the consumers.

Scrap Iron.—A few sales of Old American Rails at \$24.50 are reported. The water-works trustees sold to-day a big quantity of Cast Scrap for \$13 @ ton.

Sheets.—Stocks have been slightly replenished, and moderate quantities can now be obtained on the basis of \$3 for No. 27, and \$2.80 for No. 24.

Louisville.

LOUISVILLE, Ky., November 19, 1888.

Pig Iron.—Buying has been steady during the week, and parties who were slow in making purchases are now compelled to pay an advance. What this is it is almost impossible to tell, but we believe that Iron has advanced fully 75¢ @ ton. Buying throughout the West has not been general, and some points yet feel that the present upward movement cannot be maintained, and that the coming month will show a slight decline in prices. Those who are best situated to know the condition of trade and the amount of stocks now on hand feel that this is a mistake, and that a still further advance will take place. It is not thought the market will have a boom, nor is it considered desirable, but it is felt that present prices will be maintained, and that as orders come in of necessity a slight advance will be made from time to time. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$16.50 @	\$17.00
Southern Coke, No. 2 Foundry, new classification.....	16.00 @	16.50
Southern Coke, No. 3 Foundry, new classification.....	15.50 @	16.00
Silver Gray, different grades.....	15.50 @	16.50
Gray Forge.....	15.00 @	15.50
White and Mottled, different grades.....	14.00 @	14.50
Hanging Rock Coke, No. 1 Foundry.....	17.00 @	17.50
Hanging Rock Charcoal, No. 1 Foundry.....	20.75 @	23.00
Southern Charcoal, No. 1 Mill.....	16.00 @	17.00
Southern Car-Wheel, standard brands.....	22.75 @	23.75
Southern Car-Wheel, other brands.....	19.00 @	21.00
Hanging Rock, Cold Blast.....	22.00 @	25.00
Hanging Rock, Warm Blast.....	19.00 @	20.00

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., PITTSBURGH, November 20, 1888.

The most important event of the week was the action of the river coal operators, who, at a meeting yesterday, agreed to stop mining indefinitely after December 1st. This action was rendered imperative by the overstocked and depressed condition of the down-river markets, where it is difficult to make sales even at actual lay-down cost.

Pig Iron.—There has been no important change in the situation since our last report. Demand keeps up well, furnaces are all busy, some of them sold several months ahead, and the outlook is favorable for a good healthy trade all winter. Furnacemen think they should have a better price for their product, but consumers aver that they are paying all and even more than it is worth, when present prices of Finished Iron are taken into consideration. The indications warrant the conclusion that there will be a steady consumption throughout the winter, with but little change one way or the other in prices. We quote as follows:

Neutral Gray Forge.....	\$16.00 @	\$16.25, cash.
All Ore Mill.....	16.75 @	17.00, "
White and Mottled.....	15.00 @	15.50, "
No. 1 Foundry.....	18.00 @	18.50, "

No. 2 Foundry.....	17.00 @	17.50, "
No. 1 Charcoal Foundry....	23.50 @	24.00, "
No. 2 Charcoal Foundry....	21.50 @	22.50, "
Cold Blast Charcoal.....	25.00 @	28.00, "
Bessemer Iron.....	17.50 @	18.00, "

Some few sales of Gray Forge were reported at \$16.50, cash, but this price can only be secured for an extra Iron, as consumers have no trouble in getting all they want at \$16 @ \$16.25, cash. In regard to Bessemer, while there was a sale of 500 tons reported at \$18, cash, it was an extra lot, as \$17.50, cash, is nearer the mark for the ordinary analysis.

Spiegel.—Spiegel, 20 %, quoted at \$27.50 @ \$28.50, cash, and Manganese, 80 %, \$56.50 @ \$57.50.

Muck Bar.—The offerings continue light, and with some inquiry the market may be quoted firm at \$29 @ \$29.50, cash. Those mills making a specialty of Muck are pretty well sold up, and this accounts for the very limited offerings and strong market.

Manufactured Iron.—There is a continued fair degree of activity. Mills generally are pretty fully employed, and likely to be for some time to come. No change in Prices. Bars, 1.80¢ @ 1.85¢; Plates, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢; Skelp Iron, 1.85¢ @ 1.90¢ for Grooved, and 2.10¢ @ 2.12¢ for Sheared; all 60 days, 2 % off for cash.

Nails.—The price here is still quoted at card rates, \$1.90 for 12d to 40d, 60 days, 2 % off for cash, but cutting is still being done elsewhere. Wheeling is reported as having taken an order recently for 10,000 kegs, to go West, at \$1.65, net cash, 2000 kegs to delivered immediately and the remainder at stated intervals thereafter. Some of our manufacturers can scarcely believe that the order would be taken at Wheeling or any where else at the price quoted, but the broker who made the purchase gives it publicity, and, thus far, it has not been contradicted. It is claimed by those in a position to know that the price quoted does not cover actual cost of production.

Wrought-Iron Pipe.—There has been quite a falling off in new business within the past week or two, but the mills generally are still pretty fully employed in working up back orders. Business nearly always falls off at this season of the year, and no material improvement can reasonably be looked for until the spring trade opens up. Prices remain unchanged: Discounts on Black Butt-Welded, 52½ %; do. on Galvanized 45 %; on Black Lap-Welded, 62½ %; on Galvanized do., 52½ %; Boiler Tubes, 60 % off. Two-inch Tubing, 18¢ ¾ foot, net; 5½ inch Casing, 40¢ ¾ foot, net.

Billets, &c.—Bessemer Steel Billets are quoted at \$29, cash, at maker's mill and Nail Slabs, \$28.50; market for both easier. Domestic Bloom Ends quoted at \$19, and Rail Crops at \$19.50, the latter are reported scarce. A sale was lately made of 4000 tons of Wire Billets to a New England mill.

Old Rails.—There appears to be less inquiry, but with scant offerings prices are still maintained. Sales reported at from \$24.85 to \$25.25, cash. With the advent of cold weather, which cannot now be much longer delayed, the work of lifting will be very much curtailed, and it is expected, therefore, that the offerings will fall off in consequence.

Steel Rails.—Heavy sections are still quoted at \$28 @ \$28.50, cash, at mill; several sales reported at \$28.25. The sale reported some weeks ago in the East by the new mill here at \$27.50, cash, delivered at Buffalo, was for a special lot, which was wanted to test the machinery of the new mill which, as stated elsewhere, will, it is expected, be started up in

January. We learn from good authority that no Rails can be purchased here below prices quoted, and even at these there is but very little margin for profit. It is stated that a good many orders have been booked within the past few weeks by nearly all the mills in the country. New Steel Rails are only worth about \$3 ¾ ton more than Old Iron Rails.

Railway Track Supplies.—Spikes are still quoted at \$2.20, 30 days, delivered; Splice Bars, 1.85¢ @ 1.90¢; Track Bolts, 2.85¢ with square, and 2.95¢ with Hexagon Nuts.

Merchant Steel.—There was a meeting of the Bessemer Steel Association the other day, but there was no change made in prices. Best Brands of Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth do., 2½¢.

Old Material.—There is a fair business at unchanged prices. No. 1 Wrought Scrap at \$21, net ten; Wrought Turnings, \$13 @ \$14; Car Axles, \$25.50 @ \$26.50; Cast Scrap, \$15.50 @ \$16.50, gross ton; Cast Borings, \$12 @ \$13; Old Car-Wheels, \$20.

Naylor & Co., the well-known importers, will shortly open a branch office in the Lewis Block, Pittsburgh. A. S. Hay, a member of the firm, and A. Holland, the prospective Pittsburgh representative, were in this city last week, making the necessary arrangements for the opening of the new office.

Detroit.

WILLIAM F. JARVIS & Co., under date of November 19, report as follows: There has been an improvement in the market since our last report, and a larger number of small orders have been placed. Several inquiries for round lots for delivery after January have been received, some of which will undoubtedly result in orders. The continued scarcity of cars is causing great inconvenience to furnaces that have Iron on hand, as they are unable to ship it on this account, and as a natural consequence consumers are complaining loudly at the delay. The outlook is encouraging and prices are held firm. Navigation on the lakes will soon be closed and this may cause some advance in Lake Superior Charcoal, as only a limited number of furnaces can ship during the winter to Eastern points, as freight rates from upper lake furnaces are too high. We quote for the present as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @	\$20.50
Lake Superior Coke, all ore.....	19.75 @	20.25
Lake Superior Coke, cinder mixed.....	18.50 @	19.00
Standard Ohio Black Band.....	19.75 @	20.25
Southern No. 1.....	17.75 @	18.25
Southern Gray Forge.....	16.25 @	16.75
Southern Silvery.....	17.00 @	17.50
Jackson County (Ohio) Silvery.....	18.50 @	19.00
Old Wheels.....	20.50 @	21.50

New York.

Office of The Iron Age, 66 and 68 Duane street, New York, November 21, 1888.

American Pig.—The volume of new business being done is light, and the number of inquiries for forward delivery is not large. Still, the market is steady and the tone healthy. Some propositions have been made for delivery of Southern Iron next year, but it is stated that sellers must take the risk of freights, since the railroads decline to guarantee rates for 1889 delivery to be the same as now—\$4.86 to New York and \$5.11 to Boston. One case has come within our notice where a Southern furnace company have declined to book more than one quarter of a 5000-ton lot, which the consumer was willing to take. We continue to quote Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is very quiet, with prices remaining: Coltness, \$21 @ \$21.50, nominally; Shotts, \$20.75 @ \$21; Langdon, \$21, and Dalmellington, \$20 @ \$20.25.

Spiegeleisen.—No business has been done and prices remain nominally \$27 for German 20 %. Ferromanganese, 80 %, prompt delivery, has sold in small lots at \$54.

Wire Rods.—The market is very dull and weaker, Basic Wire Rods having sold at a delivered price equivalent to \$38.65 at this port. The demand for foreign stock is shrinking more and more, and is now practically confined to the Eastern Wire, Barb Wire and Wire Nail mills which do not roll their own Rods. It is probable that next year the importations will fall off even more. The West is now practically captured by the domestic mills. With the new Rod mill building at Anderson included, the mills of this country will be able to turn out next year somewhere between 300,000 and 350,000 tons. It is urged by importers that they cannot long hold the Eastern trade unless foreign Rods are kept low enough to put Eastern Wire mills in a fair position to hold their own against their Western rivals. They argue that from the standpoint of the foreign Rod maker any attempt to exact high prices would be suicidal. On the other hand it is insisted that for the present foreign Rods are as cheap as they are likely to be so long as the price of Billets abroad remains where it is. Even when the German Rod combination was in existence there was so little margin in rolling Rods that only five or six concerns remained in the business, and even one of the most prominent of them changed one of its mills to light Rails. We quote the market dull at \$38.75 @ \$39 for Basic Rods, with the probability that \$38.50 could be done.

Old Rails.—We hear of a sale of 1200 tons on the line of a road in Western Maryland at \$23, and of a lot of 500 tons at \$23.50, on the cars Jersey City, shipped from Bridgeport, Conn. A number of mills in Eastern Pennsylvania are in the market, but the supply available here is small and generally closely held. We quote \$23 @ \$24 for Tees for large lots.

Scrap.—The market is quiet, but steady, at \$21 for Yard, with few sales reported.

Plates.—Fair orders for Marine Steels have been placed here, and we learn that the Steel Plates for 19 boilers for a Brooklyn sugar refinery were taken by a mill in Eastern Pennsylvania. One of the leading Western mills selling in this market has taken an order for about 2000 tons of Ship and Boiler Plates at Philadelphia, the Angles, Deck Beams, &c., going to an Eastern Pennsylvania mill. We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.44¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.5¢ @ 2.55¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—A number of the mills complain of a falling off of orders. Some of the big contracts which nearly every prominent mill had as a *pièce de résistance* have now been filled, only one mill having received additional work of this character lately in the form of about 6000 tons of Brooklyn Elevated construction. The largest Beam mill in the country has gone on single turn. We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢. Foreign Beams can be laid down at about 2.65¢ @ 2.75¢, but are in very light demand.

Bar Iron.—The scarcity and high price of Old Rails have caused some of the mills to which this market is tributary to with-

draw; still the market is not perceptibly stronger. We quote: Carload lots, half extras, 1.7¢ @ 1.75¢ for Common; 1.75¢ @ 1.8¢ for Medium, and 1.8¢ @ 1.9¢ for Refired, with prices for fancy brands running up to 2.4¢ @ 2.5¢. Foreign Hoops are quoted nominally 2.05¢.

Steel Rails.—The event of the week has been the placing of the greater part of the order of the Pennsylvania Railroad; three Pennsylvania mills on the line of the road receiving each 15,000 tons, with the important proviso that they may deliver the Rails at any time during the winter. The railroad generally places at the same time a number of smaller orders in Chicago, Cleveland and Scranton, aggregating about 15,000; so far as we can learn, these have not yet been given out. It is stated that the Rails were placed at \$28 at mill, a figure which the trade regards as somewhat high, considering the market of the past few weeks, and which it is somewhat difficult to explain, even when the fact is considered that the road has the advantage of carrying a very heavy tonnage of raw materials for the manufacture of the Rails. We are informed that one of the mills not on the line of the road has offered to sell at \$27.50. The contracts are of special importance, because at least one of the mills, and possibly others, have made sales to other lines based upon the Pennsylvania price. It is intimated that in the case of at least one mill a balance of last year's order, at a considerably higher price, has been cancelled, by the placing of the new order. We hear of sales to Eastern roads aggregating about 4000 tons, and of 5000 tons to the Pacific Coast. The latter was \$2 under the price at which English Rails were offered, delivered, so that at a lower rate of duty the domestic mill would have been crowded out, even on the basis of the low price of \$27.50 at Eastern mill. In the West a contract of 17,000 tons, to be delivered in about equal parts at Omaha and Kansas City, has probably been placed. The market is firmer, though not without a shade of irregularity, the usual quotation being \$27.50 @ \$28. According to the report of the Board of Control the deliveries up to the 1st of November were 1,029,179 tons, the sales for 1888 delivery being 1,250,740 tons. For 1889 the sales are reported at 116,180 tons up to November 1st, but it is certain that at least 150,000 tons have been placed since then. In regard to the rumors persistently circulated for some time past of a disruption of the Rail Association, or at least of a growing dissatisfaction among some of the members, it may be stated that whatever grounds there may have existed for it are likely to be removed in a few days.

Financial.

While there is visible no strong impetus in business circles—especially in the absence of speculation—in several respects there is an improvement compared with ante-election days. Tariff questions being at least temporarily set at rest, those industries more directly affected manifest greater confidence, and the same holds true of certain branches of trade, notably those identified with the wool product. Many enterprises awaiting the decision at the polls are being pushed forward. Money is easy and no apprehension is felt respecting the immediate future. Contentment among the great railroad corporations still occupies a prominent place in public estimation. The Classification Committee has finished its report, which will conform to the requirements of the Interstate Commissioners, and, in revising classes, most freights have been graded up, so that the railroads must make heavier revenues. Commissioner Fink has called for a telegraphic vote for the adoption of this new

classification, and, from present appearances, the members of the Joint Executive Committee will unanimously approve of it.

The Stock Exchange markets are comparatively dull, with limited transactions. Rumors respecting trunk line troubles and prospects are the chief disturbing factor. It is conceded that railroad business throughout the country has sustained a severe shock, but traffic continues heavy. Shipments east from Chicago for the week were 36,586 tons, an increase of 5630 tons compared with the previous week. On Monday selling orders from London encouraged bear raids, and the trunk line stocks were the principal sufferers. A favorable development in the trunk line situation is the promised adoption by all lines of the recommendations of the Classification Committee, which grade up most classes of freight, and will, it is thought, enable the roads to secure a heavier revenue for hauling the same tonnage. Among other reports is the existence of an agreement designed to protect the roads from alleged infractions of the Interstate law. The New York and New England is receiving some attention, owing to the approach of the annual meeting, and to the anticipated improvement looked for after the opening of the Poughkeepsie Bridge early in 1889, which is expected to increase materially the road's coal traffic. On Monday the market was irregular. It was announced that a meeting of managers of Northwestern and Western railroads had been called in Chicago on Wednesday, to endeavor to formulate an agreement covering all the Western lines. It was also learned from Washington that the war of rates between the trunk lines has received the serious attention of the Interstate Commerce Commission, but that body, while deploring the existing troubles, has failed thus far to find any remedy for them or any authority to exercise any remedy. Judge Cooley, chairman of the commission, says: "In the absence of legal proof of secret reductions of rates we cannot institute suit, as we would be glad to do if testimony were offered to us upon which we could proceed." Members of the Interstate Commission do not believe that Congress will enact any legislation repealing the prohibition of pooling, and they do not think that permission to pool would permanently improve the present situation. They hope that the coming meeting of the trunk line presidents will result in a settlement of the traffic war.

Government bonds were stronger for the 4s, which sold at 128. Quotations are as follows:

U. S. 4s, 1891, registered.....	107½
U. S. 4s, 1891, coupon.....	108½
U. S. 4s, 1907, registered.....	128
U. S. 4s, 1907, coupon.....	128
U. S. currency 6s.....	121

The Treasury purchases of bonds continue quite small, partly for the reason that the offerings at the figures the secretary is willing to pay have fallen off materially. The effect upon the financial situation, however, is imperceptible.

The total clearings of 41 cities last week show a decrease of 9.5 % compared with the corresponding week last year; outside of New York the decrease is 6.7 %. New York decreased 14.1 %; Philadelphia, 6.1 %; Chicago, 6.9 %; Baltimore, 6.1 %; Cincinnati, 5.6 %; New Orleans, 4.8 %; Pittsburgh, 3.9 %; St. Paul, 5.6 %; Galveston, 21.6 %; Wichita, 35.9 %; Los Angeles, 35.9 %; Duluth, 45.10 %; Boston increased 4.9 %; St. Louis, 3.9 %; San Francisco, 10.9 %; Kansas City, 9.4 %; Minneapolis, 14 %; Omaha, 18.2 %; Memphis, 16.9 %, and Denver, 27.5 %.

The weekly bank statement shows a small but unexpected increase in the surplus reserve, which now stands at \$11,591,000, against \$7,488,000 at the corresponding time last year and \$9,930,000 in the third week of November, 1886.

The loans were contracted \$983,000; specie decreased \$1,288,900; legal tenders are up \$1,234,900, almost equal to the loss in specie. Money is still wanted in the South, but the West has no special requirements. Loanable funds in this market are in better supply, and the demand for commercial paper is good. We quote 60 @ 90 days' indorsed paper at 4½ @ 4¾ %; longer dates, 5 @ 5½ %; single names, 5½ @ 6 %. The Treasury Department issued a circular announcing that no more deposits to retire circulation will be received until December 1, as the \$3,000,000 monthly limit has been exhausted.

Sterling is very firm, owing to the advance of the rate of discount in London. Posted rates are \$4.85½ @ \$4.89.

The Produce Exchange markets generally have a lower tendency. Wheat is lower, with an increasing visible supply and on Tuesday prices fell off 3¢. Flour is dull and lower. The only export business at present is on account of the Lisbon market, the movement having become rather important since the decline. Nearly all the Western millers are now running on half time to permit an absorption of the surplus product, as well as on account of the relatively high price of grain. Corn lower, with liberal sales for export. The demand for wool is phenomenal, sales in Boston during the week having amounted to 8,847,000 lb, the largest ever known, and the advance is at least 2¢ on nearly all grades. Philadelphia carpet manufacturers announced an intended advance in prices, but the alternative of a 10 % reduction in wages is now under consideration. New York dry goods jobbers report a healthy trade.

Exports of merchandise from this port during the week were valued at \$8,490,997, making a total since January 1 of \$411,033,625, as compared with \$415,545,000 for the same time in 1887 and \$386,353,000 in 1886. The recent favorable balance of trade is due to the increased exports of cotton, breadstuffs and provisions showing a material decline. In breadstuffs the decline is in wheat only. For the last four months the aggregate of the five principal classes of exports from the United States compare as follows:

	1888.	1887.
Cotton.....	\$48,745,171	\$59,796,471
Breadstuffs.....	43,257,353	53,867,109
Meat and dairy products.....	29,305,542	31,664,068
Cattle and hogs.....	4,733,335	3,388,674
Mineral oils.....	17,351,359	16,428,381
Totals.....	\$143,982,760	\$165,131,708

The imports of specie at this port during the week were \$393,000; exports nominal.

Metal Market.

Copper.—Spot Chili Bars have fluctuated 2/6 from day to day, closing the same as a week ago. £78. 2/6, but futures declined from £79 to £78. 15/, good merchantable brands giving way from £78. 2/6 to £78, and Best Selected from £83 to £82. 10/. Sales, 425 tons. Here the same listless tone and almost total lack of trade and speculation has continued, only 25,000 lb, November, being sold at 17½¢, the quotation for November, December and January being 17¢ @ 17½¢, spot nominally 17½¢, and casting brands 16¢ @ 16½¢.

Tin.—During the week under review spot Straits improved in London from £102. 12/6 to £103, and futures from £101. 7/6 to £101. 17/6, the sales summing up 1110 tons. There has been greater animation here, some 150 tons changing hands at 22.45¢ January, 22½¢ February, and spot at 22.35¢. The Straits shipped this way, November 1 to 15, 200 tons, against none last year, and to England 500 tons, against 800; to England altogether since January 1, 16,000, against 13,800, and to this country 8150, against 4100, as per cable from Gilfillan, Wood &

Co. to Mr. Charles Nordhaus, East-India agent, 89 Water street, New York. *Tin Plates*.—The demand during the week has again been quiet, the trade holding off their orders, as the market has been a declining one. We quote at the close, large lines, $\frac{3}{4}$ box: Siemens-Martin Steel, Charcoal Finish, \$4.90 @ \$5.75; Coke Finish, \$4.70; Ternes, \$4.10 @ \$4.25; Bessemer Cokes, \$4.25 @ \$4.35; and Wasters, \$4.15. Cokes are 13/8 @ 13/6 at Liverpool.

Lead.—Our market has been moderately active only, some 500 tons being sold in the open market at 3.65¢ @ 3.70¢, and 116 tons on 'Change, this also being the closing quotation, at which the market winds up quiet, while in St. Louis there is steadiness, but also a tame state of affairs, at 3½¢. London is 2/6 lower for the week, and quotes Soft Spanish £13. 2/6, and English Pig £13. 12/6.

Spelter.—Has been dull and featureless at 5½¢ @ 5¼¢ Common Domestic, and 6¢ Silesian, nominally, the London market having given way from £18. 12/6 to £18. 2/.

Antimony.—Hallett has improved £1 in London, to £44, while here a fair demand has prevailed at 10¼¢, and for Cookson at 12¼¢.

New York Metal Exchange.

The following sales are reported:

THURSDAY, November 15.		
30 tons Tin, January	22.30¢	
10 tons Tin, February	22.30¢	
25,000 lbs. Lake Copper, November	17.50¢	
FRIDAY, November 16.		
100 tons Lead (on dock)	3.65¢	
SATURDAY, November 17.		
10 tons Tin, December	22.45¢	
MONDAY, November 19.		
50 tons Tin, February	22.50¢	
40 tons Tin, January	22.45¢	
TUESDAY, November 20.		
16 tons Lead, January	3.75¢	

Coal Market.

The Anthracite Coal trade is dull and weak, under excessive production and decreasing demand. All sizes are now in full supply, even Stove having become abundant. As a consequence reports are freely circulated of cuts made in order to stimulate sales. The one phenomenal fact of the week, and which cannot fail to engage attention, is the enormous shipments from the mines, the Wyoming region especially seeming to be in full activity, and this in the face of the official announcement that the production for October was in excess of any month in the history of the trade, aggregating no less than 4,187,000 tons. For the week ending November 17 the total is 902,530, an increase of 126,000 over the previous week and 144,500 tons compared with the same week in 1887. Schuykil is increased 10,000 tons, Lehigh 12,000 tons and Wyoming 103,000 tons. For the year since January 1 the aggregate is 33,861,000 tons, an increase of 3,386,000 compared with the same time last year. The Reading Company will mine on full time until the end of the month, when it will come down to three quarters time, and probably all the other companies with it. The four new collieries that the Reading Coal and Iron Company proposes to open will be in operation about a year hence, making in all an addition of 1,000,000 tons per annum. The new improvements will cost about \$150,000. It should be noted that despite the heavy output from the Coal regions the stock on hand at tidewater shipping points October 31 was 359,000 tons, a decrease of about 12,000 tons during this month. Prices are nominally unchanged, as follows: Hard

White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.65; Pea, \$2.75.

It is understood that the Coal operators assume that the market will, with Thanksgiving Day interruption, take all the Coal arriving at tidewater, but they will probably take action on the 29th to restrict.

Bituminous Coal is easier, with signs of an approaching overstock and possible temporary suspension at the mines.

The Lehigh Valley Railroad, in the suit brought against it by Cox Brothers & Co., has filed an answer denying nearly everything that is stated in the complaint, but admits carrying Bituminous Coal for but little more than half the price of Anthracite per ton per mile, and states that it costs more to load and unload Anthracite Coal than it does Bituminous.

At a meeting of Pittsburgh operators on Monday it was unanimously decided to shut down all the Monongahela River lines for an indefinite period.

The Poughkeepsie bridge will be opened for business February 1, taking Anthracite from Pennsylvania direct to the East side of the Hudson.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Nov. 21, 1888.

The recent advance in the syndicate's nominal prices for Copper, followed as it has been by a partial reaction, has tended to strengthen the belief that the interest mentioned can fully maintain prices only by following their former policy of requiring a guarantee that Copper purchased from them will not be resold. As it is, smelters who purchased prior to the late advance are underselling present syndicate prices, and it is believed that they will continue to do so for some time if these figures are maintained. Some significance is, however, attached to the fact that the supply has increased only 1000 tons the past fortnight—the smallest accumulation for any two weeks since January. This is attributed, in part, to the withholding of supplies at mines owned by the syndicate or members of the body. Copper furnace material shows, relatively, greater firmness than Bars, but the advanced prices asked early in the month have not been realized. James Lewis & Son report sales, since the 1st inst., of 2000 tons Anaconda Matte at 15/6, to arrive, delivery at Swansea, and 87 tons Matte, made from American Ore, at 15/ $\frac{3}{4}$ unit.

It is stated, on apparently good authority, that English capitalists have made an offer of £1,000,000 for the Sotiel Copper mines, Portugal.

Speculative operations in Block Tin have been on a larger scale, and prices have hardened somewhat the past few days. The "bear" interest have sold futures with more or less freedom, and express confidence in heavy shipments from the East the next few months, swinging prices in their favor. The "bull" party, however, appear inclined to make a stubborn contest.

Business in Tin Plate has been disappointing. Makers have granted concessions on prices to attract orders for forward deliveries, but the response from buyers is thus far slight. The production is now

very large, and promises to be even greater in the near future, additions to old mills and the erection of new plant having enlarged the capacity considerably. A site has been selected for the large works to be erected at Llanelly, Carmarthenshire.

In Pig Iron warrants operations have been on a moderate scale. Although stocks in Connal's stores are still increasing, the probability of enforced restriction of output consequent upon a scarcity of coal restrains bear sales. The large stocks of warrant Iron and the high rate of interest for money, on the other hand, adversely affect outside speculative purchases, causing as they do the belief that prices are likely to decline. Purchases for consumption are very fair, but the export trade is moderate. Only slight changes have taken place on makers' brands of Scotch Iron, but Middlesboro' and Hematites are lower.

A new brand of Iron, styled Sellivara, the product of Swedish Ores, has been placed on the market. Sales of this article are said to have been made at 55/ for Forge grade, and 57/6 for qualities suitable for foundry work.

In Shipbuilding and Railway Steel there continues to be a brisk business; prices very strong on the former, but still somewhat uneven in the instance of Rails. Billets also continue in good demand, but Blooms, Slabs, Rods, &c., are quiet. The Moss Bay Company have secured an order for 14,000 tons of Rails for the Bengal and Nagpur railway. The Crawshaw Steel Works and the Star Iron Works have been started up.

The report is again in circulation that a syndicate is forming to control the rolling mills in Great Britain and on the Continent.

Scotch Pig.—There has been only a moderate business, but prices hold fairly steady.

No. 1 Coltness, f.o.b. Glasgow	49/
No. 1 Summerlee, " "	49/6
No. 1 Gartsherrie, " "	47/
No. 1 Langloan, " "	48/6
No. 1 Carnbroe, " "	43/6
No. 1 Shotts, " at Leith	48/6
No. 1 Glengarnock, " Ardrossan	47/6
No. 1 Dalmellington, " "	42/3
No. 1 Eglinton, " "	41/
Steamer freights, Glasgow to New York, 6/6, Liverpool to New York, 10/.	

Cleveland Pig.—The market has been dull and prices have again weakened. No. 1 Middlesboro', G.M.B., 36/; No. 3 do., 33/6 @ 33/9. •

Bessemer Pig.—Prices are irregular and weak, the demand being slow and supply liberal. West Coast brands, mixed numbers, 44/3, f.o.b. shipping point.

Spiegeleisen.—Transactions have been of moderate volume, but offerings are moderate and prices steady. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There continues to be a lively business, but orders are filled at former prices. Standard English sections quoted at £3. 18/9, and light sections £4. 2/6 @ £4. 7/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—Only a moderate business, and prices unchanged. We quote £4 for 7 x 7, f.o.b. at N. W. England shipping point.

Scrap Iron.—There is but little demand and the sales making are at former prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Steel Billets.—The demand continues fairly active. Makers are well sold ahead and firm on prices. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—Moderate sales making at about former prices. Bessemer, £4, f.o.b. at N. W. England shipping point.

Old Rails.—Very little doing in these. Prices are nominal in a good measure. Tees quoted at £3. 3/9 @ £3. 5/, and Double Heads £3. 8/9 @ £3. 10/, c.i.f. New York.

Crop Ends.—The market quiet, but steady. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—There has been a fair business at barely steady prices. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/ @ 15/6
IC Bessemer steel, Coke finish.....	13/9 @ 14/
IC Siemens.....	13/9 @ 14/
IC Coke, B. V. grade.....	13/3 @ 13/6
Charcoal Terne, Dean grade.....	12/ @ 12/6

Manufactured Iron.—In most branches there is a fairly active trade and prices remain firm. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.....	£ s. d. @ 8 2 6
" Common.....	@ 5 10 0
Staff. Blk Sheet, singles.....	@ 7 10 0
Welsh Bars (f.o.b. Wales).....	5 0 0 @ 5 2 6

Tin.—Operations have been on a more liberal scale, and prices, while irregular, show greater firmness. Straits quoted at £101, spot, and £101. 15/ for three months' futures.

Copper.—Business slow, and prices somewhat unsettled. Chili Bars, £78, spot, and £78. 10/, three month's futures. Best Selected, £82.

Lead.—The market is very quiet, but steadier. Soft Spanish, £13. 2/6.

Spelter.—Demand has been light, and prices are rather lower. Silesian, ordinary, £18. 2/6 @ £18. 7/6.

CHILI.

VALPARAISO, September 14, 1888.—**Copper**—has been fluctuating very little, in consequence of the firm cable reports, and what little change there was was due to the varying exchange. Sales amounted to 18,759 quintals at \$29.55 @ \$30.30, which at 26½d., and taking \$29.65 as first cost, equals f.o.b., without freight, per steamer, £77. 6/2. **Nitrate**.—A good inquiry has prevailed, both for immediate shipment and September and October, but as very little Nitrate was immediately available, and suitable vessels were scarce, sales were limited to 170,000 quintals 95% at \$2.80 and 64,000 quintals 96% at \$2.85 @ \$2.87½. The price of \$2.80 equals, cost and freight, ½ cwt., 8/8½. November and December delivery was offered at \$2.80, without pressure. The closing quotation for 96% is \$2.87½. August shipments to Europe amounted to 57,000 tons, and to the United States to 5000. There remained loading on the 1st inst., for Europe, 75,800 tons, and for the United States, 8000 tons. Charters during the fortnight reached 34,810 tons for Europe and 2270 tons for the United States. **Coal**.—Cargoes arrived were by no means easily saleable, so that for Newcastle 25/ @ 26/ ½ ton had to be accepted. July sail brought 28/; later shipments, such as August and September, cannot be had under 35/ @ 36/ as, with the prevailing high freights, not many arrivals are likely. **Exchange**.—Bills on London 90 days' sight, have been sold at 26½d @ 26¼d.—*Weber & Co.*

EAST INDIES.

PENANG, October 4, 1888.—**Tin**.—During the fortnight there were receipts of, alto-

gether, 10,500 piculs, of which Europeans took 4780 and Chinese about 6000. The market opened at \$38.45 ½ picul, at which Chinese bought; subsequently there was an improvement to \$38.92½, but, later on, a rising exchange was followed by a reaction in Tin, the latter declining to \$38.60, at which Chinamen again bought to-day, the demand for China remaining quite lively. *Gum Benjamin*—of the better descriptions—has been taken, to a moderate extent, at \$53 @ \$56 per picul.—*Schmidt, Kustermann & Co.*

SWEDEN.

STOCKHOLM, November 7, 1888.—**Iron Ore**.—The general impression in Sweden and Norway is that the Lulea-Ofoten Railroad is going to prove a paying affair anyway, even if the cost of building should exceed the estimate so far made considerably. If the export of Ore at any time reaches 1,500,000 tons, the original investment of capital and preferred bonds would begin to draw interest, and if the export should further increase the shareholders will receive dividends. The railway all the way to Gellivara measures 132 English miles in length and is in working order, but there are great engineering difficulties a distance of 22 to 25 miles over the mountains on the track to Ofoten, a distance of 176½ English miles, the difficult portion being estimated to cost something like £20,000 ½ mile, while the rest will cost probably £4000 ½ mile. After the latter railway of 176½ miles is finished the owners of the mines and railroad will be able to lay down the ton of Ore at 16/ in England, and at such a price, or more, millions of tons can be easily sold. In England the Gellivara line, so far as built, is considered well constructed, whereas the Swedish engineers are of a different opinion, condemning as they do the building on frozen ground. The Ore shipping season at Lulea has been brought to a close now for the current year, shipments aggregating 54,200 tons in 30 steamers.—*Dagbladet*.

RUSSIA.

ODESSA, November 8, 1888.—**Petroleum**.—Baron Rothschild, head partner of the Parisian house, is at present at Baku for the purpose of personally inspecting the Naphtha works on the spot and determining what may be done in order to extend all the business of the Caspian Black Sea Naphtha Company. He also intends buying still larger tracts of land in Transcaucasia, not only for the Oil that may exist there, but also for the laying out of vineyards and the making and exporting of wine after the French fashion. So far the borings for Oil at Tiflis have produced no result. The depth of 40 fathoms has been reached, but the pressure of water is such that progress is slow. That Oil exists on the spot the natural wells abundantly prove. Perhaps a greater chance of striking Oil may be in the neighborhood of Baku. There are Oil wells between Tioneti and Tiflis all the way down to the Caspian, but it has yet to be shown that the borings will prove productive in the locality. Some boring is also going on at Elizabetopol and vicinity, with no better result so far.—*Odessa Gazette*.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from November 10 to November 17, inclusive, and from January 1 to November 17, inclusive, were as follows:

Iron and Steel.			
	Nov. 10 to Nov. 17.	Jan. 1 to Nov. 17.	
Iron Ore: A. Earnshaw.....	250	8,837	Tons.
Pig Iron: Crocker Bros.....	1,565	13,357	Tons.

Hardware.

The demand continues in moderate volume, winter and other seasonable goods constituting a good portion of the business. While a confident feeling prevails in the trade and business throughout the country is generally satisfactory, the time of year has been reached when merchants have generally supplied themselves with goods for the trade of the next few months, and orders are in many cases principally for small quantities of Hardware to complete their assortments. Prices remain very steady, and in goods that lie near the raw material there are indications of increasing firmness, especially in the fact that manufacturers are indisposed to accept orders for such goods the execution of which is deferred beyond the first of the year. This is regarded as a favorable symptom, and indicates the probable wisdom of placing orders for such goods, on many of which low prices are now ruling.

Wire Nails.

There is little change in the general situation, quotations on Standard Nails remaining as before. Some of the manufacturers are issuing lists for the goods in papers, in which the list prices are advanced 2 cents per pound, with announcement of a deduction of 1 cent per pound from the list on Nails packed in 25-pound boxes, and of 2 cents per pound on the Nails packed in 100-pound kegs. Other manufacturers retain their lists as before on the basis of 100-pound packages, with advances of 1 and 2 cents, respectively, for 25 and 1 pound packages.

Cut Nails.

The irregularities lately alluded to are less pronounced. They grew largely out of the fact that one or two smaller mills were closing out Nails previous to stopping their manufacture, at least for the present, or to turning to other branches, like the manufacture of Muck Bar, either for the open market or for neighboring mills engaged in other lines. They have led, however, to considerable inquiry for forward delivery, say 60 to 90 days, though so far as we are able to ascertain little business of this kind has been done. We quote \$1.80 to \$1.90 for carload lots and \$1.90 to \$2 for small lots from store.

Miscellaneous Prices.

The Sandpaper market continues unsettled, materially lower prices being quoted than those which prevailed previous to the breaking up of the combination, as announced in last week's issue. The competition between the different manufacturers promises to be animated. As a general price on small quantities, discount 35 to 40 per cent., may be named, with a discount 45 per cent. on 50 reams, and of 50 per cent. on 100 reams.

Mill Roving Cans are now offered as follows by the Union Indurated Fibre Company, of New York, at the following prices:

	Per doz.
10 inches diameter, 36 inches deep...	\$33.00
10 " " 33 " " "	31.00
10 " " 30 " " "	30.00
12 " " 36 " " "	36.00
12 " " 33 " " "	34.00
12 " " 30 " " "	32.00
14 " " 36 " " "	48.00
14 " " 33 " " "	45.00
14 " " 30 " " "	42.00
17 " " 36 " " "	72.00
17 " " 33 " " "	66.00
17 " " 30 " " "	60.00

These are described as light, strong, and having the generally superior characteristics of the ware. They are in use in some of the Eastern mills, and giving excellent satisfaction. They are also described as specially adapted for use as Store Barrels for Pickles, Seed, Flour, and

also for use about restaurants, hotels and home for offal barrels. Covers of the same material are also manufactured.

November 16 the following revised prices of Shot were announced, subject to the usual discount of 2 cents per bag of 25 pounds if paid within five days from receipt of bill:

Drop, per bag, 25 pounds.....	\$1.23
Drop, per bag, 5 pounds.....	.30
Buck and Chilled, per 25-pound bag.....	1.48
Buck and Chilled, per 5-pound bag.....	.35

Notwithstanding this decline in price it is a question whether the market is yet settled, the probability being that there will be another reduction provided Lead does not advance beyond the figures now ruling, as there is more than the usual difference between the raw material and the finished product.

The following is the list of Perfection Padlocks manufactured by the Ames Sword Company, Chicopee, Mass., which are alluded to in their announcement on page 43. The Padlocks, up to No. 150, are subject to a discount of 40 per cent., and No. 150 and upward to a discount of 50 per cent.:

No.	Size, inch.	Kind.	Per doz.
50	¾	Plain Brass Padlocks (Dog Collar), 6 Levers, 2 Keys, Small Shackle.....	\$4.50
50½	¾	Plain Brass Padlocks (Dog Collar), 6 Levers, 2 Keys, Large Shackle.....	4.50
51	¾	Plain Nickel Padlocks (Dog Collar), 6 Levers, 2 Keys, Small Shackle.....	6.00
51½	¾	Plain Nickel Padlocks (Dog Collar), 6 Levers, 2 Keys, Large Shackle.....	6.00
75	¾	Plain Brass Padlocks, 6 Levers, 2 Keys.....	5.00
76	¾	Plain Nickel Padlocks, 6 Levers, 2 Keys.....	6.50
77	¾	Brass Padlocks with Clevis Drop and 31-inch Chain, 6 Levers, 2 Keys.....	9.00
78	¾	Nickel Padlocks with Clevis Drop and 31-inch Chain, 6 Levers, 2 Keys.....	11.00
100	1	Plain Brass Padlocks, 8 Levers, 2 Keys.....	6.00
101	1	Plain Nickel Padlocks, 8 Levers, 2 Keys.....	8.00
102	1	Brass Padlocks with Clevis Drop and 12-inch Chain, 8 Levers, 2 Keys.....	9.00
103	1	Nickel Padlocks with Clevis Drop and 12-inch Chain, 8 Levers, 2 Keys.....	11.00
150	1½	Plain Cast Bronze Padlocks, 8 Levers, 2 Keys.....	11.00
152	1½	Plain Cast Bronze Padlocks with Staple and 10-inch Chain, 8 Levers, 2 Keys.....	12.00
187	1½	Plain Cast Bronze Padlocks, 8 Levers, 2 Keys.....	12.00
188	1½	Plain Cast Bronze Padlocks with Staple and 10-inch Chain, 8 Levers, 2 Keys.....	13.00
225	2¼	Plain Cast Bronze Padlocks, 8 Levers, 2 Keys.....	13.00
226	2¼	Cast Bronze Padlocks with Spring Drop, 8 Levers, 2 Keys.....	14.00
227	2¼	Plain Cast Bronze Padlocks with Staple and 10-inch Chain, 8 Levers, 2 Keys.....	14.00
228	2¼	Cast Bronze Padlocks with Spring Drop, Staple and 10-inch Chain, 8 Levers, 2 Keys.....	15.00
250	2½	Plain Cast Bronze Padlocks, 8 Levers, 2 Keys.....	15.00
252	2½	Plain Cast Bronze Padlocks, Clevis Drop and 10-inch Chain, 8 Levers, 2 Keys.....	16.00

McNiece's Ice Creeper, manufactured by William McNiece, 515 Cherry street, Philadelphia, Pa., is sold at \$15 per gross, subject to a discount of 10 per cent.

The All-Steel Grip Ice Creepers, manufactured by the Penn Lock Works, Philadelphia, for whom W. H. Jacobus & Co., 90 Chambers street, New York, are agents, and illustrated on page 802, are sold at \$3 per dozen pairs, subject to a discount of 33½ per cent.

The James L. Haven Company, Cincinnati, Ohio, call our attention to a typographical error in the statement of their prices given in our issue, 1st inst., in which Ox Shoes were quoted at 5½ cents per pound, instead of 6½ cents, the correct figure.

Items.

C. F. Guyon & Co., 99 Reade street, New York, have been appointed agents for the Niles Mfg Company, Chicago, Ill., and are thus offering the Niles' Double-Acting Spring Hinges. These Hinges are fully described in the circular of the company, which illustrates their special features, attention being called to the advantages possessed by them.

E. C. Atkins & Co., Indianapolis, Ind., have issued a revised edition of their "Saws and Saw Tools." It contains 128 pages of matter revised to date and showing the recent additions to their line. It relates to Circular, Band, Gang, Rip, Cross-Cut and other Saws, Anvils, Straight Edges, Hammers and Saw Tools for saw-makers' use and a full line of Mill Supplies and Saw Mill Specialties. A valuable feature of the book will be found in the full instructions with illustrations in regard to the use and care of Saws, which will be of service to sawyers, filers and those using these goods. They also refer to their branch house in Memphis, Tenn., where they carry a full line of Saws, Saw Tools and Mill Supplies. A copy of this book will be sent on application to any sawyer or lumberman.

The Union Indurated Fibre Company, of New York, are calling the especial attention of their trade at this season to their holiday novelties. In Umbrella Stands or Holders of this material they offer several styles of decoration. Pa-Crusta, Mosaic Inlay (wood effect), hand decorated and plain for home decoration. Waste-Paper Jars or Scrap Baskets, with those same decorations, are also finding a large sale.

On page 42, M. M. Buck & Co., St. Louis, Mo., advertise that they have for sale a very complete and desirable Malleable and Gray Iron Foundry. Those interested are wanted to correspond with the company, and they inform us they are desirous of closing it out at the earliest possible moment.

The Skillman Hardware Mfg. Company, Trenton, N. J., in their descriptive catalogue give prices and descriptions of their extensive line of Mineral, Porcelain, Jet, Bronze Metal and Wood Door Knobs, together with a number of Builders' Hardware specialties. Their exceptionally large variety of Door Knobs will be noticed, as well as other goods. In addition to those represented in the catalogue, they have recently enlarged their assortment by a number of Shutter Knobs, Hook Shutter Bars and Straight Reversible Shutter Bars.

John P. Lovell Arms Company, Boston, Mass., have issued a new catalogue of their Guns, Rifles, Revolvers, Fishing Tackle, Sporting Goods, &c. It is of interest as showing some standard lines with recent novelties. Among these we notice the Springfield Roadster and Bean's Breech-Loading Gun Cane.

Walbridge & Co., Buffalo, N. Y., issue a convenient pamphlet devoted to Sleigh Bells, Snow Shovels, Soapstone Foot-Warmers, Skates, Hand Sleighs, &c. It also calls attention to the Never-Slip Horseshoes.

In addition to the agency for the Sequatchee Hoe and Tool Company, held by H. S. Jackson & Co., Nashville, Tenn., to which we referred in our last issue, they announce also those of the American Tube and Iron Company, Benwood Iron Works, Baldwin Locomotive Works, J. H. Sternbergh & Son, Oliver Bros. & Phillips, Oliver & Roberts Wire Company, W. P. Townsend & Co., and others.

Paine, Diehl & Co., Philadelphia, Pa., announce that they control the sale and manufacture of the Keystone Beaters, and

will offer them to such of the trade as agree to maintain prices. The success of the plan which they have adopted in showing the Egg Beaters in operation is referred to, and a constant and increasing demand is reported.

The R. Wallace & Sons Mfg. Company, Wallingford, Conn., have issued a new and exquisitely printed catalogue of their Sterling Silver-Ware, Nickel Silver-Ware, Fine Table Cutlery, &c. The production this year of a very large number of wholly new patterns is referred to as requiring an entirely new catalogue, and it is evident that many original designs are represented in this volume. The illustrations given being finely engraved and on paper of exceptionally excellent quality, exhibit the goods very satisfactorily. The catalogue is divided into the following departments: Silver-Plated Ware, which represents a large variety of articles, occupying about 50 pages; Sterling Silver-Ware, with illustrations, without prices; Fine Table Cutlery, Cast-Steel Silver Plated, of which a variety of patterns is shown, many of which are new and exceedingly attractive, and Novelties in Steel in cases, representing an interesting line of Nut Picks, Fruit Knives, Coffee Spoons, Button and Glove Hooks, Pocket Fruit Knives, Nut Cracks, &c. A separate catalogue refers to Cast-Steel Spoons, Forks, &c., Silver Plated and also Tinned.

The Porter Mfg. Company, Burlington, Iowa, issue a price list of Porter's Patent Window and Door-Screen Corners, Sticks for Frames, &c., and the Queen City Adjustable Window Screen.

Tendencies in Trade.

We continue below extracts from recent letters from Hardwaremen in which our correspondents more or less fully allude to the present condition of trade as divided between manufacturers and jobbers. It will be seen that in the letters given a considerable divergence of view is expressed, each writer referring to the matter from his own standpoint. It will be observed that many of them allude to the important place occupied by Hardware jobbers as distributors, handling a large proportion of the goods sold and serving greatly the convenience of the retailer. But many of the letters will be of interest as giving our correspondents' views on various matters connected with the trade. There will also be found in them something that will be suggestive to both merchant and manufacturer.

Hannibal, Mo.—I have no specified record of my business, commencing 1853. Always bought as near home as possible to save transportation expenses, prices and quality being equal. To sum up the whole matter, it is this: The retailer can buy cheaper through the jobber than from the factory with the exception of a few staple goods, where a sufficient quantity can be bought to get the extra discount, as Locks, Butts, Screws and some tools. Otherwise I buy of the jobber a general assortment of Hardware for cash cheaper than from the manufacturer, considering expense it must incur on a small quantity, which is the way every prudent retailer should buy if he wants to keep an assortment and make it pay. There is no profit for a merchant to buy \$50 worth of Maydole Hammers, or the same amount of Steel Squares, if he only has sales for about \$10 worth of either in 12 months, when half-a-dozen can be bought whenever needed at, say, 10 per cent. more. He will always have the benefit of ruling market prices. The question for me is, Have Fred P. Straub & Co. confined themselves to a strictly Hardware business—that is, all kinds of Hand Tools, Building Hardware and such articles, made in part of Iron or Steel, for general use, or have they been selling Farm Machinery, Wagons, Buggies, Stoves and Tinware, all under the name of Hardware? If so, they have to buy direct from the manufacturer. On the other hand, they may have increased their business from ordinary retailer to small jobber. Then, of course, they must buy of manufacturer. There is a vast amount of goods made now in the West. Take a line north to south from Michigan to Tennessee, a country 35 years ago not thought about from the manufacturing standpoint.

Every merchant looked to the East to buy goods. Now we see manufacturing establishments almost everywhere. Hence, no doubt the Eastern manufacturer loses some of the Western trade every year, excepting in certain specialties.

Fort Dodge, Iowa.—We think that the tendency among smaller jobbers is to buy more directly from the manufacturer and not depend on larger jobbers as much as in the past. But the retail dealers, almost without an exception, buy from jobbers. This is the case in this territory, and the principal reason is that the retail dealer, as a rule, buys in small quantities and must have his goods at once. This can be accomplished if he buys from a jobber, but if he sent his small orders to a manufacturer he could not get his goods in time to do him any good.

Pueblo, Col.—We are satisfied that there is a decided increase of dealings with manufacturers, owing to solicitations for custom and greater inducements offered by manufacturers to the smaller trade.

Washington, Ind.—With regard to our special trade we think the jobbing portion remains about the same, or nearly so, as previous years. The new Railroad law gives us an advantage in getting goods from Western jobbers that we formerly sent East for, but now the difference in freights about equalizes the difference in cost, so that we don't think our factory orders have increased any appreciable amount.

Randolph, N. Y.—We buy few goods direct from the manufacturers, for this reason: On the amount of our purchases we can do fully as well, and in many cases better, with the jobber as with the manufacturer. We buy the greater portion of our goods West, as we can buy as well and make a nice saving on freights. Probably if our business were doubled we would find it to our advantage to deal with manufacturers. We would prefer to do so, and lean that way as much as possible now.

Peoria, Ill.—The small dealers have almost given up buying from manufacturers, because they have to buy more than they want of many kinds of goods in order to make a shipment, and they prefer to buy in smaller quantities and get goods oftener, even though paying for the privilege. The larger retailers are often of more importance than the jobber, and are so much impressed with that idea as to be willing to pay the manufacturer more for goods than they would have to pay the jobbers, simply to keep up the impression. Our experience is that what we have gained in the small dealers' trade has been lost on the larger trade, leaving the balance about the same.

Fort Smith, Ark.—Years ago St. Louis jobbers had complete control of this city's trade, and in the Southwestern section of this country manufacturers never solicited; neither did the manufacturers' representative call on us for trade direct. In the last four or five years the solicitations of the manufacturers with the small jobbers and large retailers in the Southwest has each year increased largely, the manufacturers offering goods at such prices that the St. Louis jobbers could not or would not meet them. Consequently the large jobbers have been placed between two millstones, and the grinding process is still in operation. The most benefit in this accrued to the small stores, jobbers and retailers. It has built up more small jobbing centers throughout our section who deal direct with the factories or their agents at a consequent loss to the large jobbers, which, for our section, were at St. Louis, Cincinnati, Chicago and, say, Memphis. The manufacturers have very likely gained also thereby, as the small jobber is not so exacting in demanding a ruinous price of the manufacturers as the large jobber. They may sell less in this way, but their profits are larger. Fort Smith, with the exception of one or two retail establishments, buys direct from manufacturers or their agents. She is gradually forcing St. Louis out of the territory surrounding Fort Smith, pursuing her to the limits where it becomes merely a matter of freight rates. Little Rock is fighting both Memphis and St. Louis. Springfield, Mo., tussles with St. Louis and smaller jobbing centers. Hot Springs, Pine Bluff, Ark., are doing the same with the larger jobbers. On the one side we have Fort Smith, and other points in our section increasing their jobbing trade yearly through the aid of the manufacturers, and on the other a yearly decrease in sales and profits to the large jobbers located in large cities.

Davenport, Iowa.—We think the jobbing business is not on the increase, as the large manufacturers are trying to do away with the middlemen by direct offers to the country trade and small manufacturer and by limiting the discounts to the jobbers to such a small percentage as not to pay business expenses. They will fail again in this effort as they did before. Jobbers, on account of the variety of their goods, can reach consumers at less expense than the manufacturers of a few articles.

The past has given to a good many manufacturers a severe lesson, which ought to be in their memory, but the prosperous position of the jobber has created jealousy and another lesson seems to be necessary.

Louisville, Ky.—We believe the jobber has an important place to fill, of which he cannot be deprived. It is a continual case of turn-over—the small houses grow into jobbers and jobbers who have insufficient capital or insufficient brains are displaced. Of course, if it comes to such a pass that a jobber cannot secure sufficient margin, by reason of his supposed advantages, he will simply turn his attention to supplying a smaller class of trade than he does at present. Certainly the rule of *facile descensus* will apply here as well as elsewhere.

Jerseyville, Ill.—I am buying most all my Hardware from the jobbers, principally in St. Louis. Of course there are some goods purchased of manufacturers, but they do not exceed 15 to 20 per cent. of my purchases.

Geneseo, N. Y.—While it is for the interest of the retail dealer to buy certain lines of goods at first hands, we would say that as far as our observation goes the jobber is more than holding his own, for the reason that the variety of goods he, as representative, has makes him more than an even competitor for the manufacturer with only one class of goods to offer, and with this line in many instances in the hands of the jobber at the same price, or a very small advance, thereby making one or more less accounts. The retailer can also by buying more goods of the jobber get better prices for the whole invoice. We think it is with them somewhat as it is with us, that the more a customer buys the better they can afford to use him.

Quincy, Ill.—We think the jobbing business is on the increase in the West. The new jobbing houses in the West, together with the increased number of traveling men sent out by the old houses during the last few years, have made competition so sharp that there is little or no saving for country merchants to buy of manufacturers or their agents.

Brookings, Dak.—In our district, and so far as our observation goes, Irons are bought from manufacturers or their agents, also Tin goods and Scales; Hardware and miscellaneous goods from jobbers.

Searcy, Ark.—Merchants of this place buy most of their Hardware from jobbers, very little being bought from manufacturers.

Morrilton, Ark.—We buy more from manufacturers than formerly.

Doland, Dak.—We are buying two-thirds of our goods from jobbers.

Scotland, Dak.—The merchants West buy most of their goods from jobbers, as manufacturers' representatives do not get as far West as this, unless they want to introduce some novelty. We should say jobbers get the bulk of trade out West.

Paoli, Ind.—I buy principally of the jobbing trade, but buy of the manufacturer in some lines, and am inclining toward the manufacturer. A few years ago I bought of jobbers exclusively.

Highmore, Dak.—Our tendency is toward direct dealings with the manufacturers more and more each year. It is merely a question of price with us, as we do not overstock in order to obtain an extra discount, but can obtain it on our usual purchases from the manufacturers.

Lebanon, Ind.—We are of the opinion that the tendency is to trade direct with the manufacturers. We buy at least two-thirds of our goods direct.

Rapid City, Dak.—If the dealer has business enough, we think it pays to buy of the manufacturer; but, buying in small lots, it is much better to sort up with a jobber. The Hardware merchants of Rapid City buy mostly of jobbers.

Adrian, Mich.—If there is an increased tendency toward direct dealings between the retailer and manufacturer, presume the cause is, prices being equal, the retailer likes to have his goods come to him in fresh packages, and not have some unfamiliar make substituted to fill an order. Also, the "back order" business is a sea of trouble to the retailer.

Ottumwa, Iowa.—Our impression is that there has not been much increase in the jobbing business during the past two years. This, we think, is due generally to depression in the Hardware business and the very small margins of profit made by the jobbers, rather than to a tendency among retailers to buy direct from the manufacturers.

Quincy, Ill.—We as jobbers buy most of our goods direct. In this section small dealers are supplied by the jobbers.

Watertown, Dak.—In this part of the country we are dealing more and more direct with

the manufacturer, and find we can do much better. We buy where we can buy the cheapest, and in almost every instance where we want a good bill in any one line we can do the best from the factory.

Keokuk, Iowa.—Cannot see much change in proportion of business done by jobbers. Retailers buy a few specialties of manufacturers, but the bulk of their goods from jobbers. Think the buying of goods from jobbers is rather on the increase than otherwise, principally on account of the time required to get goods of manufacturers, retailers generally expecting their orders to be filled the same day they are received.

Vinton, Iowa.—We buy most of our goods from manufacturers, not because we can buy goods much cheaper, but for the following reasons: The manufacturers agree to furnish a special make of goods, the jobbers being frequently unable to do this, because they do not carry a full line of the goods wanted; the manufacturers do not usually charge case and cartage, and goods come in better shape.

The following letters are selected from our advices from Ohio, and will be of interest as referring to a number of places, large and small, thus giving a more complete view of the tendencies in that State than is afforded in the more cursory view of the field at large afforded in the letters printed above:

Columbus, Ohio.—The country merchants in all the territory over which our trade extends make all their purchases of Hardware from the jobbers, with perhaps the rare exception of some special article. Goods are sold so close by the jobbers that it is no object to deal with the manufacturer. The Hardware trade has largely increased within a few years past in both wholesale and retail business.

Richmond, Ohio.—In this section of the State goods are largely bought of jobbers.

Bridgeport, Ohio.—I think the tendency of the times is toward dealing with manufacturers.

Granville, Ohio.—We think jobbers' trade is growing every year, and if they only keep good goods at manufacturers' prices the retailers will purchase of them.

Gallipolis, Ohio.—I buy both from the jobber and the manufacturer. In some lines of goods I buy exclusively from manufacturer, while in other lines I buy of jobber and manufacturer, but taking it as a whole I buy the bulk of my goods from manufacturer. I think that this is the case with most houses in this section that amount to anything.

Massillon, Ohio.—We find the tendency (regarding ourselves) toward direct dealings with the manufacturers.

Kenton, Ohio.—We have very little knowledge where the Hardware trade generally throughout our State buy their goods, but judging from what we know as to the stores in this country they buy the bulk of their goods from the jobbers. Of Heavy Hardware, such as Iron, Nails, Barbed wire, Gas-Pipe, &c., the bulk is bought from the manufacturers. We find that, generally speaking, we can do as well with the jobber as with the manufacturer.

Chillicothe, Ohio.—In our trade there is very little change in our buying for the last four years.

Bryan, Ohio.—We find it profitable to deal with the manufacturer direct when we wish to use the quantities of goods that he wishes to sell, but we think that many dealers do as well with jobbers when they are purchasing in small quantities.

Hamilton, Ohio.—We think the tendency is to buy from the factory more and more every year.

Perrysburg, Ohio.—My experience is that jobbers sell fully as low to the retail trade as the manufacturers, except in some special cases, though there are always some who think they are not buying low unless they buy from headquarters. The jobbers are a great convenience to the retail trade, as the retailer can order a large line of goods from one source and save freight that he would be obliged to pay by ordering the same goods from different sources. The jobbers' trade is becoming localized, and goods will be sold in the territory naturally tributary to their location. I think I would pay more for the goods I buy if there were no jobbers, as the lively competition keeps prices down to a small margin. The business is getting to be done by large and wealthy houses. I think they are a necessary part of the business and are here for all time.

Woodville, Ohio.—The practice of most of the wholesale houses doing a very extensive retail business in selling goods to the consumer, and that, too, in the immediate vicinity where they have Hardware dealers for customers, at prices but a little over those charged to dealers,

is not relished by the trade. Further, the pernicious practice of traveling men over-anxious to sell goods, especially in small towns, when failing to sell to the regular trade, proceeding straight to some general store and very often stocking them up with goods that belong to the Hardware trade only, at very low prices, for the purpose of drawing out other trade, of course, is not looked upon with favor by the trade. I would prefer, therefore, to deal directly with the manufacturer rather than a wholesale-retail house, or those who furnish goods to general stores.

Dayton, Ohio.—We are buying as much from the jobbers as we are from the manufacturers. The price decides how we will buy. Our tendency in buying is in the direction of the manufacturers.

Howard, Ohio.—I buy all goods from jobbers.

Portsmouth, Ohio.—It seems to us that Hardware dealers are disposed to buy direct from the manufacturers, or their agents, and the only way the jobbers can prevent it is by giving away a part of the extra quantity discounts allowed them by the manufacturers.

Ironton, Ohio.—We can safely say that we are buying as many goods of jobbers as we did ten years ago, and think that we will do so as long as we are small dealers. We know by experience that there is no money saved by buying small lots of factories direct. We think, and, in fact, know, that when we give an order for \$500 worth of Hardware there are goods in this order made by 25 different factories. Should we order the goods direct from factories there would be 25 orders to send, 25 lots of freight to receive, 25 freight bills to pay, 25 drayages to pay, 25 entries to make in books, and some of the goods come in two or three weeks late. Besides, not one of the manufacturers would thank us for such a small order and the price is about the same as the jobber would gladly give us. We think that as long as we can count ourselves retailers we will buy more of our goods from jobbing-houses, as the Hardware store has probably the greatest variety of goods of any other class of stores in the country. We think that as long as there are small Hardware stores there will be jobbers also. We are of the belief that this matter will remain in the future as it has been in the past, that the great part of General Hardware will be bought of the jobber.

Washington C. H., Ohio.—We think tendency is to have direct dealings with manufacturer or his agent.

Apple Creek, Ohio.—I find that the large retailers in this section are buying more of the jobbers than manufacturers, and that the jobbing trade in our State is on the increase. We have Cleveland, Youngstown, Akron, Canton, Toledo, Mansfield and Dayton with large jobbing houses, with stocks ranging from \$75,000 to upward of \$300,000, while a few years ago Youngstown, Akron, Canton, Mansfield and other places contained only retail stores. In most instances we can buy cheaper of the jobber than the manufacturer. The jobbing trade is on the increase.

Pomeroy, Ohio.—We buy the greater part of our goods from jobbers and manufacturers' agents—Iron, Nails, Horseshoes, &c., from manufacturers.

Toledo, Ohio.—Our dealings with jobbers and manufacturers for the past year, as nearly as we can find out, have been about equally divided, and we are buying more from the manufacturers now than formerly.

Business Methods.

Kellogg, Johnson & Bliss, 108 and 110 Randolph street, Chicago, have a system of preserving copies of orders which they claim is far more satisfactory than any other plan they have tried. For this purpose they have taken a blank book of 400 pages, with the pages numbered and an alphabetical index in front. As most of their goods are bought regularly from certain houses, they assign a number of pages to each house, according to the volume of business which they have been in the habit of transacting in that line. Plenty of room is left for houses from whom purchases are made irregularly. In this book all orders are copied before they are mailed, and in it also the goods are checked off when they are received. The orders sent to each house are thus kept together. The objection to the use of an ordinary copying book is that the orders are necessarily intermingled, and besides it often happens that through carelessness or haste on the part of the person copying the letter an undecipherable page

is left, which may perhaps relate to the most important part of an order. An occasional error, it is true, may be made in transcribing orders in the method followed by Kellogg, Johnson & Bliss, but in a long series of years they have had very little trouble from this cause, whereas they formerly suffered much inconvenience when using the ordinary copying book. The same firm also use an invoice book for their stock. This is a book of 500 pages. In it all stock is entered in alphabetical order, the names of articles having under them descriptions of every variety carried and their price. This stock book is found of daily value to salesmen, and it is also of very great use in taking account of stock. Kellogg, Johnson & Bliss have one of the largest and best equipped retail stores in the country, and, while they handle a general line of Hardware, they give special attention to Builders' Hardware and Mechanics' Tools.

Arrangement of Stores.

A dealer in Montgomery City, Mo., favors us with a description of a wire-cloth rack, which, in his opinion, is the best for the purpose which has ever come under his notice. He says:

I believe I have a better wire-cloth rack than any I have ever seen, and at very small expense. A fair idea of the device may be gained from the sketch. Each end of the rack is made of a 2 x 6 inch dressed pine board, and the two are joined together at the bottom with a

Fig. 301.—Wire-Cloth Rack.

2 x 6 inch piece, making the frame 36 inches wide and providing room for five sizes of cloth. These are slipped on Judd's pine curtain rollers and inserted through holes in each end of the frame, as indicated in the engraving presented herewith. One end of this roller is squared to fit an ordinary grindstone crank. The other end has a gain cut all around it, something after the style of a key seat, except it is crosswise the roller. A piece of No. 8 wire is slipped through the uprights and the edge of the hole into the gain, to keep this rod from working out while unwinding the cloth. In the upright post is cut a series of slots, in which I place rollers of the same description as those above referred to. Into each end of these rollers is screwed a round head blued screw, while a square screw hook is placed in the post just behind the roller holding the wire. To this blued screw I attach a coil brass spring, the opposite end of which I place over the square screw hook above mentioned. The roller and springs give sufficient tension to hold the wire taut while the cloth is being unwound. A rack of this description can be made for \$1.25 which will hold six rolls of wire cloth. I have many other conveniences in use in my store which I may find time to write about later.

Short vs. Long Discount.

While the cash discounts mentioned in the following article from the *American Storekeeper* are larger than those usually given in Hardware, the principle embraced is still applicable, and the matter deserves the careful attention of Hardwaremen:

We will suppose you have purchased a bill of \$1000 and have received the invoice, on which the terms are given as "6 off 10 days; 5 off 30 days; 4 off 60 days." We will first remember that discount is an allowance made for the payment of money before it is due, and is equivalent to the interest of the amount of the invoice, \$1000 in this case, during the 60 days. To apply our mathematics to the case in point, if we pay this bill within 10 days we will deduct \$60 from the invoice and remit \$940. What we have saved equals the interest on \$1000 for one year at 6 per cent. The advantage of doing this is very apparent. If we say we will wait 20 days and take off 5 per cent., we had better think a moment and then not do it. If we should do so, we would pay \$10 for the use of \$1000 for 20 days; this is at the rate of $1\frac{1}{4}$ per cent. per month, or 18 per cent. per annum. You will at once recognize that no merchant should pay such an exorbitant rate of interest, except in time of great emergency. Let us figure a little further and take it for granted that we do not propose to pay the bill until 60 days have expired, and that we then propose to pay \$960. If we do this, we pay \$20 for the use of the money for 50 days. A little calculation will show you that this is equivalent to paying about $1\frac{2}{3}$ per cent. interest per month, or $14\frac{2}{3}$ per cent. per annum. If, now, you do not propose to pay at the end of 60 days, and prefer to pay at 3 months, and pay the \$1000 net, you will be paying \$60 for the use of \$1000 for 80 days, which is at the rate of $2\frac{1}{3}$ per cent. a month, or about 27 per cent. per annum. If the figures in the previous cases were astonishing, these are astounding, and we do not believe that any merchant can say, after reading this carefully, that he can afford not to discount his bills.

A Million Dollars and a Thousand Years.

BY KNARF.

These terms, "a million dollars and a thousand years," are only comparative terms, to designate untold wealth and unlimited life. If I had these at my disposal, they should both be devoted to rectifying some of the most glaring evils of our modern business life—if I felt as I do now. My feelings on the first evil I would tackle may be somewhat wrought up, but I do not think unduly so. It goes by the name of "credit," or words which translate into that, the world over. It is not a large word, and the first letter is near the initial one of the alphabet; but it is a word that brings disaster to the world.

The origin of credit is not certainly known, but is supposed to have come into use when Cain went to dwell in the land of Nod; wanting to trade with his brother-in-law one day, and finding he had put on his other pants before leaving home and left his pocketbook in them, asked his kinsman "to put it on the slate." The same person has left other legacies to the world, which have become equally unpopular. Credit may be one of the evils that must be endured, especially in the nineteenth century. But, from the sewing woman who gets a pound of butter from the corner grocery on tick, until she gets her money on the present unfinished job, to the speculator who buys an elevator full of wheat on futures, the system is the same.

Do the profits to the wholesale Hardware jobber justify the risks he takes in lending his goods around the country—of having

them lent by his traveling representatives?

If he were the only house that sold Mr. Gimlet a bill during the month, the risk would be small. But Mr. Gimlet has the pleasure of entertaining on an average three traveling men each day, who are dependent upon their position the following year in proportion to the amount of their sales this year; consequently they are more than desirous of taking his order for present shipment, and of duplicating the amount of goods in 60 days to fill up his broken assortment. In fact, each of these 18 drummers each week makes all known inducements to book Mr. Gimlet's orders, and our friend Mr. Gimlet, being a shrewd buyer, leaves the house little margin in profits after the \$8 or \$10 a day for salary, traveling expenses and the additional expenses of the house are deducted. The jobber writes a sharp letter, inquiring why the screws and strap-hinge price had been cut so on Mr. Gimlet's bill, with the usual statement that at regular prices the house is making no money. The answer comes back that prices on the road and prices in the office are two different things, and if the salesman sells goods he must meet competition, and then the matter drops. The salesman's answer answers itself. Mr. Gimlet has been buying somewhat more largely of everything than usual, for the crop outlook is good, and, though it is Presidential year, the prospects for a spring trade are good. But the wheat gets frozen out in his section of country by winter rains which melt their snow covering; oats turn out poorly, followed by a large crop of potato bugs, and dry weather, which uses up the berry crop. Legislation in Congress affects the price of raw material; iron drops, and his two carloads of nails have to be sold at an actual loss.

These depressing influences coupled with campaign uncertainties deter the moneyed men from investing in new buildings, the manufacturers from enlarging or improving their plants—in short, the wheels of commerce miss the lubricating causes that insure quiet, easy running, and by the time Mr. Gimlet's bill begins to mature he finds it necessary to ask an extension, giving his paper for the same. His credit has always been good; he has done a safe conservative business; his creditors do not want to close him up, as he may yet be a good customer; Dun and Bradstreet have always quoted him "fair," and a special report from the agency assures them that his embarrassment is only temporary. Matters in Mr. Gimlet's establishment do not improve with time, and as he considers that his family has claims upon him greater than jobbers, who have taken the risks, and made money from him for years, he arranges his worldly affairs so a confidential friend becomes owner of his stock just previous to his notes maturing.

If Mr. Gimlet could have disposed of what goods he did sell for cash, the fraudulent assignment would have been avoided. When he saw the way things were going he sold more freely on credit than he had before, hoping to realize from his book accounts in time to meet his paper. Failure on the part of his customers to fulfill their promises in time to avoid disaster took away his only and last hope. The history of the two or three hundred reported failures a week would read much the same as this, with the word credit, with a big C, at both ends of the novel.

The newly married couple want to buy a stove and the necessary trimming to conduct the culinary department of their newly found paradise. They have so many other things to buy, they can't pay all cash for the outfit, but would like to pay \$5 a month. Mr. Gausedoor sometimes sells stoves on the installment plan, and as he has a form of lease that covers

everything but the souls of his patrons he does not hesitate to let the strangers have what they want on time, making it necessary for seven months to elapse before the bill is paid. Mr. Gausedoor has had to pay for his trimming in 60 days or less, and for his stove in four months. He has made \$4.85 on the deal, and waits six months for his profit, unless he counts his profit before he receives all the cost of his goods. Either the husband or wife make the payments promptly each month, for four or five months, and then they fail to put in an appearance. A visit to their home reveals the fact that the wife is poorly, not being used to hard work, and the husband has been laid off, or is sick, or some good reason why they are not able to meet their payment.

If Mr. Gausedoor's bill was the only one, and all their household plunder but the stove and trimmings were paid for, it would not have been so hopeless; but upon investigation Mr. Gausedoor finds they have signed leases for their furniture and sewing machine. The wife had always been used to a musical instrument in the house, so they thought by a little more economy they could pay \$5 a month on an organ. Their house rent was \$5 a month. They had agreed to pay this \$25 a month on \$1.50 a day that the husband earned, leaving them \$14 a month for their living expenses. Mr. Gausedoor sees the case is almost hopeless, and pulls his stove and trimmings. The other dealers follow suit, and the married couple lose the \$100 or \$125 they have paid. Here is another failure, which is never reported in commercial circles, but causes more suffering and loss of faith in God and man than Mr. Gimlet's did. If this young couple knew they could not get goods on credit the wedding would have probably been deferred until they had enough capital earned to start them on a cash basis. This is not simply a supposed case, but repeats itself over and over in reality each year. Both the merchant and purchaser are injured by credit.

The statement has been made that there is not enough money in the world to pay all the debts at once. This may be the case, but \$1 kept moving will pay the entire indebtedness of the world. But it has got to get a move on it, and keep it up. What a feeling of independent manhood must be the possession of the retail merchant who lives up to the conspicuous notice hung in his store, "Terms Cash!" He can refuse one credit without fear of offending, because he refuses all credit.

What a disagreeable feeling when you see old Judge Pennyman coming into your store. He is soaked with whisky, and you are perfectly sure your shoe bill will encroach upon the principle invested in the goods you sell him, to say nothing of the profits. But you hate to refuse the old resident a little credit, so you sell him a pocket knife for just a few days, and after he has left the store you intentionally forget to charge it, as ever getting the pay is so doubtful.

We are apt to copy as well as admire methods which bring success. The largest as well as the most successful corporations are conducted on the cash system. We admire the stability of Government buildings, and anything in the construction line put up by Uncle Sam we are sure will be well put up. But the money is always ready to pay for it. If the credit system were desirable why should not the railroads sell tickets on time, waiting for the traveler to reach his journey's end and receive the money, the getting of which was the object of his journey, and then pay for the ride? Why do not the telegraph companies send messages and wait for pay until some other time? Why, if these corporations can't get along and do business successfully on anything but a cash basis, can we expect to? The

proportion of those who are successful in business is put down as one-tenth of those who start a business for themselves. There may be reasons why they are not successful, such as temperament, habits, location, ability, &c., &c., but credit is at the bottom of it all.

The affect of the ability of one to have "good credit" is bad. A fact needing no proving is that persons will always buy more freely when having things charged than when paying as they go. Also when the bills come to be paid almost always they are larger than they expected. Would it not be a good plan to look at this method of credit from a higher standpoint? Not that it is a favor you are conferring upon the merchant in taking his goods in exchange for a spoken or implied contract to pay some time, and look at it as if you were asking the loan of money from the merchant. Let the merchant sell his goods and get the money for them, and let the banks sell the credits. And, Mr. Merchant, how many of your customers would you loan money to, even to the cost of the goods they buy and take away home. In a general store in the lumber regions of Michigan we have an example of my theory. When customers want goods on time or credit they are referred to the merchant; he finds how much they want and for how long a time. He then makes out a note for the amount, with interest from date, and, after their signing it, he gives them the money and they pay cash for what they buy.

The money is given them and they pay it to the salesman in exchange for the goods. The credit system is often the result of competition and the desire to make sales, either from actual need of money to pay bills coming due or to gain custom. Time is an almost irresistible inducement to purchasers, and, in buying, they so far overdo the matter that they soon become reckless as to results. A practical solution of the credit system would be a national exemption law, exempting everything a person owns or could own, so no debt could be collected by law. Confidence in men's honesty, not backed by law, would be so much less that credit would be a thing of the past. Without vouching for the truth of the following statement, it has been said that in Japan—I think—any one who owes any one on their New Year's Day is prohibited by the Government from continuing in business until such debts are paid. His business place is closed.

Exports.

PER SHIP MINISTER OF MARINE, OCTOBER 25, FOR MELBOURNE, AUSTRALIA, CONTINUED.

By *R. W. Forbes & Son*.—40 dozen Shovels, 125 dozen Washboards, 4 dozen Egg Beaters, 15 crates Churns, 5 packages Hardware, 1 package Hardware, 11 packages Hardware, 108 dozen Axe Handles, 43 dozen Shovels, 18 dozen Axes, 24 dozen Axes, 2 dozen Bench Screws, 8 dozen Curry Combs, 2 packages Carriage Hardware, 20 dozen Sluice Forks, 4 packages Agricultural Implements, 6 Parers, 16 cases Hardware, 7 Bird Cages, 8 boxes Stoves, 1 dozen Cork Pullers, 1 dozen Carpet Sweepers, 1 case Toys, 1/2 dozen Razor Strops, 2 packages Fruit Evaporators, 28 packages Hardware, 14 dozen Axes, 15 1/2 dozen Hatchets, 2 dozen Bench Screws, 1 dozen Money Drawers, 1 case Hardware, 1140 boxes Clothes Pins, 1 package Farming Machine, 28 packages Hardware, 6 dozen Wringers, 1 case Bench Screws, 80 dozen Shovels, 362 dozen Handles, 6 dozen Horse Brushes, 9 crates Churns, 22,435 pounds Barb Wire, 2 packages Hardware, 2 cases Scales.

By *Arnold, Cheney & Co.*—360 dozen Handles, 960 dozen Handles, 1080 dozen Handles, 3 cases Hardware, 1 case Axes, 8 cases Saws, 800 dozen Handles, 700 dozen Handles, 4 cases Axes, 54,814 pieces Roofing Slate, 4 cases Hardware, 1 case Hardware.

By *New Haven Clock Company*.—1740 Clocks.

By *H. S. Chipman*.—12 cases Step-Ladders.

By *J. H. Startin*.—3395 pounds Iron Rakes.

By *A. Field & Co.*—50 sets Axes.

By *Russell & Erwin Mfg. Company*.—42 cases Hardware, 51 cases Hardware.

By *Plumb, Burdick & Barnard*.—3330 pounds Iron Bolts, 5665 pounds Iron Bolts, 8468 pounds Iron Bolts.

By *Healy & Earl*.—1 box Hardware, 1 case Saws.

By *Welsh & Lea*.—7 cases Iron Bolts, 30 packages Hardware.

By *Ansonia Clock Company*.—112 boxes Clocks.

By *W. K. Freeman*.—300 dozen Axe Handles, 23 packages Lamp Goods, 3 boxes Hardware, 1 package Drills, 12 packages Hardware.

By *Woodhouse & Stertz*.—3244 pounds Axes, 9 cases Hardware.

By *W. Peabody & Co.*—22 cases Woodworking Machinery.

By *Arkell & Douglas*.—104 dozen Hatchets, 50 dozen Axes, 20 dozen Forks, 41 dozen Axes, 70 dozen Axes, 400 pounds Nails, 105 dozen Saws, 18 dozen Hatchets, 2 bundles Hardware, 229 pounds Lampware, 36 sets Axes, 4 cases Hardware, 1 case Carriage-Ware, 2 dozen Saw Clamps, 12 dozen Pulleys, 199 pounds Castings, 6 dozen Mattocks, 6 dozen Picks, 2 cases Wrenches, 1 1/2 dozen Wringers, 16 dozen Shovels, 16 dozen Axes, 500 Broom Handles, 3 dozen Mattocks, 1/2 gross Axe Grease, 1/2 dozen Machinery, 259 pounds Hardware, 18 dozen Glue, 7 1/2 dozen Chisels, 7 packages Stone, 160 1/2 dozen Chisels.

By *J. Dixon Crucible Company*.—671 pounds Lead Pencils.

By *McLean Bros. & Rigg*.—12 dozen Saws, 14 dozen Braces, 1900 pounds Nails, 15 dozen Bench Screws and Wrenches, 10 dozen Clamps, 10,000 Bolts, 351 pounds Oil Stoves, 13 dozen Axes and Hatchets, 8 dozen Axes, 1 dozen Plated-Ware, 13 Coffee Mills, 39 Meat Choppers, 36 dozen Hammers, 1 dozen Store Trucks, 6 gross Mouse Traps, 18 sets Wheels, 2 dozen Miter Boxes, 51 Chucks, 46 dozen Saws, 3 Chucks, 43 dozen Locks, 49 dozen Mouse Traps, 1 case Wrenches and Bell Studs, 3 gross Tin Oilers, 21 dozen Washboards, 12 dozen Lamp Burners, 204 dozen Chimneys, 6 packages Plated-Ware, 3 gross Fly Traps, 40 dozen Illuminators, 1 dozen Firearms, 50 sets Axes, 7 dozen Wringers, 9 cases Drills, &c., 24 dozen Washboards, 48 dozen Axes, 20 Harrows, 28 dozen Drills, 30 dozen Axe Grease, 12 1/2 gross Axe Grease, 45 Weeders, 60 dozen Axes.

PER BARK V. L. STAFFORD, NOVEMBER 1, FOR PORT NATAL, AFRICA.

By *Arkell & Douglas*.—6 cases Agricultural Implements, 2 dozen Meat Cutters, 1 dozen Axes, 3 dozen Washboards, 2 dozen Picks, 30 dozen Picks, 3 Ranges, 10 cases Plow Parts, 62 dozen Brooms, 208 Agricultural Implements, 60 dozen Axes, 5 cases Bolts, 6 Carriages, 10 cases Plow Parts, 208 Agricultural Implements, 3 dozen Wire Goods, 4 dozen Hatchets, 20 dozen Axes, 6 dozen Axes, 40 Plows, 30 dozen Handles, 3 dozen Wheelbarrows, 1/2 dozen Agricultural Implements, 2 dozen Saws, 22 dozen Plated-Ware, 4 dozen Hardware, 12 pairs Sash Pulleys, 1-6 dozen Presses, 80 dozen Hatchets, 2 dozen Sewing Machines, 88 dozen Picks, 1/2 dozen Store Trucks, 150 Plow Beams, 150 pairs Handles, 150 Plow Parts, 5 dozen Axes, 6 dozen Picks, 12 crates Stoves, 1 Carriage, 3 sets Axes, 182 dozen Handles, 39 cases Sash Weights, 4 dozen Braces, 14 1/2 dozen Saws, 6 dozen Hammers, 2 dozen Mandrels, 6 dozen Locks, 54 dozen Axes and Picks, 129 pounds Sash Cord, 1 dozen Agricultural Implements, 152 Plows, 3 dozen Fruit Jars, 180 feet Sash Cord, 75 pounds Horse Nails, 84 dozen Shovels, 9 cases Hardware, 19 1/2 dozen Lampware, 6 dozen Axes, 1 case Hardware, 8 cases Meat Cutters, 5 dozen Wrenches, 2 dozen Handles, 1 case Hardware, 8 dozen Drills, 1-6 dozen Trucks, 9 pairs Hinges, 9 dozen Locks, 1 case Castings, 4 cases Hardware.

By *Marcial & Co.*—10 dozen Axes, 10 dozen Hatchets, 6 dozen Hatchets.

By *H. W. Peabody & Co.*—1 case Hardware.

By *H. A. Caesar & Co.*—25 dozen Axes, 48 pieces Plows, 125 dozen Plow Points, 125 dozen Plow Parts, 32 dozen Plows, 150 dozen Plow Parts, 3/4 dozen Axes and Hatchets, 40 pieces Plows, 72 dozen Plow Frames, 904 pieces Plow Parts, 24 pieces Plows.

PER BARK H. S. JACKSON, NOVEMBER 1, FOR EAST LONDON.

By *W. H. Crossman & Bro.*—2500 pounds Sash Weights, 102 1/2 pounds Sash Cord, 90 dozen Hatchets, 9 Scales, 32 dozen Chains, 10 Stoves, 125 dozen Brooms, 100 dozen Handles, 395 cases Plow Parts, 20 Corn Shellers, 13 Mills, 45 Churns, 6 dozen Clocks, 2000 pounds Nails, 18 packages Carriage-Ware, 4 cases Carriage Hardware, 1820 pounds Sash Weights, 78 pounds Sash Cord, 24 dozen Handles, 20 dozen Hatchets, 40 dozen Brooms, 42 dozen Washboards, 18 Stoves, 221 cases Plow Parts, 2300 pounds Nails, 3 dozen Clocks, 36 Grindstones, 3 packages Carriage-Ware, 14 packages Hardware.

TO MOSSEL BAY.

48 cases Plow Parts, 15 dozen Brooms, 6 1/2 gross Axe Grease, 11 dozen Axes, 8 dozen Hatchets, 1 gross Blacking, 840 pounds Sash Weights, 32 pounds Sash Cord, 42 dozen Handles, 900 pounds Sash Weights, 47 1/2 pounds Sash Cord, 1 box Hardware, 1/2 dozen Corn Shellers, 6 dozen Fly Traps, 119 cases Plow Parts, 24 barrels Carriage-Ware, 1050 pounds Sash Weights, 46 pounds Sash Cord, 1 barrel Hardware, 9 dozen Hatchets, 13 dozen Axes, 24 dozen Handles, 1 dozen Fly Pans, 6 dozen Fly Traps, 20 dozen Brooms, 300 dozen Axe Grease, 110 cases Plow Parts, 1200 pounds Nails, 6 cases Carriage Hardware, 10 packages Carriage-Ware.

PER BARK SIMON, OCTOBER 31, 1888, FOR AUCKLAND, NEW ZEALAND.

By *R. W. Forbes & Son*.—3 gross Shade Rollers, 8 cases Oil Stoves, 9 racks Churns, 9 cases Wringers, 100 dozen Axe Handles, 455 pounds Bolts, 3 boxes Lampware, 4 dozen Wringers, 1 case Lawn Pumps, 1 package Hardware, 10 dozen Shovels, 105 dozen Axes, 7 dozen Forks, 30 dozen Shovels, 8 boxes Scales, 20 dozen Hatchets, 16 dozen Hammers, 4800 Carriage Bolts, 30 dozen Washboards, 60 dozen Axe Handles, 2 packages Carriage Hardware, 11 crates Stoves, 1267 feet Belting, 1 barrel Hardware, 2 boxes Rat Traps.

By *W. H. Crossman & Bro.*—1 case Toys, 10 cases Sates, 100 gross Pistol Caps, 4 packages Lamp Goods, 60 dozen Handles, 12 dozen Axes, 180 dozen Handles, 75 dozen Brooms, 1 dozen Hay Knives, 1/2 dozen Bolt Cutters, 1 dozen Stove Trucks, 3 3/4 dozen Wringers, 1000 pounds Horse Nails, 1 dozen Ox Bows, 12 dozen Mouse Traps, 2000 pounds Nails, 3 dozen Razor Strops and Hardware, 11 cases Hardware, 5 cases Tools, 1 case Hardware, 382 Wood Spoons.

By *H. W. Peabody & Co.*—308 dozen Handles, 30 dozen Shovels, 1450 pounds Nails, 4 packages Clocks, 3 packages Lawn Mowers, 3 crates Sewing Machines, 300 pounds Nails, 7 packages Fire Arms, 2 packages Tools, 6 cases Blacking.

By *Mailler & Duereau*.—372 dozen Handles, 60 dozen Handles, 72 dozen Handles, 180 dozen Handles, 50 dozen Washboards.

By *Welch & Lea*.—2 cases Iron Bolts.

By *Healy & Earl*.—4 crates Forges.

By *Gowlds Mfg. Company*.—3418 pounds Pumps.

FOR WELLINGTON.

By *Mailler & Duereau*.—5 boxes Castings.

By *R. W. Forbes & Son*.—5 packages Hardware, 4 packages Kitchen Utensils, 9 dozen Wringers, 2 cases Stoves, 10 Axes, 2 packages Plated-Ware, 262 dozen Handles, 10 racks Churns, 60 dozen Brooms, 40 dozen Shovels, 25 dozen Axes, 25 packages Hardware, 2 packages Kitchen Ware, 24 cases Handles, 8 crates Churns, 1 case Agricultural Implements, 2 1/2 dozen Wringers, 16 dozen Hatchets, 33 packages Hardware, 60 dozen Shovels, 30 dozen Sash Cord, 6 cases Scales, 2 gross Axe Grease, 2 1/2 dozen Wringers, 2 cases Carriage Hardware, 2 packages Store Trucks, 19 cases Choppers, 1 1/2 dozen Emery-Wheels, 390 dozen Axe Handles, 1 package Hardware, 3 packages Hardware, 2 crates Stoves, 2 dozen Wringers, 12 dozen Handles, 6 dozen Mattocks, 1 crate Agricultural Implements, 40 boxes Horse Nails, 10 dozen Hammers, 10 dozen Shovels, 2 sets Harness, 1 dozen Whip Sockets, 9 sets Axes, 9 packages Hardware, 20 dozen Shovels, 78 cases Horse Nails, 50 dozen Shovels.

By *W. H. Crossman & Bro.*—1120 pounds Axe Grease, 10 dozen Sluice Forks, 130 pounds Sash Cord, 36 dozen Shovels, 1 case Stove Fittings, 9 Store Trucks, 13 1/2 dozen Wrenches, 1-6 dozen Stoves, 6 gross Pencils, 3 cases Plow Parts, 6 dozen Hatchets, 6 1/2 dozen Churns, 1/2 dozen Scales, 1 case Hardware, 2 dozen Pruning Shears, 2 cases Lamp Goods, 12 cases Tools.

By *McLean Bros. & Rigg*.—2 dozen Shears, 6 dozen Hammers, 1 dozen Handles, 1-6 dozen Scales, 1/2 gross Egg Beaters, 18 Clocks, 1 case Plated-Ware, 1 1/2 dozen Augers, 8 1/2 dozen Chimneys, 1 dozen Stoves, 2200 Bolts, 11 Churns, 4 cases Fruit Jars, 1 Stove, 8 dozen Wrenches, &c., 6 dozen Cranks and Rollers, 250 Handles.

By *H. W. Peabody & Co.*—23 cases Handles, 16 packages Hardware, 2 dozen Wringers, 4100 pounds Nails, 52 dozen Shovels, 13 packages Hardware, 500 feet Cordage, 51 packages Carriage-Ware, 98 packages Hardware, 3000 pounds Nails, 20 packages Stoves, 1 case Agricultural Implements, 40 dozen Shovels, 6 crates Churns, 172 dozen Handles, 4 packages Pumps, 1 case Razors, 5 dozen Wringers, 26 cases Hardware, 12 packages Carriage-Ware, 1 case Wringers, 1 crate Stoves, 48 dozen Handles, 210 pounds Nails, 865 pounds Bolts, 2 cases Machinery, 54 dozen Handles, 3 barrels Hardware, 1 case Twine, 103 packages Hardware, 5 packages Pumps, 6 cases Hardware.

The Boss Two-Speed Boring Machine.

This machine, which is represented in Figs. 1 and 2, is put on the market by J. H. Osborne & Co., Union City, Ind. Its special feature is indicated in its name, and consists in the fact that it can be run

Fig. 1.—The Boss Two-Speed Boring Machine.

at two different speeds, a comparatively slow speed for large augers and a speed two and a half times as great for small augers. The manner in which this is accomplished is indicated in Fig. 1, which shows clearly the mechanism of the ma-

Fig. 2.—The Boss Two-Speed Boring Machine, Folded.

chine. Two augers may, if desired, be kept in the machine, to use either of which it is only necessary to point it downward by first raising the gear frame out of the main frame, inverting and replacing it, keeping the cog gearing on the right-hand side of the machine. It will be observed that the machine will bore at any angle, and that it may be folded up com-

pactly, as shown in Fig. 2. The advantage that results from having a different speed suited to the size of the auger bit used will be appreciated, and it is placed on the market by the manufacturers in confidence that it will be found to meet the wants of the trade. The quality of the workmanship is also alluded to, and various improvements which have been incorporated in the machine. The point is also made that there are no springs or shifting gear to get out of order.

The Standard Calf Weaner.

The accompanying illustrations are descriptive of a new calf weaner which has been brought out by the Standard Wire

The Standard Calf Weaner.

and Iron Works, of Chicago. It consists of a perforated metallic concave plate which fits over the calf's nose and mouth, and is kept in place by suitable straps and a hinged metal frame. In front of the plate and on the sides of the frame are metallic points intended to slightly prick the cow, but which are too blunt to hurt her. The frame to which the plate is attached is hinged at a suitable distance up the calf's jaw to get out of its way when it lowers its head to feed, and to drop back over its mouth when it raises its head to suck. The plate does not closely cover the calf's mouth and nose and interfere with its breathing, but is at least 2 inches from them. The construction of this weaner obviates the fault found with open muzzles, which are apt to catch in brush or limbs of trees, and be broken by the calf in endeavoring to free itself. Bennett

Improved Soldering Furnace.

M. L. Hull, of Cleveland, Ohio, is offering the trade an improved soldering furnace which has been devised to meet the special requirements of tinner, roofers, metal pattern-makers and others who are called upon to perform work in which soldering is required. The furnace uses gasoline as a fuel. By means of the illustration, the reader will be able to gather a very clear idea of the general appearance and construction of the device referred to. The arch, under which the soldering irons

are placed, is made of fire-clay, similar to that employed for fire-pot linings in heating stoves. In order to strengthen this arch as well as to prolong its life, it is covered with Russia iron. The burner employed is of simple construction, being entirely closed in from drafts, rendering it specially desirable for outdoor work.

Improved Soldering Furnace.

The wooden hand-wheel, shown at the right in the engraving, is so arranged, the manufacturer claims, that it never becomes sufficiently hot to burn the hand. The cut-off or switch cup is rapid in operation, and is said to be entirely satisfactory in every particular. The pneumatic rubber pump handle, which has been recently patented, is shown at the base of the furnace, and it only requires a slight pressure of the hand to supply the necessary air to the gasoline tank. The form of handle shown has been found to be much more convenient and durable than the rubber bulb formerly employed. The tank is strongly made in one piece, stamped from metal. The manufacturer states that soon after the fire is started, the arch above referred to becomes red hot on the inside, after which time a very small fire will be sufficient to keep the irons in condition for use. The entire furnace weighs only 12 pounds, and exclusive of the iron arch, only 10 pounds.

& Shirk, 154 Lake street, Chicago, are sole selling agents.

The Vulcan Iron Works, 86 North Clinton street, Chicago, have recently added a brass foundry to their establishment, and are now prepared to make aluminium bronze castings, for which there is a large field.

New Idea Spring Hinge.

The accompanying illustration represents full size the New Idea Spring Hinge, which is put on the market by the Stover Mfg. Company, Freeport, Ill. It indicates satisfactorily the construction and special features of the hinge, in which, it will be observed, are some new features. The

can be used with any size of coupling; that it is inexpensive and does it work without excess of friction, thus saving wear. We are also advised that it is made of lighter wire than is used in their other makes, thus securing more flexibility while it is still sufficiently strong and durable. It is stated by the manufacturers, in their announcement on page 43,

The New Idea Spring Hinge.

manufacturers lay special stress upon the fact that the hinge holds the door strongest at the closing point; that the spring is covered, protecting it from the weather; that there is an exceptionally light amount of strain upon the spring while in actual use. Enlarging upon one of these features, the company explain that the spring has three to four times more resistance at the closing point than others on the market, and that the resistance gradually decreases in opening the door. The hinge is also referred to as subject to less than one-half the actual working strain of any other. The illustration given represents the No. 1 hinge, a No. 2 being also made larger and stronger, 4 x 4 inches, which is intended for use on large doors.

Hub Thill Spring.

Butts & Ordway, 147 Pearl street, Boston, Mass., are putting on the market a new thill spring called the Hub, which is

Hub Thill Spring.

illustrated in the accompanying cut, which shows its form and the respects in which it differs from other similar goods on the market. The points are specially made in regard to it that there is no projecting edge to tear the sponge or wash cloth; that it

that they will send a sample pair on application to any hardware, carriage or saddlery house desiring it.

The Champion Blotter Bath.

This article, which is manufactured by the F. F. Adams Company, Erie, Pa., is represented in the accompanying illustration.

Fig. 1.—The Champion Blotter Bath.

tion, Fig. 1. It consists of a japanned metal case, neatly trimmed, measuring about 12 inches in length by 10 inches in width and 3½ inches in depth outside. The case incloses three porous tile slabs, which are represented in Fig. 2. These slabs are grooved out in such a manner as to permit them to absorb the water either slowly or rapidly, at the will of the operator; when little copying is required the water being kept low so as to come only in contact with the points of support in the tile, or kept high so as to come in contact with the thick part of the body of the tile when a great deal of copying is to be done. The pads are placed on top of the tiles by which they are evenly moistened with

the requisite amount of moisture. The pads are made especially for this purpose, and are referred to as possessing peculiar absorbing qualities adapting them to this use, while they are also especially durable. They are designated as the Champion copying pads. Simple directions for their use are given, and it is pointed out that the porous tile slabs will at once absorb moisture, and in turn gradually transmit it to the pads, which will retain for an indefinite time the evenly distributed moist surfaces desired for copying. The points are also made that the bath will not become foul, and that it combines the feature of being always ready with the sterling qualities of simplicity, neatness and

Fig. 2.—Porous Tile for Blotter Bath.

general convenience, and the claim is made that it will yield the most satisfactory results. The bath is made in two sizes, the smaller of which is illustrated above, the larger sizes containing five tile slabs instead of three. The circular of the company gives a number of testimonials from houses who have used the bath, a number of well-known hardware concerns being among them.

Standard Fibre Ware.

The Standard Fibre Ware Company now have their factory in active operation at Mankato, Minn., turning out seamless water-proof pails, slop-jars, wash-basins, keelers, &c., which are made of flax fiber. They have purchased the sole right to operate under ten patents, necessary to this branch of manufacture, in the States of Michigan, Illinois and Wisconsin and all States and Territories west of the Mississippi River. As flax fiber is expensive, they have located their factory in the great flax-producing section of the country, in which the stock can, of course, be had more cheaply than elsewhere. The machinery is mostly novel, being especially adapted to the manufacture of paper ware. The patent on pressed-ware dies covers the process of pressing out the water from the board through the pores of the wooden dies. Other machinery consists of pail presses, pail calenders, machines for trimming off the ends of pails, for bending and forcing in bottoms, for rolling hoops into shape to go over the top edges, also to go over the bottom edge or chime, &c. While a superior paper pail can be made with these machines, flax fiber tow makes a peculiarly tenacious stock, capable of being finished into goods of remarkable lightness and durability.

The tow is, of course, first beaten to a pulp, which is done by ordinary beating machines. If intended for pail bottoms or pressed ware, it is run out on a board machine, and for pails it is run out on a pail machine or winder. Each article of pressed ware, when wet, is subjected to a pressure of 80 tons, and when nearly dry to a pressure of 120 tons. Water-proofing is a very important process. A solution is used of such a character that the ware can thereafter be baked gradually until a heat of about 250° F. is reached, during which the substance of the water-proofing and stock is oxidized, and the article is made waterproof. But to make it proof against hot water it is further treated with another preparation and baked to 225°. The great superiority of flax fiber over other stock in making such ware is claimed to be its strength of fiber to bear the corrugating,

curling, pressing and water-proofing processes. The ovens are heated by steam in such a manner as to secure perfect uniformity of temperature.

In all their operations the company have sought to produce a good article and not a cheap one, believing that their policy would prove to be the best in the long run. They direct special attention to their patent process of affixing the bottom iron hoops to their pails. The hoop is so attached as to protect the edge, at the same time reaching to and supporting the bottom of the vessel. Besides this support the bottom is fitted into a corrugation made on the side of the pail, thus doubly securing it. Each vessel is highly finished with a superior coating of enamel, and the best grade is hand-painted and decorated, afterward being baked to secure a lasting finish, remove all taste or odor, destroy all injurious mineral properties, and to fit it to hold unaffected any liquid that may be put in it.

The Emery Knife Sharpeners and Oil Stones.

The Tanite Company, Stroudsburg, Pa., are putting on the market the Solid Emery Oil Stone herewith represented, Fig. 1, and the Knife Sharpener shown in

Fig. 1.—Solid Emery Oil Stone.

Fig. 2. The latter article consists of a wooden stick three times coated with fine emery, and is referred to as possessing especial advantages over the old-fashioned style and other goods for the purpose put on the market. Its durability, the efficiency with which it does its work, and the low price at which it is offered are points specially made in regard to it, and it is pointed out that it can be used for kitchen knives and carvers, for sickles, lawn-mower knives and other cutting instruments. The solid emery oil-stone

Fig. 2.—Knife Sharpener.

shown in Fig. 1 is described as in all respects similar in quality to the well-known Tanite emery-wheels. Two grades of these stones are made, one for putting on a rough edge and one for a cutting edge on fine tools. The rough-edge stone is described as doing the same work that the grindstone will, and it is claimed that its work is performed with exceptional ease. The company advise us that they are putting these goods on the market as a prominent line, and are intending to offer them exclusively to the hardware trade.

Curley's Patent Corkscrew.

This article, illustrated above, is put on the market by Dame, Stoddard & Kendall, Boston, Mass. It is made entirely of steel. As indicated in the cut, the shank of the screw is given play in the handle, with a construction which is referred to as affording a powerful leverage by which

the corkscrew is enabled to do its work with exceptional facility. The directions given for the use of the corkscrew are: That the bottle be placed on its base, the screw inserted in the cork in the ordinary way, and when the inside of the bell strikes the top of the bottle, the corkscrew is still kept turning, being slightly pulled at the same time, and in this manner it is claimed that the most obstinate corks can

foundation. The works have been in constant operation for some time, employing a force of about 300 men. Prospects are reported bright and the company expect to gradually increase their force to 500 men.

Grip Ice-Creeper.

The Improved All-Steel Grip Ice-Creeper illustrated in the accompanying cut is put

Curley's Patent Cork Screw.

be twisted out with ease. The screw is so adjusted in the handle that, when broken, a new one can be easily substituted.

The growth of Mexican trade is shown by Treasury Department statistics. During the fiscal year ending June last the total exports from this country were \$48,885,-

on the market by the Penn Lock Works, 142 North Fourth street, Philadelphia, Pa., whose New York office is with W. H. Jacobus & Co., 90 Chambers street, New York. The points emphasized in regard to this creeper are that it has steel points; that no screws or straps are required; that it is quickly applied and will hold fast.

In applying, the part A is placed against the heel of the shoe, and acts as a brace, the clip B being placed on the outer edge of the sole, and the clip C sprung into place with the hand or button hook, as shown in the cut. The spring

and points of this creeper are made of tempered steel, and the clips of wrought steel. Three sizes are manufactured—No. 1 for

Improved All-Steel Grip Ice Creeper.

We are informed that the report that the plant of the Lafayette Car Works, at Lima, Ohio, had recently resumed operations after a long shut-down is without

ladies, No. 2 for soles measuring less than 3½ inches in width, and No. 3 for soles measuring more than 3½ inches in width. They are packed one dozen pair in a box.

THE IRON AGE

THURSDAY, NOVEMBER 29, 1888.

The Hart Disk-Clutch Hoisting Machinery.

We present on this and the following two pages engravings showing different applications of an entirely new form of machine for giving motion to ropes, chains, &c. It was designed by Walter Hart, 2 and 4 Stone street, New York, and constitutes one of several interesting exhibits at the American Institute fair now held at New York. The object of the design was to provide an efficient machine for hoisting, lowering, pulling, hauling, easing, and transmitting power, manipulating ropes,

for the general purposes of a hoist; a specific application of the principle in a device for attachment to the hand-rope hoist, so as to change it at will to a power-hoist; another specific application for the safe lowering of boats. The aim of the production of this last was principally responsible for the invention.

Fig. 2 represents the sectional view of the clutching mechanism, and clearly explains the nature of this detail. In this a plane-faced disk, B, is shown keyed to a shaft, A. The drum C, which also is keyed to this shaft, has a number of longitudinal grooves; D is a loose bevel-faced disk with lugs fitting in the grooves in C, and

in Fig. 3. The device, as will be readily seen, is a complete departure from the hitherto usual mechanical method by which ropes or chains are drawn in or paid out. The apparatus now in use, whether simple or complex, invariably contains, as the principal part, a drum to which the rope or chain is made fast, and on which the one or the other is rolled for drawing in or hoisting, or unrolled for paying out or lowering. This method is not applicable when it is necessary for the rope or chain to be freed instantly and in its entirety. To accomplish this, a capstan-head is generally used, it being affixed to shaft ends, two or three

Fig. 1.—Hatchway Clutch Power Hoist.

NEW HOISTING MACHINERY, DESIGNED BY WALTER HART, NEW YORK.

haws, wire cable, belts and some classes of rigid objects, such as rods, bars and rails.

The essential feature of the machine is found in the arrangement of two disks so as to rotate in different planes, and, while rotating, to gradually grasp, tightly hold and gradually release any suitable object held between them, carrying it along with them in their motion of rotation. A lateral movement is given to one of the disks, by which it is caused to approach to or recede from the other, which permits not only of the placing of objects of different diameters or thickness between the disks, but allows of an exact adjustment of pressure, in accordance with the demand of the strain, whether for hoisting, lowering, drawing in or paying out. This lateral movement acts in conjunction with, or independently of, the rotary, and can be applied whether the machine is in motion or at rest. The engravings represent a sectional view of a double-acting machine

having a channeled projecting sleeve E. The threaded sleeve F, working on A, has several projecting arms, each of which carries an anti-friction roller. The arms are of different lengths, and with the rollers hold the disk D at such an angle with respect to the shaft A that the inner faces of the two disks B and D are brought parallel along one line of the radii above the shaft, and from that line diverge on both sides, a maximum being reached at the directly opposite line. The nut G encircles F, and is held in place by the standards H and I. Rotation of the nut obviously produces lateral motion in F. The collar K, keyed on the shaft A, is furnished with anti-friction rollers, and resists the thrust of the screw-sleeve F, which is in effect the strain of the load. It will be seen accordingly that the principal working parts are few in number, and substantial in construction.

One form of this hoisting machine Mr. Hart terms a clutch-winch is shown

turns or more of the rope being made on such capstan-head. This demands that the loose end of the rope or chain should be held taut, so as to prevent surging, which requires the services of a separate person or persons. As long as there is any pull or strain on such rope or chain, it must be so held, or else must be made fast. The clutch-winch performs its work very differently. It grips the rope at any part of its length, be the size large or small. It holds the rope against any pull. It pays the rope out slowly, quickly, or instantly releases it. It can be constructed in duplicate, when it will at one and the same time act on two ropes, haul in and pay out, hoist and lower, hold fast both, pay out both, hold fast and pay out, hold fast and haul in. The variety of work it will perform is claimed to be far beyond the capacity of any other hoisting machine, while its action is more controllable. The machine can fill the functions of a number of different hauling de-

vices, and can replace the sprocket-wheel as a means of continuous motion. As an attachment to cranes, it allows of any length of rope or chain, as it does not wind on a drum but lays loosely. Furthermore, as the rope or chain is always the same distance from the center of the clutch-shaft, the power and speed are invariably uniform in regard to the rope and the load.

As an auxiliary to change the hatchway hand-over-hand hoist to a power-hoist, the clutch can be fixed to the ceiling, as shown in Fig. 1. The clutch shaft is furnished with both a tight pulley and a loose pulley, but it can be kept in continuous rotation, as lowering is effected by separating the disks (by counter-motion of cord and nut) which opens the clutch. The guide then takes the position shown by the dotted lines and the hand rope falls in a perpendicular direction, as also shown by the dotted lines, the load descending by gravity being controlled by the check rope. If it is required to lower by power, then an additional fast-pulley with cross belt or other reversing device must be added and the grip kept closed.

We have already indicated that the use for which the machine was first designed was the lowering of boats safely and rapidly. Fig. 4 shows the method of application. It will be seen that, placing each of the falls in a separate clutch, on one shaft, both falls will be paid out simultaneously and equally, lowering the boat with an even keel. Only one man will thus be required to attend in a thorough manner to a duty which now takes several to carry out in an inefficient and uncertain way, especially when disaster calls for immediate action. The wide range of work and variety of form to which the device may be successfully applied is clearly apparent, and considerably enhances the interest, which, even with a more limited capacity, would be attached to it.

Large Furnaces on Alabama Material.

At the Birmingham meeting of the American Institute of Mining Engineers, Fred. W. Gordon, of Philadelphia, read a paper on large furnaces on Alabama material, as illustrated in practice by one of the Ensley furnaces of the Tennessee Coal, Iron and Railway Company. A number of well-known furnace managers took part in the discussion, a revised edition of their remarks being subsequently printed. We may quote the remarks of George Jamme, of the Dayton Coal and Iron Company, Dayton, Tenn:

It is now about one month since the Birmingham meeting of the American Institute of Mining Engineers took place, and the reported success of the Ensley furnaces continues. I see nothing, however, to materially change the opinion expressed by me at the meeting on Mr. Gordon's paper, which appeared to me at that time to be rather a "headquarters-in-the-saddle" sort of bulletin than a convincing and established proof that high and large furnaces are best for Alabama materials. I have too much respect for Mr. Gordon's evident and remarkable abilities, and courage in expressing his conviction, to capriciously criticise his expressed opinions, even had any reverse attended the operations of the two Ensley furnaces now in blast. Any furnace is subject to accident, and in such matters conclusions should not be hasty; therefore, I propose to give my views without reference to the events of the past month's career of the Ensley furnaces, simply on general principles, as I gave them at Birmingham. Mr. Gordon, in introducing our English cousins, and deprecating their action in decapitating their high furnaces, permits a wider range of criticism, and gives an opportunity to correct a prevalent

notion that the ores used in the furnaces of the Birmingham district and the Chattanooga district of the South, are one and the same in composition, and that the fuels used in these districts are also the same. I do not know that Mr. Gordon holds this opinion, but I do know that it is entertained by our cousins abroad and by many of our Northern friends.

Coke.—Judging from what we have seen in the way of coke at the Ensley and Pio-

cause the coke to break across when being pulled and before the coke leaves the oven. The result is a general friability caused by the presence of these slate particles or pieces. This, however, can be remedied, so that Pratt coke need not necessarily be called a "soft" coke, and there is no reason why it cannot be made equal to fair competition with Connellsville coke. It is as low in ash, about as high in carbon, it has the proper ring, is

Fig. 2.—Section of Clutch Mechanism.

Fig. 3.—Double-Action Clutch Winch.

HOISTING MACHINERY, DESIGNED BY WALTER HART, NEW YORK.

neer furnaces, the coke used in Alabama is not a soft coke, or, if it is, it need not necessarily be so. There are many places on this continent where coke much softer and much more poorly put together is used, and still money is made in the manufacture of pig iron. If the coke at the above-mentioned furnaces is structurally soft, it is due to bad treatment of the coal, either in mining or immediately afterward. It is due to the presence of slate particles, or rather pieces, more or less large, that place themselves across the columnar structure, arrest the action of the incandescent gases in their work, and by their resistance to parting in the columnar direction

equal to Connellsville in cell capacity, and I believe as able to resist crushing test as any Connellsville coke. Washing cannot be used to make it any better, for water is not abundant enough in the South near the Pratt mines to permit that process, and if there is anything in the claim that the Connellsville ash "makes" the Connellsville coke, it may as well be applied to Pratt coke.

In the Chattanooga district the condition of coke is very different. Ash is more abundant. It often rises to 23 per cent. when the miners are careless, and 19 per cent. may be called normal. In this district high and large furnaces have been advocated, but have

not been as successful as was expected, not altogether because of the condition of the coke, but for reasons relating to the ores of the district. The use in them of ores of the Alabama district has not, however, altered the case. Coke made under the same conditions of manufacture as those of the present practice in Alabama and Tennessee would work exactly the same if made of coal from other districts, and with such coke, the dust-catchers, absolutely necessary in Alabama as well as Tennessee, would be required in districts where they are not yet known, to relieve the gorged stomachs of furnaces. With this evil furnace-managers in Southern practice are well acquainted. Without the convenient dust-catchers, the coke would fill the flues with a dust which,

are, by the way, not now ostentatiously exhibited by our good friends in that city. It is quite certain that the large furnaces that have been in operation in Birmingham for several years have not been as successful as the smaller ones, either in freedom from disaster, regular running, or a good quality of metal. With smaller furnaces, and more of them, the risks would be lessened; depressions would be tidied over more easily by a more elastic control of production, and the first cost of erection would not be enhanced in the same degree as the risk and loss of time in recovering from "trouble," which are disproportionately large with furnaces of excessive width of bosh or great height. For instance: Was the Ferryhill furnace, in England, with 103 feet high and 27

good foundry iron. Anything that retards the pace gives time for saturation of the metallic iron with silicon, and is the cause of production of pig-metal with high silicon. Mr. Gordon couples large diameter with height; these assist each other in preparing disasters; rapid driving is accompanied with abundant blast, the section of plastic material is carried higher, and more readily within the reach of increased burden and cooling influences, and less under control than in the smaller furnaces.

Mr. Gordon does not seem to believe in the irregularity of composition of the Southern ores. With more extended actual practice he would have found that they do vary greatly (especially the hard ores) in the amount of lime; and, unfortunately, the difference does not carry with it a corresponding change in the proportion of silica. It is in this respect that I fear the practice of carrying a high percentage of silica in his calculated burden for slag will bring him to grief, or at least those who under his inspiration are in pursuit of large production. I have not had opportunity to obtain an analysis of the pig iron we saw at Ensley, nor has the verdict of the captious customer had time to become known. Even at this time of writing I cannot see yet that the success so far obtained at Ensley is due to the proportions of the furnaces. The South Chicago furnaces, which have been proposed to us as examples of successful running, are not high furnaces in the proportions of the Ensley; and I would ask Mr. Gordon whether the brilliant success at the Chicago furnaces is not due to a proper mode of distribution of stock at the top, rather than to the low percentage of lime, and the special conditions and relations of iron and cinder produced. This mention of the South Chicago furnaces may seem digressive in discussing furnaces working on Alabama materials; yet it is a fair parallel argument. Before ranging myself to Mr. Gordon's opinion that high and large furnaces are best for Alabama materials, I shall require further evidence produced by experience. But I feel quite sure that no one will yield with more grace than I, if any good way can be established to relieve the Southern furnace managers of some of the ills which, in the words of our former president, Mr. Bayles, make their hair turn prematurely gray.

Visitors to the Scandinavian Exhibition, at Copenhagen, Denmark, have been struck with the remarkable electric light-house and its machinery, destined for the Hanstholm, on the west coast of Jutland. This light is about 2,000,000 candle-power, the greatest in the whole of Europe, its range being about 26 miles. With the light is combined a station for powerful fog-horns, or roarers, worked by compressed air. The light is in the exhibition placed on an improved low tower, built of soft limestone, but the tower on the Hanstholm is over 200 feet above the sea level. At the foot of the tower there is the building containing the electric and pneumatic machinery for the light and for the fog-horn. The light has been kept burning every evening since the latter part of August, and the powerful flashes or rays revolving in the sky afford a remarkable sight. The foghorn was not sounded for fear of the tremendous roar annoying the inhabitants of Copenhagen in general, and the visitors to the exhibition more especially.

The Minnesota Iron Company will ship this year by rail and lake fully 450,000 tons of iron ore. The Chandler mine in Minnesota will also ship between 50,000 and 55,000 tons. The total production of the Vermillion range will thus be over half a million tons.

Fig. 4.—Clutch Boat Hoist.

HOISTING MACHINERY, DESIGNED BY WALTER HART, NEW YORK.

moreover, is not found in the South to be as good a fertilizer as the dust found in the flues of Northern or Eastern furnaces.

Plant.—No impartial visitor could find fault with the plant at Ensley, or, in fact, with any of the recently built furnaces in the Birmingham district. When the Ensley plant is complete it will be, without doubt, the finest in the world. Nothing has been spared to endow it with full power in every requisite. The plant is simply "monumental." Is this, however, a criterion of economy? Is it a commercial perfection? I think not. I take it for granted that furnaces are not built, like monuments, to be gazed at and admired. They must have a successful industrial life apart from natural advantages of location; in other words, they must be built to make money, and as much of it as possible—not in a spasmodic manner, or in a steeplechase style, resulting in such wrecks as are to be seen in and around Birmingham, in furnaces that are hardly a decade old, and

feet of bosh a success, as compared with the 80 feet high, and 18 and 20 feet bosh of Middlesboro', both sizes working on similar materials? Height in a furnace, as I think Mr. Gordon will agree, is correlative to the ease of reducibility of the ore in use. Will the large Ensley be as successful in the use of the red fossil ores as the Belgian furnaces are, which use the Minette, and make respectable quantities at a price that even the most enthusiastic real estate agent in Birmingham or Sheffield has not yet dared utter? The Belgian furnaces are not high furnaces; their height reaches only a few feet above the top of the boshes of the Ensley; their stove capacity is very modest; but their low consumption of fuel is remarkable, and may yet be envied by our Ensley friends when they look behind the returns.

In the manufacture of foundry pig (and that is the kind of stuff the Ensley furnaces will have to make) rapid driving becomes an absolute necessity—a *sine qua non* of

The Armington & Sims Engine Works.

In referring to the works at Providence, R. I., of the Armington & Sims Engine Company, which we recently had an opportunity of visiting, we need not specially introduce to our readers the Armington & Sims engine, which, within the past few years, has established for itself so wide and flattering a reputation. This, in fact, was strikingly evidenced by the amount of work with which the shops at present are crowded, everything being worked to its full capacity without apparently much relieving the pressure of business.

The company have been in the buildings which they now occupy, on Eagle street, only for the last six months, the engines having previously been turned out at the works of the Builders' Iron Foundry. There is, accordingly, evidence of newness in some of the shop arrangements, strengthened by the additions which were being made to the facilities for handling and turning out work. The capacity of the works for putting engines on the market is now rated at one engine of 100 horse-power per day, and work is being done constantly on some 200 engines of various sizes and in different stages of completion. Power for the shops is supplied by a 90 horse-power Armington & Sims engine. In the line of heavy tools, our attention was specially attracted by a 10-foot Niles boring mill, and two others of 6 and 7 foot capacity, built by the Pond Machine Tool Company. A large number of interesting special tools, among them milling machines, rotary planers, and a planer of novel design, with stationary table and traveling tool block, built by the Newton Machine Tool Works, of Philadelphia, are used, the character of the work to be done affording a good opportunity for their employment. All the smaller plane surfaces of various parts of the engines are ground, a Brown & Sharpe grinder, and one built by the Springfield Glue and Emery Wheel Company, of Springfield, Mass., being used for the purpose. The work accomplished by them is quickly and cheaply done and eminently satisfactory. In the upper of the several stories of the main building only comparatively light machinery is placed, one of the floors being given up to a nickel-plating plant for plating lubricators and other special fittings for the engines. All these floors receive light from all sides, the building standing alone, and are therefore remarkably cheerful and in striking contrast to the average machine shop. For the economic handling of the heavier parts of work a system of overhead trolleys has been adopted, the conveniences of which are too generally appreciated to require special remark. These trolleys have a lifting capacity of 10 tons, amply sufficient for all requirements. In addition the ground floors are fitted up with tracks and cars, the tracks running through the yard from one building to another in different directions, a number of turn-tables being provided. Heavy pieces of work can thus be readily carried from shop to shop. A 10-ton traveling crane erected in the yard further facilitates this work, and is specially useful in loading the finished engines on trucks for shipment. The crane has been designed by Mr. Pardon Armington and runs with remarkably little friction, a light wind being sufficient to carry it along its track. Every engine before being sent out is tested under steam, a special room being fitted up with testing blocks and other necessary appliances. The drafting rooms and pattern-making department are in a separate building. No heavy foundry work is done, there being only a small brass foundry for turning out composition castings and Babbitt metal. This latter is compounded with great care, so as to suc-

cessfully meet the requirements of high-speed engine running. A small forge is fitted up for light work. The heavy engine castings are turned out under special arrangement outside of the works.

Considerable interest is attached to some of the engines which have more recently been turned out at the works and a number which are now approaching completion. Departing for special purposes from the well-known form of single cylinder automatic which in the past has done such good work, a double cylinder engine was built, the aim being to secure if possible smoother running and great power with compactness. The first engine of this design, we believe, was put into the works of the Pond Machine Tool Company, at Plainfield, N. J., for driving their electric light plant. The engine is of 100 horse-power, and its performance has been highly satisfactory in every respect. The design has been adopted for the electric lighting installations aboard the new cruisers of the navy, and several of the engines have already been turned out. They are rated at 30 horse-power, have 5 x 7 inch cylinders, and run at a speed of 400 revolutions per minute. The cranks are set 180° apart, so that a practically perfect balance of the moving parts is obtained. Both valves are worked by one valve stem, but in all other respects the details are similar to those of the single engine. The engines are coupled to the dynamos either by flexible couplings or by gearing. A striking novelty is found in the compound condensing engines which the works are now building on special order from the Government. They are intended for the ordnance shops at Washington, and are arranged for rope driving, each engine having two sheaves. The cylinders are placed side by side, and have diameters of 10½ and 16½ inches, with 12-inch stroke. The engines will run with 220 pounds boiler pressure, and at a speed of 275 revolutions, at which they will average 100 horse-power each. The cranks here also are set 180° apart with the same advantage of perfectly balanced parts. Five engines of this design will be built for the Government. A set of engines, 12 in number, which are in course of construction for the Philadelphia Edison Company also deserve notice. They are to develop 440 horse-power each, or over 5000 horse-power altogether, and will run at 230 revolutions. The remarkably high speed for engines of this size is specially noteworthy, and their performance when completed may well be watched with interest. Eclipsing all previous engines, however, so far as speed is concerned, will be the engines designed for working the electric search lights which are to be fitted up in the bows of the new cruisers of the navy. Great compactness, coupled with the requisite power, is there an element of considerable importance, and will, we think, be secured in a very marked degree in these engines for which patterns are now being made. They will embody the main features of the regular Armington & Sims engine, but will have two double-acting vertical 3 x 5-inch cylinders, and are to run at a speed of 800 revolutions per minute, at which they will develop 20 horse-power. Mr. Armington has in contemplation, also, a 200 horse-power double compound tandem engine, which, in the event of being designed, would probably be put on the market as a regular engine for general manufacturing purposes. The activity in all departments at the works will perhaps be better realized when it is stated that the company are at present 87 engines behind their orders.

Prof. Edward Orton, State Geologist, has made a measurement of the monster gas well drilled at Findlay lately and computes the yield at 31,600,000 cubic feet per

diem. This is more than two and a half times as large as the famous Karg, which was computed at 12,000,000 daily. The well is thus proven the largest in that section, if not in the world. It is owned by the Syndicate Oil and Fuel Company of Findlay, Ohio, a rival of the Standard. The well is 1200 feet deep and 60 feet in the Trenton rock. It gave scarcely any gas when drilled in, but on being torpedoed it responded with a vast flow. The well is now being tubed and packed and the gas will be shut in for use.

Labor-Saving Machinery.

From the current number of the *Fortnightly Review* William Morris, poet and artist, sends out over the roofs of the world a quiet and exceedingly bitter cry against the deteriorating effects upon society of labor-saving machinery. The Philadelphia *Ledger* summarizes his views and comments on them. The artisan, Morris holds, no longer has in his work the pleasure which he once enjoyed of individual creation, of making it the expression of his own individual taste and skill; having lost that, he has lost the inciting cause of happiness which his daily labor should give him, and he finds his vocation dull and cheerless. The man has become a mere part of the machine; he is not greater, but less than it; he is not elevated, but cast down by it. To the skilled, ambitious handicraftsman, losing his creative skill, the labor-saving machine has become the great invading Moloch, the destroyer of his originality and his taste.

But the maker of things is not the only sufferer from labor-saving machinery; the buyer of them also suffers. He is no longer permitted to purchase a thing of use or show which is in itself unique; he must buy one of many all alike, made by the hundreds or thousands, or millions from the same pattern, wrought out upon the same lines by the same machine. The man who wishes to wear a hat of last year's fashion cannot do so; he must wear the one of this year's fashion, as the machines are no longer making the former. His furniture must be like that of his neighbors; the machine decrees the design, the execution of it.

But, bad as this begins, still worse remains behind. The worst of it all is, says Mr. Morris, that the machine in forge, factory and shop has come between the employer and employed, destroying the old close and friendly relations between them there, separating them by a wide, deep, impassable gulf of divergent interests. The employers are a class of "slaveholders," the employed, "slaves." The machine breeds discontent among the workingmen; it makes Socialists, Communists, dangerous classes of them.

In all this lament of the poet, artist and Socialist, for Mr. Morris of late years has become a noted teacher of the creed of Socialism and a great leader in its ranks, there is that one grain of regretful truth which gives excuse for its being made. But from even the poet's, artist's, and especially from the Socialist's point of view, if the latter is, as he maintains, a well-wisher and helper of humanity, there is a good deal to be said in favor of the labor-saving machine. It is not, as Mr. Morris now contends, and as thousands before him have erroneously contended, an unmixed evil.

Admitting that it has interfered with individual invention and skill, and made artisans fewer and workmen more numerous; that it has multiplied bad or indifferent designs of things, and so dwarfed original creations and crushed out the myriad forms of beauty which would have grown from under the hands of hosts of skilled workers, must it not also be ad-

mitted that it has given of such taste and beauty as it produces to millions where handicraft gave only to the favored few, the wealthy? And if it has reduced the number of artisans and increased the number of poor workmen, has it not given to both those classes a prosperity undreamed of by the old handicraftsman? Compare the state of the workman of these days of the labor-saving machine with that of his predecessors; look into his home filled with many comforts which formerly would have been considered luxuries by all but the very rich; look at his well-housed, well-fed, well-clothed family; look at his wage rate, at his savings in bank and building association, and compare his condition with that of those who before him wrought 12, often 14 hours per diem with their hand tools. The homes of the workmen of to-day are infinitely more tastefully furnished than were those of the fairly well-to-do before the machine was brought into factory and shop. And as for the rich, are their homes less beautiful or artistic than those

showed that the operatives of them earned an average of \$126, gold, more in 1884 than in 1830. In this last mentioned year the hours of labor were 14, in the former mentioned year they were 10, so that the wages of 1884 per hour, as compared with those of 1830, were double. Further, said Mr. Atkinson, "Skillful female weavers earn more now than male overseers and second hands earned in 1830." In 1817 the average wages of skilled artisans in New York City, where they were as high as anywhere, were \$9 per week, and a working day was 12 hours long.

It is not only in this country that the wages of the workman have increased and his hours of labor decreased since labor-saving machinery came into common use; the same conditions have prevailed everywhere, though not to so great a degree. The machine has undoubtedly dwarfed or killed some of the genius or talent of individual craftsmen; but, considered in respect of all its influences, it has not left the world worse, but better, for its coming. The

Mr. Swank will be potential with the powers at Washington. In providing the sinews of war which gave Chairman Quay the opportunity to put his plans into successful operation, the iron trade of Pennsylvania was most liberal, and this was brought about largely through Mr. Swank's efforts. The importance and efficiency of his services in distributing the tariff tracts broadcast through the States are recognized by the interests represented, and the feeling is that too much cannot be done in acknowledgment. In addition to recommending his appointment to a suitable position under the Government, there is talk of the manufacturers making a personal testimonial of their appreciation in the presentation to Mr. Swank of a \$10,000 house.

New Belt Power Punch.

We show on this page an engraving of a new belt power punch made by the New Doty Mfg. Company, of Janesville, Wis., for the use of boiler-makers and sheet-iron workers generally. The punches are built from new patterns in the different sizes, ranging in weight from 150 to 8000 pounds. The smallest one will punch a $\frac{1}{4}$ -inch hole in $\frac{1}{4}$ -inch iron or its equivalent to the center of 4 inches, and the largest will punch a 1-inch hole in $\frac{1}{4}$ -inch iron or its equivalent to the center of 74 inches. These machines are strong and well proportioned. All shafts, bolts and plungers are of steel, and every machine is fitted with an improved stripper, which can be adjusted to the $\frac{1}{16}$ part of an inch. The deeper jawed machines are provided with links, and when these are adjusted the machines will do still heavier work. The machines all have tight and loose pulleys and start and stop with a clutch worked by a lever. They can be started and stopped instantly, thus holding the punch at any desired point. The distance from the center of punch to the front of machines is but $\frac{1}{4}$ inch, thus enabling the operator to punch flanges.

NEW BELT POWER PUNCH, BUILT BY THE NEW DOTY MFG. CO.,
JANESVILLE, WIS.

of their elders? Never before in the life of the world was art so common in the designing and making of all things as now, and never before was the artistic feeling so great or so generally shared. Art in even the surroundings of life belongs now to the multitude, where once it belonged to the few.

As a Socialist Mr. Morris would have the great masses of those who labor for their daily bread lifted up out of vice, ignorance and dire poverty. He would make them all prosperous, contented, happy. In 1800 wheat was a dollar a bushel, and the average wage rate \$1 a day. Put the two facts together and it will be seen that it then took a whole week's wages—yes, more—to buy a barrel of flour. Until the recent increase of the price of flour, caused by the partial wheat failure of this year, a barrel of excellent flour could be bought for \$5, the very highest fancy grade for \$6, or for, at the most, the wage for three days' work.

One of the best authorities on economical questions in this country is Mr. Edward Atkinson, of Massachusetts. In the elaborate paper read by him in 1884, at Montreal, before the British Association for the Advancement of Science, he exhibited the great increase of wages which had occurred in this country since 1830. Taking two cotton mills as examples, he

machine has not only cheapened homes, food, clothing and fuel to the entire body of consumers, but it has made of the great farming class a richer class. It has taken thousands or hundreds of thousands of men from the mines, shops and forges and made farmers of them. Farming pays chiefly because of the labor-saving machine, of that which makes the implements of the farm and of that which transports the products of the farm to market. The labor-saving machine has added to the hosts of consumers, has created a demand from millions for such things as were once bought only by the rich, and, though it has wrought evil in some ways, it has wrought infinite good in others. If it has hurt labor in some ways, it has helped it in others, and, by making the lives of men and women more prosperous, it has made them happier.

We find the following in the Philadelphia Press: From the talk among influential Republicans in the iron trade it would appear that James M. Swank, manager of the American Iron and Steel Association, stands a much better chance of securing substantial recognition from the incoming Federal Administration than many of those being boomed for office by the political leaders. The influence back of

The famous Cockerill Company, of Belgium, made a gross profit in the last year of 2,927,740 francs, against 2,395,420 francs the previous year. For a dividend of 50 francs per share and for writing off for depreciation 828,729 were needed, and 464,443 francs were paid for loss in building two unserviceable steamers on the Ostend-Dover line. The company employ 8800 men, to whom 8,863,997 francs in wages were paid.

Prof. Hanford Henderson, of the Department of Chemistry and Physics at the Philadelphia Manual Training School, has just issued in pamphlet form his lecture on "Aluminium," which was delivered early this year before the Franklin Institute. The importance which has always been attached to the production of cheap aluminium makes the subject one of special interest at the present time, and the lecture will be found very profitable reading. Professor Henderson briefly reviews the investigations of some of the earlier scientists, such as Lavoisier, Sir Humphrey Davy, Oersted and others, and then describes the method of preparing metallic aluminium originated by Deville, and which, as may not be unknown, is the method in practice at the great French establishment at Salindres. It is now the sole source of the metal in France and England, and has more recently been so greatly improved that unless some exceedingly advantageous method of reduction is proposed it promises to remain the ruling process. The improvements brought out by Mr. H. Y. Castner, of New York, are also dwelt upon, as well as the Cowles process.

Registering Scale-Beam Attachment.

The fact that where large amounts of any kind of material are being weighed mistakes in recording the weights are very apt to be made, has prompted Messrs. Borden, Selleck & Co., 48-50 Lake street, Chicago, Ill., to bring out the scale-beam attachment which we show on this page. The nature of the arrangement, we think, will be readily understood.

The shelf A receives an electrotpe of raised figures, which correspond exactly in location with the divisions and graduation on the beam—in other words, if the poise C rested in the notch representing 40,000 pounds in weight a striking bar, B, attached to it will come immediately over 40,000 in raised figures on the support A. Hence, if the striker B receives a sharp blow at D it will bring the striker B D in contact with the raised figures 40,000, and this will be printed on a card that is placed between the striker and the figures. The long beam is gradu-

gether, we may snip the edge of one or two of the thicknesses, but the piece cannot then be torn across. With steel the case is different. It is true that in the present day we hear very little indeed of mysterious steel failures, but it must not be forgotten that immunity has been purchased by the sacrifice of much initial strength.

The Benardos Electric Welding Process.

The process of welding invented by Mr. N. V. Benardos, of Petersburg, consists in laying the pieces of metals to be united on one another with the welding seam spread with chips of the same metal, to form the negative electrode of a voltaic arc. The circuit occurs through an iron table upon which they lie, and which is connected with one pole of the source of electricity. A carbon, depending in size on the strength of the current as well as upon the hardness of the metals to be welded, is placed in

Regenerative Gas Engines.

The next step in the direction of increased economy of fuel in gas engines will, according to the London *Engineer*, most probably be the utilization of the waste heat of the exhausted gases. The other important sources of loss—viz., radiation and absorption of heat by the water-jacket—may be regarded as unavoidable with motors of the present prevailing types. Engines have no doubt been proposed which dispense with the water-jacket altogether, but there seems to be little probability of such machines coming into extended practical use. It is also significant that the most successful gas-engine builders appear to regard the method of external refrigeration as a necessary evil, and make no serious attempt to do away with it. Putting aside, then, the losses due to radiation and conduction, amounting in all to about 66 per cent., we have about 17 per cent. of the total heat of combustion converted into available power,

REGISTERING SCALE BEAM ATTACHMENT, MADE BY MESSRS. BORDEN
SELLECK & CO., CHICAGO, ILL.

ated to 500 pounds, and the least amount that can therefore be weighed on that beam is 500 pounds, while the small beam E is graduated with 500 pounds, 20 pounds at a time, it, of course, becomes necessary to add the weights at the two different points to get the exact weight. The engraving represents a railroad track scale-beam, and they are never graduated finer than we have stated above. The same principle can be applied to any style of scales where the graduations may run to pounds or half-pounds, but on the railroad track scales 20 pounds is as close as it is cared to go. The raised type on the shelf A has a type-writer ribbon stretched lengthways. It is evident that weights taken in this way will prevent the many mistakes that occur from careless reading of the weight indicated on the beam, from an incorrect record in the weigh book, &c.

The reason why a comparatively large crack in an iron-plate is by no means so injurious as a very small one in a steel plate, lies in the fact that the iron is not homogeneous. It consists, so to speak, of a number of separate layers pasted together with cinder. Unless the crack extends through all the layers to the same depth, rending cannot well be initiated. If, for example, we take half a dozen thicknesses of calico and cement them to-

an insulated holder connected by a cable to the other pole and forms the positive electrode. This is passed to and fro over the seam by a workman who protects his hand from sparks by a leather glove and his eyes by a dark glass screen fastened to the carbon holder. As soon as the workman brings the carbon to the proper distance from the seam the electric current leaps from pole to pole with a strong hissing, and melts very rapidly the chips and edges of the metal bars, which are united when cooled. This process should be called rather soldering than welding, for in welding the heated metals are united by mechanical working, while in soldering a third metal is used to cement the other two together. One thing is to be noted—the metal in the weld has had its condition changed from a fibrous to a crystalline structure, which is evidently due to the complete fusing of a metal afterward rapidly cooled. The tensile strength at the weld is considerably decreased, as records of a few tests seem to indicate.

The new rail mill of the Allegheny Bessemer Steel Company will be ready to start up, so it is stated, in January. While not as large as the Edgar Thomson Works, it will be one of the most complete mills in the country, and will have all the latest improvements and appliances.

while an almost equal quantity of heat passes away in the exhaust gases without performing any duty. In the Atkinson cycle engine the quantity of heat carried off by the jacket is only about 19 per cent., the heat converted into work is nearly 20 per cent., and the heat carried off by exhaust is over 50 per cent. In gas engines of good construction the escaping gases have a temperature of about 500° C., and, if we assume the maximum temperature to be 1500° C., the theoretical efficiency would be 0.56. Now, if we suppose the temperature of the exhaust gases to be usefully lowered to, say, 140° C. with the same initial temperature, the theoretical efficiency would rise to 0.76, with a corresponding gain in actual efficiency. It is not practicable to reduce the final temperature by further expansion of the gases in the cylinder, so that some form of regeneration affords the only means of a closer approximation to the conditions of maximum efficiency.

The employment of regenerators with engines using town's gas is, for obvious reasons, out of the question; but for the rapidly increasing number of motors burning producer gas, the application of the regenerative system must lead to a large saving of fuel. Atkinson and Otto engines working with Dowson gas are at present using less than 1.5 pounds of coal per indicated horse-

power per hour, as certified by their users, who can have no reason for understating their fuel consumption. In some cases it is said to be as low as 1.1 pound; and it may be safely assumed that gas motors using generator gas can be worked with an hourly consumption of 1.25 pounds of coal per horse-power—particularly if the engines are specially designed for burning generator gas—as ordinary engines have features which, though advantageous when

tion, as the temperature of the exhaust gases is low enough to permit the use of continuous conducting regenerators. Gas generators working with cold air use about 5 per cent. by weight of steam with the air blast; and the percentage of combustible in the gas averages 40 per cent., with over 50 per cent. of nitrogen. A hot-air supply drawn from a regenerator would insure the decomposition of a larger proportion of steam, thus enriching the gas

Resolve to stop mining under existing circumstances on the first day of December, 1888, for an indefinite period; provided that any coal required in the flat trade for this city or between here and Parkersburg shall not be affected by this resolution.

After the meeting, a number of the operators stated that the production and shipment of coal has been so great this season that the markets have become completely gutted and prices too low to afford any profit. This is the first time that the iron operators have been compelled to suspend mining on account of overproduction.

The Davis Bench Dog and Clamp.

We show on this page engravings of a new form of bench dog and clamp brought out by F. N. Gove, 16 Exchange Place, N. Y. It is of simple and substantial construction, and will be found useful in a variety of ways. Fig. 2 represents the device in position on a bench, holding a board, while Fig. 1 shows rear views of the clamping mechanism. It will, no doubt, be readily understood that the two grooved projections on each dog, which resemble screws, one of them being movable laterally, are slipped into two adjoining holes in the side of the bench at approximately the desired distance apart. Pushing down the end levers then brings into operation a cam on each of their ends, which acts on the movable projection, causing the dog to firmly grip the bench. The clamp adjustment is easily and quickly made, the clamp, as shown in the upper of the two cuts, marked Fig. 1, having a lateral travel of several inches. It also is firmly clamped by pressing down a lever. This, by means of a toggle action, causes the

Fig. 1.—Clamping Mechanism.

Fig. 2.—General View of Device in Working Position.

THE DAVIS BENCH DOG AND CLAMP, MADE BY F. N. GOVE, N. Y.

gas of high calorific power is used, lead to considerable loss when fuel gas is substituted. Rankine estimated that 90 per cent. of the heat in the exhaust of air engines might be retained for use by means of a regenerator. If we suppose, in the case of a gas engine working in near proximity to the producer or generator, that 75 per cent. of the exhaust heat could be returned to the producer by means of a suitable regenerator, the fuel consumption would be reduced to less than 1 pound per indicated horse-power per hour—a result certainly worth striving for. The regenerative apparatus required is simple and inexpensive, and would require practically no atten-

and reducing the volume of useless nitrogen.

Monongahela Coal Mines.—At a meeting of the Monongahela Valley Coal Shippers, held in Pittsburgh on Monday, the 19th inst., the following resolution was adopted:

Whereas, The unprecedented continuation of water for shipping coal has so overstocked the market that it is impossible for us to make sales at any prices; and,

Whereas, The landings at Cincinnati and Louisville are filled up to their utmost capacity, and in the event of severe freezing weather or extreme high water, there would certainly be immense loss. We, therefore,

serrated clamp proper to slightly move both forward and downward sufficient to securely hold the board. The set screw shown at the bottom is for the purpose of taking up wear on the bar along which the clamp fixture is moved. The serrated clamps are capable of being set at different heights, set screws holding them in place.

Referring to the matter of great weights on locomotive driving wheels, it is interesting to note that in the Swinerton polygon-driver locomotive, now running on the Boston and Lowell road, and which a short time ago was so much talked about,

a weight of 19 tons is borne by the single pair of drivers. The damaging effect of this excessive weight on the permanent way will no doubt soon become apparent. Incidentally we may repeat that the polygonal feature of the drivers has not proved a success. The 210 faces milled on the wheel treads soon disappear after running, and the engine is therefore virtually a locomotive with a single pair of ordinary drivers.

New Suction and Force Pump.

The Goulds Mfg. Company, of Seneca Falls, N. Y., are bringing out the new suction and force pump, shown in the annexed engraving. It is mounted on a strong iron frame, with gearing, tight and loose pulleys, &c., and is adapted for feeding boilers or working in any place or capacity under heavy pressure. The pump is geared 4 to 1, and for continuous service the pulley shaft may be run between 140 to 160 revolutions per minute, and

New Suction and Force Pump.

against 75 pounds pressure per square inch. The stroke measures $4\frac{1}{2}$ inches. The pump is made in five sizes.

The New Sturtevant Automatic Engine.

In addition to the single-valve automatic engine which Mr. B. F. Sturtevant, of Boston, Mass., brought out about a year and a half ago, he is now building engines with independent expansion valves and separate outboard pedestals. The older design, it may be remembered, was self-contained. The most marked characteristic is in the novel and peculiar form and combination of the main and cut-off valves.

The passages in the main valve, for the admission of steam to the cylinder, do not extend through the entire thickness of the valve, as is usually the case when a riding valve is used, but resemble the exhaust cups, except that they are only as wide as the ports in the cylinder. Within the thickness of the main valve is a cylindrical seat, in which runs a cut-off piston valve, which receives from the variable cut-off eccentric a differential movement relatively to that of the main valve, such that it is withdrawn just before the beginning of the stroke, opening the passage through the main valve into the cylinder. The piston-valve returns, at the dictation of the governor, to close the passage and cut off the steam. As at this time the two valves are moving in opposite directions, this action is almost instantaneous. This particular form of cut-off valve, having very little motion in its seat and being subject to no lateral pressure, has very little wear. Even were there a little leakage after continued service, it would cause but very slight loss. It could only take place during expansion, before the

closing of the port by the lap of the main valve—that is, only in the earlier stages of expansion, when the difference between cylinder and chest pressure is slight, and even then this leak would be only into the cylinder and never into the exhaust. The main valve is set to cut off at three-quarters stroke; but, obviously, such cut-off is usually of no effect, for the cut-off valve is expected, for economical running, to act before the half-stroke is completed. The main valve is carefully balanced by pressure plates upon its back, so that the power required to move it is reduced to a minimum.

The cut-off valve stem passes through the tubular stem of the main valve, which is fitted with a stuffing-box at its outer end. Perfect alignment and freedom from wear are secured by guiding the stems by a small cross-head attached to the main stem.

Supported by four studs upon the arms of the governor pulley are four weights, co-operating by their centrifugal force to compress two long and powerful springs. The cut-off eccentric is pivoted to the hub of the governor and is so connected with this system of weights and springs that the action of the weights swings it across the shaft regulating the cut-off, but in no way affecting the admission, exhaust and compression, which are controlled by the main valve. The heavy weights, the stiff springs and the balanced frictionless valve combine to make the governor very sensitive to the least change in the load and speed. Too sudden action on its part is prevented by a dash-pot connected with the system of weights and springs. The points of admission, exhaust and compression being in no way affected by load or speed, and the only duty of the piston valve being to cut off the steam, the effects of change of load or speed, so evident in other engines, are not, it is claimed, perceptible upon the cards from this class of engines. The largest size engines of this type are provided with a fly-wheel independent of the governor, and, for the purpose of lessening the thickness of the main valve, two cut-off piston valves instead of one are arranged to run side by side within its thickness. Otherwise the construction of the two types is substantially the same.

It is not without interest to note here also that Mr. Sturtevant is now building small single-valve upright automatic engines.

The Leland Tap Driving Head.

Every mechanic is well aware of the many difficulties attending machine tapping, and also of the great amount of time consumed in doing the same operation by hand.

The Leland Patent Driving Head, brought out by the Hampden Tool Company, of Holyoke, Mass., is designed to solve these difficulties, combining also great speed with accuracy. One of these machines, it is claimed, is capable of doing the work of five or six men in shops where it is in operation, and giving excellent satisfaction. The machine is made in but one size, covering the whole field from $\frac{1}{4}$ inch to $1\frac{1}{4}$ inch inclusive, without any adjustment from one size to another. Ordinarily the attachment will be used in upright drill or screw machines which have right and left belts for going ahead or reversing at will. The annexed cut explains the construction. In operating the upper member is lowered until its driving lugs come in contact with those of the lower member, which are on a clutch ring, driven by being thrust into its tapered seat by two wedges. These are actuated by a toggle joint operated by a spring, as shown. The tap, with its spindle projecting top and bottom, is held

by a spring gib, allowing an easy change from one size to another. As the bottom of the hole is approached, the tap spindle moves up, taking with it the guiding bar for the toggle joint, thus drawing in the wedges and allowing the clutch ring to drop off its seat and pass around freely. This permits the lower member to come to rest while the machine still goes ahead. The driving clutch is now thrown out by virtue of the tap spindle being at the bottom of the hole. For reversing the cross head of the drill or other driving machine is raised until the pin passing through the shank of the lower member drops to its seat in the chamber of the upper member and comes in contact with the side reversing pin. The driving machine having been

Tap-Driving Head, Made by the Hampden Tool Co., Holyoke, Mass.

reversed, the tap is withdrawn from the hole. The full lines in the engraving show the driving position of the details, and the dotted lines show the tapping position when at the bottom of hole.

According to one of our German exchanges, a new process has been brought out in Vienna of turning out copper-coated steel wire for electrical purposes. The old method was galvanic, while, according to the one now proposed, the steel wire will be coated by spirally winding around it very thin copper bands. We need perhaps not specially point out that the object in all such wires is to combine the great conducting power of the copper with the tenacity of the steel.

It is feared that the death of Dr. Hostetter will necessitate the reorganizing of the South Pennsylvania Railroad, of which he was one of the leading men. His estate is valued at \$14,000,000.

THE WEEK.

The Standard Oil magnates are now said to aspire to a complete control of the natural gas interests of the great manufacturing center comprised in Western Pennsylvania, Ohio and West Virginia. A Pittsburgh stock broker is quoted as saying: "The Standard people saw what a big thing there was in gas, and have gone quietly along absorbing millions of acres of gas lines, and the gas companies will wake up some fine morning to find their supply of gas utterly inadequate, their lands all drilled, and the Standard Oil Company ready to purchase their stock or furnish them gas at their own terms. In addition to this they practically own the Ohio oil field, and will be prepared some day to make more gas than the world can burn." The \$11,000,000 of dividend-paying stock represented by a Philadelphia company is supposed to be looked upon as a tempting morsel.

Goldwin Smith, at the recent banquet of the New York Chamber of Commerce, expatiated freely upon the promised advantages of commercial union with Canada, but so long as the leaders of the two great political parties in the United States are not disposed to favor the project apart from political union discussion is idle.

About half of the land west of Central Park, New York, owned by the late Joshua Jones, was sold at auction last week by the executors of the estate and brought about \$2,000,000. The property was bought by Mr. Jones' father in 1808 for less than \$3000.

A plan is under consideration by the Southwestern roads to regulate traffic in the interest of security holders as well as in that of shippers. It is proposed to run all competitive business through a clearing house, the supervision of which shall be in the hands of persons outside of the management of any one of the companies. An important detail of this plan is that no president shall be allowed to act independently of the majority of the board of control without the authority of his directors.

Despite the alarming war rumors lately flying in Europe the speech of the Emperor at the opening of the German Reichstag was extremely pacific and without allusion to military credits.

The industrial exposition at Richmond, Va., during seven weeks was visited by 500,000 people, freight tonnage on the railroads meanwhile almost doubled; bank clearances in October increased nearly \$2,500,000 as compared with the same month in 1887, and it is claimed that the Richmond exposition not only cleared expenses, but will yield a handsome dividend to the stockholders.

United States Treasurer Hyatt, in his annual report, just completed, states that the surplus available for the reduction of the public debt at the close of the fiscal year was \$111,000,000, an increase of \$8,000,000 over the year before. During the year the net Treasury balance increased about \$60,000,000, due to an increase of \$37,000,000 in the assets and a diminution of \$23,000,000 in the liabilities. The net decrease of the principal of the interest-bearing debt during the year was \$75,000,000. Of this amount \$51,484,000 in bonds were purchased for the sinking fund, and for the precious privilege of paying this debt before it was due the taxpayers were obliged to give \$8,274,000. The silver coinage during the year yielded \$32,484,000, almost every dollar of which went into the Treasury vault. The Treasurer is of the opinion that the people have all the silver dollars they want or are willing to take,

and recommends that if the purchases of silver are to continue the bullion be put into forms of heavy bars or ingots, arguing that the present supply of the dollars will be sufficient for any demand there is likely to be for them; and that any increase of the certificate circulation could be based with perfect safety on the uncoined metal.

A contract signed last week by the Canadian Minister of Railways, at Ottawa, indicates that the engineers' plans of the proposed Chignecto Marine Railway, to connect the Bay of Fundy with the Straits of Northumberland, are to be immediately put in course of construction. The estimated cost of the work is \$5,500,000, and it will be finished in the autumn of 1890. A dock is to be constructed at each end for the reception of vessels before they are transferred to the railway. That at the Bay of Fundy will be 600 x 300 feet, and that at Chignecto is to be 800 feet long, in addition to which there will be a lifting dock 200 feet long. At the Bay of Fundy terminus there will be a hydraulic lift which will lift and lower vessels 40 feet. Opinions in Canada differ in regard to the necessity for a work necessarily so expensive.

Governor Church, of Dakota, in his annual report, estimates the present population of the Territory at more than 700,000, including Indians.

Not deterred by the seizure of the steamer Haytian Republic by a Haytian man-of-war, two more steamships suspected of carrying arms to the insurgents have been permitted to sail from New York, the Collector being without evidence sufficient to warrant their detention. The United States cannot be held responsible for the ultimate destination of arms or ammunition that may be landed within the jurisdiction of the Dominican Government.

It is understood that the new 5000-ton steamship for the Pacific Mail Steamship Company, just put under contract in England, is intended to run between San Francisco and China as successor to the City of Tokio, an American-built steamer recently lost.

The Sioux City bridge has been completed, at a cost of \$1,250,000, opening a direct route from Northwestern Nebraska, Dakota and Wyoming points to Chicago and the East.

John W. Keely, of "Keely motor" fame, was recently consigned to a prison cell for contempt of court in failing to produce the plans, specifications and general working model of his motor, as ordered by the court on September 1, but soon released.

The latest scheme for the relief of Ireland is a land purchase bill favored by the Government, who propose to advance the necessary capital. The impracticability of the measure appears from the fact that tenants in arrears cannot be purchasers. Hence, they are offered advantages which they are in no position to accept. The bill, therefore, in its practical workings could be little better than a new method of evicting tenants from their holdings.

A syndicate of New York capitalists have obtained from the Dominican Government a concession for a railroad from San Domingo City to Azua, a distance of about 100 miles, covering a subsidy of about \$2000 per mile, besides grants of valuable timber lands comprising dyewoods and mahogany.

A number of merchants and shipowners in this city doing business with Haytian ports have addressed a petition to the State Department requesting Secretary Bayard not to recognize the blockade maintained by General Légitime in Cape Haytien, Port au Paix, Gonaives and St. Marc, as they

had large business interests in those ports. Moreover, General Légitime had not been duly elected President of the island of Hayti.

The enormous water-power of the Lachine rapids is to be utilized by an American company with the object of lighting the city of Montreal by electricity.

The Canadian Pacific Railroad has made arrangements to run trains into Chicago, so as to share in the transportation business between that point and New York.

Most of the cars on the North Side and Atlantic divisions of the Long Island road have been fitted out with apparatus for steam heating from the engines. The New Haven road is experimenting with various systems. The New York roads are all getting ready to abolish stoves.

Speculative contracts are legal, as decided by the Supreme Court, General Term. In the case of Samuel W. Lewis against Charles G. Wilson, as president of the Consolidated Stock and Petroleum Exchange, the General Term of the Supreme Court has decided that his suspension from membership was legal, and incidentally that speculative contracts for future delivery are also legal. Mr. Lewis's principal point was that the Exchange was without power to discipline him, for the reason that these contracts which he had entered into were illegal in that they were contrary to the provisions of the statutes against gaming and betting. The court said: "To make such contracts illegal it must appear affirmatively that they were entered into as gaming contracts and not as real transactions for the purchase and sale of property. When the gaming intent is not made out a contract for the future sale or delivery of stocks not owned by either of the parties at the time is a valid agreement, capable of being enforced between the parties making the contract."

An Indianapolis editorial, supposed to have been inspired by the President-elect, says "the Civil Service law must be enforced."

The General Assembly of the Knights of Labor, in session in Indianapolis, on Friday re-elected General Master Workman Powderly for two years, and also the following: Morris L. Wheat, General Worthy Foreman; John W. Hayes, General Secretary-Treasurer; Mrs. L. M. Barry, General Investigator of Woman's Work; A. W. Wright, John Costello, James J. Holland and John Devlin, members of the General Executive Board. The latter were named by General Master Workman Powderly.

The American parcels post system already comprises within its scope Canada, Mexico, Honduras and the West India Islands, and will soon be extended to most of the States of Central America, as well as China and Peru. Of the merchandise transported all but 15 per cent. originates in the United States and is sent to foreign purchasers.

Manufacturers in the domestic silk industry are at present very active, but prices are low, owing to competition. The total annual production is valued at about \$60,000,000. Twelve large mills in Paterson alone turn out about \$10,000,000 annually of finished goods, not to speak of the output of more than 100 smaller concerns. The imports of silk manufactures at New York during the first six months of the current year amounted to nearly \$16,000,000, and of unmanufactured silk at all the ports, \$11,329,000.

Bedell, the mortgage forger, lately in the employ of a leading law firm, was sentenced by Recorder Smyth to 25 years and 4 months at hard labor in the State prison. The Recorder said the crimes he had committed were of very great enormity, remarking further: "This community has

been recently startled by a large number of cases almost similar to the one which your case presents. Something must be done, and it is the duty of the Court to endeavor, if possible, to deter others from the commission of similar offenses."

The building season in New York for 1888 shows a great decline in the number and extent of new investments, compared with 1887. According to the statistics of the Bureau of Buildings the number of buildings proposed in 1887 up to the 31st of October was 3981, at an estimated value of \$62,941,072. On October 31, this year, the total number of buildings proposed to be erected was 2704, at an estimated value of \$40,886,375, thus showing a decrease of 1277 buildings and \$22,054,697.

	Buildings.	Estimated value.
1887.....	3,981	\$62,941,072
1888.....	2,704	40,886,375
Decrease.....	1,277	\$22,054,697

The decline is attributed wholly to overproduction, more dwellings having been erected on the West Side than there are people to occupy them. The outlook for 1889, therefore, is not promising.

The situation in Samoa is strained, the several consulates being under guard by marines from men-of-war in the harbor, while American and English merchants, it is charged, are subject to gross indignities from the German invaders.

A letter from Barcelona, speaking of the Spanish exhibition, says: "There is a general feeling of dissatisfaction among Americans here about the whole thing. There are some street cars, and some machinery and tools from New York, a reaper and a windmill on exhibition, but nothing worthy of the United States."

A number of capitalists of Cleveland have engaged in a project for a water-pipe line system to supply the Ohio cities and towns with water from Lake Erie. If it proves feasible to run 230 miles of pipe they will undertake to supply Columbus and Cincinnati.

The Chinese Government, without formal action, is silently retaliating the Chinese exclusion act of Congress by withdrawing from American markets. One of our contemporaries remarks: "Quite large amounts of American clocks, machines, heavy cotton goods, sheetings and the like have heretofore been taken. This is all stopped. The Chinese merchants—than whom there are none shrewder in the world—offer no explanation of their change of attitude. They simply decline to buy. Their tea we can have for coin, but they can buy textiles and machines where they are better suited. Here is a young trade, already amounting to millions per annum, imperiled, at great loss to our merchants and shipowners, and which our rivals may get! For whose benefit? Nobody's, unless it may be a few office-holders and laborers on the Pacific Coast, who hope thereby to enhance the cost of labor to their fellow-citizens, the employers of labor."

Detroit papers more than intimate that the scheme for building a tunnel under the Detroit river for railroad purposes will end on paper. The Michigan Central Railroad Company have taken legal proceedings to condemn the land required for tunnel purposes, claiming that it is needed for the extension of another railroad track. The projector of the tunnel scheme, who founded the Detroit Bridge and Iron Works, persists in his determination to build the tunnel, in the interest of the city.

The high price of copper is bringing into life numerous producing companies who long ago suspended operations because they ceased to be profitable. At least a dozen of that description are men-

tioned which might easily resume. The Boston Transcript remarks: "This country could probably supply the world with copper, and if the French syndicate persists in maintaining the present price, this country will surely add to its producing capacity. High prices always stimulate production. Stimulated production ends in overproduction, to be followed by a collapse in high prices and underproduction, which in turn again stimulates prices and production, completing a trade circle. It may be argued that the syndicate will crush the new companies, which it may, but alas, the promoters of new companies are in numerous instances the managers of old companies that are now syndicate allies. This copper problem is an immense problem, and thousands of interested parties will watch its solution."

The publication of the 22d volume of the Tenth Census Report, which has just been issued, completes a most elaborate work. The report complete includes 22 volumes, in addition to which there was a preliminary volume giving tables of population, and a compendium of two quarto volumes of 1772 pages. The whole report makes a library of 19,304 pages, and cost, exclusive of printing, engraving and binding, \$4,853,350, or 9 $\frac{1}{2}$ cents per capita of population in 1880, a less relative cost than any similar publication ever issued. The appropriation for printing, engraving and binding was \$1,018,116.

The new bureau in the Agricultural Department at Washington is about to go in operation under the direction of Prof. W. O. Atwater. A feature of the work will be to engage the ablest specialists in this country and Europe to compile articles on subjects about which information may be required. Still another function of the bureau will be to supply Congress with information that may be found necessary to aid in its legislating upon agricultural matters.

The total production of wool in the world is estimated at a fraction over 2,000,000,000 pounds. Australasia is put down in this estimate at 455,570,000 pounds, the United States at 307,588,000 pounds, the Argentine Republic at 283,047,000 pounds, Russia at 262,966,000 and Great Britain at 135,000,000 pounds. All other countries range each below 100,000,000 pounds.

The American Forestry Congress, which will be held in Atlanta, Ga., on December 5, next, has for its object the creation of a public sentiment in favor of a more rational treatment of our forest resources.

It is announced that wages in the copper mining regions are to be advanced, in response to the advance in the selling prices of copper.

The African native chiefs in the interior regions back of Zanzibar and in the vicinity of Lake Nyanza are likely to find use for thousands of firearms, sold to them by Europeans in exchange for ivory, slaves, &c. The alleged German invaders are the first to suffer from their fierce animosity.

Chief Engineer Church of the Aqueduct Commission having resigned, he is succeeded in that office by Alphonse Fteley, vice-president of the American Society of Civil Engineers and a graduate of the Paris Polytechnic School. He has been an active engineer all his life. The cost of maintaining the engineering corps will be reduced one-third on account of the advanced stage of the aqueduct improvement. General Newton, late Commissioner of Public Works, is succeeded by David Lowber Smith, who has a thorough acquaintance with the department.

MANUFACTURING.

Iron and Steel.

The report that the Spearman Furnace, of the Spearman Iron Company, at Sharpsville, Pa., had been closed down on account of labor troubles is without foundation. On Monday, the 19th inst., the men gave notice that they must be paid an advance of 10 per cent. in wages. This was refused and the furnaces were banked down for one day, when the men withdrew their demand and operations were again resumed at the old rate of wages.

A press dispatch from Chambersburg, Pa., under date of the 22d inst., says: "Mr. A. Whitney, an extensive car-wheel manufacturer, of Philadelphia, is negotiating for the purchase of part interest in the Falling Spring Furnace, in this place, long operated by Hunter & Springer and C. Burkhardt & Co., but which has been idle for several years. The negotiations have not been completed, but it is stated on good authority that Mr. Whitney will purchase a one-third or a two-thirds interest in the furnace, and that it will be put in blast as soon as arrangements can be made for securing a sufficient supply of charcoal."

Carnegie, Phipps & Co., Limited, are contemplating the erection of three additional open-hearth furnaces at the Homestead Steel Works, at Homestead, Pa. A member of the firm on being interviewed regarding the matter made the following statement: "We are making improvements when they are found to be necessary, but do not desire any publicity. Work on the three new furnaces has not been commenced, but they may be built soon."

The Pittsburgh Steel Casting Company, of Pittsburgh, have been notified by Secretary Whitney, of the Navy Department, that the Hainsworth cast-steel gun will be tested on December 5.

It is stated that William F. Nevigold, of Bristol, Bucks County, Pa., has been in Rome, Ga., making final arrangements for the establishment of a large rolling-mill plant in that place. Several other Pennsylvanians are also interested in the enterprise, the product of which will be principally in the shape of hoop iron and cotton ties.

The plant of the Apollo Iron and Steel Company, located at Apollo, Pa., is to be improved by the erection of at least one additional sheet mill and possibly an additional steel furnace.

Oliver Bros. & Phillips, of Pittsburgh, are gradually changing their furnaces at the South Tenth street mill, to make them like the puddling furnaces in their Allegheny plant. This is part of a change from high to low pressure in the use of gas. The dimensions of the pipes will be increased.

No. 2 furnace, of the Allentown Iron Works, at Allentown, Pa., is being dismantled.

Joseph Hunt has resigned his position as general manager of the Cameron Iron and Coal Company, at Emporium, Pa., owing to variability of climate, and will spend the winter in the South. The resignation takes effect on January 1 next, and, in the meantime, the new blast furnace, erected under the supervision of Mr. Hunt, will be put in operation.

While experimenting on a patent process for burning Lima oil, at the plant of the Beaver Falls Iron Company, Beaver Falls, Pa., on the 19th inst., an explosion occurred, destroying the puddling department of the works and severely injuring six men, one of whom has since died. The loss is estimated at \$10,000, fully cov-

ered by insurance. The Whitaker Iron Company, of Wheeling, W. Va., are the principal owners of the plant.

The Duluth Iron and Steel Company are now putting up the shell of their furnace at Duluth, Minn. The casting house and engine house have been finished except the roof, which is being hurried to completion also. Outside work at this plant will then be suspended for the winter, but shopwork will be actively prosecuted.

The Minnesota Car Company are erecting very extensive buildings for their new works at Duluth, Minn. They are already well under way and will be pushed through the winter, so as to be ready to install the machinery as soon as possible. The plant includes axle works and a rolling mill. The latter will be operated on scrap and will turn out stock for the axle works, as well as some sizes of bar iron for the car shops. The company expect also to make their own car-wheels. The capacity of the works will be 15 cars per day.

The West Superior Iron and Steel Company have their large pipe foundry at West Superior, Wis., ready for the roof. It is a brick building, 550 feet long and 70 feet wide, with annexes making it 120 feet wide in part. The machinery will be put in this winter, so that the plant will be ready for work in the spring. The foundations for the company's blast furnace have been started, but further operations in that direction have been suspended for the season.

Machinery.

The J. H. McLain Machinery Company, of Canton, Ohio, are at present employing over 100 hands, an increase of 50 per cent. over last year. The firm operate their plant 12 months in the year, and make five styles of grain grinders—two for steam and three for horse-power—the Fouty windmill and general foundry and machine work.

The Baldwin Locomotive Works, it is said, will turn out this year 700 locomotives, equal to at least two locomotives every working day. Last week the works received a contract from the Argentine Republic for the construction of 80 freight, passenger and shifting locomotives, to be delivered early next year. They are for use on the Provincial Railway, running to Buenos Ayres.

The Waterbury Farrell Foundry, at Waterbury, make a specialty of headers for special shapes for working cold, which formerly was worked hot. A double-header is being built for a concern in Cleveland and another for P. & F. Corbin. They are building considerable machinery for the Aluminum Brass and Bronze Company, at Bridgeport, Conn.

A press dispatch from Fort Wayne, Ind., under date of the 23d inst., says: "The Fort Wayne Jenny Electric Light Works were totally destroyed by fire early this morning. Loss \$300,000; insurance, \$148,000. Three hundred employees are temporarily thrown out of work."

The St. Louis Iron and Machine Works Company, of St. Louis, are contemplating the reconstruction and enlargement of portions of their extensive works and also the addition of a large amount of new and improved machinery.

The Wilmsen Belting Company, of St. Louis, Mo., have sent us one of their small catalogues directing attention to their rawhide belting, for which superior advantages are claimed.

The demand for a smoother to do the smoothest of surfacing has increased so much of late that the Egan Company, of Cincinnati, Ohio, have devised a special smoother to work off a surface

from any kind of wood. This machine, we are told, has met with the most pronounced success, having been awarded the medal of superiority at the Cincinnati Centennial Exposition.

The Brown & Sharpe Mfg. Company, of Providence, R. I., have just sent us several of their catalogues. One of them, dated April 1, 1888, is principally in the nature of a price list, though engravings and descriptive particulars of the different machines and tools are given. It will accordingly be found of general interest to machine-tool users. A second catalogue, rather more pretentious in arrangement, is of earlier date, but has several inserted pages which show some of the later developments in the machine-tool line. The engravings in this catalogue are generally well executed, and add in a great measure to its attractive features. A third catalogue gives a list of books in the library which the company have established for the benefit of their employees, and which shows in a very striking way that the intellectual requirements of the latter have not been neglected. The books have been carefully selected with the view of affording instruction as well as entertainment.

Messrs. William Seafert & Co., of Chicago, Ill., have issued a small catalogue briefly setting forth the features of the Seafert electric system of light and power. The system is applicable to arc and incandescent lighting, galvanoplastic work, street railway propulsion, and the general transmission of power.

Mr. George J. Fritz, of the Central Iron Works, St. Louis, Mo., has just sent us a catalogue giving price and dimension lists of pulleys, shaftings, couplings, &c. The lists are very comprehensive, and will no doubt prove interesting to power users.

Messrs. Evens & Howard, manufacturers of fire brick, gas retorts, &c., have just issued a small catalogue directing attention to their specialties, among them salt-glazed sewer pipe. A number of illustrations are given, together with particulars of general trade interest.

Hardware.

Shepard Hardware Company, Buffalo, N. Y., have been making some improvements in their Lightning ice-cream freezer, the sale of which during the past year they refer to as having been very large. They are working on patterns for sizes 20 quarts and upward, to be made with fly-wheels. They are also at work on a new catalogue which they expect to issue in a few weeks.

In a recent paragraph relating to the purchase of Geo. G. McMurtry's plant for the manufacture of hot-pressed nuts by the Iron City Mfg. Company, the address of the company was incorrectly given as South Pittsburgh, Tenn., instead of Pittsburgh, Pa.

Benjamin Burgess, late of Drake's Standard Machine Works, has established a factory for heavy edge tools at 209 South Clinton street, Chicago. He makes a specialty of butchers' cleavers, but also turns out mill picks, paper knives, brick knives and turning tools.

The display track of the "Fat Stock Show" in the Chicago Exposition Building is inclosed by a steel picket fence of the Hartman Mfg. Company's make. This novel fence, we are informed by the agent, has been sold and shipped to 38 States and Territories during past season. A large increase in capacity has been effected at the works in Beaver Falls, and branch sales agencies established in Chicago and Kansas City. The company are now exclusive sales agents for the Hartman mats, which are referred to as having been improved by recent inventions. Special machinery has superseded hand work, thus enabling the goods to be sold

at materially lower prices than heretofore. The demand for the new Hartman Flexible is especially referred to, large export orders having recently been received.

The St. Nicholas Mfg. Company, 784 to 794 Madison street, Chicago, have issued a very handsome catalogue of 48 pages, containing illustrations, descriptions and price lists of children's goods. Their line comprises sleds, hand sleighs, toy furniture of all kinds, children's desks, parlor cylinder desks, folding card tables, blackboards, express wagons, doll perambulators, bicycles, &c. Many of their goods have been greatly improved by the introduction of new and special designs, and their line has been considerably increased by the addition of more sizes and a greater variety of styles. The company have a wholesale and retail salesroom at 177 Wabash avenue, their office and factory being located at the address above given.

St. Louis Shovel Company, St. Louis, Mo., are making extensive alterations and improvements in their plant. They are placing in position a number of steam presses and hammers, and have put in operation quite a number of ovens operated by the aerated oil process, which, in addition to giving the requisite high heat which is necessary, also does away with the bother of coal and ashes. When the alterations are completed their capacity will have been about doubled, and they will be in a position to handle their increasing trade with promptness and dispatch.

We are informed that the report that James H. Mann, axe manufacturer, at Lewistown, Pa., had notified his employees of a 10 per cent. advance in wages, to take effect on December 1, is without foundation.

Miscellaneous.

The statement recently published that the Cambria Iron Company, of Johnstown, Pa., had purchased the plant of the Dunbar Coke Company, in the Connellsville region, is without foundation. The truth of the matter is that the Cambria Company have purchased about 40 acres of the Connellsville coke bed and 80 ovens, the same being the plant of the Atlas Coke Company, and are now operating the same. Possession was given on Thursday, the 15th inst.

The works of the Faraday Carbon Company, at Pittsburgh, destroyed by fire some weeks since, have been rebuilt and were put in full operation this week.

A report was published in Pittsburgh, last week, to the effect that the H. C. Frick Coke Company had purchased a controlling interest in the property of the Connellsville Coke and Iron Company, located in Dunbar township. N. P. Hyndman, the Western States agent for the latter firm, with headquarters in Pittsburgh, states that there is no truth in the report whatever.

The De-Oxidized Metal Company, of Bridgeport, Conn., have issued three small pamphlets devoted to their different specialties. One of these is Babbitt metal and various other grades of anti-friction metals. The pamphlet devoted to these gives, among other things, figures of speed, which are guaranteed for the different compositions. Another one of the pamphlets directs attention to name-plates of de-oxidized bronze, suitable for manufacturers' purposes. Artistic bronzework also is treated of, together with de-oxidized bronze bells for public buildings, locomotives, steamboats, &c. The third pamphlet finally gives prominence to the use of de-oxidized bronze and copper in ingots, bars and castings of all kinds.

The Iron Age

New York, Thursday, November 29, 1888.

The Interstate Commerce Law.

It must be admitted that our railroads, as a whole, are not as prosperous as they were last year or even as they should be to earn interest charges and the usual dividends. It is true that the protection of private ownership of stock sometimes requires the announcement in Wall street that large earnings warrant a dividend, but this is contrary to other facts put forth. An unusual number of interviews with prominent railroad men have appeared in the daily papers, and all charge the Interstate Commerce law with being the cause of the whole decrease in net profits. With this is coupled the statement that better times in transportation cannot be expected until this law is repealed or essentially modified. All signs point to a combined and skillful attack upon the law in Congress, public opinion being meanwhile influenced through Wall street by articles or interviews in newspapers and by papers in leading magazines. In this last respect Mr. Blanchard's article in the August *Forum* upon the necessity of railroad pools is, we understand, likely to be followed by others in the same strain. It is more than hinted in some quarters that something at least of the present cut in freight rates was due to or is now kept up for the purpose of creating the very impression which we are discussing—that the Interstate law "must go."

Whether the Interstate law cannot be amended with benefit is still an open question, and therefore the discussion of changes in the direction of the public good is a very practical one, but such business discussion is not helped by unfairly charging to that law every change in the commercial world which may affect railroad-ing or any other business unfavorably. It is the opinion of many merchants that the law as it stands has turned out to be more favorable to the railroads than to them, and it will be a surprise to them to learn that a strong effort will be made to repeal the only sections of the law which put any checks upon tariffs. The partial failure of the wheat crop and consequent loss of export traffic is for one thing surely not chargeable to any legislation, nor the further fact that sales of manufactured goods in the territory of the short crop may not be as great as last year, to the loss of merchant and carrier alike. It is therefore of importance to the full discussion of any repeal of the existing law that business men should form their opinions according to the merits of the case without regard to one-sided newspaper writings.

One point deserves attention. In the place of the section prohibiting pooling it is proposed to substitute one which shall legalize pools. The argument, briefly, in this: All the trouble comes from rate-cutting, which makes one shipper pay a higher rate between two points

than his competitor shipping between the same points by another road. This, practically, has just as bad an effect as though the two men shipped over the same road at different rates. If pools were strong enough they could compel the observance of the same tariff on all lines, and, hence, to legalize pools will secure the desired impartiality. A strong argument, but, as a matter of practical politics, no party could afford to contemplate such action in the present state of public opinion west of the Mississippi and the great lakes. It will, therefore, be proposed that pools so legalized shall be put under the Interstate Commission. But here comes in the further question: What shall be the powers of the commission over legalized pools? If it be merely to register the statistics of the pools, then the latter would be masters of our commerce. It is not probable that public sentiment in the West would ever consent to this. There remains, then, the alternative that the commission should have power to order a reduction or advance in the rates. They are doing this now, but only relatively. If one place or article is given a rate, then another must have it, too. They do not pass upon any rate of itself—that is left to the railroad managers. But, in the case of power over legalized pools, there would be the right to change rates, not relatively, merely, but absolutely. This would be really giving the Government and not the railroads the power to make freight rates. Suppose, under such a system, that the freight rates on iron became a political question and was carried into Congress! We can all see the great changes and dangers to our commercial methods which would flow from such a system. There is further to be considered the bearing of all such legalizing or ignoring of railroad pools upon the general subject of combinations and trusts, to the evils of which the public mind is somewhat sensitive.

It must be confessed that the problem of railroad control is very difficult, and one where no solution yet in sight gives promise of avoiding injustice to either side. It is really a question of expediency, a business question, and when it comes up in Congress, and any proposed change is embodied in a bill, the business men of the country, after carefully considering the whole matter, should make their influence felt.

There is a good deal that is suggestive in the recent substitution in several cases by the British Admiralty of 12-hour trials for war ships for the hitherto customary six-hour runs. The utter uselessness of these latter as measures of what ships can do when in commission was pointed out a number of years ago, and since then every breakdown of a ship's machinery has given further opportunity for heaping strictures upon those responsible for the narrow time limits. As a matter of fact, every one who has given even the slightest attention to the matter knows that the engines in the navy, both here and abroad, can be made to work satisfactorily under full speed for a period of six hours only with the greatest difficulty, and are rarely, if ever, expected to be afterward called upon to repeat the performance. Experience, at any rate, has shown that where full speed runs have been attempted in the course of regular work a breakdown invariably has

resulted. The reasons for this are perfectly clear. The engines are made extremely light, much lighter than those of the mercantile marine, with a consequent loss of rigidity and strength, and as a final result we find the several navies priding themselves on the possession of, say, 18 and 19 knot vessels, so listed by official trial, while in reality probably none of them could maintain such a speed even for only two of three hours. The absurdity of such a system of classification is painfully apparent. A year or two ago some effort was made in the United States to have the duration of trial trips reduced to four hours, a circumstance which, however, very fortunately did not come to pass. To be of practical service at all the trials should long since have been extended over several times their present duration, and the new course of the British authorities is therefore deserving of all praise and worthy of being followed by others.

The World's Glut of Merchandise.

In all quarters of the globe the volume of merchandise seeking transportation appears to be in unusual volume, so that facilities for carriage on land and sea alike are not infrequently taxed beyond their utmost capacity. The foreign and domestic commerce of the United States are no exception to the rule. The scarcity of ocean tonnage at the port of New York has been a standing complaint for some weeks past, and tonnage is reported to be in demand the world over for the conveyance of merchandise. In many foreign trades the rates paid are higher than in New York. The natural consequence is that freight awaiting transportation has accumulated heavily at this point, while vessels are obtained with increasing difficulty. The most reasonable explanation of the scarcity of shipping is the rush of tramp steamers to share in the profits of the Russian wheat trade, and as this class of steamers exerts a controlling influence in the freight market the usual supply of tonnage available in American ports is much deranged. Outward rates to South American and East Indian ports are noticeably advanced. Many vessels have been detained in Australia by the labor strikes there, and a large number have been caught by the winter in the Black Sea. One effect of the situation is to start a heavy boom among shipbuilders in the United Kingdom, whose yards are reported to be full of work in progress, with engagements sufficient to keep them occupied for a year to come.

From a review of the situation the conclusion is inevitable, as we gather from shipping agents and ship owners in this city, that the waste of ocean tonnage from natural causes has not been replaced by recent additions, while the world's traffic in all directions has of late received a strong impetus. The present outlook, therefore, is good for American shipbuilders. Their yards are already well occupied, with the assurance of heavy contracts yet to come, on Government account as well as from several corporations and individuals, who contemplate additions to their respective fleets. With foreign builders fully occupied the "free ship" privilege, for which some have so vociferously clamored, is likely to prove of doubtful advantage. The new year, under these circumstances, may be

considered as looking more cheerfully for American shipbuilders, perhaps, than ever before, and this is true of the seaboard as well as of builders on the lakes. Nor should the influence upon the iron and steel trades of the United States of high ocean freights be overlooked. They have now cut off to a considerable extent imports of foreign material, to compensate for the falling off in the demand for material on the part of the railroads.

A New Era in Ecuador.

Since the revolution in 1885 a new era of prosperity has been inaugurated in Ecuador, a country of manifold and splendid resources. The equator passes through the northwestern corner of Ecuador, but the heat is tempered toward the Pacific by the mountainous character of the country traversed from North to South by the Cordillera of the Andes, and on the Eastern slopes of these all the way to the plains by the great watershed of the Amazon and its tributaries. The soil being fertile and the climate not too dry, Ecuador abounds in a variety of leading tropical staples, chief among which is cocoa. All Ecuador requires is peace, better finances and railroads.

The republic covers an area of 206,200 square miles, including the Gallápagos Islands; the population was 1,004,651, as per census in 1885, of whom 252,000 inhabited the 15 chief cities, without counting 600,000 wild Indians in the Eastern provinces. The new President, Dr. Antonio Flores, whose term of office will expire on June 30, 1892, has long been Ecuadorian minister in Washington and Paris, and is favorably known as a man of great ability and energy, whose administration will inspire confidence. Dr. Flores is in the first place bent upon reorganizing the finances, in a poor plight through occasional revolutions. On the sterling debt of £1,824,000, on which interest was paid during 37 years, from 1830 to 1867, unpaid coupons have accumulated to date to the amount of £373,920, although the rate of interest was temporarily reduced to 1 per cent. Including these £2,197,920 the republic owes abroad and at home only \$14,348,582, principal and unpaid interest, a mere trifle, the income of State being \$5,107,992 in 1886, and rapidly on the increase since then. For any money the Government requires at home it has to pay 9 per cent. interest to the banks at Quito, who declared dividends last year of 16 to 20 per cent. Once the sterling debt is in proper shape, Ecuador would probably be able to procure money in Europe at 5 per cent. An American syndicate is even now ready to build a railroad from Quito to the Pacific if the credit of the republic were restored. Hence the Government has lately informed the English bondholders that it was ready to treat with them if they would send an agent to Quito furnished with full power, a proposition which they have consented to. Meanwhile, in order to be able to repress promptly any renewed attempts to break the peace at home, the standing army has been reorganized, now counting 4730 file, together with the national guard, all fully equipped, and Remington rifles in the arsenals for an emergency. The navy

consists of three war steamers of modern construction and armament, built in England, ready to co-operate with the army by preventing the landing of rebels, so frequent in former years.

A syndicate of Canadian bankers and merchants obtained in March last by purchase control over the railways built by Mr. Mark J. Kelly, together with those in course of construction, and they are now being finished rapidly, one being the Yaguache-Duran Line, another the Yaguache-Chimbo, and the Chimbo-Sibambe. The distances are not great, but the engineering difficulties all the more so. Agriculture is the main source of wealth, but Ecuador is also rich in gold. Among other quartz mines there are the Zaruma and Cascajal, and the placer mines along the Chimbo River. An English company is engaged in gold mining at Portobello, in the Zaruma district. Cocoa receipts at Guayaquil for shipment abroad amounted to 334,267 quintals of 101½ pounds American in 1887, against 384,752 in 1886. From January 1st to October 23d, this year, the receipts were 254,000 quintals, against 305,000 during the corresponding period of last year; the quality is medium. Ivory nuts have also become an important export article, 258,125 quintals being received at Guayaquil last year, against 197,808 in 1886. The total export in 1886 amounted to \$8,014,409. The American trade presents the following figures:

Fiscal year.	Import into the United States.	Domestic export to Ecuador.
1887.....	\$1,131,169	\$1,049,392
1888.....	1,118,627	810,567

Telegraphic communication was established this year between Quito and Bogotá, the capital of Colombia, and Guayaquil, by cable, communicates with the rest of the world. One of the drawbacks which the inhabitants of Ecuador suffer from frequently is the earthquakes, caused by the occasional activity of the volcano Tungurahua, which had been silent since 1797, but had a formidable eruption in January, 1885, since when shocks of earthquake have multiplied, one occurring on September 25 last and one on November 16. If an influx of foreign capital completes the Ecuadorian railroad system—as there is now every prospect will be the case—the republic will no doubt enter upon a period of prosperity from which our commercial relations with it will not unlikely benefit largely.

In the "Statistical Abstract," of which a second edition has lately been published by Mr. James M. Swank, we find some very instructive figures bearing on the iron industry of New England, concerning which there has been considerable discussion of late. Taking Prof. J. P. Lesley's figures for 1856, Mr. Swank makes the following comparison: In 1856 New England produced 34,051 net tons of pig iron; in 1887 it turned out 37,252 tons. In the meantime the make of the country rose from 911,698 tons to 7,187,206 tons. Now, on the face of it New England has remained woefully behind, and yet, when we go behind the returns, the case does not seem to be quite so desperate. Practically speaking, New England has never made anything else but charcoal pig iron. Now, in 1856 the whole country made 330,321 tons of that class of pig, of which New England is credited with 34,051, or

a little over 10 per cent. In 1887 the quantity of charcoal iron made in the United States was 578,182 net tons, of which New England made a little less than 7 per cent. The position is far more serious in rolled iron, including iron nail plate and iron rails. While the production of the whole country has advanced from 557,850 net tons in 1856 to 2,588,500 tons in 1887, New England can show a record of progress only from 78,989 tons to 85,101 tons; and it may be stated in regard to the latter figure that by far the greatest part of it must be the make of one mill. In the manufacture of cut nails New England has declined from 560,000 kegs in 1856 to 267,453 kegs in 1887, while the mills of the whole country made 6,908,870 kegs in 1887, as compared with 1,824,749 kegs 30 years since. We believe that the causes for this decline are not far to seek. Practically, New England has no mineral fuel suitable for blast-furnace use, except what the Rhode Island anthracite may possibly prove itself to be worth. In accessibility to raw materials and proximity to the greatest markets New England cannot compete with its rivals east and west of the Allegheny Mountains. Its decline is due to natural causes, and can only be arrested by special measures.

Natural Gas in Iron Making.

During the past year complaints have become more numerous among the iron-makers who have adopted natural gas as a fuel in their works. The grounds for dissatisfaction have been twofold, speaking in general terms. The most serious probably has been the inadequacy of the supply at different seasons and fluctuations in the pressure at certain times. The second has been the tendency displayed by the natural gas companies to advance the prices.

With the object of securing data upon which to base some conclusions concerning the magnitude of the evil *The Iron Age* has called upon manufacturers to give them confidentially the facts bearing upon the questions whether or not they had given up the use of natural gas as a fuel, whether or not they have or are now experimenting with any new fuel gas, whether they had modified their appliances for burning natural gas, and whether there had been any recent changes in the price.

Spreading broadly, the replies come from three districts, Pittsburgh and its outlying districts, Wheeling and the Mahoning Valley, replies being received from 35 firms. From Pittsburgh reports concur in stating that natural gas is generally used now wherever it has been introduced in the district, and the manufacturers agree in stating that although prices have been advanced from 20 to 75 per cent. and more the balance is still in their favor. In one or two instances experiments with fuel gas are being made, and the consensus of opinion seems to be that improvements have reduced the consumption of gas considerably. We quote the following two letters as fairly representative:

We think none of the manufacturing establishments using natural gas that are situated in the natural gas field proper or in close proximity have given up its use, or have had any want of supply or satisfaction in its use, further than a temporary annoyance at

two or three times for a day or two during the last two or three years, caused by accidents to lines or the consumption for the time being exceeding the piping capacity. We have not experimented for any new fuel process, as we have not found it necessary. A slight advance has been made to some consumers during the last year where the previous rates charged were abnormally low. Ourselves and others have made improvements in the modes of using gas to avoid a useless waste, and the gas is more sensibly and economically used now than during the earlier days of its use. Even with the present enormous pipeage capacity of the companies in the vicinity of Pittsburgh, two-thirds of the present consumption could be supplied from these pipes if the waste were as great as in the first year or two of its development.

The second letter referred to reads as follows:

The natural gas companies in this district have all or nearly all made some advances in their charges for the fuel, but I believe the main reason for this is, that the running expenses of the companies and the cost of maintenance of pipe lines prove to be larger than at first estimated. Our supply runs very steady; our appliances have been very economical from the start, and we have made no changes in the same of late. While it is likely that the natural supply will weaken or give out some day, I think that day is as yet in the remote future. In nearly every case where individual wells have weakened, the cause has proven to be the too close location of other wells to the same. For instance, I know of one company whose first well they drilled was a tremendous gusher; the second one in the same field was also a good one. They subsequently drilled four more holes near by, and now the six holes do not produce much more than the two first ones, but otherwise the flow is pretty steady. The same company have now leased another field, about 8 miles distant from the first field. New gas territories are being discovered constantly. The Versailles territory, which was at one time already abandoned, is now producing nicely, it having been discovered that the main supply of gas is found at about 2300 feet to 2400 feet depth. Several large works are now supplied from this territory.

From another manufacturing center we have the following report, which treats the subject from a different standpoint:

We have not given up the use of natural gas, but have found the supply so variable as not to be satisfactory. We have had to put at least half our boilers on coal to make good the deficiency, as, in order to run our mill steadily, it must, of course, be equipped for minimum supply of gas, not the maximum. Speaking generally, we would say that even if the supply of natural gas had been entirely satisfactory we would deem it wise to be prepared with an alternative. On the first consumption of natural gas, one of its greatest claims was that it could be turned into any ordinary furnace. With continued use soon came the demand for economy, which means many changes in the construction of the furnaces to suit them to natural gas. With a plant once adapted particularly to natural gas the large manufacturer finds himself very much at the mercy of the company supplying the gas, and has to put up with many vexatious irregularities, as a change back to any other fuel involves considerable cost and delay. The part of wisdom is, therefore, to prepare an alternative plant for the supply of an artificial fuel gas of such nature as can be turned into the same mains as those which supply your natural gas, and which can be worked in identically the same manner. We question very much whether such an equipment run steadily will not be found more economical in the long run, even at a slightly increased gas cost, than an irregular supply of the natural gas.

In the Wheeling district the question of the supply of natural gas has been somewhat vexatious, and while its use has not been entirely abandoned by more than two concerns, other works have restricted its employment to certain parts of their es-

tablishments, and all seem to suffer more or less from shortage at certain seasons of the year. The winter consumption for domestic purposes has become so important a factor, and so profitable to the natural gas companies, that, tempted besides by the higher price they have succeeded in getting from this class of customers, they have been unable to supply all the manufacturing establishments. One of the managers of the district goes over the ground in the following communication:

We have not given up the use of natural gas. Our supply is somewhat limited, but by using a little coal we are able to get along comfortably. Contemplating the possibility that the supply of natural gas might give out, we have looked carefully for some kind of fuel to take its place, but have as yet been unable to satisfy ourselves as to the best substitute. Some of our competitors have been using some of the cheap Ohio oils, but, so far as we can learn, the experiment has not been a success; and even should some successful mode be discovered of using this oil, the supply is about as uncertain as that of gas. We have not modified our appliances for burning natural gas, and have never been able to see much economy in any of the various appliances that have from time to time been adopted. Should the supply of gas become an entire failure, we should probably go back to the use of coal, burning it as we did before gas was introduced; but have no doubt that the time is not far distant when some more economical mode of using coal will be discovered and adopted. I have talked with parties who are using oil, vaporizing it by a jet of steam, and with others who use various patent appliances for converting the oil into gas, and the concurrent testimony is, that with coal at \$1 to \$1.25 per ton, it would be a cheaper fuel than oil at 65 cents per barrel. As we own our own coal, and can deliver it at the works for less than \$1 per ton, we would be inclined, as above stated, to fall back on coal as a fuel should our natural gas supply fail. While gas manufactured from coal can be used economically for heating or puddling purposes, we have not been satisfied that any plan has yet been adopted by which fuel gas could be used effectively and economically for generating steam.

In the Mahoning Valley the situation is far more serious. We have reports from five large works which acknowledge that they have been forced to give up the use of natural gas for the sole reason that the supply has been irregular and inadequate. One of them informed us that the pressure fluctuated between the extremes of 50 pounds and zero, while the majority appear to have made efforts to reduce the quantity consumed by modifying the appliances. They have returned to the methods used by them before making the change—some again burning coal, and others fuel gas. Among the latter, one reports a consumption of about 600 pounds of slack and nut coal, all told, including lighting up, to the ton of finished iron, by employing Smith gas furnaces. One works is experimenting with a new fuel gas process. One mill runs on coal in the boiling furnaces, and on natural gas in the finishing department.

Summing up the results of our inquiries, we may state that inadequacy of supply is only keenly felt in the Wheeling and Mahoning Valley districts, that there is considerable activity and much interest in improved methods looking to fuel economy, that, on the whole, natural gas is less wastefully used, and that the tendency is strongly in the direction of equalizing the prices which manufacturers are paying for their natural gas. It is evident that whenever there is a shortage, the supply to domestic consumers is given precedence

to that of the manufacturing establishments. We cannot close our review without quoting the following paragraph from a letter from the general manufacturer of one of the largest works in the country, who says: "I think it can be laid down as a general principle that, where natural gas is ample for the wants of the manufacturer, and is supplied to him at a moderate cost, he would prefer it above all others as the most reliable and generally useful for the largest range of heating, giving the maximum and minimum heat just as it is required."

OBITUARY.

JOHN R. ONDERDONK.

John Remsen Onderdonk, an engineer of national repute, died at Chicago on the 22d. inst. At the time of his death he was in charge of the construction of the tunnel under Lake Michigan, intended as a part of the new Chicago water supply. His brother, Andrew Onderdonk, is the contractor for the work. John R. Onderdonk was born March 22, 1840, in New York. He was a descendant of one of the old Dutch families that had taken from the first a prominent part in public affairs. His father, John Remsen Onderdonk, was a civil engineer of prominence, while one of his uncles, William Treadwell Onderdonk, was bishop of Pennsylvania, and another uncle, Henry Onderdonk, was bishop of New York. Mr. Onderdonk was educated in New York, studying architecture as a profession. He did not study engineering as a specialty, his successes in this line having been made in later life. At the opening of the war he enlisted in a New York regiment, serving with the Army of the Potomac, as well as in the later campaigns. He was twice wounded, and retired with the rank of major, but he never used his military title, and made no boasts of his war record, which was that of a brave soldier, nevertheless. At the close of the war he married Miss Rosina Jacobs, of Jersey City. He leaves one son, a young man 19 years old, who is fitting himself to continue the family career by a course of study at the Stevens Institute, in Jersey City. Mr. Onderdonk's chief successes were made in conjunction with his brother, Andrew Onderdonk, who early achieved national reputation by his skill as a civil engineer. Andrew Onderdonk took 700 miles of grading on the Canadian Pacific Railroad, in the most difficult part of the territory traversed by that road in British Columbia. John R. Onderdonk was his brother's superintendent, and had full control of the work, which was carried to a successful conclusion. The other great works that stand as monuments to the dead engineer's talent are the Alameda bulkheads, the San Francisco sea wall, and the Oakland and San Francisco ferry slips. He was the architect of J. C. Flood's splendid house on "Nob Hill," and he planned and erected many other residences in the Pacific Coast cities. Mr. Onderdonk went to Chicago about a year ago, to take charge of his brother's contract on the water tunnel. His remains were taken to New York City for interment.

The Chicago, Burlington and Quincy Railway Company have notified the Indianapolis Car Works, at Indianapolis, Ind., that they have been awarded the contract to build 1000 box cars for that company, to be delivered as fast as practicable. This contract, with those recently taken, will keep the works busy until spring.

Ferro-Silicon and the Economy of Its Use.

At the last meeting of the American Institute of Mining Engineers, held at Buffalo, Messrs. W. J. Keep and Edward Orton, Jr., presented an interesting paper on ferro-silicon, which we take pleasure in reprinting practically in full:

During the past two or three years consumers of pig iron have been seeking more knowledge regarding the chemical questions involved in foundry practice. This desire has been increased by the papers of Prof. Thomas Turner, of Mason College, Birmingham, reporting a series of tests made to show that silicon is a useful rather than a damaging element when present in proper quantities in cast iron, and that by its use pig irons and scrap, which when used alone are totally unfit for foundry purposes, may be made to give satisfactory results. Professor Turner has shown that the strength of a cast iron depends on:

1. The amount of weakening impurities present.

2. The proportion existing between the combined and the graphitic carbon in the cast iron.

He says that the tendency of combined carbon is to increase hardness and brittleness, while graphitic carbon makes iron soft, malleable and tough; too much of either form is a disadvantage; the strength depends on the proportion.

Strength being the thing most desired, irons having an excess of weakening impurities will not find a market, and therefore the only thing to provide for is the proper proportion between combined and graphitic carbon. Professor Turner shows that by a judicious use of silicon this proportioning can be accomplished exactly according to the wish of the founder; an increase of silicon changing combined carbon to graphitic and *vice versa*. When the founder understands its use he may soften and toughen, or harden and strengthen his iron to suit his requirements; but Professor Turner warns him against the use of silicon, without first understanding when it is needed; for in an iron where the carbon is already graphitic, more silicon may weaken it and make it brittle.

From the effects produced by the extensive use of high-silicon irons for many years, and from the discussion of the subject during the past few years, silicon has come to be considered as a softening agent. In the United States for a number of years past many foundrymen have depended upon the irons made from the lean ores of Ohio and Kentucky as softeners to counteract the hardness of irons made from the refractory ores of Lake Superior and Northern New York and the irons of the South; but it has only lately been generally understood that this softening quality is due to silicon. Upon examining the analyses of Ohio softeners, made from native ores, it will be found that the percentage of silicon runs from 3 to 7 per cent., and that none regularly made previous to 1887 contained more than 7 per cent. As the process by which silicon accomplishes these desirable results has become better understood the demand for high-silicon iron has increased. In 1887 foreign irons containing as high as 10 per cent. of silicon were imported into the United States. These high-silicon irons go under the name of ferro-silicon. As the call for this imported product increased ferro-silicon containing from 7 to 14 per cent. of silicon, and of a very high grade in other respects, has been produced in America to supply this demand.

The question has naturally arisen whether the use of irons containing such a high percentage of silicon is as economical as when the percentage is lower. This

has led us to the experiments and conclusions set forth in the present paper. We shall treat the subject under the following general divisions: First, a comparison of the composition of foreign and American ferro-silicons; second, the inquiry whether the silicon in the pig is retained in the iron when remelted, and, third, the inquiry whether the silicon in the pig is imparted to other irons during remelting without loss of silicon.

I. *The Composition of Foreign and American Ferro-Silicon.*—To make this comparison we have selected from the stock of irons in our possession, and with which we are familiar, having repeatedly tested them, the following examples: Govan ferro-silicon, from a prominent Montreal firm, the analysis being published by them. (Marked *a* in Table I.) A foreign ferro-silicon, obtained from a well-known New York broker and analyzed for our tests by Fleming. (221 in Table I.)

The ferro-silicon used by Professor Turner in making his tests, the analysis being published by him. (This iron we have not ourselves tested.) (Marked *b*, in Table I.) The only American ferro-silicon with silicon as high as 10 per cent. that we have heard of as being made regularly is the "Pencost" brand, the producers of which kindly furnished us with all the metal that we needed for our experiments. Nos. 403 and 401 of the table, representing American ferro-silicon, are of this iron. These irons were analyzed for our tests by Mr. Orton and Professor Lord. We add, for purposes of further comparison, four analyses of two well-known brands of Ohio softeners—namely, "Wellston" (*c* and *d*, analyzed by Britton) and "Globe" (No. 178, analyzed by Setterwall, and *e*, analyzed by Orton). We could add analyses of other high-silicon irons, both foreign and American, that we have in our possession; but for the present purposes these will suffice. The following table gives the analyses referred to:

TABLE I.

	No. of test.	Kind of iron.	Silicon.	Combined Carbon.	Graphitic carbon.	Manganese.	Phosphorus.	Sulphur.
Ferro-silicons.	<i>a</i>	Foreign "Govan"....	10.55	1.84	0.52	3.86	0.04	0.03
	221	Foreign (New York broker)	10.62	2.32
	<i>b</i>	Foreign used by Professor Turner.....	9.80	0.69	1.12	1.95	0.21	0.04
	403	American "Pencost"....	12.08	0.06	1.52	0.76	0.48	tr.
Softeners.	401	American "Pencost"....	10.34	0.07	1.92	0.52	0.45	tr.
	<i>c</i>	American Wellston....	6.67	2.57	0.50	tr.
	<i>d</i>	American Wellston....	5.06	0.75	0.05
	178	American Globe.....	5.89	0.30	2.85	1.00	1.11	0.02
	<i>e</i>	American Globe.....	6.64	0.99	tr.

The points which attract attention in this table are:

1. The large proportion of combined carbon in the foreign irons. If this carbon remains in the combined state after the ferro-silicon is added to the foundry mixture, it will tend to harden the resultant casting. The carbon of the American ferro-silicon is in the graphitic state, to begin with, and therefore such irons should be the superior softeners.

2. Manganese in the foreign irons runs much higher than in the American. It is the general belief that manganese acts more powerfully than silicon and in an opposite direction, causing carbon to assume the combined state. If this is the case, a large part of the silicon in the foreign irons would be needed to neutralize the effect of their contained manganese, leaving much less silicon to exert a softening influence upon the combined carbon

of the hard iron which it is expected to soften than would be the case if the manganese were absent. In the American silicon-irons the manganese is so low that the silicon is free to act directly on the combined carbon of the iron to which it is added.

3. The foreign irons are nearly free from phosphorus, while "Pencost" contains about one-half of 1 per cent. and the other American irons which we have mentioned contain about 1 per cent. We may remark that in most foundry mixtures phosphorus will not run below one-half of 1 per cent., and therefore the effect of the phosphorus, added by the use of American ferro-silicon, will not affect the mixture. Such a small quantity of these high-silicon irons is needed to produce desired results that if they contained no phosphorus whatever this use could not reduce phosphorus in the mixture one-tenth below its former amount. Again, perhaps a small percentage of phosphorus in foundry iron may do more good than harm.

4. We observe the high percentage of silicon which these irons, both foreign and American, contain, as compared with the American softeners made in former years. This increase in silicon percentage has led to the name ferro-silicon.

II. *Is the Silicon in the Pig Retained in the Iron when Remelted?*—The high silicon irons are made in a furnace at a very high temperature, and it has been asserted that when remelted in the foundry at a much lower temperature the iron will drop much of its silicon, which will be carried off in the slag. The introduction of these high-silicon irons has led to discussion as to the relative value of softeners with high or low silicon, and also as to the relative economy in the use of a 10 per cent. metal as compared with an iron in which the silicon reaches only half that percentage. We wish it distinctly understood that we discuss in this paper, not the question whether the silicon is oxidized by the blast of the foundry cupola or not, or how much may be lost in that way, but simply whether remelting at a lower temperature will release a portion of the silicon, and, if so, in which iron—that is, high or low-silicon iron, the loss is the less. We have made a number of tests to arrive at the truth. We secured seven pigs of "Pencost" ferro-silicon, containing silicon ranging from 4½ to 12 per cent. These pigs (except the first one) were made at the same furnace and from the same stock, and under the same general conditions, which would insure a similar composition in each, except as to the silicon, and the change in carbon which the variation in silicon would produce. Sets of test-bars were made from each of these pigs and tested by "Keep's Tests"; the crucible temperature being about the same as that of the foundry cupola. These test-bars were then again remelted and a second series of bars was cast and tested. Both the first melts and the remelts were then analyzed, with the results shown in the following table:

TABLE II.

Silicon in original pig of Pencost ferro-silicon.	Silicon in test bars.		Silicon in test bars.		Actual loss of silicon from		Percentage loss from	
	Number of tests.		Number of tests.		First melt.		First melt.	
	First melt.	Second melt.	First melt.	Second melt.	First melt.	Second melt.	First melt.	Second melt.
4.36	397	4.35	405	4.25	0.01	0.11	0.22	2.52
6.76	398	6.75	406	6.57	0.01	0.18	0.14	2.66
8.09	399	8.07	407	7.99	0.02	0.08	0.24	0.99
9.42	400	9.27	408	9.31	0.15	gain	1.56
10.34	401	10.25	409	10.24	0.05	0.05	0.48	0.48
11.34	402	10.82	410	10.76	0.52	0.07	4.58	0.64
12.08	403	11.68	411	11.48	0.40	0.20	3.31	1.71

An examination of these results reveal that on the first melting the irons having

less than 10 per cent. of silicon lost on an average 0.55 per cent., while those containing 10 per cent. and over lost 2.80 per cent. of the silicon held in the pig. On the second melting the losses are twice as great in the low as in the high percentages. From these observations we conclude that though the absolute loss is greater in the higher numbers, it is still so small in all cases as to be unworthy of consideration.

To further prove the question, whether irons high in silicon can hold their silicon when melted at lower temperature, a series of pigs, from an Ohio furnace now out of blast, was tested, and the pigs and bars analyzed. These pigs were all made from the same mixture of ores and represent all the grades of iron made at the furnace. The results appear in the following table:

TABLE III.

No. of test.	Grade of iron.	Silicon in original pig.	Silicon in first melt.	Loss of silicon.
35	Silvery, flaky	6.99	6.92	0.07
34	Silvery, flaky	6.86	6.80	0.06
33	Silvery, flaky	6.82	6.75	0.07
36	Silvery, open	5.66	5.63	0.03
39	A1 foundry	5.15	5.20	+ .05
37	B1 (hot)	4.66
38	B1 (cold)	4.05	4.00	0.05
40	No. 2 foundry	3.64	3.44	0.20
41	No. 1 mill	3.57	3.59	+ .02
42	White	1.97	1.98	+ .01

The tests show great uniformity in the losses of silicon, which are in all cases trifling. A careful study of these two series of tests of Ohio Silicon Irons, the silicon ranging from 2 to 7 per cent. in the ordinary softeners, and from 5 to 12 per cent in the "Pencost" ferro-silicons, or, taking both tables together, from the white iron, made so by low silicon, to the whitish iron produced by an excess of silicon, leads us to conclude:

1. That silicon pig iron loses practically none of its silicon in remelting through being melted at a lower temperature.

2. That there is practically the same actual (not proportional) loss from irons with comparatively low silicon as with high, and therefore one is as economical as the other so far as the silicon is concerned.

Before leaving the question of loss in silicon due to the lower temperature in remelting, let us compare the losses in foreign with losses in American ferro-silicons. In the following table we exhibit the determinations of silicon in a 16 per cent. ferro-silicon (396), imported by a prominent New York broker; a 12 per cent. metal (213), imported by the same firm; and a 10 per cent. metal (214), imported by a Montreal broker. These samples are sufficient to represent foreign irons, and we introduce Nos. 403 and 401 as representing American ferro-silicons.

TABLE IV.

Number of test.	Kind of iron.	Silicon in			Percentage loss in.	
		Original pig.	First Melt.	Second Melt.	First Melt.	Second Melt.
396	Foreign (New York broker)	16.32	14.47		11.33	
213	Foreign (New York broker)	11.99	10.84		9.69	
214	Foreign "Govan"	9.85	9.81		.40	
403	American "Pencost"	12.08	11.68	11.48	3.31	1.71
401	American "Pencost"	10.34	10.29	10.24	.48	.48

These results show distinctly that these foreign irons lose in remelting more than the American irons with which they are compared. We will not endeavor to account for this in the present paper.

III. *Is the Silicon in the Pig Imparted to other Irons without Loss?*—That is, will ferro-silicon hold its silicon until mixed with irons deficient in silicon; and, for making such mixtures, will high or low-silicon iron lose most silicon? To arrive

at conclusions regarding these questions we made four series of melts. Each series was composed of four casts and each cast of six sets of test bars. We used for these a white-iron base (376) with 0.186 per cent. silicon and a gray-iron base (253) with 1.249 per cent. silicon; and for adding silicon we used the first pig of "Pencost" (397) before spoken of, containing 4.36 per cent. of silicon, and the fifth pig (401), containing 10.34 per cent. silicon.

The first series was gray (376) and 4.36 per cent. of ferro-silicon (397).

The second series was white (376) and 10.34 per cent. of ferro-silicon (401).

The third series was gray "FLM" (253) and 4.36 per cent. of ferro-silicon (397).

The fourth series was gray "FLM" (253) and 10.34 per cent. of ferro-silicon (401).

The four numbers of each series were to contain respectively 1.5, 2, 2.5 and 3 per cent. of silicon. Having been weighed with great care they were melted so as to avoid oxidation, and were cast into bars and tested, when each set of bars was analyzed, with the results shown in the following table:

TABLE V.

Percentage of Silicon calculated to be in Test Bars.	Number of Test.	Silicon found in Bars White (376) and 4.36 per cent. Pencost (397).		Number of Test.	Silicon found in Bars White (376) and 10.34 per cent. Pencost (401).		Number of Test.	Silicon found in Bars Gray FLM (253) and 4.36 per cent. Pen- cost (397).		Number of Test.	Losses of Silicon in White (376) and 4.36 per cent. Pencost (397).		Losses of Silicon in White (376) and 10.34 per cent. Pencost (401).		Losses in Silicon Gray FLM (253) and 4.36 per cent. 3.00	343	2.95	347	2.87	351	2.88	355	2.86	359	1.06	1.13	1.13	1.13	1.14	1.14	1.14	1.14	
Average deviation from calculated per cent.												.08		.08		.06		.09

A careful examination of this table reveals the following facts:

1. Losses in silicon increase as the percentage of silicon in the mixture increases. That is, an iron deficient in silicon can have its silicon raised to 2 per cent. with less loss than if raised to 3 per cent.

2. Losses are slightly higher when using the 10 per cent. than with the 4 per cent. iron; but the losses are so small in all cases that no commercial discrimination can be drawn in favor of one class over another in the matter of economy of silicon. In the extreme case of melting a white iron and a 10 per cent. silicon metal together, to produce a dark, soft foundry iron, there was no excessive loss in silicon.

IV. *General Conclusions.*—We may draw from the results presented the following general conclusions:

1. Pig irons of any grade may be melted and cast without excessive loss in silicon or excessive change in chemical composition.

2. Ferro-silicons lose in remelting a little more silicon than do the softeners containing less silicon; but the difference is so small that commercial distinction is not possible.

3. In alloying silicon irons with scrap or pig iron deficient in silicon, the silicon is practically all retained in the mixture, and no economy in silicon results from the use of one class of American silicon iron over another.

4. American ferro-silicon, so far as we have investigated, is more economical than the imported, and probably, in most cases, softens to a greater extent.

We think that we have accomplished what we set out to do. Our discussion is altogether from a chemical standpoint, and we have proved that the founder can produce a desired grade of casting by compounding suitable irons, as cheaply, if not more so, than by purchasing iron in which the combination is already what he desires. As soon as we can prepare a report upon

the physical characteristics of these irons and the mixtures that we have made, we shall publish such results.

The Denver Castings Contract.

The *Evening Post* of November 26 publishes the following:

"The *Iron Age* has another article, and we are constrained to say a disingenuous one, on the contract for 5000 tons of iron castings taken by an English firm for delivery in Denver, Col., in competition with Chicago firms bidding for the same work, the English firm having to get over a duty of 1½ cent per pound, or \$28 per ton, as we had computed it. We usually defer to trade journals in matters relating to their specialties, but in this case we discover such glaring errors that we cannot allow them to be passed over in silence. The contention of *The Iron Age* is that the duty on these castings is not 1½ cents per pound, at which rate, it says, they could not be imported at all, but is 45 per cent. ad valorem, a much lower rate. It computes

the equivalent of 45 per cent. ad valorem at \$9.31 per ton, while the duty at 1½ cents per pound would be \$25 per ton of 2000 pounds, the contract being for "short" tons, instead of English long tons. The *Evening Post* is chided for making a mistake about the number of pounds in the ton under this particular contract—as though that could make any difference in a case where the rate of duty is so much per pound, and when the tariff does not deal with tons at all. In order to dispose of this branch of the subject, we will state, once for all, that the contract, as described, is for 10,000,000 pounds of iron castings, and that the total duty at 1½ cents per pound is \$125,000.

"Now, as to the contention of *The Iron Age* that the rate of duty under the law is 45 per cent. ad valorem, and that this is a lower rate than 1½ cents per pound would be, we have examined the law very closely, and also several compilations of the tariff, official and unofficial, and we find no authority for the statement of *The Iron Age*, and we now challenge it to produce any. The law says:

Cast-iron vessels, plates, stove-plates, and irons, sadirons, tailors' irons, hatters' irons, and castings of iron not specially enumerated or provided for in this act, 1½ cents per pound.

It is certain that castings of iron for cable railway companies are not specially enumerated or provided for in this law. Therefore, they must be dutiable at the rate of 1½ cents per pound, and not as 'manufactures of iron not otherwise provided for,' which are dutiable at the rate of 45 per cent. ad valorem. And here we encounter another remarkable discrepancy between *The Iron Age's* calculations and those of official publications at Washington City. The Senate Subcommittee on the Tariff prepared and published, only two months ago, 'A Comparison of Tariff Schedules' to accompany the bill presented by them as a substitute for the Mills bill. On page 103 of this

document they state that the ad valorem equivalent of the present specific duty on iron castings is 30.78 per cent., which is lower than the rate on iron not otherwise provided for, instead of being higher, as *The Iron Age* contends. They show how they reach this conclusion by giving the number of pounds imported in the fiscal year 1887 (693,322) the value (\$28,154) and the duty collected (\$8666). Anybody can calculate for himself that a duty of 1½ cents per pound on the number of pounds here given amounts to \$8666, and that 30.78 per cent. of the stated value thereof is also \$8666. We leave *The Iron Age* to grapple with the Senate Committee and also with their proposed reduction of the duty on iron castings, which the Mills' bill leaves untouched."

The *Evening Post* misrepresents us when it states that we claim that the duty is not 1½ cents per pound, but is 45 per cent. ad valorem. Our position was that the business was impossible at 1½ cents per pound duty, and that therefore those who imported the castings must necessarily make the effort to secure the 45 per cent. ad valorem rate. In *The Iron Age* of November 1, page 671, we put the matter in the following language:

"An interesting question arises as to the rate of duty which will be paid on these castings. They consist mainly of yokes, so shaped as to support the track rails on their extended arms, the slot rails on central uprights, and the cable tube in an oval base. If they are wholly of cast iron it is difficult to see how they can pass the custom house at any other rate of duty than 1½ cents per pound under paragraph 157 of the Indexed Tariff. As it is asserted, however, that they will be imported at 45 per cent. ad valorem, it is probable that they will be changed slightly from the condition of mere castings, so that they can be brought in as manufactures of iron under paragraph 216. If the duty of 1½ cents per pound should be imposed, it is evident upon very superficial computation that it would be impossible to import them at the price at which they are to be delivered. These facts will develop in time, as the occurrence is so important that it will not be allowed to pass wholly out of sight by the foundrymen interested."

The *Evening Post* previously referred to the article of which the above is a part, so that it is difficult to escape the conclusion that it has attempted deliberate misrepresentation in order to assume the airs of superior knowledge. It seems almost superfluous to reply to the marvelous discovery which the *Evening Post* has made of figures published in the document of the Senate Finance Committee to which it triumphantly refers. The very small quantity of castings imported are made up of small articles. If our contemporary had done a little more figuring it would have discovered the difference. The 693,322 pounds were valued at \$28,154, which is equal closely to 4 cents a pound, or \$80 per ton, while the yoke castings were quoted under \$39, delivered at Denver, with a \$7 rate of freight to be deducted. Evidently the material imported is of a very different class than heavy yoke castings. The very fact that imports could be made proves that the articles must be high-class castings. To parade percentages under such circumstances certainly does not display a high order of intelligence.

As we announce elsewhere, the contract has gone to an American concern ultimately, so that the incident may be regarded as closed. It has served to show, however, what contortions a newspaper will undergo to avoid acknowledging an error when it has the misfortune of laying claim to infallibility.—*Editor Iron Age*.

The Pennsylvania Steel Company will build a steel works to consist of three 12-ton converters at Sparrow's Point, Md.

Brass Making in Waterbury.

Among the many manufacturing villages and towns strung along the Naugatuck Valley down to Bridgeport, Conn., Waterbury is the largest. Added to its scenic charms, the Naugatuck Valley possesses strong attractions to those deeply interested in witnessing the evidences of a busy, prosperous community. There are few traces of the squalor and the harsh surroundings which characterize the majority of manufacturing towns. There is an air of neatness and of prosperity which is, unfortunately, beginning to desert New England, of which it was once generally characteristic. It is a record of which both employers and employees may well be proud, and which is more eloquent than any favorable impressions created on a first visit to the town that Waterbury's industrial history chronicles but one strike.

One of the leading industries of the Naugatuck Valley, of which it once had the monopoly and still commands the control, is the manufacture of brass and copper. The greatest number of mills in any one place are concentrated at Waterbury, which is practically supported by the brass industry and allied or tributary branches of manufacture. It is stated—and casual observation seems to bear out the claim—that there are few working communities in which the average wealth is so high. The blessings of industry and enterprise appear to have been, more than usual, shared by the many instead of being concentrated in the hands of a few. While they are largely the accumulations of the last generation, the foundations for it were laid as early as the beginning of this century, when the Grilleys, three brothers, began the manufacture of brass buttons, finishing the rolling in a set of 2-inch rolls driven by horsepower. From an interesting illustrated volume entitled "Waterbury and Her Industries," by Homer F. Bassett, published by the Lithotype Printing and Publishing Company, of Gardner, Mass., we take the following historical data: In 1802 Abel Porter & Co. began the manufacture of gilt buttons, and under the successive names of Leavenworth, Hayden & Scovill, J. M. L. & W. H. Scovill, and the Scovill Mfg. Company developed into a very large manufacturing concern. From the same beginnings the Benedict & Burnham Mfg. Company developed, brass rolling being commenced in 1825. The next to follow was the Waterbury Brass Company, whose first sheet was rolled early in 1846. Holmes, Booth & Haydens was organized in 1853, the leading spirit in the concern subsequently forming the Holmes, Booth & Atwood Mfg. Company in 1869, the name of the company being changed in 1871 to its present style, the Plume & Atwood Mfg. Company, whose rolling mill is, however, located at Thomaston. The fourth brass mill of the town is that of the Waterbury Mfg. Company.

The renown of the parent industry, the brass manufacture, has been overshadowed, however, so far as the celebrity of the town is concerned, by the manufacture of clocks and watches. Wooden clocks were made as early as 1790. The production of brass clocks was begun as a branch of the Benedict & Burnham Mfg. Company, but separately organized in 1857 as the Waterbury Clock Company. It is to the enterprise of the same firm that the last and most famous industry of the town was established in 1880, the manufacture of watches by the Waterbury Watch Company. Among the other subsidiary industries is the manufacture of pins by the American Pin Company, curtain trimmings by the American Ring Company, fancy metal goods and buttons by the Steele & Johnson Mfg. Company, the Lane Mfg.

Company, plated ware by the Rogers & Hamilton Company and Rogers & Brother. Randolph and Clowes manufacture brass tubing as a specialty, and Blake and Johnson produce rivets, pins and screws.

The water-power obtainable from the Naugatuck River was probably the inducement which tempted the early manufacturers to locate along its banks. Even to-day it is a factor in some of the works. The rolling mill of the Waterbury Brass Company, for instance, being partly driven by a large wheel. Like in the majority of the inland manufacturing towns of New England, the fuel question is quite serious, coal being rendered relatively high. Thus the Naugatuck Valley Railroad charges \$1 per ton for the haul of 30 miles from Bridgeport to Waterbury. The Meriden, Waterbury and Connecticut River Railroad has been extended lately to Cromwell, and hauls coal for 80 cents. The freight in manufactured goods to New York is 13 cents per 100 pounds, and 25 cents to Chicago. In spite of the fact that the raw materials, copper and spelter, come chiefly from the West, so that Naugatuck Valley manufacturers may have against them in the future the cost of transportation from there on stock, and to the West on goods; in spite of the fact that their fuel is comparatively high, Naugatuck Valley manufacturers do not for the present see any dangers in the possibility of serious competition for the Western trade from local manufacturers there.

THE BRASS MAKERS AND THE SYNDICATE.

The manufacturers of Waterbury complain bitterly of the effects upon their business of the operations of the French copper syndicate. All of those whom we saw agree in stating that consumption has fallen off very materially, and that even in the direction of electrical wire, where no decrease might be expected, the demand in 1888 has not been as heavy as it was in 1887. It is possible, however, that the fact that a number of iron wire drawers have entered into the manufacture of copper wire may account for this fact. No such explanation is possible when dealing with the many other channels of consumption. We have been cited a number of articles for which formerly brass was used in other industries in which the alloy has been entirely superseded by other sheet metals, principally steel. This substitution has been aided by the advances in the manufacture of the latter, with special reference to its undergoing the strains incident to drawing and shaping cold in different ways. Unlike the copper manufacturers, who have succeeded in maintaining a trade combination, the brass makers have for a number of years been engaged in a sharp competition, which had lowered prices in some lines even below cost of manufacture. Knowing, as every one who has watched the growth of copper mining in this country, that the operations of the syndicate were carrying values far above the normal figure, the brass manufacturers of the Naugatuck Valley resisted the rise with all the power in their command. They did not believe that it was more than a wild speculation doomed to an early collapse. In the fancied security, which a large amount of raw material bought at low prices gave them, they held off. Competition forced them all to meet the prices for manufactured goods, which the most skeptical of all chose to set. They claim that even to-day, after every vestige of all low-priced raw material has disappeared, and all are working on dear stock, their prices of product have not risen enough to compensate for high copper. They claim that an unsatisfactory state of affairs before the rise has become intolerable since then. They have lost both in trade and whatever margin there may have been has been further reduced. The managers of the works in the

Naugatuck Valley must come before their stockholders with the tale of a very unsatisfactory year, to which is added another serious consideration. A visitor to any brass mill will be struck with one fact—the large amount of metal which is in course of manufacture. In other words, the many operations through which the raw material must pass before it is shipped keeps a large floating stock in rotation. In the annual inventories this must be a serious item. Is the manufacturer wise who enters it at present cost, with the conviction that at some future time, possibly during the new fiscal year, when the inevitable crash comes, it may be worth only one-half of what was actually paid out for it? Is it safe to pay dividends, if he has earned any, when the value of his stock from the ingot to the goods in his warehouses and in the hands of his agents may decline one-half in a single day? Is it expedient to draw funds from a business when he can be confronted at some future time with engagements for the purchase of several months of supply of raw material at a fancy price, with customers using right and left every artifice which a phenomenal decline brings out to escape from accepting and paying for goods bought? The brass manufacturers did not reap any advantages from the advance; they are suffering under the present high level of prices, and must ultimately face a certain loss, against which they have no means of protecting themselves.

On the whole those of the works visited were fairly well engaged, although disappointment at the volume of business was quite freely expressed. The fact that some parts of the plants visited showed some idle machinery bore out the statements made. It is probably only natural that employment should be somewhat fitful. It is only natural when the fact is taken into consideration that buyers will not do more than cover their immediate wants. The result is that orders usually are relatively small, and that when they come they are coupled with the demand for immediate shipment. The trade naturally endeavors to throw upon the manufacturers the burden of carrying the stocks. The latter prudently keeps it as close as possible down to the minimum. In an industry in which the number of articles produced is very large the present condition of affairs adds to details already fairly bewildering, and must to some extent increase both the manufacturing cost and the general expenses.

Any effort to describe the methods of manufacture employed would be inadequate without numerous illustrations of machinery, of which a great part is of special design, developed for some one specific purpose, and often the jealously guarded property of one particular works. When we add that a rapid inspection of nearly any one of the plants alone is the work of hours, we need offer no apology for not making any attempt at a description of any individual concern.

The metals composing the alloy are melted in plumbago crucibles in ordinary melting holes, with hard coal as the fuel, the alloy being cast into bars of different shapes in iron split molds, which can be readily taken apart. Generally speaking, the feeling among brass-makers seems to be that it is in these departments of their business that least progress has been made. We have been told by one connected with the business for over a generation that today practically the same methods are employed which were used 30 years ago. There seems to be considerable irregularity in the product, even when the operation of casting is conducted by the same man. The principal defect is the presence of blow-holes, apparently distributed irregularly over the surface and

partly throughout the metal. One of the manufacturers expressed the conviction that if the subject were taken up in a thorough manner and investigated scientifically some means could be secured of arriving at the desirable aim of casting thinner bars without flaws. This would lead to a notable reduction in the cost, since then the number of passes necessary to reduce the thickness to the gauge aimed at would become less, and a tedious and expensive operation—that of overhauling—would be avoided. The latter consists in scraping out bodily by hand or special machine scrapers those parts of the partially rolled bars which show defects.

The rolling mills do not differ in any material respect from the same character of machinery employed in other branches of sheet-metal manufacture, except that, on the whole, they are run at slow speed and the product is handled almost entirely without the use of machinery before and behind the train. During the process of rolling down the metal must be repeatedly annealed, the apparatus used for this purpose being large ovens which are almost exclusively heated by wood. The brass manufacturers have found that the use of mineral fuel in a solid form is impossible because the sulphur in it tends to injure the quality of the metal. We understand, however, that one of the mills is now building an experimental gas furnace with a view to superseding the more expensive wood by gas. As we have already stated, it is necessary, during the breaking down, to overhaul the bars to remove defects. The final products of the rolling mill are sheets and strips of brass, a large part of which is marketed in that form, while a very important proportion of it is cut up in the mills themselves in developing a large line of special manufactures to which we shall refer later.

The manufacture of wire does not differ materially from that in iron and steel, except that the first operation from the bar is to divide the latter into a series of square bars by putting them through slitting machinery. Annealing, tumbling and pickling become necessary in different parts of the operation.

The third special line of producing what may be called raw material is the manufacture of tubing, either soldered or solid drawn. For the former ordinary clutch benches are employed, while for the manufacture of the latter hydraulic drawing benches are used. By employing special dies corrugated and other shapes are made, and by special machinery fancy rods are produced.

It is, however, in the further manufacture of sheet brass that the largest amount of special machinery is employed and a vast variety of articles are made in an ingenious manner. Drawing presses of varying designs, punches, screw-threading, spinning and polishing machinery are used to manufacture a great variety of articles, among which are prominent lamp trimmings and fixtures. We had occasion, too, to watch the practically automatic manufacture of jack chains, the production of brass and steel pins and the ingenious machinery for papering them at the works of the Plume & Atwood Mfg. Company. We saw a number of rivet machines at work, and inspected the machinery used for single and double wrapping electric copper wire and the manufacture of KK electric wire at the Holmes, Booth & Haydens Works. Taken altogether, it is in this department, in the cutting up and shaping of brass that Yankee ingenuity has displayed to greatest advantage its far famous achievements. It has been aided in it by the exceptional quality of the metal used, which is capable of standing a large amount of torture.

The capacity of the Sable Iron Works, Zug & Co., will shortly be increased.

Multiple Expansion Engine Cards.

Mr. H. W. Spangler, in a paper on "Multiple Expansion Engine Cards," recently read before the Engineers' Club of Philadelphia, remarked:

The object of combining indicator cards from multiple expansion engines is to show whether the proper relation has been maintained between the pressure and the volume during the entire action of the steam, and what proportion of work we have lost by using separate cylinders.

It is essential that the cards shall be placed in such a position that if the pressure and volume are co-ordinates, the points thus indicated are those actually obtained from the cards. This necessitates that the length of each card should be proportioned to the volume swept through by the corresponding piston, and each one should be set at a distance from the vertical line proportional to its own clearance. It is only by this method of setting the cards that the co-ordinates indicate pressure and corresponding volume. A common method of combining cards is to make their length proportional to the volume swept through by the piston and bringing them all to the same vertical line. These cards are of no more use than the original ones, as the indicated horse-power alone can be determined from them. Still another method is to make the expansion and compression lines in two successive cards meet on the initial pressure of the second one. The error in the reasoning by which this method was arrived at is that the same amount of steam (as steam) is not necessarily present in the two cylinders.

Invisible Torpedo Boats.—A serious drawback in torpedo boats is the emission of smoke and sparks from their funnels, which is almost certain to disclose their whereabouts to an enemy at night. To remedy this evil Messrs. Yarrow, the well-known torpedo boat builders, a few years ago constructed a torpedo boat for the Spanish Government, in which two smoke ports were provided, one on each side of the vessel, about 15 feet from the bow. Each of the ports was fitted with a damper, under the control of the steersman, who could direct the products of combustion through one or the other at will. On approaching an enemy the smoke would be directed through the port on the unexposed side of the vessel. With this arrangement some inconvenience was experienced by the crew from the heated gases, &c., being carried along the deck at times by the wind. Attention has recently been drawn to an apparatus invented by M. Oriolle, and which was tried a short time ago at Rochefort Arsenal. By means of this device the smoke undergoes such a change in the smokestack that the flames and sparks entirely disappear from the funnel. The smoke spreads horizontally over the surface of the water and envelopes the boat in a dense mist, impenetrable to the electric light. This invention is said to have proved satisfactory in every way, and will render torpedo boats at night absolutely invisible.

A Spanish industrial paper, in an article on the exhibits of English machinery at the Barcelona Exhibition, lays special stress on the fact that the exhibitors of cotton spinning machinery not only showed the newest inventions in actual motion, but allowed manufacturers and others who wished to test the inventions to bring their own raw material for the purpose. This concession on the part of exhibitors, the quoted authority says, has done a great deal to influence Spanish manufacturers in favor of English machinery.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, November 28, 1888.

Pig Iron.—Sellers report increased activity, more confidence being shown by buyers. Although a heavy business is not expected until December, at the present rate of increase the anticipated demand will strike the market very early in the month instead of toward the close. For the first time in several weeks the leading houses unanimously report a good volume of business, but with some of them trade was confined to small lots. The largest orders for Coke Pig Iron placed during the week were actively contested among the sellers, and, although prices were generally well maintained, a Southern company was, as usual, found willing to make an abatement. The other Southern companies do not seem disposed to follow suit at present, and such occurrences only serve to emphasize the general strength of the market. But a short time since such a concession would have extended all along the line. Soft Coke Irons are a little dearer wherever any change has been made. The car-wheel makers have made no purchases during the week so far as known, but a good trade is expected in that direction very soon. We quote as follows for cash, f.o.b. Chicago: Lake Superior Charcoal, Nos. 1 and 2, \$20; Nos. 3 to 6, \$20.50 @ \$21; Alabama Car-wheel, \$26.25; Jackson County Softeners, No. 1, \$18.60; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband), No. 1, \$20.50 @ \$21; other Ohio Soft Irons, No. 1, \$17.50 @ \$19.50; Lake Superior Coke, No. 1, \$18 @ \$19; No. 2, \$17 @ \$18; No. 3, \$16 @ \$17; Coke Bessemer, \$17.50 @ \$18; Southern Coke, No. 1 Foundry, \$17.50; No. 2 Foundry and No. 1 Soft, \$17; No. 3 Foundry and No. 2 Soft, \$16.25; Gray Forge, \$15.50.

Bar Iron.—The wagon-makers are asking for bids on large quantities of material for their use, and jobbers have also bought heavily of the mills. Some Car orders have been placed, but not large lots. The mills are finding much difficulty in filling orders promptly, especially on Guide Irons. The heavy demand and better price realized for Muck Bar will probably cause some of the mills now selling Bar Iron in this market to pay still less attention to the finished product, which cannot but have a favorable influence on prices. The Mahoning Valley mills are holding firmly to 1.65¢ at mill, and the most diligent search is necessary to find other mills willing to do a little better. About 1.75¢, half extras, at Chicago, is now the ruling price for mill lots of Common Iron. From store small lots are to be had at 1.85¢ @ 2¢, according to quantity and quality.

Structural Iron.—The business in this line referred to last week has not yet been placed. Prices are unchanged, mill orders being quoted as follows, f.o.b. Chicago: Angles, 2.15¢ @ 2.20¢; Universal Plates, 2.25¢ @ 2.30¢; Tees, 2.55¢ @ 2.65¢; Beams and Channels, 3.40¢. Small lots from store sell at 2.35¢ @ 2.50¢ for Angles, 2.60¢ @ 2.70¢ for Tees, and 3.80¢ for Beams.

Plates, Tubes, &c.—Trade has been fairly active during the week in small lots from regular consumers. This is largely attributable to repairs that will be necessary on tugs and lake steamers, which will go out of use with the closing down of navigation this month, and the cessation of operations on saw mills at an early date. Boiler makers report very light demand for new work, which makes their small

purchases from store stock a desirable trade to jobbers, who in this way dispose of much of the accumulated odds and ends. Store prices are reported firm, with a tendency to advance. Manufacturers are slow to accept large contracts for future delivery at prices they have been naming for the past three months. Mills generally report a good supply of orders, and are holding off on further contracts in the hope that they will secure higher figures for next year's delivery. The low-priced mills that were in the market several weeks ago have obtained all the orders they want. The demand for Heavy Sheets, Nos. 10 to 14, remains strong and prices firm at 2.60¢ @ 2.70¢; Tank Iron, 2.60¢ @ 2.70¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron, 4.25¢; Flange Steel, 3.75¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢. Boiler Tubes are reported firm at 60 % off.

Sheet Iron.—There continues to be an active demand for Light Sheets. A prominent jobber reports that on an average he turns away daily orders aggregating from 5 to 8 tons in pick-up lots. Orders that were placed with mills in September in many cases have not yet been delivered. In quantities suitable for stove pipes and other unimportant manufactures stocks are a little more plentiful. In small lots jobbers quote No. 24 at 3.10¢; No. 25 and 26 at 3.20¢, and No. 27 at 3.30¢. Ten cents a hundred advance on these figures could be obtained if the stock was within reach.

Galvanized Iron.—The excellent demand for Galvanized Iron that has existed for some time past has thoroughly broken stocks, and jobbers find great difficulty in supplying the demand from the smallest trade. The shortage is chiefly found in the lighter gauges from No. 24 up. So long as the demand for Black Sheets remains so great there is very little chance for relief in the Galvanized grade. Jobbers do not anticipate that their stock will be fully replenished during this season, and are doing their utmost to accommodate their customers from stocks on hand. Prices are quoted firm at 60 % and 5 % off on Juniata, and 60 % and 10 % off on Charcoal.

Merchant Steel.—While the week has been quiet in most lines, some good contracts have been placed for special shapes and qualities. The mills making Crucible Plow Steel are busy and prices are firm. Soft Center Steel is in light demand, but a better trade is being done than for two months previously. Solid Crucible Steel is now largely taking the place of Soft Center. The Open-Hearth manufacturers have apparently taken all the orders they want at low prices, and are disposed to ask more on future contracts, but Crucible Spring Steel is weaker, and a buyer of 50 to 100 tons could secure a decided concession on quotations. Bessemer Bars are lower, mill orders having been taken at 1.90¢, f.o.b. Chicago. We quote as follows from stock: Bessemer Bars, 2.30¢ @ 2.40¢; Tool Steel, 8.50¢ @ 9.50¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢ @ 2.75¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—The condition of the market remains as heretofore reported. The demand is only for lots ranging from 500 to 1000 tons, and the mills in operation have scarcely sufficient work on hand to keep them going. Mills are making a nominal quotation of \$30 per ton, but in the light of some larger orders that were placed in Pittsburgh recently this figure can hardly be considered a market value for large buyers. Competition between established mills is exceedingly strong, and the opening of a new one in the early future with improved machinery has been

largely instrumental recently in testing the extreme weakness in the Steel Rail market. It is reported that a meeting of the Steel Rail Association will be held in New York on the 26th inst., for the purpose of adjusting prices and making allotments.

Old Rails and Wheels.—Among buyers there has been an indifferent inquiry for light weights, with very little demand for standard weights. Some 3000 tons have been offered during the week, but at figures which are from \$1 to \$2 a ton above what consumers are willing to pay. A nominal quotation for this market would be \$23 @ \$23.50. Old Steel Rails, long lengths, are quoted \$19.50 @ \$20; short lengths, \$17. There is nothing doing in Old Car Wheels. Dealers are asking \$19.50 @ \$20. The supply, however, is considerably larger now than it has been for some weeks, and it is probable that a movement will occur soon in this branch of trade.

Scrap Iron.—We hear of sales aggregating about 400 tons of No. 1 Forge at \$21. The demand is only in small lots for this grade and very little inquiry for anything else. Dealers' prices for selected stock are as follows per ton of 2000 lb: No. 1 Forge or Railroad Shop, \$21; Track Scrap, \$19.50 @ \$20; Horseshoes, \$20; Axles, \$26; No. 1 Mill, \$15.50; Pipes and Tank, \$13; Light Wrought, \$11; Cast Machinery, \$14; Stove Plate, \$12; Cast Borings, \$9; Wrought Turnings, \$12.50; Axle Turnings, \$14.50; Coil Steel, \$15; Leaf Steel, \$16.50; Locomotive Tires, \$16 @ \$17; Mixed Country Scrap is quoted at \$14 @ \$15.

Hardware.—The Shelf Hardware trade has been unusually active during the past week, some of the local houses having been obliged to work their force at night to keep up with the rush of orders. The demand is very general, invoices covering every variety from staple to holiday goods, House-Furnishing Wares, Builders' Hardware, &c. The open weather is doubtless enabling a great deal of outdoor work to be prosecuted now which would in ordinary seasons have been postponed until spring. In Heavy Hardware an opposite condition of affairs prevails. The demand is light and trade is very disappointing; still, this is usually to be expected at this time. No changes in prices are reported except in Shot, which has been marked down to correspond with the drop in Lead. It is now quoted at \$1.15 regular and \$1.10 for quantity. Solder is unchanged.

Nails.—Inquiries from large buyers for prices on next year's deliveries are increasing, but manufacturers are not meeting their views in this respect. For immediate delivery prices of Steel Cut Nails are down to an extremely low point, some of the manufacturers being evidently weary of carrying large stocks in their warehouses and desiring to convert the same into hard cash. But buyers hold off in such cases, expecting to place orders at still lower figures. The impression is growing that the time to buy is at hand, and that the turn of the year will see materially higher prices. The low prices now being quoted are accompanied with a proviso that specifications shall average considerably above the base. The removal of this restriction will probably set the ball in motion. But the large stocks now in first hands will then be in second hands, purchased at very low prices, ready to be pushed out at every opportunity, and what advantage will the manufacturers reap from the higher price which is to follow? Steel Nails are now selling at \$1.95 from stock, and cirloads on track at \$1.90. Jobbers report a fair demand in a small way, with sales nearly equal of Steel and Wire Nails. The latter are still sold at \$2.60 in small lots, and are firmly held.

Barb Wire.—A meeting was held at Cleveland, on Friday last, of prominent manufacturers. It was not a general meeting of the trade, but a preliminary meeting to lay the foundation for a plan which will be thought effective to extricate the business from its present unsatisfactory condition. The manufacturers are not selling much Barb Wire at present, but those who are running their works are accumulating large stocks in their warehouses, for which they anticipate a good demand early in the coming year. If the price can be advanced meanwhile they will be well situated to realize the full benefit. Jobbers are still quoting small lots at 2.90¢ for Painted and 3.60¢ @ 3.65¢ for Galvanized.

Pig Lead.—A contract for furnishing 100 tons to the Department of Public Works was let, on Friday, to E. W. Blatchford, at 3.54¢.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. }
PHILADELPHIA, Pa., November 27, 1888. }

The past week has not been of a very decided character, and it is as difficult to indicate the course of the market now as it has been at any time during the entire year. Generally speaking, the market is dull, but prices cannot be called weak, although in some cases there is a willingness to shade a trifle, sooner than lose a good-sized order. But mills and furnaces are so well sold up that there is no actual necessity for immediate business, hence there is a feeling of indifference unless orders can be had on fairly satisfactory terms. As to the future, neither side seems disposed to trade much beyond the current year. Sellers would doubtless accept offers at about current rates for January deliveries, although they are not seeking business, hoping that consumers will take the initiative. This they are not inclined to do at present, and probably will not until they can form some fairly correct idea as to what their requirements will be during the early part of the coming year.

Pig Iron.—Has shown a fair degree of firmness, considering the general apathy of buyers. It can only be accounted for on the supposition that consumption is in full proportion to production, as there are no inconvenient accumulations of stocks either at mills or furnaces. The ultimate course of the market, therefore, is contingent upon the amount of new business coming in to replace that which is now almost completed. Upon this point it is extremely difficult to pass an opinion. As already stated, the conditions are favorable for a large business during 1889, but whether it will be offered in time to prevent any serious weakening in prices remains to be seen. Furnaces keep blowing in all the time, and instead of waiting for the demand to pick up again the supply is steadily increasing, which is not a hopeful feature under the circumstances. Part of the hesitancy among buyers is probably due to this fact, although they will not delay placing orders if they find that their requirements are likely to be of important dimensions. Meantime the market is hesitating and waiting, as it has been for the past three or four weeks, thus far neither gaining nor losing to any appreciable extent. It is worthy of notice, however, that recent reports from the offices of *The Iron Age* in Chicago, Cincinnati, Pittsburgh and other important centers are of a uniformly favorable character, which if confirmed by events in the near future will give strong support to this and other markets on the seaboard. Quotations remain same as last week—viz., \$16 @ \$16.50, at tide, for Gray Forge; \$17 @ \$17.50 for No. 2, and \$18 @ \$19 for No. 1 Foundry.

Blooms.—There is a good deal of business in Steel Blooms, one lot of over 2000 tons for rolling into shapes having been placed at about \$30, delivered to consumer's mill. Ordinary quotations are about as follows: Steel Nail Slabs, \$29 @ \$29.50, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 7/8 "bloom" ton of 2464 lb.

Muck Bars.—Prices are a little irregular, and, on the whole, hardly as firm as they were a week ago. Sales are chiefly at about \$30, delivered, although some hold for \$30.50. Mill quotations may be given as \$29 @ \$29.50, f.o.b. cars.

Bar Iron.—Sellers appear to be a little more disposed to meet the demand, and prices are somewhat easier than they were a week or two ago. Local mills are all fairly busy, but Western Iron is being offered at low prices, hence more or less weakness in the general market. A heavy consumption of Bar Iron is going on, and, from present appearances, there is no reason to apprehend any material change in price, although in the meantime buyers of large lots are in a position to command concessions of from a half tenth to a tenth for deliveries during the current year. For next year's deliveries there is more disposition to hold on to present quotations; hence, for the moment, there is comparatively very little business doing. Sellers' asking prices are from 1 8¢ to 1.9¢ for Bars and 1.95¢ for Grooved skelp, with sales at about these prices for small lots, and at fractionally lower figures in special cases.

Plate and Tank Iron.—Business is a little quiet, although mills are fairly busy for the present. The outlook is not specially promising at the moment, but it is thought that a great deal of work will be on the market after the holidays. The shipyards are again in the market for about 1000 tons of Plates, and while there is some anxiety to secure new business, prices are not likely to be shaded beyond what is usual on orders of this class. Quotations about as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.25¢ @ 2.3¢; Shell, 2.7¢; Flange, 3¢ @ 3 1/4¢; Fire-Box, 3 1/2¢ @ 4 1/2¢.

Structural Iron.—The demand is very slow at the moment, and some of the mills are beginning to want orders. Prospects are said to be moderately good, but there may not be much done until after the holidays, so that prices, while somewhat irregular, are nominally about as follows: 2.05¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The demand is not important, but with greatly reduced stocks, prices are fairly maintained. The best makes in small lots are quoted as before:

Best Refined, Nos. 26, 27 and 28... 3 1/4 @ 3 1/2¢
Best Refined, Nos. 18 to 25... 3 @ 3 1/4¢
Common, 1/2¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4 1/2 @ 4 3/4¢
Best Bloom Sheets, Nos. 22 to 25... 4 @ 4 1/4¢
Best Bloom Sheets, Nos. 16 to 21... 3 1/2 @ 3 3/4¢
Blue Annealed... 2.8 @ 3¢
Best Bloom, Galvanized, discount... .62 1/2 %
Common, discount... .67 1/2 %

Merchant Steel.—The demand is about as usual, at prices as follows: Tool Steel, 8 1/2¢; Machinery, 2.6¢; Crucible Spring, 4 1/2¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—The market is dull, and while there is a good deal of business in prospect, buyers appear to be in no hurry to place orders. Quotations remain at from \$28 to \$28.50, at mill, but it is said that these figures are for winter deliveries, beyond that many manufacturers are talking higher prices.

Old Rails.—Business is quiet, owing to the scarcity of Rails, but prices are very firm. There are buyers at \$23.50, Philadelphia, but holders are asking all the way from \$24 to \$25 for lots in store, and \$24.50 for shipments. It is likely that \$24 could be obtained for fair sized lots, good delivery, but the feeling is somewhat unsettled, so that there is no saying what a day might bring forth.

Scrap Iron.—The demand keeps pace with the supply, hence prices are fully maintained, and may be quoted as follows: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought Iron Pipe.—The demand seems to have been pretty well satisfied, and large lots are not saleable, unless on special terms. In ordinary transactions, discounts are irregular, but nominally as follows: Black Butt-Welded, 52 1/2 %; Galvanized do., 42 1/2 %; Black Lap-Welded, 62 1/2 %; Galvanized do., 52 1/2 %; Boiler Tubes, 60 %.

Nails.—The building season is about over, hence there is not much demand for Nails at present. Prices are more uniform than they have been for some time, although the large concerns are closely watching their trade, and meeting any cuts that are made outside of legitimate bounds. Store prices, \$1.90 to \$2.

Louisville.

LOUISVILLE, KY., November 26, 1888.

Pig Iron.—There has been steady buying during the week, and one large transaction for several thousand tons, consisting of Mill and Bright Irons, was made. The market is holding its own, and is as strong as any time during the last 10 days. The decline of 20¢ 7/8 ton in freight rates does not affect the market, as it is understood the recent advance was hardly justified, and the present rate is as high as should have been put into effect. There is a strong demand for Brights and Southern Silvery Irons, which are scarce, as most of the furnaces are running on Foundry grades, and it is reported that one furnace at Birmingham has made as much as 80 % of Foundry Iron for some time, showing much better work than they have done in the past.

Southern Coke, No. 1 Foundry, new classification.....	\$16.50 @ \$17.00
Southern Coke, No. 2 Foundry, new classification.....	16.00 @ 16.50
Southern Coke, No. 3 Foundry, new classification.....	15.50 @ 16.00
Gray Forge.....	15.00 @ 15.50
White and Mottled, different grades.....	14.00 @ 14.50
Silver Gray, different grades.....	15.50 @ 16.50
Southern Charcoal, No. 1 Foundry No. 1 Mill.....	17.75 @ 18.25
Southern Car-Wheel, standard brands.....	18.00 @ 17.00
Southern Car-Wheel, other brands.....	22.75 @ 23.75
Hanging Rock Coke, No. 1 Foundry.....	19.00 @ 21.00
Hanging Rock Charcoal, No. 1 Foundry.....	17.00 @ 17.50
Hanging Rock, Cold Blast.....	20.75 @ 23.00
Hanging Rock, Warm Blast.....	22.00 @ 25.00
	19.00 @ 20.00

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. }
CINCINNATI, November 26, 1888. }

Pig Iron.—The local market for Pig Iron during the week under review has continued active, but the volume of transactions in the aggregate has not been so great. A strong tone has prevailed and full prices have been realized, but there has been no advance of moment obtained over the rates current a week ago, although for sales made on several months' time a proportionate advance has been realized. The demand continues to be mainly for Forge Irons, but there has been some in-

crease in the sales of Foundry grades, while Car-Wheel Iron has met an urgent request, with some advance obtained on specially desirable grades of Southern make. Buyers are not content, apparently, to cover contracts in hand, but are disposed to buy such amounts at present rates as will place them in an independent position, beyond the reach of eccentricities of the market. Furnaces heretofore have been ready to meet the demand at any remunerative rates, and more recently, having orders so well in hand, have gradually and slowly advanced the market, which buyers have followed with but little protest. The market continues to progress, although a few furnaces are withdrawing from the market, being either sold much ahead or anticipating higher prices, and having no cause to sell now, are declining orders for the present. The aggregate sales made here during the week are about 25,000 tons, and some heavy contracts are likely to be closed to-morrow. One local house has booked orders at the rate of 1500 daily, and another house has closed contracts for 11,800 tons, while a representative of a large Southern company has accepted orders for about 10,000 tons, but this latter is probably embraced in those of the factor's report. The bulk of these sales have been of Forge grades, but one lot of 1500 tons Southern Car-Wheel Iron sold at \$25.50, and 1500 tons No. 2 Foundry at \$15.50, cash. The following are the approximate quotations for the local market cash, f.o.b. Cincinnati:

Foundry.

Southern Coke, No. 1 (new classification).....	\$16.25 @ \$16.75
Southern Coke, No. 2 (new classification).....	15.50 @ 16.00
Southern Coke, No. 3 (new classification).....	15.25 @ 15.50
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	18.00 @ 18.50
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.50 @ 18.00

Forge.

Strong Neutral Coke.....	15.00 @ 15.25
Mottled Neutral Coke.....	14.00 @ 14.25
Gray Forge.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—There has been a further increase in the volume of business in this branch during the week, but no advance in prices is recorded, although the market has hardened materially. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3¼¢ @ 4¼¢ $\frac{1}{2}$ lb.

Old Material.—There has been a moderate inquiry for both Old Rails and Wheels, and the market has ruled firm, with less disposition to sell except at full prices. Old Rails are quotable at \$23 @ \$24 and Old Wheels at \$19, cash, Cincinnati.

Nails.—The demand has been moderate and the market has ruled steady. Jobbing prices are based upon 12d @ 40d, which sell at \$1.95 $\frac{1}{2}$ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$1.95 and Steel Wire Nails at \$2.65 $\frac{1}{2}$ keg.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, November 27, 1888.

There has been nothing of an unusual character developed in the general iron trade during the past week. The mills and furnaces generally have about all they can do in working up old contracts, even if no new contracts are taken. The Iron Age, of the Gray's Iron Line, will arrive

the latter part of the week with a cargo of 1300 tons of Charcoal Pig Iron from the Cumberland River. This will be the first lot of Southern Iron of any magnitude to arrive here for several years. It was sold several months ago for future delivery.

Pig Iron.—There has been a very fair business the past week, and the market for well-known brands of Neutral Gray Forge is firmer, but prices remain unchanged. We can report sales of some 6000 tons at \$16 @ \$16.25, cash; one lot of 2000 tons at \$16.25. There is but little good Iron offering, and for this prices are steady, as quoted. In regard to Foundry Irons, there is a fair business in the aggregate, although the inquiry is chiefly for small lots, to supply immediate requirements. Bessemer Iron is slow and weaker. Within the past two weeks it has gone off from 25¢ to 50¢ $\frac{1}{2}$ ton. Round lots of good brands are now to be had at \$17.50, cash, at which price a sale of 1700 tons was reported. Small lots command 25¢ @ 50¢ $\frac{1}{2}$ ton more. Reliable advices from the Mahoning and Shenango Valleys report the furnaces out there pretty generally sold up, some of them several months ahead, and some of the furnace owners are refusing to contract for future delivery at present prices. Producers are apprehensive of higher prices for Coke, Ore and labor in the near future, and they want to keep themselves in a position to be able to take advantage of the market. In other words, if the cost of production is increased, the price of Pig Iron will have to be advanced, and furnacemen appear to be indifferent as to making additional sales, especially for future delivery. We quote as follows:

Neutral Gray Forge.....	\$16.00 @ \$16.25, cash.
All Ore Mill.....	16.75 @ 17.00, "
White and Mottled.....	15.00 @ 15.50, "
No. 1 Foundry.....	18.00 @ 18.50, "
No. 2 Foundry.....	17.00 @ 17.50, "
No. 1 Charcoal Foundry.....	23.50 @ 24.00, "
No. 2 Charcoal Foundry.....	21.50 @ 22.00, "
Mill Charcoal.....	19.00 @ 20.00, "
Bessemer Iron.....	17.50 @ 18.00, "

Muck Bar continues in scant supply and with considerable inquiry, especially for immediate delivery. Prices are firm, as quoted: \$29 @ \$29.50, cash, as to quality, in which there is considerable difference. Sale of 2000 tons reported at \$29.50. It is rumored that sales have been made for January and February at \$30, cash, but these reports lack confirmation and must be taken with allowance. So far as we can learn, there have been no sales made above \$29.50, cash, which may be regarded as the ruling quotation.

Spiegel.—Sales of Spiegel, 20 %, at \$27.50 @ \$28.50, cash. Ferromanganese, 80 %, \$56.50 @ \$57.50.

Manufactured Iron.—There is a fair degree of activity, but new business is not as plentiful as it was a few weeks ago. Prices remain unchanged, as follows: Bars, 1.75¢ @ 1.85¢; Plate, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢; all 60 days, 2 % off for cash. Demand for Skelp Iron has fallen off during the past week or so, but prices remain as last quoted, 1.85¢ @ 1.90¢; Sheared, 2.10¢ @ 2.15¢.

Nails.—Manufacturers here still refuse to sell below card rates, but, as might be expected, they are not selling any large quantities, as buyers can do much better elsewhere. In regard to the order for 10,000 kegs noted in our last report as having been placed at Wheeling, or in the Wheeling district, the broker making the deal claims that the price was more than \$1.60, net cash, but refuses to give the price. A person connected with the deal who could have no object in misrepresenting the matter reported the price at \$1.60, and there is reason to believe that the price quoted is not far from the mark.

Wrought-Iron Pipe.—There has been little change to note during the past week. Orders are falling off, as is usual at this

season, and there is not likely to be much improvement until spring. Manufacturers do not expect to do much during the winter season. Prices remain unchanged, as follows: Discounts on Black Butt-Welded Pipe, 62½ %; on Galvanized do., 52½ %; 2-inch Tubing, 13¢ $\frac{1}{2}$ foot, net; 5¼-inch Casing, 40¢ $\frac{1}{2}$ foot; Boiler Tubes, 60 % off.

Billets, &c.—There is less demand for Bessemer Billets and the market is easier. These are now quoted at \$29, cash, delivered at maker's works; Nail Slabs quoted at \$28.50; Domestic Rail Ends quoted \$19.50, cash. Sale of 2000 tons Domestic Bloom Ends, at \$19, cash.

Old Rails.—There is an improved demand and the market is firmer, but prices remain unchanged. We can report sales, in different lots, of 3500 tons American Tees, at \$25, cash. With such weather as we have had for the past day or two, the work of lifting will be very much curtailed, if not suspended, the effect of which will be to stiffen the market.

Railway Track Supplies.—Spikes are still quoted at \$2.20, 30 days. Splice Bars, 1.85¢ @ 1.90¢; Track Bolts, 2.85¢ with square and 2.95¢ with hexagon Nuts.

Merchant Steel.—There is a fair business at unchanged prices. Tool Steel, 8¼¢; $\frac{1}{2}$ lb; Crucible Spring Steel, 4¼¢; Crucible Machinery, 5¢; Open-Hearth do., 2¼¢.

Old Material.—There is a fair business, and prices as a rule are steady. Sales of No. 1 Wrought Railway Shop Scrap at \$21 $\frac{1}{2}$ net ton; Wrought Turnings, \$18.50 @ \$14; Car Axles, \$25.50 @ \$26.50; Cast Scrap, \$15.50 @ \$16 $\frac{1}{2}$ gross ton; Cast Borings, \$12 @ \$13; Old Car-Wheels, \$20. Sales of short pieces of Steel Rails at \$18.75 gross, and long length ditto at \$20.50.

New York.

Office of *The Iron Age*, 66 and 68 Duane street,
NEW YORK, November 27, 1888.

American Pig.—The market is quiet and the volume of business doing is, on the whole, disappointing. Some consumers are inquiring for 1889 delivery and some business has been done, at present prices, for next year. It is intimated that the Thomas Iron Company will certainly not ask higher prices for 1889 delivery, which would seem to put at rest for some time to come any talk of any advance in the section largely controlled by its action. We continue to quote Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is weaker. We quote: Coltness, \$21, nominally; Shotts, \$20.50 @ \$21; Langloan, \$20.75 @ \$21, and Dalmellington, \$19.75 @ \$20.

Spiegeleisen.—We quote nominally \$27 for German 20 % Spiegeleisen, and \$54 for Ferromanganese, 80 %, prompt delivery.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.44¢; Steel Tank, 2.25¢ @ 2.3¢; Shell, 2.5¢ @ 2.55¢; Flange, 2.65¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢. Foreign Beams can be laid down at about 2.65¢ @ 2.75¢, but are in very light demand.

Bar Iron.—We quote: Carload lots, half extras, Common, 1.70¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢; Rolled, 1.8¢ @ 1.8¢.

Steel Rails.—The past week has been quiet so far as the Eastern mills are concerned, but has been all the more eventful in the West. It has been characterized by an extremely sharp contest for business between one mill in the Pittsburgh and one in the Chicago district, over business aggregating about 30,000 tons. A large number of contradictory rumors are afloat concerning the prices made, but there seems to be very little doubt that prices have been accepted below anything ever done in the history of the Steel Rail trade in this country. It is openly asserted that \$26 at mill has been considerably cut, and it is added that at the meeting of Steel Rail manufacturers yesterday, the fact was acknowledged by one of the contestants. Whether or not the fight is over remains to be seen. Suffice it to say that the representatives of the Steel Rail mills in the country met, talked over the situation and continued their present arrangement slightly modified. Even this is a gain, since some of the manufacturers expected the withdrawal of at least one, and possibly two mills. The meeting was held at the Windsor Hotel, being called at 11 o'clock, adjourned after several hours' session to 8 o'clock in the evening. All the leading mills were represented, the new Pittsburgh works excepted. It was finally decided to continue the August arrangement, with this change: Every mill has the right to sell any part of its allotment, or all of it, to any other mill. Until now the allotment of those works which was not taken after a certain time was redistributed among the other mills. The result was a constant pressure for new allotment by a few concerns who sold freely, which was resisted by the tardier and led to some friction. For the present the modification alluded to is not likely to create a heavy demand for the allotment of idle mills who are out of the race, simply because a number of the active sellers are engaged in the problem of getting orders for what they can sell. Nor does the temptation seem great to pay anybody else for the privilege of doing a losing business on a somewhat larger scale, since there is not a single mill in the country which can pay interest on plant when selling Rails at \$26. In the East the market is quiet at \$27 @ \$28 at mill.

Old Rails.—Outside of a lot of 2000 tons of Foreign Tees, to arrive, sold to an Eastern mill at \$23.25, ex-ship, we hear of no transactions.

Scrap.—The market is quiet. We hear of one lot of 200 tons of No. 1 having been sold, delivered to ship, at \$21, and a lot of 100 tons at \$20.50, the latter because the seller was forced to clear it away.

Rail Fastenings.—Spikes are active at \$2.20 @ \$2.25, delivered. Angle Bars have sold low in the West, one order, at Fort Worth, Tex., being placed at 2.05¢.

Financial.

While in some quarters there are heard expressions of disappointment, the general tenor of advices respecting trade and prospects for the new year is of a hopeful character. Railroad troubles, the suspension of wheat exports and derangement of the flouring industry, together with an outward movement in gold, are the principle drawbacks. Despite these facts, the accounts respecting trade and business, as gathered from representative men in New York City during the week, are generally encouraging. Dry goods jobbers report a healthy market, and the aggregate of sales for the year is believed to exceed that of the corresponding period in 1887. In the woolen industry quite a large number of mills have resumed, and the outlook for another year is promising. Credits and

collections generally are good, especially in the winter wheat States, there being fewer complaints than a year ago. The cotton crop is large; estimates vary from 6,750,000 to 7,250,000 bales, indicating a yield about equal to that of last year, valued at something like \$280,000,000, costing each bale \$40. The Produce Exchange markets are unusually dull, with wheat exports suspended by high prices, but a belief that the surplus will be required sooner or later strengthens the views of holders. Pork is 12 % higher than a year ago, and business is good. Corn exports are said to yield better returns than last year. The rice crop is short, and prices are advancing. The oil market is in the control of trusts, under conditions wholly artificial. In the leather market there is general contentment. The volume of business exceeds that of last year, the export of sole leather alone being equal to some \$5,500,000 for 1888, or say 10 % larger than in 1887. The home product of hides has increased rapidly, in consequence of the growth of the ranches, cheapening the cost of the raw material. Touching railroad interests, the fact will not escape attention that, notwithstanding the recent extraordinary pressure of traffic, the revenues of the year thus far will not equal those of the same period in 1887. The net earnings, according to the estimates of a leading authority in these matters, ought to be about \$300,000,000, the gross earnings being probably in excess of \$1,000,000,000. The big coal companies have had a remarkably prosperous season, the demands for consumption having exceeded all precedent, at remunerative prices. For the year the total output will be close upon 38,000,000 tons, or 4,000,000 tons larger than that of 1887. The meeting of Congress December 3 will be watched with some solicitude, but radical legislation is not expected.

The Stock Exchange markets were chiefly affected by trunk-line difficulties, and the general tendency of prices was lower in the absence of investors and with continued selling on foreign account. The declaration of the usual dividend, 3 % semi-annual, by the Chicago and Northwestern, had a strengthening effect; also a reported agreement among the Southwestern lines. On Saturday a heavy drop in New England was a noticeable feature. On Monday there was further weakness on reports of large specie shipments by this week's steamers. The situation in regard to railroad contentions is fairly well stated by a leading brokerage firm, as follows: "The Interstate Commerce law has driven the railroads to measures that they probably never thought of before its passage. Its prohibition of pooling will, unquestionably, compel larger combinations of our railroad systems than we have yet seen. Just how this unification of interests and centralization of power is to be brought about the railroad men themselves may not be able to predict, but the shrewdest and most far-seeing of them admit that the tendency is in the direction indicated, and, as they appreciate the necessity of greater harmony and unity of action, it is quite safe to assume that they will yield to the necessity that is more powerful than is the law." In other quarters it is probably intimated that the deliberate purpose of railroad corporations is to bring the Interstate law into discredit, thus compelling remedial action by Congress.

Government bonds were firm but not very active, the latest sales reported at the board being \$3000 coupon 4s at 128½ and \$15,500 do at 128½. Quotations are as follows:

U. S. 4½s, 1891, registered.....	107½
U. S. 4½s, 1891, coupon.....	109
U. S. 4s, 1907, registered.....	128½
U. S. 4s, 1907, coupon.....	128½
U. S. currency 6s.....	121

The weekly bank statement showed an increase of \$720,075 above legal require-

ments. This makes the surplus now held \$12,311,875, against \$6,664,400 at the corresponding time last year. The banks hold at present several millions of funds belonging to banks at other financial centers, but if the entire amount were withdrawn the banks would still be in a better position than for some years previously at this season. In loans there was a contraction of \$2,176,800. Deposits decreased \$2,410,700. The week developed a better demand for money, accompanied by somewhat higher rates. Money on call loaned at an average of about 2½ %. The fact that the beginning of a year is now at hand caused a better demand for the time loans also. Rates were 4 % for three to four months and 4½ % @ 5 % for four to six months. The recent gold movement has produced no visible effect on the local money market. The banks report less demand for currency from their correspondents in the interior than for a long time. The demand for commercial paper was active and the supply was not abundant. The exports of specie from this port during the week amounted to \$4,495,918, mostly in gold bars, making a total since January 1 of \$35,515,263, of which \$11,668,000 was silver, as compared with \$16,483,646 for the same time in 1887. Imports of specie for the week were nominal.

The market for sterling was very dull and easier. The posted rates are \$4.85 @ \$4.85½ @ 4.88½. Some of the leading bankers are inclined to believe that the special foreign demand for specie has been about filled. The urgent demand for gold from South America, where English and German capitalists have made large investments, especially in the Argentine Republic, has made it necessary to pay such rates for the precious metal that our bankers have been enabled to ship it even while exchange has ruled at figures which under other circumstances would have made the operation a losing one.

The foreign commerce of the United States for October is unexpectedly favorable in almost every particular. The total exports were \$79,903,856 and the imports \$69,549,614—balance of trade \$10,354,242, less than \$2,000,000 of which was an excess in the shipments of specie over the receipts of specie. This increase in the outflow of produce and merchandise is entirely due to the increased clearances from other ports. As the figures now stand the unfavorable balance is \$55,000,000, or about the same total as at this time last year.

The imports of merchandise at this port during the week were valued at \$8,885,797, of which \$1,819,000 represented dry goods. Since January 1 the total is \$419,919,000, against \$424,137,000 for the same time last year and \$392,499,000 in 1886.

Coal Market.

The congested state of the Anthracite Coal trade, resulting from overproduction and the close of navigation on the lakes and canals, provokes measures to check supplies from the mines, and it is understood that action to effect this purpose will be taken before the close of the present week. Three-quarters time, it is said, will be the rule throughout the mining regions. Meanwhile prices for most descriptions of Coal are weak. It is noticeable that some of the largest companies are making extraordinary preparations for an increased business in the coming year. The Reading and the Pennsylvania Railway Company alike are about to introduce the Dodge system of Coal storage at their terminals—that is, the use of tall masts, from the top of which, by means of a patent tackle, cars are moved to and fro between the mammoth coal dump and the

loaded trains. The Reading will have eight heaps at Port Richmond, each of them averaging nearly 50,000 tons. The Pennsylvania will have at South Amboy ten heaps, representing 100,000 tons. In this way an expensive water front becomes unnecessary. The system will be introduced at Chicago and other lake ports.

The Pottsville *Miners' Journal*, writing of the Schuylkill region, says: "The Reading Coal and Iron Company have expended a great deal of money this year in the improvement of their collieries and in the preparatory work needed to open new ones. Some of those that have not been in working trim for years have been or are in progress of recovery. Bear Ridge, at Mahanoy Plane, has been almost renewed, and has been working for a month, after being idle for years."

At least six other important collieries are named which are being prepared for a larger scale of operations. Prices nominally are as follows, but report says they are sometimes shaded 15¢ @ 50¢ per ton: Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.65; Pea, \$2.75.

Freights from shipping ports in New York harbor are quoted \$1 @ \$1.15 and discharge to Boston.

Metal Market.

Copper—Since our last week's report Copper has gone on weakening in the London market, not unlikely in anticipation of expected unfavorable statistics for England and France at the close of the present month. Thus, spot Chili Bars gave way from £78. 2/6 to £77. 17/6; ditto futures from £78. 15/ to £78. 5/; good merchantable brands from £78 to £77. 17/6; Best Selected being sustained at £82. 10/; sales, 500 tons. Our own market has been inactive and weaker with futures; November gave way from 17.50¢ to 17.35¢, and December is not worth over 17.45¢; spot, nominally 17.50¢ @ 17.62½¢.

Tin—London has been unable to uphold the advance of the previous week, and spot Straits has declined from £103 to £100. 17/6; Futures also come slightly lower, being £101. 10/; against £101. 17/6 last week. Sales 350 tons for the week. Here the sales on 'Change have been trifling at 22.40¢, spot, closing at 22.30¢ @ 22.35¢. The statistics for November are looked forward to with considerable interest, since they are likely to determine the course of prices for some time to come. **Tin Plates**—There has been very little doing, and prices are unchanged. We quote at the close, large lines, per box: Siemens-Martin Steel, Charcoal Finish, \$4.90 @ \$5.75; Coke Finish, \$4.70; Terns, \$4.10 @ \$4.25; Bessemer Cokes, \$4.25 @ \$4.35; and Wasters, \$4.15. Cokes continue unaltered at Liverpool, 13/3 @ 13/6.

Lead—The week has been an excessively dull one, sales in the open market not exceeding 300 tons at 3.60¢ @ 3.65¢ for Common Domestic, closing at 3½¢, St. Louis declining from 3.40¢ to 3.37½¢. In London Soft Spanish is also lower, coming £13. 2/6 this morning, against £13. 5/ yesterday.

Spelter—Advices from the West are anything but encouraging; the demand there has fallen off, and at the smelting works stocks are once more accumulating. Here the market has become quite flat and weak, so that Common Domestic cannot be quoted over 5½¢, while Silesian, in view of the drooping European tendency, is not worth over 5½¢.

Antimony—Is about the only metal exhibiting any life. In London Hallett remains firm at £44, and here it brings 10¼¢ @ 11¢, while Cookson commands 12¼¢ @ 13¢, the market winding up strong for both, with a first-rate demand and light stock.

New York Metal Exchange.

The following sales are reported:

FRIDAY, November 23.	
20 tons Tin, spot.....	22 40¢
100 tons Lead (on dock).....	3.62½¢
MONDAY, November 26.	
10 tons Tin, February.....	22.50¢
TUESDAY, November 27.	
25,000 lbs. Lake Copper, November.....	17 40¢

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, TUESDAY, Nov. 27, 1888.

The speculation in Copper has been somewhat brisker, but the fresh animation reflects reselling by operators who purchased some time ago on the belief that the "syndicate" was about to advance prices considerably, rather than a tendency to invest on the part of outsiders. In point of fact the operations have consisted almost wholly of sales by these holders and the purchase of the supply by the "syndicate" agents. The latter, it is said, are taking up the outside offerings in order to check the growing outside competition and consequent underselling, the sellers meanwhile being nowise backward about taking the small profits afforded by the transfer. Apart from the above there have been no new features. Consumers buy very conservatively.

Two new Copper producing concerns have been floated. One is styled the Calabak Company and the other the New Zealand Company. Both companies profess their ability to produce Copper at less than one-half the present market prices.

Operations in Block Tin have centered within a marrow quarter, general interest being exceedingly tame. The more conspicuous traders have succeeded in stiffening prices somewhat, however, despite the lack of outside interest.

Tin Plate makers report a more active market and some heavy booking, particularly of orders for Bessemer sorts, at prices within the extreme range ruling for a fortnight past. The increased business has imparted more tone to the general market.

On expectations of heavier demands from America there has been livelier speculative buying of Scotch, Cleveland and Hematite warrants. Prices have hardened all along the line, and there is a better tone to the market for makers' iron also.

The Waterloo works are shortly to be restarted on Phillips Pig Iron.

There has been more demand for Old Iron Rails. The inquiries disclose a moderate and concentrated supply, and also the fact that holders will not sell except at an advance on late nominal prices. There has been a full 2/6 advance since last report.

Cleveland Pig—Prices have shown no positive rise, but are firmer, and the market is more active. No. 1 Middlesboro', G.M.B., 36/; No. 3 do., 33/6 @ 33/9.

Scotch Pig—There has been a more active business, and, while fluctuating considerably, prices are decidedly firmer.

No. 1 Coltness, f.o.b. Glasgow.....	49/
No. 1 Summerlee, " ".....	48/
No. 1 Gartsherrie, " ".....	48/
No. 1 Langloan, " ".....	48/
No. 1 Carnbroe, " ".....	48/6
No. 1 Shotts, " ".....	48/
No. 1 Glengarnock, " at Leith.....	47/6
No. 1 Dalmellington, " Ardrossan.....	47/6
No. 1 Eglinton, " ".....	47/
Steamer freights, Glasgow to New York, 3/6, Liverpool to New York, 10/.	

Bessemer Pig—There is a better tone to the market and prices are firmer. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen—The market very firm and demand very active. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails—A large business still passing, but competition is sufficient to prevent prices advancing. Standard English sections quoted at £3. 18/9, and light sections £4 @ £4. 10/, f.o.b. at N. W. England shipping point.

Steel Blooms—Very little demand for these. Some sellers name slightly lower prices. We quote £3. 18/9 for 7 x 7, f.o.b. at N. W. England shipping point.

Scrap Iron—There is more doing and prices are firmer, while showing no positive changes. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Steel Billets—The demand continues fairly active and prices remain firm. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs—A fair business at steady prices. Bessemer, £4, f.o.b. at N. W. England shipping point.

Old Rails—The market is quite strong. Demand is brisker, and buyers have offered 2/6 advance. Tees quoted at £3. 6/3 @ £3. 7/6, and Double Heads £3. 10/ @ £3. 12/6, c.i.f. New York.

Crop Ends—More doing in these, and the market firmer. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate—There has been a fairly active business at reduced prices. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/ @ 15/6
IC Bessemer steel, Coke finish.....	13/6 @ 13/9
IC Siemens " " ".....	13/6 @ 13/9
IC Coke, B. V. grade.....	13/3 @ 13/6
Charcoal Terne, Dean grade.....	12/ @ 12/6

Manufactured Iron—Former prices prevail, and the market has continued fairly active. We quote, f.o.b. Liverpool:

	£	s.	d.	£	s.	d.
Staff. Ord. Marked Bars ..	8	2	6			
" Common ..	5	10	0			
Staff. Bl'k Sheet, singles.....	7	10	0			
Welsh Bars (f.o.b. Wales)...	5	0	0	5	2	6

Tin—Business has been fairly active, with only slight variation in prices. Straits quoted at £100. 17/6, spot, and £101. 12/6 @ £101. 15/ for three months' futures.

Copper—The market very quiet and prices without change of importance. Chili Bars, £78, spot, and £78. 5/ @ £78. 10/, three months' futures. Best Selected, £81. 10/.

Lead—Business slow and mainly at former prices. Soft Spanish, £13. 2/6.

Spelter—Demand has been slow, and prices are weaker. Silesian, ordinary, £17. 15/.

The Johnson Steel Street Rail Company, of Johnstown, Pa., are testing the Eureka petroleum fuel gas, the same which was tested by Oliver Bros. & Phillips, in Pittsburgh.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from November 19 to November 22, inclusive, and from January 1 to November 22, inclusive, were as follows:

CHILL.

VALPARAISO, September 28, 1888.—Copper—Its prices are sustained in Europe in spite of the unfavorable statistics. Copper has been offered sparingly, causing prices to appreciate slightly and leading to sales of 14,342 quintals at \$29.40 @ \$30, \$29.70 equaling £77.6/2, per steamer. Nitrate.—Business was at first interfered with by the national holidays, but it subsequently revived all the more as cable advices were favorable. October-November delivery met with a strong demand, the price paid for 95% being \$2.80 @ \$2.82 1/2. As, however, suitable vessels were scarce, and available nitrate with them, transactions were somewhat restricted thereby. During the last few days the inquiry extended to later deliveries. Nothing can be had now before the end of the year, and for every month in the new year the price is \$2.82 1/2 @ \$2.85. We quote 96% at \$2.90. Total sales have amounted to 347,000 quintals at \$2.80 @ \$2.83 1/2 for 95%, and 50,000 quintals 96% at \$2.90. \$2.82 1/2 equal £8.11 1/4 @ cwt. Coal.—The arrivals are by no means large thus far; as, however, requirements have been covered for some time to come, not much transpires in the way of sales. Newcastle, per steamer bound for Iquique, is offered at 25/-. Nothing is being done in lots that sailed in August and September. These are held out of the market, consignees expecting a rise later on, since shipments this way are again on the decrease. Exchange.—Has been fluctuating between 26 1/2 d and 26 3/4 d, closing at the latter figure for 90 days' sight drafts on London.—Weber & Co.

EAST INDIES.

MANILA, November 19, 1888.—Hemp is nominal at \$11.50 @ picul, against \$10 same time last year, equaling 1/2 ton, cost and freight, £39.15/ @ £35.7/. The clearances for the United States, since last cable, have been 13,000 bales, as compared with 6000 in 1887. Since January 1 there have been shipped to the United States, altogether, 211,000 bales, against 231,000, and there are loading for the same destination 25,000, against 15,000; cleared for England, since January 1, 298,000, against 200,000 bales; loading for ditto, 12,000, against 7000; cleared for all other countries, 63,000, against 38,000. Receipts at all ports since last cable, 21,000 against 5000; since January 1, 584,000, against 477,000 in 1887 and 359,000 in 1886. Freight, \$7, against \$5.50. Exchange, six months' sight, London, 3/7 1/2, against 3/8 1/2.—Ker & Co., per cable.

COLOMBO, CEYLON, October 11, 1888.—Plumbago.—Better qualities continue scarce and in request, whereas inferior sorts are weaker. We quote at the close: Large Lumps in rupees, 1/2 ton, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust, 42 @ 65. Ebony.—Having been effected during the week. Coir Yarn.—Is in moderate request at 7 @ 12 rupees @ cwt. for Nos. 1 to 4. Shipments since October 1, of Plumbago, have been to England 1118 cwt.; to Hamburg, 300; to the United States, 2380; together, 3798, against none last year; 21,407 in 1886; and 8832 in 1885. Exchange, 6 months' sight, 1/4 31-32.—John W. Greene, 82 Broad street, New York, agent for Volkart Brothers.

JAPAN.

TOKIO, October 12, 1888.—Iron and Steel.—The import of Steel Rails has been in 1887 64,463 tons from England, against 56,950 in 1886, and 63,771 tons from Germany, against 33,945 in 1886. The import of Nails was 32,355 tons from England, against 37,409 in 1886; 35,222 from Germany, against 26,299, and 1233 from Belgium, against 23,074 in 1886. Out of the 219 foreign firms established in Tokio 123 hailed from England, 42 from Germany, 39 from the United States and 35 from France. Copper.—The French syndicate is represented in Japan

by one English and one German firm; it is through the medium of these two concerns that the said syndicate has been able to make contracts "to arrive" with some of the leading owners of Japanese Copper mines, among others with Furumava, who owns the Tachiwo mines, turning out as he does a well-known brand of fine Copper. The contract is for all the mine is capable of producing till 20,000 tons shall have been delivered. The price is \$350, in silver, 1/2 ton for the entire amount. As security, \$250,000 has been deposited with the branch establishment of the Hong Kong and Shanghai Banking Corporation in Yokohama. This puts an end to the export of Copper by Japanese firms, who prior to these contracts have been shipping Copper to China and India for their own account. For the brands of all other Copper smelting works in Japan are too unknown abroad to sell them there to advantage, and, besides, every one of them turns out so little, comparatively speaking, that it would not be worth while to try introducing them.—Japan Mail.

SPAIN.

BILBAO, November 3, 1888.—Iron Ore.—With the exception of a few single cargoes hardly anything has been done in the way of sales during the week under review. There is some demand for delivery next year, but the prices asked are different from those so far ruling on the spot. The mining companies are asking higher figures, to which the owners of iron works do not so far feel disposed to subscribe, and this is one of the reasons why the ore trade has become so languishing. The Bilbao mine owners seem to lose sight of the fact that there are desirable Iron Ores procurable elsewhere in Europe, like, for instance, in Sweden, even preferable to ours for Steel making. It is true Swedish Iron Ore exportation has not yet been started on a large scale. As yet the Swedish railway is not in running order through its entire length, but it soon will be, there being plenty of capital to carry out the enterprise. Our mine owners may dislike hearing the truth, but we do not hesitate in warning them. Meanwhile Campanil is bringing 8/ @ 8/3 1/2 ton, and Rubios 6/10 @ 7/8. Total exportation since January 1 has reached 3,129,672 tons, against 3,649,758 same time last year. Pig Iron.—During the week 1200 tons have come to be exported, and 825 have been shipped coastwise.—Bilbao Maritimo y Comercial.

RUSSIA.

ST. PETERSBURG, November 14, 1888.—Petroleum.—An imperial decree is about to be issued of a protective nature in favor of Caucasian Naphtha producers against foreign competition, thus confirming what has been hinted before, that the Emperor, after visiting Baku in person, is going to take special care of the interests of the firm of Nobel Brothers, and that the measure to be taken by the Government will be specially directed against the Rothschild Petroleum undertakings in Russia.—Journal de St. Petersbourg.

HOLLAND.

ROTTERDAM, November 14, 1888.—Tin.—Following are the October statistics of Tin:

	Banca.		
	1888.	1888.	1887.
	Sept. 30.	Oct. 31.	Oct. 31.

Prices of Billiton, fl.....	62 1/2	62 1/2	70

—Koch & Vlierboom.

The United States Geological Survey estimate the total value of all minerals mined in 1887 at \$538,000,000, the greatest annual yield ever produced, and \$70,000,000 in excess of the total for the previous year. No other country in the world can make a similar exhibit.

Hardware.

With the advance of the season the volume of business is rather light, prices remaining remarkably steady with very few changes. Manufacturers are generally pursuing a conservative course and avoiding an undue accumulation of goods. There is but little complaint in regard to collections, and the general condition is regarded as satisfactory and promising.

Wire Nails.

No change has been made in quotations since our last report. The arrangement between the manufacturers of the Standard Nails is working smoothly and prices are reported as quite closely adhered to. With the understanding that exists between them, the manufacturers' prices are regarded as more settled than they have been for a long time, and it is thought not unlikely that a slight advance may be made before long. Of this, however, the manufacturers give no intimation, but it is an inference drawn by well-informed parties in the trade.

Barb Wire.

There has been little change in the New York market quotations, continuing as at our last report: 4-Point Galvanized, carloads, 3.6 cents; 3-ton lots, 3.7 cents; less than 3 tons, 3.9 cents, with delivery. The demand is quite limited.

The Washburn & Moen Mfg. Company last week obtained a preliminary injunction from Judge Blodgett, at Chicago, restraining the Joliet Barb Wire Company and H. B. Scutt, its president, individually, from infringing the Glidden patents. The bill filed charges that Scutt was licensed by the Washburn & Moen Company to manufacture a Barb Wire of a style called the Eureka. Instead of manufacturing that style, however, he manufactured under the name of Eureka a Barb Wire which was covered by the Glidden patents. He was sued both for violation of his license and also for infringement of the Glidden patents. Pending the settlement of the suit the works at Joliet have been shut down.

Cut Nails.

A slight improvement in the volume of business is reported, but prices remain unchanged at \$1.80 @ \$1.90 for carload lots, with little prospect for an early advance, in the opinion of some of the leading sellers.

A cut freight rate on Nails from Wheeling to Denver, which was made last week, threatens to precipitate a railroad war between the lines running to Colorado points. The cut was quite heavy, amounting to about 60 cents per keg.

Miscellaneous Prices.

The Gage Tool Company, Vineland, N. J., advise us that in view of the increase in their business, and consequent enlarged facilities for manufacturing their Planes, they are enabled to give the trade a somewhat better margin, and quote discount 20 and 10 per cent., instead of 20 per cent., as heretofore. They also allude to the satisfactory export demand there is for these goods, inquiries being received from South America, Australia, Mexico, England, Germany and Italy.

The Energy Mfg. Company, Philadelphia, Pa., issue a six-page circular relating to their Rope Hoisting Machines, Center Grinders, Rope Clamps and other goods, the construction of which is explained, with list prices. We are advised that these goods are handled extensively by the Hardware trade throughout the country, and in a sheet containing names of parties who have handled or used their goods we

notice the names of several well-known Hardware men and many prominent manufacturers. The discount to the trade on the Hoisting Machines is 25 per cent.

The following are the prices of the Carpet Sweepers manufactured by the Goshen Sweeper and Wringer Company, Goshen, Ind.:

	Per dozen.
Conqueror.....	\$23

Ammunition is regarded as in a more satisfactory condition than it has been in for some time, the market being more regular since the action of the association, to which we referred two or three weeks ago. There is less cutting of prices, and the regular quotations are quite generally adhered to.

The Lightning Nail Puller, for which the Simmons Hardware Company, St. Louis, Mo., are sole agents, is quoted at \$21 per dozen. A description of this article is given on page 840.

Business Tendencies.

From a wholesale Hardware merchant in Texas we have received the following letter in regard to the question which has been discussed at some length in these columns as to whether the jobbers are encroaching in their trade upon the business of the manufacturers, the result of which has been to show that while the manufacturers are in general holding their own and making advances with the larger retail trade, the jobbers are filling an important place as indispensable distributors of Hardware, and by their energy and enterprise supplying a good proportion of the retail merchants, who find it to their advantage to purchase from them rather than send a large number of small orders to many manufacturers. Concerning the general question our correspondent writes:

The discussion in *The Iron Age* of the tendencies of trade being more than usually interesting I have concluded to take a hand in it. *Is the jobber losing ground in the distribution of Hardware?* This question is determined by the well-known natural law that all bodies move in the line of least resistance. The tendency of distribution of Hardware, as well as all other products, is toward the least expensive and most convenient route between producer and consumer. This is the natural tendency, and no trust or combination will ever be strong enough to effectually overcome it. The retailer complains that the jobber sells direct to the consumer. The jobber complains that the manufacturer sells direct to the retailer. The manufacturer complains that the jobber cuts prices which the former tries to maintain for the jobber's special benefit. All three seem to forget that they have a right to buy in the cheapest market and sell in the dearest market, as far as competition will permit, and most people exercise that right nowadays without regard to the inconvenience they may incidentally occasion either the jobber or manufacturer.

We may safely lay down the rule that the bulk and value of goods determine the necessity of jobbers. The greater the bulk and the lower the value the less chance there is for jobbers. Therefore, such goods as Stoves, Agricultural Implements, Barbed Wire, &c., are usually sold direct from manufacturers to retailers. Jobbers in those lines are nearly extinct. Again,

in large trade centers, such as New York and Chicago, manufacturers have agencies with stocks, which, in competition between themselves, capture the cream of retail trade, leaving no room for jobbers. Thus, line after line is taken away from the jobber by the specialist. Hence the largest distributing points do not offer the most promising future for the Hardware jobber. I am a jobber, and will say to my friends, East, West, North and South, that we still have a right to exist, which I will show. The vast majority of retailers do not reside in large distributing points. Many of them can buy bulky staples direct, but should they attempt to buy 100 articles made in 100 different factories which would average less than 40 pounds to the lot, and cost as much freight as 100 pounds, open 100 accounts on their books and buy 100 drafts for payment, they would soon learn that it is much more convenient and economical to buy their 100 articles from one house, pay one freight bill for all, run one account and buy one bill of exchange for payment. The same rule works both ways. The manufacturer can afford to pay the jobber for distributing his goods. A jobber representing 100 factories can distribute goods more economically than a manufacturer representing only one. The jobber relieves the producer of sending travelers to every cross-road of the country and running a multitude of small accounts, and making a multitude of shipments and carrying a large stock. He also relieves the retailer of carrying a large stock, keeping a multitude of little shipments on the way, running a multitude of little accounts, &c. Hence, for the present at least, the Hardware jobber is an economical necessity.

The following is from a Kentucky retailer, and gives the situation as seen from his standpoint:

We buy for cash and give the manufacturers preference, and get close prices and new goods. Jobbers are courting the small trade and even selling the blacksmiths and carpenters at same prices offered dealers. When jobbers retail goods to our trade, why should they expect us to give them orders and kick because we buy from factory?

We also take pleasure in giving place to the following contribution to the discussion, which is written from the point of view of the jobber and gives our correspondent's impression of the tendency of trade in the matter under consideration. It relates, it will be observed, especially to the Western jobbing trade:

Manufacturers of Hardware, as well as those who are engaged in making other kinds of stock merchandise, find the distribution of their product fully as important as the details of its manufacture. Some goods, it is true, are said to "sell themselves," but they are usually of novel and attractive construction or such as seem to have met and supplied a long-felt want, or they introduce simplicity and cheapness to take the place of clumsiness and high prices. There are long lists of staple articles, however, in which the goods made by one manufacturer vary but little from those made by another, or if they do vary it is in matters of detail and not of principle. In all such cases it is an important consideration how to reach consumers, and also how to reach them in the greatest numbers. It may be a comparatively easy matter to manufacture the goods, but if they cannot be sold in sufficient quantity to compensate the makers for their labor and the use of their capital, the factory will sooner or later stop its machinery and close its doors. The lesson has been learned over and over again, and sometimes at very great cost, that merely to

make an article is of no consequence if a market cannot be found or established for it. In seeking outlets for goods the Western market is by no means overlooked. The large and constantly increasing population of that section demands an enormous supply of staple goods, which are distributed among the consumers by the retailers, who in turn are supplied very largely by the wholesale merchants or jobbers, who receive their supplies directly from the manufacturers.

The jobber in the West occupies a peculiar position, which is not thoroughly comprehended by those who are only conversant with Eastern business methods. He is called upon to supply a great variety of goods to purchasers who may be scattered over an immense territory, but who desire to receive their goods promptly when ordered, requiring him to carry an immense stock, and to keep it constantly replenished. As the population of the West has increased, and railroad facilities have been enlarged, the number of jobbing centers has multiplied, but the prominent jobbers of the leading Western cities maintain their hold throughout most of their old territory and continue to thrive. The jobbers in the smaller cities are usually retail merchants who have been shown by their own experience that a profitable business could be sustained by carrying full stocks of goods, with which to supply at short notice the wants of retailers in their particular locality, among whom, however, some lines of trade will continue to be controlled by the jobbers in the large cities.

The Hardware manufacturer who establishes relations with the Western jobbers finds through them, under ordinary circumstances, a satisfactory channel for the distribution of his goods. They advertise them, put descriptions of them in their catalogues, and push the introduction or sale of them through their traveling salesmen. Much will depend, of course, upon the selling qualities of the goods themselves, but as far as possible the machinery of the jobber will be used to effectively make the desired distribution. There are many Hardware manufacturers who only use this method of disposing of their goods in the West, but there are others who in recent years have for various reasons established agencies in the principal Western cities, notably in Chicago. In a majority of cases the representation is secured through an individual or firm acting for a combination of interests which are not in conflict with one another, but there are some conspicuous instances in which a single line is thus represented. Full stocks of goods are carried by some of these Chicago branches, while others exhibit samples only and make shipments to purchasers direct from the factory. The branches selling by sample are in a manner experimental, except as to some lines of goods in which the establishment of a warehouse at Chicago would add considerably to their cost to the purchasers who would be supplied from it. Here and there a very unsatisfactory result has followed the attempt of some manufacturer to establish an agency, while there are very few that have achieved brilliant success.

The growth of these manufacturers' agencies has been assisted to a considerable extent by the efforts of enterprising young men who have had experience in connection with established Hardware houses, and who seek in this line an opportunity to build up for themselves an individual business from which they would otherwise be debarred by lack of capital, if the jobbing trade were their only hope. These manufacturing agencies, when extensive enough, maintain a force of traveling salesmen, who visit the most important towns in the West along the leading railroad lines, but there are many agents of recent appointment or limited capital who

are their own salesmen. The efforts of these branch houses are mainly directed toward securing the trade of wholesale houses, and some of them will on no account sell to retailers. They say that in this way they secure all the business they can handle, and by preserving cordial relations with the wholesale merchants they are better able to maintain prices. The number of wholesale houses through the West and Northwest is so large that their influence is very important. There are other manufacturers' agents, however, who do not confine attention to the wholesale trade, but who also invade the retail field and capture such business as they can from the best houses of that class. In doing this they directly antagonize the jobbing interest, which is particularly strong in the large Western cities, embracing firms of large capital, long standing, high credit, managed with exceptional ability, firmly intrenched in the closest and most amicable relations with the body of the retail trade, and often authorized to act as exclusive agents in their section for the largest and most influential manufacturers in the East and elsewhere. In a contest with such opponents and in such a territory the cost needs to be well considered before it is rashly undertaken.

To a superficial observer it would appear that the establishment of manufacturers' agencies in Western cities meant the introduction of an era of transition, in the course of which the jobber would be eliminated as no longer necessary in the conduct of trade. As manufacturers increase in number, as competition among them becomes more bitter, and as declining profits make it necessary to secure a larger volume of business to get as good a net return as when profits were high and margins wide, it is possible and altogether probable that efforts to reach the better houses among the retailers will increase. But it will be a long and weary struggle and a costly one, and the jobbers of the West seem destined not only to hold the volume of trade which they now enjoy but also to obtain their share of the natural increase in business which arises from the rapid growth in population of the West and Northwest, the greater necessities of the people as they become more prosperous, and the wider extension of all kinds of public improvements.

Items.

Withington & Cooley Mfg. Company, Jackson, Mich., have issued in their usual attractive style an illustrated catalogue showing their Farm and Garden Tools for the coming season. It shows their well-known line of goods, on which list prices are given, revised to date. The cover is especially attractive, being given an old-bronze finish and artistically embossed.

A. Baldwin & Co., New Orleans, La., incorporated July 1, 1888, with a paid-up capital of \$400,000, with Albert Baldwin as president, are now erecting a new store on the site formerly occupied by the City Hotel. The ground on which this building is to be erected measures 150 feet front on Camp street and 240 feet on Common street. The building will be seven stories, built of Philadelphia brick and stone. Every precaution has been taken to insure the comfort and safety of its occupants, and also the speedy and economical handling of goods. An idea of the strength of the building may be gained from the fact that the second floor is calculated to carry with safety 1000 pounds to the square foot; the third and fourth floors, 500 pounds to the square foot; the fifth floor, 400 pounds to the square foot, and the sixth and seventh floors, 350 pounds to the square foot. The store will be provided with four power elevators of the most improved pattern. The com-

pany's stock will consist of foreign and domestic Hardware, Mill, Railroad and Builders' Supplies, Agricultural Implements and Machinery. In addition to their jobbing business they are manufacturing in a separate building a number of Agricultural Implements especially adapted to the Southern trade.

The Huebel Mfg. Company, Newark, N. J., announce that they have arranged with Tower & Lyon, 95 Chambers street, New York, for the exclusive sale of their Malleable-Iron Oilers and Malleable-Iron Hand Lamps, by whom their product will hereafter be sold and invoiced.

New Process Twist Drill Company, Taunton, Mass., issue a convenient card in which they illustrate their Drills and give a table showing the different sizes of Drills that should be used when a full thread is to be tapped. This card, which is furnished with an eyelet for hanging up, will be found convenient. They also allude to the special features of their Drills, explaining that what is new in their process is the fact that the Drills are hot forged and not milled, all sizes larger than $\frac{1}{4}$ inch being thus made. Their Wire Gauge, Alphabet, Jobbers and all other sizes up to and including $\frac{1}{4}$ inch are described as made of P. S. Stubbs' Steel and are milled.

Of the Cyclists' and Sportmen's Gun and Rifle Company, 147 Washington street, Boston, Mass., Edward D. Bean is president and Samuel L. Hodgman treasurer.

The E. C. Meacham Arms Company, St. Louis, Mo., in their November price current of Guns, Ammunition, Sporting Goods, &c., represent a varied assortment of Arms and other goods in the lines indicated, together with Pocket Knives and Skates. They call special attention to their No. 1027 Breech-Loading Shot Gun, on which they are offering a special price, quoting it at \$15.

The Seneca Falls Lawn Mower Company, Seneca Falls, N. Y., have issued a descriptive catalogue and price list of the Lewis Lawn Mower, of which as a new article we gave a description a few months ago. The catalogue is neatly printed and contains a number of pictorial illustrations enforcing the merits of the machine, while cuts are also given showing the different patterns, with an explanation of its construction. The arrangement of the oil reservoirs connected with the lubricating device of the machine is specially illustrated.

The Worcester Faucet and Mfg. Company, Worcester, Mass., in their illustrated catalogue and price list explain the special features of the Worcester Faucet, with cuts showing the different patterns in which it is made. It is pointed out that this Faucet is made self-closing and non-self-closing, and in all forms is slow closing—that is, the closing of the valve is automatically retarded or extended over a sufficient length of time to gradually stop the flow, so that it will close with an easy motion and without any injurious shock or hammer. Other points in its construction are also fully explained.

Rector & Wilhelmy Company, Omaha, Neb., issue a well-printed circular in which they call attention to seasonable specialties and miscellaneous goods, of which illustrations and list prices, with discounts in cipher, for which a key is furnished, are given. It opens with Metals, which are followed by Meat Cutters, Skates, Sleigh Bells, Toy Banks, Cutlery, Plated Ware, Lanterns, Saws, Axes, &c.

The Miller Hardware Company, of Canton, Ohio, organized November 2d, 1888, have bought the stock of Paints, Artists' Materials, &c., of John H. Werner & Co.,

of Canton, Ohio; also the Hardware stock of W. A. Strayer, of Canton, Ohio. The Miller Hardware Company intend doing a wholesale and retail Hardware business. H. H. Miller, the manager of the company, is a well-known business man of Canton. The active members of the Miller Company are of the D. D. Miller Company, of Wooster, Ohio, one of the largest Hardware companies in Ohio.

D. W. Bosley & Co., 273 East Madison street, Chicago, Ill., issue circulars describing their different styles of Weather Strips and other goods. They refer to the Excelsior Weather Strip, Flexible Weather Strip, Adjustable Door Bottoms and Spring Door Bottoms. The Excelsior Weather Strips, made of wood and rubber, are familiar to the trade and are handled by jobbing houses in Boston, Philadelphia and Baltimore, and by John H. Graham & Co., of this city, who are agents for their sale. The Flexible Weather Strips are made entirely of rubber and put up in lengths of 50 feet, making a package 6 or 8 inches wide, 1000 feet making 1 foot square. They are thus given, it will be seen, a place in shelf goods.

The Protection Ventilator Company, 153 Fulton street, New York, issue a circular describing the Perfection Metal Molding and Rubber Cushion Weather Strip, which they are manufacturing. Illustrations are given of their sizes Nos. 0, 1, 2 and 3, ranging from $\frac{1}{4}$ inch to 1 inch.

Trade Topics.

From a well-known house in Melbourne we have the following, in which they refer to the value of *The Iron Age* and its advertisements, and give suggestions which may be of service to advertisers:

As regards *The Iron Age*, we go through each number with great interest and pleasure, especially in its new and more compact form, and very many of the lines we now regularly import owe their introduction to us to its columns. We find the notes as to the market prices, new goods, arrangement of stores, of considerable value to us; but it is to the advertisements that we chiefly turn in search of new lines suitable to our markets. We can hardly suppose that any suggestion we could offer has not been already thought of by you, but we should like to say that an illustrated advertisement is much more likely to attract attention than plain letter-press, and that the illustration should be changed frequently, and that if in the advertisement a note was made referring to page on which the price of the article is given, it would be a convenience. The mass of trade literature is now so large that it only gets skimmed through, and the illustration of a new line catches the eye when a mere description of the same line would be passed over.

The following letter from a Florida Hardwareman refers to hardships in connection with freights. Many of our readers will probably sympathize to a greater or less extent with the feelings of our correspondent:

Some time since I saw in *The Iron Age* a "kicker" about classification of freights on Hardware suggesting that the fraternity, manufacturers, jobbers and retailers, club together and see if there could not be a change made to our advantage. I am ready and willing to join the crowd for the following reasons: I this morning received from New York two cases of Locks that cost net per dozen there, \$1.60, and the freight charges were 30 per cent., or just 48 cents per dozen, and three cases of Loose Pin Cast Butts that cost 24 per cent. to get them from New York. Comment on this is not necessary to Hardwaremen. It is simply out of all reason. I deal in Crockery, Lamps, Woodenware, Tinware, &c.,

but at such figures as above the Hardware freights overtop the balance. A remedy is certainly needed for this practice.

The following are our advices from Louisville, Ky., under date November 24:

The Hardware trade of Louisville, Ky., for the past two weeks has been rather quiet, although satisfactory in the main for this season of the year. The extreme wet weather prevailing has seriously interfered with purchasing, especially in the retail departments, and the late, warm fall keeps winter goods from moving.

Bar and Sheet Irons are quiet; so is Barb Wire, with inclinations on the mills part to sell, but not for delivery later than December 15.

Cut Nails have been active for the past ten days. Most Wheeling mills appear to be sold up at low prices for December output. Some are entirely out of the market, and others have advanced prices. The trade looks to the mills to verify their statements that an advance will take place at the meeting next week; certainly there is room for it. The Cut Nail manufacturers would do well to imitate the action of the Wire Nail mills—viz., after loading up the trade, advance prices so as insure the jobbers a fair profit. The manufacturers can ill spare the big jobbing houses through the country; and, in a time like the present, the mills should help them by holding prices up.

The sale of Firearms and Ammunition was never before so brisk, the sporting season accounting for most of this. Shot is very low—selling for less than Bar Lead.

The other day, writes a commercial traveler, I called on an old customer, and that was all the good it did, for the weather was moist, and there were few, if any, people in town who evinced a willingness to buy anything. As it was a few moments to train time, I asked my customer, Mr. B., to go with me to the town of M., which was about ten miles up the road. He finally consented to go, and, leaving his son in charge of the store, we were soon on our way. Arriving at M., we called at the various stove and hardware stores, passing a few hours in a very pleasant manner. Mr. B. was very much interested in observing how the various stores were arranged and in observing how business was carried on. On our way back to his town he appeared to be in the best of spirits, and remarked that the trip had done him a great deal of good and that he had observed ways of doing business that would be of great service to him. We had not been in his store long after our return before he commenced to look around and notice that he was out of a number of articles that he had observed were for sale in the other stores at which we had called, and it was not long before I had received a nice order, just because he had had a chance to see something new or different from his way of doing things. It appears to me that there are many other merchants that could be "invigorated" if they would take a trip now and then to some of the neighboring towns, and call on those in a similar line of business. The interchange of ideas that would be certain to follow would be of great service to both parties. Most every person has an idea that at some time in their lives—when they become able or have time—that they will do some traveling. If this time ever does come, which is doubtful, they will find that traveling, without there is some definite object in view, soon becomes as common as staying at home. The merchant who has become accustomed to a certain amount of work every day is apt to make a poor job of retiring from business; in many cases it is not long before he "retires" from the world.

One who makes it a business to travel about the country most of the time soon learns to observe, and it does not take long before one can tell at a glance what kind of a business a person is doing, by a look at his store. When the stoves are covered with dust, and young mountains of dirt are about each stove leg, it does not look as if it was ever expected those stoves would move. It may take some talent to make a stove look as animated as

a race-horse, even when the latter is standing still; but, if it is impossible to do this, there can be no harm in trying to have the stoves and other goods look as lively as possible. Most merchants in small towns live such monotonous lives that they become more than rusty, and if it were not for the commercial missionaries, they would get so far behind the times that they could never catch up. What the average merchant requires is a little variety or change; it is not necessary that he should join a brass band or a baseball club, but there can be no harm in his taking a trip to some neighboring town now and then, and see how some other people do, and, by profiting by the (good) examples of others, it will not be many years before he has money enough to pay for a trip to Europe.

Co-Operative Buying of Hardware in England.

A good deal of interest has been awakened by the meeting recently held in London under the auspices of the Ironmongers' Association, the object of which was to consider the feasibility of forming an association or syndicate of Hardwaremen for the purpose of securing co-operation in the purchase of goods. The disposition on the part of manufacturers and wholesale houses to sell to consumers at prices approximating those given to the trade, the competition of the co-operative stores, the high prices which, under existing arrangements, retailers were in many cases obliged to pay, and the advantages expected to be secured through the consolidation of orders and the representation of a large number of houses in one buying establishment, were referred to as reasons for effecting such a syndicate. We reproduce below the substance of the address of George Bullmore, Jr., who appears to be the prime mover in the enterprise, which will be of interest to our readers as not only explaining the proposed plan, but also throwing light upon the general condition of the Hardware business in England:

Mr. Bullmore said the idea of improving the position of the retail ironmonger had occupied his mind for a number of years, and he felt strongly upon the points that would be brought before that meeting. He was aware that a scheme to a similar end had been proposed a few years ago, and that it had not been successful, but he believed that the conditions of the trade at present rendered it likely that if the matter should be again taken up success would be assured. In the first place he would remind the meeting that for some time there had been a disposition on the part of retailers to approach the manufacturers with a view to closer relationship than had previously existed. Now, he desired to state that he had no antipathy to either the merchant or the factor, nor did he intend to make a dead set against anybody. The subject under discussion was one which affected them all as individuals, and they had a perfect right to do what was best for their own benefit. He felt it necessary to make this statement, because it had got about that the proposed syndicate, association or company—whatever it might be called—is designed to make a clean sweep of the factor or merchant from off the face of the earth. He had no sympathy with such a sentiment. But what were the facts of the case? Retail traders for years had suffered from the civil service and the army and navy stores, and also from a number of so-called wholesale houses, and in his opinion it was high time that something should be done to protect their interests. The question of the competition set up by the stores he would not deal with, but he would call attention to the action of certain so-called wholesale houses. They issued to carpenters, builders, and others circulars quoting prices for various tools, which would be supplied at certain rates provided £1 worth were taken at one time, and cash paid with the order or on delivery. These lists are kept by the recipients, so that when anything is wanted instead of going to the ironmonger's shop they send direct to the wholesale house. Now, it may be said that the retailer should do the same thing, but to do that means time and money, and either one or both of these essentials cannot always be afforded. Then, not content with dealing direct with users of tools, they had also done business with drapers upon a basis which enabled the draper to offer various articles at a very low rate, against which the retailers could not afford to compete under existing circumstances. It was,

however, necessary to meet that competition, and the question naturally arose how to do it. To his mind the only way was through combination, and he proposed as a basis for discussion that a syndicate should be formed to which a certain capital should be subscribed, and that if the undertaking should be successful a fair interest should be paid to the shareholders, and the balance of the profit be distributed among the purchasers by way of a bonus, according to the business done during the year, because he was strongly of opinion that the arrangement should be established on a mutual basis. As there would be but one house to deal with there would be no necessity to employ travelers, and travelers' expenses, as they all knew, were a heavy item in the accounts of either a manufacturer or a factor. Another point he believed that would commend itself is that they would be able to buy goods and find them to be what they were assumed to be. He knew from experience that in buying from certain houses in certain provincial centers he had found things to be of German make that he believed were of English make. He did not wish to decry all German goods, but if they were sold by the syndicate they would be sold as German, and English goods would have a fair chance. Thus the syndicate would be a guarantee of quality. There were several other features to which he might refer if needful, but he hoped that the advantages which were likely to accrue from the establishment of the syndicate would be sufficient to show that the idea was practicable. He thought it would be admitted that a factor's business is almost of necessity a credit business, and that, therefore, those who buy for cash get little or no benefit from paying on delivery. If the syndicate was formed the cash buyer would get the advantage of his cash dealings, and would not be called upon, as is now the case, to help to pay for the bad debts that are made by factors. Now, having hinted at some of the advantages he desired to refer for a moment to some of the difficulties which opponents of the scheme say will be met with. First, it is declared that the intricacies of buying would be a formidable obstacle in the way of success, but he did not think that that objection was very important. It was well known that private firms were more or less dependent upon their buyers, and he did not see that it would be more difficult for the syndicate to secure the services of good buyers than it was for private firms. A second objection was that it would be impossible to successfully carry out the proposed undertaking without having depots in several large centers in which heavy stocks would have to be carried. For his part, he hoped that the business of the syndicate, if established, would soon involve that necessity, but at the outset it would be sufficient to have one warehouse, say, in London. As to the large stocks, he apprehended that, seeing the purchasers would be spread over a variety of districts, no great loss or inconvenience would be experienced in keeping stocks, because there would be a more or less steady demand for all classes of goods. It was next objected that if the syndicate was formed there would be an end to the privacy of contracts, because A would know what B was doing. This, he thought, was a very weak argument, especially when traders are willing to let directors of a Joint Stock Bank know how their accounts stood. But there would be no reason why A should become acquainted with the transactions of B, for save the directors and auditors no one need know anything about individual accounts. Again, it was objected that the syndicate would be unable to send out travelers. Now, as already remarked, there would be no necessity to send them out. These objections he did not think were important, but there would be difficulties to contend with. It might be taken for granted that some of the trade papers will oppose, and preparation must be made to meet the inevitable in that respect. To meet that opposition they must be strong at the outset, and he did not see that they could take a strong position unless the retail ironmongers take a greater interest in what so immediately concerns them. He knew from experience how difficult it was to get the ironmongers to move, how hard it is to even get a reply to a letter on this or any kindred subject. He felt confident, however, that if we can induce the friends to move in this matter, they ought not to anticipate any less success than that which has attended the Grocers' Association. He said that that association has been successful, notwithstanding the statements made to the contrary, because he held in his hand their balance-sheets, which show not only a good profit, but also a low rate of working expenses. They may not, perhaps, be able to work their syndicate on quite so low a basis; but even assuming it to be double that of the Grocers' Association, they would be successful. He concluded by moving the following resolution: "That this meeting considers that a scheme of co-operative purchasing will be to the advantage of the trade."

In the discussion which followed a number of well-known ironmongers participated, and we give below some of the points which were brought out:

Mr. Grant had a strong belief that retailers, and especially small men, ought to buy cheaper than they did at present, and he believed he was well within the mark when he stated that large buyers bought fully 10 per cent. cheaper than small men. Mr. Portway: If the present proposal was toward the establishment of a general factoring business, then he thought it would be a great mistake. Between the grocery and the ironmongery trades there was no parallel. The former comprised about 20 separate articles, but the latter included 10,000 articles, and it would, he feared, be a most difficult thing to compass the whole of them in one business.

Mr. Weeks, Jr., had some figures which he thought would throw a light upon the system of buying from factors. Certain articles had been purchased from a middleman, the cost of which amounted to £7. 10/. To ascertain what they would cost if purchased from the manufacturer, he put himself in communication with the maker, and found the sum would be £2. 8/6. In another instance a factor charged £5, against the manufacturer's price of £2. 12/6, while in other instances articles obtained through factors were 3/4, 3/8, and 4/, respectively, the maker's prices being 11d., 1/, and 1/2; and still in another case, a set which through the factors cost 2/ could be purchased elsewhere at 11d.

Mr. Tregellis was afraid that to establish a syndicate like that proposed would involve a capital which the present state of the trade would not admit of. He had a strong belief in individuality, and that it would be an unwise thing to curtail it, or even to put such a check upon competition as would tend to reduce the advantages which necessarily pertain to a man of capital and a cash buyer over a buyer who took six months' or even longer credit, and then gave a three or four months' bill.

Mr. Luckin, secretary to the association, remarked that some two or three years ago he found that in various districts ironmongers were co-operating in order to make various purchases. These ironmongers were not of necessity in competition with each other, as perhaps two or three of them might be located in one town and the others in neighboring towns. If the principle of competition was got rid of, he thought it would not matter whether the small buyers were placed on the same basis as the larger buyers. Mr. Cottis complained of not so much the difficulty of buying cheaply, but of getting good quality. He was sorry to have to say it, but he could get goods from America quicker than he could get them from a provincial center. That showed tact on the part of the Americans, and it would be highly advantageous if our English makers would copy the Americans in that respect. There was one other point to which he would refer—viz., assuming the syndicate kept an all-round general stock, he thought it would be an expensive matter to handle and rehandle heavy goods.

The resolution was then put to vote and unanimously carried, when a committee was appointed to propound a scheme which would be submitted to a future meeting. The report of this committee will be awaited with interest.

Commenting on this proposal and the discussion concerning it, the *London Ironmonger* says editorially: •

Some of the speakers made statements respecting the prices charged by factors which were either very far-fetched or revealed remarkable incompetence in buying on the part of many ironmongers. Factors, no doubt, do put on considerable profits here and there, but we think we are correct in stating that there is sufficient competition among the factors themselves to prevent the imposition of anything like the 100 or 150 per cent. profits alluded to at the meeting. In a general way, indeed, there is no room for doubting that factors do their business at 10 to 15 per cent. profit, and it is equally certain that with the very small accounts some of them have their trouble is well worth the rate of profit they get. In saying this we do not sacrifice our fixed idea, that it is better to do business direct with the manufacturers rather than through factors, but as we have no wish to be other than just and straightforward to all concerned, we recognize the fact that in many of the minor departments of the trade the factors have been, are, and probably will be, useful and convenient distributors. If ironmongers submit to exorbitant charges on the part of the factors, then the ironmongers are greatly to blame. They ought to know their own business much better than to pay such charges, and there is no excuse whatever for their not doing

so, seeing that the advertising pages of the *Ironmonger* are at their disposal at all times. The difference between buying well and buying badly is the measure of the success or failure of any business.

Amid the keen competition now existing there is hardly any excuse for an ironmonger who does not buy as well as the sizes of his orders allow him to do. If by co-operating with each other in the purchase of leading lines of goods ironmongers can do better, it is clear that they will be very foolish not to do so. But when they have done that there will be much more to be done. Many of them are content to proceed in old-fashioned ways, and show little or no disposition to move with the times. Many of them still adhere to the worn-out long-credit system both in selling and buying, and then expect to be able to compete with the man who works on a cash basis throughout, and so gets every possible advantage. Many of them have their shops full of old and unsaleable stock, and do not recognize the stern necessity for constantly changing and replacing the goods they offer to the public. Co-operative buying alone will not remedy these faults any more than it will enable ironmongers to meet the competition of such manufacturers as sell direct to the public, or that of the co-operative stores. Briefly, the ironmonger needs to "look all round," and to adapt himself to the changed and ever changing requirements of the times. He cannot afford to sit still, for if he does he is ruined. He must try well and sell well in order to keep abreast of his numerous and energetic rivals. He can do both by going about the business with combined intelligence and industry.

How to Collect.

A correspondent writes as follows: While it may take an artist to sell goods, the person who does the collecting should have a cheek that was made in a brass foundry. When a person buys anything he has to undergo a sort of inner struggle to make up his mind that the article in question is what he wants and something he cannot get along without. After this struggle is over, and the article has been charged, it is as hard to get him to pay as it is to do anything with plaster of paris after it has once set. The writer of the following rules must have been a bright and shining light in the collecting business. Particular attention is called to No. 12.

1. Never give the idea that you call because you happened to be in the neighborhood.
2. Never plead that you are in absolute need of the money.
3. Never explain why you want the money further than by some general phrase, as to meet outstanding bills. The debtor is usually an expert in showing a man how he can get along without money. He will worst you in argument, and if you lose your temper it is an excuse for him why he should not pay.
4. Always be civil, however business-like and importunate you may deem it necessary to be.
5. Never think you have done wrong because a debtor gets angry. His anger under civil treatment shows that he does not intend to pay. This you might as well know early as late.
6. Show quite as firm a resolution to get the money on your tenth call as on any previous one, or else it would have been better if you had not made it.
7. Never leave a debtor without his setting a time when he thinks he can pay, and never fail to be on hand at the time set.
8. As between yourself and an employee, let the most business-like of the two make the dun.
9. Suggest installments. Shame the debtor into an arrangement to pay something every week or month. If not \$10, then \$5, or \$3, or \$1. It will convince him that you have set to work in earnest to get the money.
10. If a debtor get angry, or has worn out your patience, a threat to attach his salary may be effective, not so much that he is likely to fear that you will get the money that way, as that he will be anxious that the affair shall not come to the knowledge of his employer.
11. A similar effect may be produced by saying you intend to place the bill in the hands of a lawyer, particularly if you mention a lawyer whom he hates or who has a reputation for harassing debtors. Professional debtors, however, become careless about legal processes.
12. Drop into a debtor's favorite haunts. It will make him uneasy, especially if you do not hesitate to ask him politely, but plumply, for your money on occasion. This may often happen after he has displayed a roll of bills.

Arrangement of Stores.

H. G. Hall & Son, 155 Beach street, Boston, Mass., send us some suggestions in regard to Hardware-store arrangement, which are represented in the accompanying cuts, Figs. 302 and 303, and also an explanation of their method of making price cards, as indicated in Figs. 304 and 305.

Fig. 302.—Shelving, Price Cards, &c.

Fig. 302 represents shelving with movable ladder and price and sample cards. The projection, 18 inches from the floor in the counter or base on which the shelving rests, will be observed. It is intended to be used as a step, which will be of service in taking goods from the shelves at such points that the ladder is not required. The regular working stock is kept in the shelving, while surplus goods are accommodated on the broad shelf above. Fig. 303 represents

Fig. 303.—Counter for Heavy Goods.

sents a counter for heavy goods. It is the same on both sides, and contains bins which are closed by doors, as indicated, in which the goods can be kept out of the dust. In Figs. 304 and 305 other price cards for Bolts and Thumb Latches are reproduced, and indicate in a general way their method of having ready access to the matter contained thereon. It may be suggestive to our readers, and we shall be gratified if their publication calls out other information in regard to methods adopted for the same purpose.

Contracts Made by Traveling Salesman.

One of the many points of law with which every dealer should be more or less familiar is that relating to contracts made by traveling salesmen, and to what extent the dealer may look for redress in case the contract is violated by the house repre-

sented by the salesman. It may be interesting to lay before our readers a few facts bearing upon this point, which show the law as laid down in the New England States. The article here given is contributed by a writer in the *Grocers and Cannermen's Gazette*, published in Boston:

The contracts made by a traveling salesman in the line of his business are binding upon his principal, though the salesman exceeds his authority. Where he agrees with his customer, in order to secure the trade, as to the mode and time of payment, and forwards his order to the house and the goods are shipped, the agreement is binding upon the principal, unless it can be shown that the customer signed the order, or knew its contents and assented thereto, and the order itself was silent upon the special agreement. The courts in considering cases involving questions of this kind have drawn very fine distinctions, until now it is a short step across the dividing line which separates the valid from the void contracts of agents. These dis-

Fig. 304.—Thumb-Latch Price Card.

tinctions, however, when examined, will be found to rest upon sound reason and good sense, and they should be fixed in the minds of all who have occasion to employ or deal with agents.

The two marked cases in New England, showing the most advanced positions of the courts, upon either side of the dividing line, are *Clough vs. Whitcomb*, decided by the Supreme Judicial Court of Massachusetts in 1870, and *Billings, Taylor & Co. vs. Mason*, decided by the Supreme Judicial Court of Maine, in August, 1888.

Fig. 305.—Price Card for Bolts.

In the former case, Judge Wells, speaking for the full court, said:

It appears by these exceptions that the goods in question were delivered to the defendant by the plaintiff, directly, and not through Clark, the alleged agent. They were so delivered upon written orders, signed by the defendant, addressed to the plaintiff, and giving the description, quantity and prices of the goods desired.

These orders were solicited and forwarded by Clark, who was the plaintiff's agent for that purpose, and was to have a commission upon sales so made. Whether he was authorized to make contracts of sale and to receive payment, or to make agreements as to the mode of payment, was in dispute upon the conflicting testimony of the parties. Unless he had such authority, or was held out by the plaintiff as having such authority, his receipt of or agreement to receive in payment other goods, by way of barter, would not bind the plaintiff, and he may recover for the goods in this action. Upon the face of the orders upon which the goods were delivered, the price is payable in money to the plaintiff.

In the latter case Judge Danforth, speaking for the court, said:

The action is assumpsit upon an account annexed. The defendant admits that he received from the plaintiff the goods charged and makes no question as to the prices. This makes a *prima facie* case against him; and though technically it does not change the burden of proof, it devolves upon him, if he would avoid this responsibility, to give some reason why. The explanation offered by the defendant is that, though he received the goods from the plaintiff, he received them by virtue of an express agreement with an agent or traveling salesman of the plaintiff, one element of which was that certain goods of a like kind, which the defendant then had, should be taken in payment. This agreement with the agent is not questioned, but the answer to it is twofold: (1) that the agent has no authority to make such a contract; and (2) that the contract under which the action is sought to be maintained was made directly with the plaintiff, though in some degree through the instrumentality of the agent.

Assuming, under the first, that the agent had no authority to make the contract he did—and the evidence is quite conclusive upon that point—still it does not change the conceded fact that he not only assumed the authority to do so, but did actually make such a contract. Waiving for the moment the second point raised, this was the only contract having the assent of the defendant, the contract under which he acted and by virtue of which he obtained the goods. It is quite clear that the plaintiff cannot hold him upon a contract he did not make, or repudiate the contract in part and hold the remainder valid.

The second point relied upon by the plaintiff must fall with the first. True, the order for the goods was sent to the principal, presumably by the agent, with the consent of the defendant. But as to the nature of the order received there is a singular absence of testimony, though we have the evidence of the plaintiff's business managers. Whether it was accompanied with a statement of the contract does not appear. It is certain the agent had no authority to send any other, and by no other would the defendant be bound. He had a right to suppose that the plaintiff's own agent would send the order correctly, and that, when he received the goods, they were sent according to the contract. If such were the case, the contract of the agent would be affirmed by the principal in sending the goods. If such were the case, the defendant would certainly be no more bound than the plaintiff who first gave credit to the agent.

We are indebted to Mr. P. Barnes, of Pittsburgh, for a very interesting photograph of a Bessemer converter at the American Iron and Steel Works of Jones & Laughlins, Limited, Pittsburgh. This photograph was taken by the light of the converter. It is very clear and sharp, and vividly reproduces the brilliant scene with which all are familiar who have visited a Bessemer plant at night.

A Duluth dispatch says a syndicate of Pennsylvania railroad capitalists, with a capital of \$6,000,000, has been formed to operate a line of steel boats to run between Duluth and Erie ports. The vessels will be 324 feet long, and will carry 3500 tons cargo. It is supposed that this action is taken to prevent the diversion of traffic caused by existing arrangements between the New York Central and Manitoba Railroad and the Northern Steamship Company. The vessels will be ready for service in the spring of 1890, will be built on the Delaware River, after the Clyde models, and a speed of over 17 miles per hour is guaranteed. The arrangements are said to comprise a large terminal plant in Jersey City.

Enamel Drive-Well Points.

An improvement in well points recently patented, and which is illustrated in the accompanying cuts, is of importance to all of our readers who have anything to do with drive wells. The points are rendered practically rust-proof by being finished in agate enamel; the same article as is used on an important line of kitchen utensils which many of our readers handle. The enamel is so applied as to secure the in-

the cut. The top of the burner is, it will be observed, so constructed as to give a flat surface of sufficient extent to hold the utensil to which the heat is applied. The point is made by the manufacturers that the wire gauze acts as a ventilator to the stove, allowing of no downward draft, so that there will be no flame beneath the gauze, the match being applied and all the flame being above it. The burner is referred to as giving a powerful heat and doing its work efficiently, while at the

Fig. 1.—Agate Enamel Well Point for No. 2 Pump.

closed metal against rust, and accordingly there is no danger of the inlet being choked. According to the circular before us points of this style are estimated to last in cold, wet earth for one or more generations. Among the features in the point, aside from the application of agate enamel, is the space devoted to the gauze strainer. This, we are informed, is greatly in excess in area over that of any other make, and is held apart from the tube sufficiently to let the water filter through its length and width, save only at the soldered margins which are indicated in the engravings. Referring to the engravings, Fig. 2 shows a 30-inch tube with perforations. It is first wound spirally with brass cord, and next wrapped with wire gauze, both being

same time it is neat in appearance and comparatively inexpensive.

Combined Stove-Pipe Thimble and Ventilator.

What is known as Ekstrom's Combined Stove-Pipe Thimble and Ventilator is being introduced by Cheney & Hewlett, 201 Broadway, New York. It is for the purpose of utilizing one flue for both smoke and ventilation purposes. How this is accomplished, is revealed in Figs. 1 to 3, inclusive, of the accompanying illustrations. The stove-pipe passes into the flue in the usual manner. The thimble is cast as a part of the ventilator, and is provided

Fig. 2.—Sectional View Showing Construction of Agate Enamel Well Point.

secured. Outside of all this is the perforated brass plate usual to articles of its class. Fig. 1 represents a 20-inch point suitable for a No. 2 pump. This improvement is the invention of Dr. W. A. Royce, of Newburgh, N. Y. The goods are sold, among others, by the Edward Barr Company, 78 John street, New York, and the Wells Rustless Iron Company, 21 Cliff street, New York. J. Addison Brown, of Riverhead, N. Y., is the local agent for the goods at that place. A letter received from the latter gentleman speaks in enthusiastic terms with reference to the utility and advantages of this improvement.

Gas Burner Stove.

This article is manufactured by Silver & Co., 56 Warren street, New York. It is described as readily attached to any

Gas Burner Stove.

ordinary gas burner, no screwing being required for fixing it in place, the stove being simply put on the burner. It is made with wire gauze, which extends across the top of the cup below the word "Vim" on the iron frame, as shown in

with means for holding the stove-pipe in place. Close inspection of Fig. 1 will reveal two thumb-nuts above the thimble. These are used to tighten a wire loop that extends down under the stove-pipe, and thus holds it in place. Above the stove-

Fig. 1.—Combined Stove-Pipe Thimble and Ventilator.

pipe a ventilator is provided, constructed register fashion, the register being in the form of a door, shown open in Fig. 1. This communicates with a pipe-shaped

part, which extends upward into the flue, and which carries the vitiated air from the room into the chimney flue, discharging it at a point so far above the smoke as to make it impossible for the smoke to return, while at the same time it gives the ascending column a certain degree of impetus.

Fig. 2.—Base or Ceiling Ventilator.

At the upper end of the ventilating duct is a valve which is operated by a bell-crank rod and handle, clearly shown in the figure. By this means it is possible to shut the ventilating draft entirely, when desired, and also avoid the annoyance of dirt com-

Fig. 3.—Kitchen Range Thimble and Ventilator.

ing into the room when anything is being done in the chimney, as, for example, cleaning the flue. Figs. 2 and 3 show modifications of the same general idea. Fig. 2 represents a base or ceiling ventilator constructed upon the same plan, omitting the thimble. This article is adapted for use in buildings where ventilators would be employed, but rendering it possible to utilize the one flue for the double purpose. It may be placed either at the base or ceiling, as desired. Fig. 3 shows the form of the article that is manufactured for kitchen ranges. In this the ventilating part is reduced to openings around the thimble, but, in other respects, the article is essentially the same. The general utility of this device will commend itself to our readers.

Magic Vegetable Parer, Corer, Slicer and Scraper.

The New York Glass Enameling Company, 88 and 90 Chambers street, New York, proprietors of a special method of coloring glass, are about putting on the market a specialty called the Magic vegetable parer, corer, slicer and scraper, which is illustrated herewith. William Cunningham, one of the company, is giv-

plumbers' apprentices. A special instructor will hold classes two evenings in each week for three months. The tuition fee for the season is \$3.

Gwinner's Patent Common Sense Caster.

We illustrate herewith a new caster which is being manufactured and placed on the market by Gwinner, Dowrey & Co.,

upright stem, which plays in a socket back of the axle, thereby preventing a direct thrust downward which would bind the stem and cause it to rotate with difficulty. The extent of oscillation is shown in that part of the caster exhibited in the

ing his attention to putting it on the market through the hardware trade. The special features of this simple implement are shown in the cut, from which it will be seen that it consists of one piece of steel of the form indicated, the ends being bent in opposite directions, so as to give the requisite construction for the purposes for which it is intended. The knives marked A and C are intended for slicing and paring and are adapted for use in either right or left hand. The use of the different parts for scaling fish, scraping vegetables, cutting fruits and vegetables, coring or eyeing fruits and vegetables will readily be inferred. The cut represents it full size. The efficiency with which it does its work, its adaptation to different uses, the ease with which it is kept clean and the very moderate price at which it can be sold are points that are specially mentioned in regard to it.

The Denver Castings Contract.

We are informed by Horace A. Keefer, of Kansas City, Mo., that the contract for castings for the Denver cable railway has been awarded by him to Shoop & Baughman, of the Centropolis Car Works, who are just erecting a large plant at Kansas City. They will commence work by December 15. This is the contract which at one time seemed destined to go to England. Mr. Keefer writes us that the chief reason for not placing the contract in England was because the engineer of the railway, Robert Gillham, did not feel satisfied to have the castings come from there, fearing delay in delivery, and also because he objected to having them inspected abroad. At present Mr. Keefer does not feel at liberty to make any further particulars public regarding this transaction, or the price at which the yokes are to be furnished.

A plumbers' trade school was opened in Philadelphia last week, under the auspices of the Master Plumbers' Association of that city, exclusively for the benefit of

of Hamilton, Ohio. The Reading Hardware Company, 73 Wabash avenue, Chicago, are agents for the sale of this caster west of Buffalo. As will be seen from the cut, this is a two-wheeled caster. It is intended for use on all kinds of furniture,

Gwinner's Patent Common-Sense Caster.

from the smallest center table to the heaviest book cases, &c. Only two screws are required to hold it in place. The caster above the axle consists of three pieces, which are held together without screws or washers, but are so loose as to be capable of rotating and oscillating as the furniture is moved over uneven floors, on extra thicknesses of carpet, &c. The weight of the furniture is thrown on the

more than one-third of its length, and is attached to the frame by a hinged joint, which permits quick operation, as it is not necessary to screw or unscrew the rod the entire length. The facility with which it can be cleaned is also referred to.

Thirty-six deaths have occurred since April 1 among Produce Exchange members who belonged to the gratuity fund.

Beef-Tea Press.

cut. The play allowed in the housing or frame would permit one of the wheels in a No. 7 caster to pass over an obstruction about $\frac{1}{4}$ inch high without difficulty. Seven sizes are made, No. 7 being the largest. The plates are made with long or short stems, the long stem plate requiring no screws to attach it to the furniture. This caster, of all sizes to No. 7, is made with either iron or lignum-vitæ wheels.

The Family Beef Tea Press

This article is put on the market by Silver & Co., 56 Warren street, New York, and embodies, it will be observed, some new features. The point is specially made in regard to it that it is quick in operation, and offered at a low price. It is intended for use for beef tea, meat, jelly, lard, &c. The cup holds a pint. It will be observed that the screw is threaded a little

Noiseless Lightning Sausage-Cutting Machine.

Peter Wilkes, Trenton, N. J., is putting on the market the Noiseless Sausage-Cutting Machine, the construction of which is illustrated in his circular, with a reference to the special features of the machine. Among these are that it is noiseless; that it does not grind or crush, but cuts the meat; that it is neat and compact, taking up little room, and has few parts; that the cover being hinged, the operator is afforded an opportunity to thoroughly clean the bowl and knives without danger of getting cut; that the knives are guaranteed to cut within the thickness of writing paper and not strike the iron; that they are easily taken out and sharpened and as easily adjusted, and that the machine is carefully constructed by skilled workmen and of the best materials. Other details in the construction of the machine are also mentioned and referred to as, with those given above, justifying the confidence of the manufacturer, who is also the patentee, in placing this machine on the market. The machine is made in two sizes. The smaller is described as cutting 50 pounds of pork sausage in two minutes or 50 pounds of beef bologna in three minutes. The larger size has double this capacity.

North's Sash Fastener.

This article is manufactured by North Bros. Mfg. Company, Philadelphia, Pa., under patents August 7, 1887, and March 18, 1888. The appearance of Nos. 40, 41, 60 and 61 is shown in the accompanying illustration, from which it may be inferred its construction is especially simple. It will be seen that the bolt is operated by a lever of sufficient length to be powerful in its action and rendering it easy to draw the sashes firmly into position. The end of the bolt which en-

North's Sash Fastener.

gages with the keeper on the upper sash is made of such a form as to cause it to take hold when the upper sash is slightly below its proper level and to simultaneously raise and draw it close to the other sash, where it is firmly held when the lever is down, as shown in the cut. The manufacturers call attention to the fact that the fastener is very strong and practically unbreakable at the locking point; that it contains neither rivets nor screws to work loose or break; that no part of it projects from the front of the sash to interfere with blinds and screens; that it is easily attached; that it presents a neat appearance, contrasting in this respect favorably with other sash fasteners on the market; and that it has received the approval of architects and builders. It is made in a variety of patterns, of iron and solid bronze.

The Secretary of the Treasury decides that appraisers of imported merchandise must be citizens of the United States,

which ruling will make a change in the practice prevailing at the port of New York.

New Nail Pullers.

The Kansas City Foundry and Machine Company, 606 Wyandotte street, Kansas City, Mo., own the patents and are the

Fig. 1.—The Lightning Nail Puller.

sole manufacturers of the Lightning nail puller and the Noiseless nail puller, illustrated in the accompanying cuts. The Lightning nail puller, for which the Simons Hardware Company, of St. Louis,

Fig. 2.—The Noiseless Nail Puller.

are sole agents, has a malleable iron socket and lever, with jaws made of Jessop's steel. A broken jaw can be replaced at slight cost. It will cut iron bands on boxes or bales, will pull headless nails, and will draw nails from $\frac{1}{4}$ inch below the surface. It is so constructed that driving the jaws into the wood does not cause them to close, hence, a nail below the surface may be gripped as easily as one not driven in below the top of the wood. The Noiseless nail puller is handled by the manufacturers themselves. Its construction is plainly shown in the illustration.

I. V. Williamson, the aged Philadelphia millionaire and philanthropist, has just rounded up a career of usefulness by devoting \$12,000,000 to the founding of a great industrial school for boys, to be known as the Williamson Free School of

Mechanical Trades. The institution will be devoted to the education of white boys, irrespective of race or religion, in the old-fashioned trades. When completed and in operation the school will be endowed with a fund of many millions, the exact sum not known, even to the founder himself, at present.

A New Coke Association.

The recently organized Coke Producers Association held a meeting at the Yough House, Connellsville, Pa., on Thursday, the 22d inst. There was a very fair attendance, a number of firms being represented by proxy. It was decided to lease 1000 cars at once and put them into the trade. The price of coke also came up for discussion, and it was decided to make no change for the present. From present indications an advance of 25 cents per ton will probably be made within the next 60 days. Owing to the lack of a full attendance the election of officers and the formal organization of the association was postponed until the next meeting, which will be held in the near future. The Clinton Works, of B. F. Keister & Co., of 44 ovens, having been sold to the H. C. Frick Company, will not be included in the association, which now stands as follows:

Works.	Owners.	Ovens.
Mammoth	J. W. Moore & Co.	508
Anchor	P. M. M. & S. Co.	100

It is a noteworthy fact that the British steamship Ireland, one of the fastest passenger steamers in the world, uses salt

water in her boilers, jet condensers and 35-pound pressure. There were circumstances which dictated the adoption of this old-fashioned system as the best, one being the practical impossibility of getting in a sufficiently large low-pressure cylinder had compound engines been used.

The elevator capacity at Buffalo is to be enlarged to permit the storage and handling of grain at that port on a scale hitherto impossible.

THE IRON AGE

THURSDAY, DECEMBER 6, 1888.

The Edison Magnetic Separator.

After a series of experiments conducted over a considerable period, T. A. Edison has developed the magnetic separator invented by him into a practical machine. The principle upon which it is based is extremely simple, consisting, as it does, of deflecting by a powerful magnet those particles in a mixture of ore and gangue which are magnetic in their fall by

tograph was taken a number of minor changes have been made without affecting the general design. The ore which is first crushed and screened (this part of the apparatus not being shown in our engraving) is delivered by a bucket elevator into the hopper, shown in part in our engraving. In the bottom of this hopper is a long slit, which can be closed by a sharp-edged casting, balanced by the counterweight shown. Below the hopper is mount-

on either side of the projection to the floor of the line of the slot in the hopper, a slender, movable partition is placed in position on the floor. Now, there exists a narrow zone within which those particles collect which are only very slightly deflected particles of gangue, to which a minute speck of magnetite may adhere. In order to collect this material separately the partition is made in the form of a narrow box, which has been facetiously termed

THE EDISON MAGNETIC IRON ORE SEPARATOR.

its field. The quartz or other gangue falling by the magnet are not affected by its attraction. The particles of magnetite or of magnetic oxide are diverted from the vertical sufficiently to reach the floor at a point considerably removed from that which they would attain in a free fall. Given, then, a thin sheet of ore dropping by a broad magnet, the gangue accumulates immediately below the orifice from which the sheet fell, while the magnetic particles of the ore will be found separated from it. The accompanying engraving, from a photograph of the machine now in place at Edison's laboratory, at Llewellyn Park, N. J., will clearly show how this principle has been carried out. We may state, however, that since the pho-

ed the magnet, a casting weighing 3 tons in this case, around which are wrapped a series of coils of wire. To regulate the power of the magnet, the arrangement provided is shown, by which any desired number of the coils can be arranged in multiple arc or in series. In the apparatus as now modified, this arrangement is put out of the way, being mounted on the top of the magnet instead of at the side. A dynamo furnishes a current of 25 to 30 amperes and 110 volts. Since our engraving was made a hand-wheel and screw have been added to move the magnet forward or backward, as needed, scales being provided to record its exact position. In order to separate more sharply the gangue from the ore as it accumulates

the "mugwump." Lately a scale has been attached to the floor and to the wall, in order to facilitate the recording of the exact position of the "mugwump." Immediately above the magnet is a pipe with a series of perforations, through which jets of air, supplied by a fan, can be projected against the following sheet of material to be concentrated should it be considered desirable to remove the dust from the ore.

Experiments have been made on various ores with the Edison separator. Among those treated being ores from the Port Henry and Chateaugay mines, of the Lake Champlain district, and from the Croton mines in Putnam County, N. Y. The results of the separation have not been checked in every case by chemical analysis, and in

some instances the latter is not completed. We are in a position, through the courtesy of John Birkinbine, of Philadelphia, consulting engineer of T. A. Edison, to place the following data before the readers of *The Iron Age*.

Witherbees, Sherman & Co., of Port Henry, N. Y., have had a number of separations made of two classes of ore which their mines produce—viz., the "New Bed Lean" and the "Old Bed Ore." The former is within the Bessemer limit as to phosphorus, but it is a part of the material mined with the richer ore of the vein. The object of the separation would be to remove the silica, which is present in so large a quantity as to prevent the advantageous shipment of the ore to the furnaces. The following analyses shows that the result is satisfactory, so far as the quality is concerned:

Separation of New Bed Lean Ore, Port Henry.

	Crude ore.	Concentrates.	Tailings.
A. Crushed to 20 mesh.....	Iron.....53.20 Phos.... 0.03	69.90 0.01	7.67 0.08
B. Crushed to 10 mesh.....	Iron.....51.60 Phos.... 0.025	70.00 0.018	7.80 0.41
C. Above 10 mesh.....	Iron.....52.20 Phos.... 0.032	68.80 0.013	18.70 0.085

The Old Bed ore is rich in iron, but it is also high in phosphorus, and the experiments were made to determine to what extent phosphorus can be removed by magnetic separation, that element being present in the ore in the form of crystals of apatite.

Separation of Old Bed Ore, Port Henry.

	Crude ore.	Concentrates.	Tailings.
Iron.....	59.5	69.15	7.10
Phosphorus.....	1.77	0.41	11.08
Iron.....	62.0	70.90	9.25
Phosphorus.....	1.46	0.18	10.54
Iron.....	64.20	71.20	9.00
Phosphorus.....	1.39	0.31	11.57

It will be observed that while a considerable proportion of the phosphorus has been eliminated it is still above the Bessemer limit. When it is considered how quickly a few stray crystals of apatite will affect the result the delicacy of the operation of removing the phosphorus will be appreciated.

The following result was obtained in a test of ore from the waste dump of the Croton mine, Putnam County, N. Y.:

Separation of Croton Ore.

	Crude ore.	Concentrates.	Tailings.
Iron.....	37.97	64.72	11.04
Phosphorus.....	0.38	0.10	0.97

So far as we know the tests thus far have not been carried out by weighing concentrates and tailings produced by running through large quantities. It may be well, however, to call attention to the fact that a high percentage of iron in the tailings does not imply a heavy loss of metal. A simple computation will prove this. Thus, in the case of sample A of Port Henry, New Bed Lean, if there were no waste, the loss of iron represented by tailings carrying 7.67 per cent. would be only 3.86 pounds in 100 pounds of the metal contained in the original ore.

Mr. Edison has not, however, confined himself to magnetites. He has experimented with roasting non-magnetic ores, in order to first convert its oxide into the magnetic oxide, and then putting it through his machine. The possibilities of handling titaniferous ores have also been taken into consideration. One of his machines is now being put up in Michigan, and others have been ordered.

Light, Heat and Power reports that the new holder built by R. D. Wood & Co., of this city, for the Peoples Gas Light and Coke Company, of Chicago, has been finished and accepted by the company. The history of this holder is somewhat peculiar. It has a capacity of about 3,100,000 feet, covers about seven-tenths of an acre, and has been entirely finished within five months of the time it was started. The

contract signed by the builders called for the completion of two-thirds of the holder this month. The builders have delivered the holder fully finished, complete in all details, and in working condition, ten days in advance of the time set for the finishing of the two-thirds. The pressures on this holder are forty-four, sixty-five and and eighty-six tenths, respectively, with air.

The Bartlett Water Supply Scheme.

J. R. Bartlett has addressed to the Commissioners of the Sinking Fund of New York a communication from which we extract the following:

I respectfully call your attention to the great need of this city for an additional supply of water for domestic use, sanitary purposes and for the requirements of commerce and manufactures, and herewith submit for your consideration a proposition to furnish from some sources independent of the Croton water-shed an ample quantity of pure and wholesome water, not less than 50,000,000 gallons daily, or such larger quantity as may be desired to meet these demands, delivered under pressure, into the lower part of the city, from the storage reservoirs and sources of supply of the Society for Establishing Useful Manufactures, of the Lehigh Valley Railroad Company, lessees of the Morris Canal and Banking Company, and of the West Milford Water Storage Company, the Montclair Water Company, and other companies, and from the sources of the Passaic River and tributaries, and from Rockland and Orange Counties in the State of New York, all west of the Hudson River, a region adapted by nature to supply water in ample quantity and of unexceptionable quality, and the reservoirs of the West Milford Water Storage Company and of the Montclair Water Company are situated within convenient reach of New York, and at elevations sufficient to secure the requisite head pressure. The above sources of supply are known to be ample to meet all of the requirements of the cities of Northern New Jersey, and to leave a surplus applicable to your needs. These waters will be conducted in pipes or in a permanently constructed aqueduct to the Jersey City shore of the Hudson River, under which, through a tunnel, the water will be conducted in suitable pipes of ample strength to secure absolute safety, guaranteeing a continuous flow of the waters required under a head pressure of at least 300 feet, delivered at such a point on the west side of the lower part of the city of New York as your honorable board may determine, within three years from date of contract, at the price of \$75 per 1,000,000 gallons, payable quarter-yearly after delivery shall have commenced. In this plan all Interstate questions are avoided, all riparian rights protected, and the waters from the sources mentioned will be in addition to the ample quantities provided for all the cities and towns in New Jersey dependent upon the Passaic watershed for their supplies.

It is difficult, says *Engineering*, to measure the total resistance of a large battery of accumulators owing to the smallness of this resistance and the high electromotive force of the battery. J. D. Dallas has, however, pointed out a method of overcoming these difficulties by coupling up the battery when composed of an odd number of cells, so as to form two batteries, one consisting of $\frac{n+1}{2}$ cells, and the other of $\frac{n-1}{2}$. The resultant electromotive force is then that due to a single cell, and the resistance can easily be determined.

Endless Rope Hoist for Shafts.

At the last meeting of the Engineers Club of Philadelphia, a description was presented by A. H. Storrs of Poore's endless rope hoist for shafts.

This system of hoisting is said to be particularly applicable to shafts of great depth. The advantages claimed are that it enables smaller engines to do the work, and effects a saving, as against the ordinary engines with drums, of about 50 per cent. in the first cost of the plant, and greatly decreases the running expenses, owing to the much smaller steam consumption; the ropes, working altogether in straight lines, should be longer lived; and worn out hoisting ropes can be used for tail ropes; the cages run with less oscillation, the length of the rope is easily adjusted; and there is decreased danger of overwinding. The plant, as put in at the Neilson Colliery of J. Langdon & Co., Inc., consists of a pair of 28 x 60-inch horizontal engines, with a pair of wood-faced rope sheaves and brake wheel, all 14 feet in diameter, placed on the crank shaft. In addition to the regular brake for controlling the engines, an extra brake is provided with which the engineer can clamp the hoisting rope into the grooves of the engine sheaves in case of an emergency, such as the breaking of a rope. The tower head sheaves are 12 feet in diameter.

The hoisting rope is made of special steel, $1\frac{1}{4}$ inch in diameter, with a hemp center, and runs from one cage over the head sheave to one of the engine sheaves, thence to and around a transfer sheave to the other engine sheave, and over the other head sheave to the other cage. The cages are also connected by an $1\frac{1}{4}$ inch iron wire tail rope, running from the bottom of one cage around a small sump sheave at the bottom of the shaft and to the bottom of the other cage. This sump sheave hangs in the bight of the tail rope, and is free to move on vertical guides. The transfer sheave, before mentioned, is a wrought spoke wheel about 16 feet in diameter, so set that it can be moved toward, or away from, the engine sheaves, thus adjusting the length of the rope, and its position is always such that the lines of pull of the ropes are tangents both to itself and to the engine sheaves, thus avoiding any side wear on the grooves or rope. The total hoist is about 1380 feet. The cages weigh 3 tons each and an empty car about $1\frac{1}{4}$ tons. The cars carry from $2\frac{1}{4}$ to 3 tons of coal or rock. The cages, cars and ropes being perfectly balanced, the load in the car and the friction of the machinery is all that the engines have to overcome, and, as this load is constant all through the hoist, a steadier engine speed is obtained than with drums.

A torpedo boat may be pierced in several places at or below the water line, and yet flotation may be secured by moving at a high speed. This has been proved by an interesting experiment tried by the English builders, Messrs. Thornycroft & Co., in a new boat. A hole of $\frac{1}{4}$ inch diameter was made in the side, about 1 foot under water, and when the boat was at rest the water flowed in very rapidly, but when moving at a speed greater than 10 knots per hour a skin of water was drawn over the hole, which resisted any inflow.

A natural gas vein of great power was penetrated on the 26th ult., at a point nine miles northeast of Tuscola, Ill., in the Champaign district. A well, which was being bored for water, had reached a depth of 367 feet, when water and rocks were forced out of it high in the air. A pipe was inserted and the gas ignited, the resulting flame being 30 feet high.

Arch Presses for Sub-Pressing.

The manufacture of the parts of clocks, watches and other similar work by the aid of sub-presses calls for a different construction of press for working the sub-press than that ordinarily used for blanking and punching sheet metal. We illustrate on this page three different sizes of these presses, built by Messrs. Blake & Johnson, of Waterbury, Conn., including one to be worked by foot and two sizes of power presses. The larger of the power presses is designed to cut out, by the aid of the sub-press, pieces similar to clock frames from sheet metal, and make all the apertures of whatever shape that may be required in the frame, at one motion of the plunger, thus accomplishing at one stroke the work which by the old method re-

has prosecuted this work, gradually increasing the depth as the transatlantic vessels have increased in size. From 1873 to 1887 the seagoing trade of Montreal increased from 412,478 tons to 870,773, and it is expected that next year the tonnage will be upward of 1,000,000.

The Ohio River Valley.

The corn crop of the Ohio River Valley this season is one of the largest that was ever produced, and although the heavy rains and high water have injured the quality in some localities, the yield is enormous. The valley producing corn commences about 30 miles above Louisville, Ky., and extends almost uninter-

tracted, the slop is fed to perhaps millions of cattle and hogs. Besides the corn crop of this region, on the Kentucky side is the heaviest producing tobacco district of the West.

Lying in this favored agricultural country, there is no wonder that the cities of Owensboro, Mt. Vernon, Henderson, Evansville and Paducah are flourishing. Evansville and Paducah are contiguous to one of the finest timber sections of the State of Kentucky. The former is the largest hardwood market in the West, and her manufacturing interests are furthered by cheap fuel, for the city and surrounding country are underlaid with coal, which is delivered at 75 cents per ton for steam purposes. Quite a number of well-known foundries and machine shops are located there, besides plow and wagon works.

Fig. 1.—Foot Press.

Figs. 2 and 3.—Power Presses.

ARCH PRESSES FOR SUB-PRESSING, BUILT BY MESSRS. BLAKE & JOHNSON, WATERBURY, CONN.

quired several operations. The smaller power press and the foot press are designed for the smaller parts of watches that are made from sheet metal. These presses are of a form that gives to them great rigidity, which is a very important point in working sub-press. The adjustment of the plunger is accomplished by means of a wedge and screw, the wedge being carried forward or backward by the screw as may be necessary to carry the dies and punches into proper position to do their work. This device works very accurately, and admits of very close adjustment.

Blake & Johnson build eight sizes of the power presses for sub-pressing, ranging in weight from 400 pounds to 4000 pounds.

The official opening of the deepened ship channel from Montreal to Quebec took place recently. A clear water depth of 27½ feet throughout has now been secured, "except at a few points which can be finished by the time of low water next fall." For many years the Government

ruptedly on both sides of the river down to Cairo, Ill., in some places broadening out 10 miles in width on one side. For instance, the Louisville and Nashville Railroad runs on a trestle and embankment from Henderson, Ky., to Evansville, Ind., over a corn field for 10 miles. On the Wabash River, which runs between the States of Illinois and Indiana and empties into the Ohio, is probably the largest body of the great corn-producing lands; here the fields are from 15 to 25 miles wide.

Near this locality, at Mt. Vernon, Ind., is one of Hudnut's grists and hominy mills that grinds 3000 bushels of corn per day. This is supplied by a steady stream of farm wagons, the railroad, and a steamer owned by the mill and employed entirely in transporting the corn crops from up and down the river to the mill. Most of this corn along the valley is manufactured into breadstuff, starch and feed meal, at the different cities, but much of it is consumed by the distilleries of Kentucky and Illinois, where after the spirits are ex-

Henderson has a fine and most successful cotton mill, and has five or six tobacco warehouses used for stemming and packing the leaf for foreign shipment. Paducah is more pretentious. It lies at the junction of the Cumberland and Tennessee rivers with the Ohio, and is the transfer point for cargoes to and from those rivers. Within a few miles of the city, between the Cumberland and Tennessee, lie beds of fine deposits of brown ore, which, together with other attractions, such as cheap fuel, lime rock, shipping facilities, and a bonus from the city, induced St. Louis capital to erect a furnace in the city limits. The Forsman Soft Steel Company is established near by, which, if successful, will take the entire output of the furnace. This process, for which a patent has just been granted, converts any kind of melted iron, regardless of properties, into steel, as it runs from the furnace or cupola, into either castings or ingots for rolling. Already a rail mill is contemplated in connection.

Improved Feed-Grinding Mills.

A few months since we briefly described an improved form of feed-grinding mill made by the Foos Mfg. Company, of Springfield, Ohio. We take special pleasure, therefore, in presenting in this issue engravings which more clearly explain the main features of the design.

Of the illustrations on this page Figs. 1 and 2 show a mill divided at the shaft and the upper part raised, so that the inside can be seen. This is done by simply removing two nuts. The ease of access to the working parts of the mill for examination will be of interest to all considering

The crusher or conveyer on the main shaft is represented at M, and is shown in detail in Fig. 4. The crusher A is cast with a recess in one of the lugs, B, from the inside, into which is dropped the head of a bolt, C, long enough to extend clear through the hub of the running plate head D. It is then fastened securely in place by a nut which is held in place (so it cannot possibly work loose) by one of the company's own nut locks. The crusher is locked to the running head by a tenon on the end of the crusher, engaging with one on the head. Thus the crusher cannot move around on the shaft, nor backward or forward, but is held firmly in place. It

It will sometimes happen, however, that pieces of iron will get into a mill too large to work through the crusher box to the plates, so that before the pin breaker gets an opportunity to act the damage is done. To prevent accidents of this kind a safety bottom is provided. This is shown in Fig. 5. The lower case or main frame A A is cast without any bottom. At the point directly under the crusher B on the shaft is a separate casting or bottom, C, which fits closely and tightly in the space left in the lower case; and this is held in place by a bar or lever, D, hung at each end on bolts E E. These bolts are drawn up so that the bar holds the casting or

GRINDING MILL, BUILT BY THE FOOS MFG. COMPANY, SPRINGFIELD, OHIO.

the purchase of such a machine. The lower case or main frame A of the mill is made in one continuous casting. The legs B B, upon which it rests, and to which it is securely bolted, are heavy castings. The shaft C is of cold-rolled steel, and of ample size in each mill to carry the largest pulleys and belts which may be desired. It runs on three long bearings, D E F, all in the single casting or main frame, so that these bearing are always in line. The journals are all made in half boxes, and can easily be adjusted when any wear occurs. All the bearings are babbitted, and will run for years before wearing out. The fly-wheel, pulley and running head J, K, L, respectively, are each carefully balanced separately before being put on the shaft. The fly-wheel is of special design, and turned on the face and both sides.

can, however, be easily removed if desired. Nuts, bolts or set screws are thus dispensed with inside the crusher-box, and cannot work loose and get into the plates.

While every precaution is taken to guard against pieces of iron or other dangerous material getting into the mill, an accident of this kind may happen. To avoid any serious breakage, therefore, the makers use a pin breaker, which consists of a wooden connecting pin in the yoke holding the temper screw. Any hard substance, as a nail or spike, coming between the plates will break this pin, the yoke and screw will be thrown to one side, thus relieving the pressure on plates, which will separate as shown, and the nail or other article will drop below and can be removed at lower spout. A new pin can be put in the yoke and the mill is again ready for work. This device has proved very efficient.

bottom firmly in place. The bar is sufficiently strong for all kinds of grinding, or any legitimate work, but should any piece of iron or other substance, as shown at G, too hard to grind get into the mill it will cause the bar to break at the point F, where it bears against the bottom (as that is the weakest point), when the casting or bottom will fall out, as shown by dotted lines. No damage is done to the mill, and the casting can be replaced in a moment by using another bar, a number of which are furnished with each mill. The value of these two features will be readily appreciated.

Returning to Fig. 2 we would explain that to the still head N and the running head L are bolted the grinding plates. One set of these are shown in Fig. 3. It will be noticed that the plan is that of gradual reduction. First, there are large

ribs on the running plates, close around the shaft, which lack less than $\frac{1}{4}$ inch of coming in contact with corresponding ribs on the still plate. These ribs engage the grain, small pieces of cob, &c., which have been broken by a breaker, and further reduced by the crusher or conveyer on shaft, and reduce them to small, uniform pieces, so that a large per cent. of the work, fully one-half, is done close to the shaft within a radius of about $2\frac{1}{2}$ to 3 inches. Then come numerous small (A-like figures) A, which stand nearly $\frac{1}{4}$ inch above the surface of the plates. These have sharp edges and cut the small pieces of grain, &c., as they pass from one to the other. Then comes a ring of fine reversed inclines, B B, extending entirely around the outer edge of both running and still plate. These take the grain, now reduced to small, gritty particles, and by rubbing reduce a portion of the product to a soft, floury meal. The metal used for the grinding plates is a special mixture of great hardness. The A-shaped figures, as

are thrown or shoveled into the hopper, and upon the double breakers, the entire length of which engages the ears, keeping them in constant motion or agitation, so they cannot clog or bridge over. The broken pieces of cobs and grain pass to the crusher on the main shaft, where they are still further reduced, as already explained, and conveyed to the plates to be ground to the desired fineness. The large slide is used to regulate amount of crushed cobs to be ground.

Heating Coke Ovens by Natural Gas.

From a recent issue of the *Pittsburgh Times* we take the following:

The experiment of heating coke ovens by natural gas has been tried in the Connellsville region with success. The Central Connellsville Coke Company, supplied by the Southwest Natural Gas Company, has used it for some time and is satisfied with the results. The Walston Company,

ovens which did not work regularly. For a set of, say 100, ovens which were kept in constant fire no lighting apparatus was needed, and, as far as the first drawing is concerned, the $3\frac{1}{2}$ tons per oven which are fit for blast furnaces would not entail any serious loss. The gas-lighting project is a good thing, but too much of a good thing for coke producers with a steady business to indulge in.

The Kansas City Foundry and Machine Company.

The Kansas City Foundry and Machine Company, of Kansas City, Mo., have within the past month opened their new works at Manchester, a manufacturing suburb of Kansas City. They are located in the beautiful Blue Valley, through which pass the Southwestern branch of the Missouri Pacific Railway and the Kansas City and Southern Railway. They are in close proximity to the Kansas City Switch and Frog Works, the new shops of the Cookson Iron Works and the Mid-Continent Boiler Works.

The buildings are constructed wholly of brick, with trussed roofs, and all are one story in height. Twenty men are now employed in the foundry, and about the same number in the machine shop. The machine-shop engine is a center crank, of 35 horse-power, built by T. M. Nagle, of Erie, Pa. The foundry engine is a 20 horse-power upright. The boiler capacity of the works is 130 horse-power, furnishing steam not only for their own purposes, but also for the Cookson Iron Works and the Mid-Continent Boiler Works. The melting capacity of the foundry cupola is 10 tons.

The company was incorporated May 28, 1888, and the buildings were completed August 1. F. B. Ray is president, T. C. Bradley is vice-president, and the foundry department is under the management of George Hurley, for many years foreman of David Creswell's foundry, in Philadelphia. The foundry is adapted to the production of both heavy and light castings, while the machine shop is specially fitted for manufacturing hardware specialties, novelty work, &c. The company are meeting with encouraging success in the demand for their iron, bronze and brass castings, making a specialty of light gray iron castings. They are sole manufacturers of the Lightning nail puller, Noiseless nail puller, and make the Fleming door hanger for the Fleming Door Hanger Company, of Kansas City.

There has been considerable controversy as to whether the Lash open-hearth furnace, which has been giving such excellent results in the Pittsburgh district, where natural gas is used, would work satisfactorily with the dirty producer gas as ordinarily manufactured in Siemens or Wellman gas producers. This question seems to have been fully demonstrated and finally settled to the entire satisfaction of all parties concerned by the results obtained at the works of the Standard Steel Casting Company, at Thurlow, Pa., who have a 20-ton furnace of this type, the gas for which is supplied by four Wellman producers. The items of labor, fuel and repairs are very much less than in the old form of open-hearth furnace, and the many advantages of the Lash furnace that have been demonstrated in working with natural gas as fuel have been carried out in the same degree in the case of producer gas. In a letter lately received by Messrs. Lean & Blair, Pittsburgh, the builders of the furnace, the Standard Steel Casting Company state that the 20-ton Lash steel melting furnace which has been in operation for several months past is giving them good results, and they are satisfied with the working of it on producer gas.

Fig. 5.—Selfy Bottom.

GRINDING MILL, BUILT BY THE FOOS MFG. CO., SPRINGFIELD, OHIO.

will be readily understood, must wear to the surface before becoming useless. The figures are alike on both sides, and when one side is used in grinding, the other side remains untouched, so that when one side becomes worn the mill can be run in the opposite direction, which is merely done by crossing the belt, changing the spout and gear wheel, and the other side of the figures, which are not worn in the least, is used, thus furnishing a fresh, new surface; and as these are used the action of the grain, it is claimed, sharpens the dull side. The plates are thus self-sharpening.

Suitable adjustments are provided for the plates in case of changing them, and for regulating for fine or coarse grinding. These are simple and easily made.

We should refer also to the double breakers with which each mill is fitted. These breakers, which are at the bottom of the feed-hopper of each mill, consist of two intergearing crushers, receiving motion direct from the main shaft by a gear-wheel, causing them to revolve toward each other. These crushers have fingers or lugs which catch the ears of corn and break the cobs in pieces. Directly under these breakers or crushers, and between them and the crusher on the main shaft, is a large slide which can be moved back and forth. The ears of corn

in Jefferson County, also tried the experiment about ten days ago and is satisfied with the results. The theory of the experiment is that by using wood to start the fire time for warming up a cold oven is much longer and the first drawing of coke is of an inferior quality. From the first results of the natural gas experiment, which gives first-class coke on the primary drawing, the idea has gained ground that the natural gas as a kindling will be universally adopted. A number of coke men expressed opinions on the subject yesterday, and the feeling was that the expense of the fixtures would be more than could be repaid by the improved quality of the first drawing. A representative of the H. C. Frick Company said that he knew the first drawing of the ovens lit with wood or coal was of an inferior grade, but that it could be used in blast furnaces. If any one who understood the practical working of ovens would think for a moment, they would see that they might run for two years continually, then perhaps lay off for anywhere from one to six months. Now, a gas fixture that can only be used once in two and one-half years would be rather an encumbrance. Some temporary provision might be made in the shape of a rubber pipe and burner, with fixtures which might be a good thing for

Improved Cable Railway Machinery.

On this and the opposite page we publish engravings of several new designs in the line of cable railway machinery, recently brought out by the Walker Mfg. Company, of Cleveland, Ohio.

A strikingly interesting piece of machinery is the 500 horse-power friction clutch coupling shown in Fig. 1. The outer member of this coupling is a plain, ordinary casting with eight arms and hub on the outside secured to the shaft. The inner member has a boss or center with four bored arms into which are fitted seg-

ments of the spring to force the segments toward the center of the shaft would have to be overcome by the wedges. The coupling is very effective and is doing good service at the Eighteenth Street Power House, in Kansas City, Mo. The sleeve is operated by a yoke and lever with worm and wheel and hand-wheel.

In Fig. 2 is shown a U frame and staggered arm-sheave. The U frame is cast in two pieces, so as to mold easily, and is hollow, with flanges in the center to bolt each half together. It also has ribs inside. The flanges form a backbone to the frame when bolted together. The sides are not

be a very difficult piece of work to turn out, but we understand that the Walker Mfg. Company's system of molding reduces it to quite a simple operation.

Figs. 3 and 4 represent sections of Walker's differential cable drums. They are shown in section so as to illustrate the loose differential rings on which the cable rests while in operation. It has long been known that the destruction to cables has been largely due to the grooves wearing irregularly in the solid drums. Owing to the severe strains to which the first groove on the receiving drum is subjected as a result of the varying loads the wear is

Fig. 1.—500 H.-P. Friction Clutch Coupling.

CABLE RAILWAY MACHINERY, BUILT BY THE WALKER MFG. COMPANY, CLEVELAND, OHIO.

ments with corresponding arms. The arm part of the segments is hollow and has an inner flange on which rests a spring through which a bolt passes and draws the segments toward the center of the shaft. This spring can be adjusted so as to make the segment clear the outer member any desired amount when the coupling is not engaged. There are four wedges at the ends of segments which are forced into position by adjusting screws and toggle levers attached to the sliding sleeve as shown. When these four wedges are forced out, the result is to lift each of the four segments in a direct line with the bore of the four arms and directly in opposition to the spring inside of the segment arm. The spring is adjusted only sufficiently to keep the segments away from the outer member, as any undue pressure

pierced with holes, as is common in such castings, to get the core out when cast in one piece. These holes make such castings quite weak, especially so as the metal forming the outside of the casting is of the greatest strength. The castings are securely bolted together and dowel-pinned before they are bored and fitted for the boxes. The sheave has staggered arms, which insures great rigidity for either horizontal or vertical motion. The principal advantage of the staggered-arm sheave is a uniform casting. As the arms do not come opposite each other, all undue strains, such as occur in straight-arm castings, are dispensed with. A great many of these sheaves have already been made of 8 feet, 10 feet and 12 feet diameter, with uniform success. As the sheave appears from an ordinary standpoint of molding, it would

very excessive on this first groove in comparison with its mates in the old style drum, in which the grooves were turned directly into the solid face of the drum. It is quite evident that after the wear progressed to such an extent as to make a very great difference in the circumference of this first groove and that of its mates it would require either stretching of the cable a given amount in each revolution of the drum equal to the difference in circumference of the smaller and larger grooves or slipping in the groove, either of which would be very detrimental both to the drum and to the cable. The differential drum dispenses entirely with any wear of the grooves or any wear of the cable while on the grooves. The cable enters on the fixed ring on the leading drum, shown in the section Fig. 3, and is

wound into the left-hand ring on the end drum and then back to the second ring on the leading drum, and so forth, putting as many wraps on as may be deemed necessary according to the length of the cable. It will be seen that all the rings in the drums are loose excepting the ring on which the cable is hauled in from the street. Should there accordingly be any inequality in the diameter of the rings, whether in first construction or by subse-

solid grooved drum without slipping of the cable in the grooves. Such slipping will wear the grooves and the cable also. When the cable is at work on the differential drums each wrap between the drums appears like a solid bar of iron, and the impression of the cable is left in the tar at the bottom of rings, which shows conclusively that there is no slipping of the cable in the rings. The latter have a diametrical friction, due to the pressure of

plished without any undue strain on the cable while passing over the drums. The bottom and sides of the rings are thoroughly lubricated by automatic grease cups inserted in the rim of the drums.

These differential drums, we understand, have been thoroughly tested at the 12th and Eighteenth Street Cable Railways, of Kansas City, Mo., and the St. Louis Cable and Western Railway Company, of St. Louis, Mo., where they have been giving

CABLE RAILWAY MACHINERY, BUILT BY THE WALKER MFG. COMPANY, CLEVELAND, OHIO.

quent wear in use, the rings will adjust themselves while the drum is in action, so that there can be no undue strain on any of the wraps of the drums. The rings on which the cable rests move slightly back or forth to suit the irregularities spoken of.

A cable is hauled on the drum under greatly varying loads according to the resistance or number of cars and amount of traffic on the road. From this it will be understood that the cable is wound on the drums tightly or loosely according to the variation of load. While the cable is passing around the drums the tendency is for these to adjust themselves or equalize the strains, which cannot be done on a

the cable in the grooves, transferred to the flat surface of the drum or the underside of the rings. This combined friction of the various loose rings is sufficient, with the leading ring, which is secured, to drive the cable. However, loose side flanges are provided with side studs and a self-registering wrench in order to produce a side friction when necessary. The self-registering wrench will so adjust the studs as to produce an equal amount of friction around the entire circumference of the rings. Each individual ring will move an individual ring with about one-fortieth ($\frac{1}{40}$) of the strength of the cable; the equalizing is thus thoroughly accom-

entire satisfaction. Other plants are being built on which these differential drums will be used.

The New York State Attorney-General, responding to the complaint of Factory Inspector Connolly that manufacturers are neglecting to educate the boys they hire, and that American boys are not being educated to trades in sufficient numbers, is clearly of opinion that a manufacturer can be held legally responsible for neglecting to train a child in mechanics only when that child has been made an apprentice by due forms of law. Otherwise no prosecution would be successful.

The New Burden Horseshoe Machine.

Mr. James A. Burden, president of the Burden Iron Company, of Troy, has just been granted two patents covering his new horseshoe machine, the principal features of which are described by the *Troy Times*:

The result sought to be accomplished by the mechanism shown in these two patents is the production of a finished horseshoe by a series of connected operations performed by a single machine, instead of making the shoe by one machine and finishing it by disconnected and separate operations through the functions of other apparatus. The mechanism illustrated in both the patents alluded to have, in the main, the same function, that of giving to the heated bar from which the shoes are made regular periods of motion and alternating periods of rest. In both constructions, while the bar is moving it is shaped, creased, rough-punched and swaged, and, while at its intermittent periods of rest, it is full-punched by a very ingeniously operating mechanism and is cut off into the required blank lengths. While these two patents provide for the same regular intermittent movement of the heated bar of iron, in one of them the rolls rotate continuously, while in the other the rolls themselves make a half turn as each set of them separately and in continued sequence operates upon the bar to shape, crease and rough-punch its passing blank lengths.

The machines operating the continuously moving rolls have an opposite half of their circular faces upon the latter cut away, so that as the rolls are continuously rotating the opposite halves of the roll faces will engage with the bar to move it a shoe-blank length, and when those parts of each set of rolls where cut away on their circular faces oppositely approach each other in their rotation they will pass over the bar without engaging with it, so that the rolls intermittently engage with the bar to move it a shoe-blank length at each rotation of the rolls. The operation of the shaping rolls in both styles of machines gives the required transversely sectional form to the bar by means of a shaping groove made in one of the rolls, and the plain engaging circular surface of the other of the two shaping rolls. One of the second set of rolls is grooved to receive the bar coming from the shaping rolls, and this groove of the second set of rolls has upwardly projected therefrom blades which press into the bar, at proper distances apart, the creases for the nail holes. From this latter set of rolls the bar passes to the rough-punching rolls, in which one of them is grooved and has punches upwardly projecting from the groove therein, with sinks made in the roller face of the other roll, to come radially opposite the punches as the rolls turn, so that at each rotation of this set of rolls each previously shaped and creased blank-length of the bar is in succession rough-punched for the nail holes at proper distances apart. Thus, as the bar is shaped by one set of rolls, as it is passing through the other two sets of rolls it is successively creased and rough-punched.

The full punching of the previously rough-punched shoe-blank lengths of the bar is accomplished by a very ingenious operation, which is the same in both patents. It will be understood that in doing this full punching the bar is heated, and, being so heated, the tendency is to destroy the punches after a short period of use, as they have to enter the iron and pass out from it, and to be in contact with the heated metal to an extent equal to the thickness of the bar. By Mr. Burden's method the bar as coming from the rough-punching rolls, from the operation of the latter, has nail-head depressions made therein that are conical and elliptically elongated in the direction of the sides of

the bar, which is caused by the entrance and emergence of the radially placed punches, with the metal displaced by the rough punching appearing on the opposite face of the bar as a burr or excrescence; the operation of rough-punching merely putting the nail-holes in a form to be finished punched by a second and connected operation.

While each of the successive blank lengths of the bar enters the full-punching mechanism, and, while the bar is at each of its intermittent periods of rest, the full punches are operated vertically and with great rapidity, to enter the holes previously rough punched, and to as rapidly move away from the bar in return. As the amount of metal to be punched out is very small, the punches are in contact with but little of the heated metal. To further aid the matter there are dies arranged on that face of the bar which is opposite to that at which the punches enter, and these dies have sinks that vertically align with the punches, the edge of the sinks facilitating the operation of the punches in removing the burrs or excrescences formed on the bar from the rough punching.

Mr. Burden, by his entirely new method of punching the blank lengths of the bar, overcomes all of the difficulties encountered by other experimenters, in the fact that in the operation of full-punching the punches have but very little heated metal to come in contact with, and when moving they operate so rapidly there is but little chance of their being injured. To guard against their becoming overheated, as a precaution several sets of punches are arranged so that they can alternately be brought into position. The bar, after these several operations have been completed, passes to the cutting mechanism. From the cutting mechanism the bar passes to the swaging or shaping apparatus, and as soon as the end of the bar has entered the latter, by a rapid movement of the cutting mechanism a proper blank length is cut off and caught by the swaging and shaping apparatus. The swaging or shaping mechanism of the two patents is the same in each of them, and a die wheel having frog-form dies on its circular face is used in both of them. The form of the wheel and its frog-form dies is about the same as in the older machines invented and patented by James A. Burden, although in the two new patents this wheel has a continuous rotation, while in the older machines it was operated with alternating periods of motion and rest.

As this die-wheel rotates, the entering end of the bar is caused when in motion to pass across the face of the revolving die-wheel, and at the same instant the cutting mechanism operates to cut off from the end of the bar one of the previously shaped, creased, rough-punched and full-punched blank lengths, which latter is caught centrally on the toe-end of one of the frog-form dies on the die-wheel, and at the same time as carried around by the latter the bending and swaging levers operate to press the bar in around the frog-form die to give to the blank the requisite form of the shoe. When this has been done another roller provided with sinks, to receive each of the frog-form dies, straightens out and makes laterally true the face of the shoe, so as to remove all buckling or lateral distortion which may have occurred. This straightening out and flattening of the shoe is very ingeniously done by an eccentric face on the sink roller that is made to tangent with the shoe upon the flat base-plate of the frog-form dies, and caused to move with the same speed as the latter by having the gears operating the same, made to differentiate at intervals as to pitch. From the die-wheel the finished shoes are removed as fast as produced and carried away by conveying belts, in the usual manner.

One of the new machines is in process of construction, and some of its parts have been completed. The work will be pushed, and when the new machine is finished its capacity will be tested and other machines will be made and operated at the Burden Iron Works. The new invention will to a great extent revolutionize the manufacture of horseshoes. William E. Hagan was the attorney for Mr. Burden in securing the patent.

This summer a new horseshoe machine was completed by James A. Burden and patented by him. The machine is called the snowshoe machine, because of the style of shoe made by it. Three of these machines are completed and will be in operation in the new building at the Burden iron works in a short time. The capacity of the snowshoe machine is 30 tons of finished shoes a day—24 hours—or 52,000 shoes in round numbers. The aggregate capacity of the three machines will be 90 tons, or 156,000 horseshoes, a day. The machines have been operated in the blacksmith shop pending the completion of the new building, and they fully meet the expectations of the inventor. The new building in which the snowshoe machines are to be operated is practically completed. It is south of the present horseshoe department at the steam mill. The structure is 332 x 62 feet. The brick walls are 18 feet in height, surmounted by an iron truss roof covered with slate. A wing 100 x 60 feet connects the new department with the old horseshoe warehouse. The cost of the new building, with its full complement of machinery—which is partly placed—including a Corliss engine, three horseshoe machines, shearing machines and punching machines, is estimated at \$75,000. The capacity of the Burden Iron Company's works for turning out horseshoes will be greatly increased by the new machines about to be started, and the capacity will be still further increased when the combination machines shall be completed and operated.

Mexican Exports.—According to the *Diario Oficial*, exportations from Mexico to foreign countries during the fiscal year 1887-88 were:

To United States.....	\$31,159,626.66
England.....	10,540,965.23
France.....	4,474,723.31
Germany.....	3,177,106.09
Spain.....	457,842.02
United States of Colombia....	109,956.86
Guatemala.....	34,827.25
Belgium.....	25,583.16
Nicaragua.....	2,500.00
Costa Rica.....	2,107.80
San Salvador.....	490.00
Holland.....	100.00
Italy.....	52.00
Peru.....	25.00

Total.....\$48,885,908.38
Against, in 1886-87.....49,191,950.05

Decrease.....\$306,021.67

Of these exportations the principal ports of Mexico exported—viz.:

Vera Cruz.....	\$16,067,992.84
Paso del Norte (frontier).....	12,022,678.45
Progreso (Yucatan).....	6,468,385.08
Mazatlan.....	4,860,767.51
Laredo (frontier).....	1,215,515.04
Puquian.....	1,004,902.71
Piedras Negras (Eagle Pass).....	874,572.62
Tampico.....	719,789.06
Matamoros.....	441,708.54
Nogales (frontier).....	691,592.95
Ensenada and Tijuana, &c., &c..	116,245.75

The frontier ports show large increase, while nearly all the seaports show large decrease.

A Paterson silk manufacturer failed to deliver a quantity of goods previously contracted for and the defense in court was a strike in the works, which made delivery impossible. Judge Donohue ruled that the strike was not a legal excuse, and this decision was sustained on appeal to the upper court.

Coal Hopper Scale.

An exceedingly convenient and useful apparatus has just been brought out by Messrs. Riehle Brothers, of Philadelphia, Pa., and is shown on this page. It is known as the Drexel Coal Hopper Scale.

The scale has an iron or wooden hopper on it and is so arranged that it can be placed under the pavement or floor, and will accurately weigh the coal that is dumped into the hopper from the wagon or cart. The hopper can be made large enough to carry one, two, three or more tons of coal, and the scale is strong enough to allow the coal to remain on it until it is used. At the bottom of the hopper is a sliding draw plate, which can be opened by the engineer and the coal dropped into

houses where a great deal of coal is consumed, a scale of this kind will be found desirable.

Recent Treasury Decisions.

RAZOR BLANKS DUTIABLE AS RAZORS.

The appellants claimed 2½ cents per pound, or as manufactures of steel at 45 per cent. ad valorem, instead of 50 per cent. assessed. From the special reports of the appraiser on these appeals it appears that the articles in question are razors with blades of regular patterns and with finished handles, and that with the exception of grinding and polishing, they are ready for use. It appears, further, that similar articles were imported in 1886, and were classified as "razors," and that action was

that they were not handled, and which were ascertained to be commercially known as cutlery, were held to be dutiable as cutlery. Department's prior decision, however, of 1873, under which duty was assessed in this case, holds that certain pocket-knife blades are dutiable as manufactures of steel not otherwise provided for, and not as penknives, jackknives or pocket-knives.

It was submitted whether, in view of the appraiser's report and the principles enunciated, these goods are not dutiable as claimed by the appraiser. This would be on the theory that as these blades are known as cutlery, and as pocket-knives are also known as cutlery, therefore, these blades should be assessed with duty at the rate specially provided for pocket-knives. In the opinion of the Department, this conclusion can hardly be accepted, inasmuch as the provisions would not seem to cover articles such as these, which are only parts of pocket-knives which are commercially known and designated as cutlery. Being commercially known as cutlery they are clearly covered by the special provision therefor, as claimed by the appellants.

DUTY ON THUMB TACKS.

Parties having appealed from an assessment of 45 per cent. duty, claiming 2½ cents per pound for cut tacks, the Secretary, affirming the assessment, says: "From the special report of the appraiser submitted it appears that the articles in question consist of thumb-tacks put up in boxes of one-half gross each, with a small steel instrument for pulling up the tacks after being used, and the United States Appraiser at New York, to whom the question was submitted, states that the articles are commercially known as thumb-tacks, which are generally used by artists and others to fasten, by the pressure of the thumb, the drawing paper or other material to a drawing board, and that it is his practice to classify them in accordance with the return made."

The Connellsville Coke Trade.

From present indications there will be no advance in the price of coke during the present month. The question of advancing the price to \$1.50 per ton, to take effect on the 1st inst., was thoroughly discussed by the leading operators, but it was decided that at present such a move would not be advisable. It is the general impression that the price will be advanced to \$1.50 per ton after January 1 next. The production of coke for the month just closed was the largest for the same period in the history of the Connellsville region. The estimated production for the week ending on the 24th ult. was 125,090 tons, and that for the previous week was 125,595 tons. Of the 13,955 ovens in the region 12,250 are in blast.

Within the last few weeks there have been published in the Pittsburgh papers a large number of rumors of coke deals, which, upon investigation, were found to be without truth whatever. The latest of these appeared last week and was to the effect that the McClure Coke Company and the H. C. Frick Coke Company had decided to consolidate their interests, for the purpose of waging war on the smaller operators, with the ultimate intention of driving them out of the business. We are authorized to state that there is no truth in the rumor whatever.

The Detroit Copper and Brass Rolling Mills, at Detroit, Mich., report to us that last week the works turned out the two largest sheets of copper ever rolled in this country. They were ¼ inch thick and 11½ feet square, weighing 3000 pounds each when finished.

COAL HOPPER SCALE, MADE BY MESSRS. RIEHLE BROS., PHILADELPHIA, PA.

an iron car or wheelbarrow and carried to any place desired, whether to a storing bin or direct to boiler. Thus all the coal is received, weighed and moved without any handling, and, as will be readily seen, the device is excellent for guarding against incorrect or careless weighing, and for the economical distribution of coal to the places desired. The scales are made specially strong and accurate, and the levers and weighing parts all regulated to the standard of the United States, so that no dispute can occur upon that point. In case the accuracy of the scales may be questioned, the United States standard weights can be placed upon them and tested. A scale of this kind was placed in the new Hood, Bronbright & Co. building, Eleventh and Market streets, Philadelphia, some time ago, and its value and importance so well proven that one has been located in the new Drexel building, Fifth and Chestnut streets, Philadelphia. For public institutions and large ware-

affirmed by the Department. The decision assessing duty at 45 per cent. ad valorem on the merchandise covered by the present appeals is, therefore, hereby affirmed.

DUTY ON POCKET-KNIFE BLADES.

The appellants claim that pocket blades are dutiable as "cutlery" at the rate of 35 per cent. ad valorem, instead of 45 per cent. ad valorem. The appraiser reports that the merchandise consists of pocket-knife blades fully finished and ready for hafting. He further states that such articles have been commercially known and designated as "cutlery" from the date of their first manufacture, but that being complete pocket-knives, except that they are not handled, they would (but for the decision above cited), be returned for duty under the special provision for pocket-knives at the rate of 50 per cent. ad valorem.

By said decision certain table-knives and forks which were complete, except

Improved Saw Mill.

The Salem Iron Works, of Salem, N. C., are putting on the market an improved saw mill for small power, having been specially designed for farmers—for example, who have a small water or steam power, but do not care to invest in an expensive mill. It is not intended for doing a large lumbering business, or for sawing long and large logs, but for those who want a good, cheap mill for their own use and do not care to saw logs over 8 feet in diameter or 16 feet in length.

The saw frame is made of seasoned long-leaf pine, 4 inches thick by 12 inches deep, well tenoned and bolted together, and is 8 feet wide and 6½ feet long. It has a mandrel 2½ inches diameter by 4½ feet long. The cone pulley gives three changes of feed, ½, ¾ and 1 inch to each revolution of the saw, as may be required to suit the power. The carriage is 37 inches wide and 18 feet long, also made of seasoned long-leaf pine, tenoned and bolted together, having four cross pieces in each 18 feet of carriage. The timber is 4½ inches thick and 6½ inches deep. The head blocks are 3½ feet long. The knees are 19 inches high and open 30 inches from saw. The head blocks and knees weigh about 150 pounds each. The mill will carry any size saw up to 48 inches diameter, and a 6 to 10 horse-power engine and boiler will furnish enough power to do a reasonable amount of sawing.

Each mill is provided with an improved double eccentric friction feed, adjustable mandrel boxes, wedge wheel, long rest, saw guide, and enough improved conical rollers and boxes to go on ways twice the length of carriage.

Dynamite Shells.

In view of the increasing attention which is given to the problem of throwing shells filled with high explosives, the results which have been obtained in this country by Lieut. James W. Graydon, late of the United States Navy, are of considerable interest. Though we have on a previous occasion referred briefly to Lieutenant Graydon's shell, we will here repeat that it is charged with dynamite and is fired out of service guns with ordinary powder. It is well known that dynamite may be exploded by a sudden concussion, and that, if it be substituted for the ordinary powder in a shell, there is a great chance of the gun being blown to pieces before the projectile can leave the muzzle. Lieutenant Graydon eludes this disposition of dynamite to explode prematurely by dividing the charge into a large number of small packets or pellets, each inclosed in an envelope of impermeable material. To still further isolate the contents of the packets, the interior of the shell is lined with a non-conducting substance, such as asbestos, and is divided into compartments by partitions. The result of the arrangement is that the nitroglycerine cannot separate from the solid matter with which it is associated, or become more concentrated in one part of it than in another; the shock of the propelling charge is also modified before it reaches the explosive, the envelopes constituting an elastic cushion which softens the blow.

The shell is provided with a percussion fuze, but to delay the explosion until the projectile has penetrated deeply into the object, against which it is aimed, the striker is seated upon a stiff spring of some length. This spring has to be fully compressed before the percussion powder is ignited, thus affording a minute fraction of time between the impact and the explosion. In this brief interval the shell can bury itself more or less deeply, bring-

ing its disruptive action to bear within the actual substance of the target. From experiments made by officers of the United States army and navy, it would appear that the method of filling shells is perfectly effectual, at least we read of no failures in the reports rendered by them to their Government. The plan is certainly simplicity itself, and, while it guards the dynamite against premature explosion,

be used with perfect safety in any gun in the service, and they all joined in recommending further experiments with the 8-inch rifle and the 15-inch smooth-bore gun.

Later trials made with a 7-inch rifle gave further highly satisfactory results. One European nation, at least, has decided that the Graydon shell is a very valuable invention. The French Government have

IMPROVED SAW MILL, BUILT BY THE SALEM IRON WORKS, SALEM, N. C.

does not seem to reduce its shattering action when it is ignited by the fuze. Three sets of trials have been made of the Graydon shells by or in the presence of United States officers. They reported that, in their opinion, Lieutenant Graydon's claim to have invented a process of so charging a shell with dynamite that it can be fired from a gun in service, with the service charge of powder, had been fully demonstrated as far as the 4½-inch gun was concerned. Two of the officers were convinced that the invention could

purchased the patent rights for their own country for the sum of \$500,000.

It is stated that the management of the Delaware, Lackawanna and Western have decided to cease using 42-inch paper wheels under their passenger equipment, and adopt the 36-inch wheel as their standard. The reason assigned is that with the 42-inch wheels they experience a good deal of trouble from the springing of axles. Their passenger car-wheels in the future will be steel tired.

An Experimental Engine for Technical Schools.

In the course of an extensive article on the Central Institution of the city and Guilds of London Technical Institute, *Engineering* describes and illustrates the experimental steam engine used in the engineering department. It appears from this that the following conditions to be fulfilled were laid down by Prof. W. C. Unwin, the director, in applying for tenders:

1. The engine must be capable of being worked as a compound expansive engine, the steam being condensed in a surface condenser.
2. Either cylinder or both cylinders together must be capable of being used as a non-condensing expansion engine.
3. With one cylinder working and without condensing it must indicate 30 indicated horse-power, with a boiler pressure of 60 pounds per square inch.
4. The steam must at will be admitted to or stopped off from the jackets of either cylinder. The condensed steam from the jackets must drain to a point where it can be drawn off for measurement.
5. The cut-off in each cylinder must be capable of being varied by hand from 20 per cent. to 60 per cent. of the stroke at least.
6. The clearance of the ends of the cylinders should be capable of being varied.
7. The intermediate reservoir between the cylinders should be as small as possible, but capable of being enlarged by a volume equal to twice the volume of the high-pressure cylinder.
8. The governor must be arranged to act on a throttle valve on the main steam-pipe. If it could also be arranged to act on an automatic cut-off to one of the cylinders it would be advantageous. Of course, when acting on the valve gear the throttle valve would be set wide open.
9. The cranks of the two cylinders must be capable of being set at right angles at 180°, and at least two other relative positions.
10. The condenser must be arranged to drain the cylinder, and the condenser and air pump must be so placed that the discharge of condensing water and of condensed steam can be delivered above the floor so as to be conveniently measured. It is very important that there should be no leakage of condensing water into the steam space of the condenser.
11. Indicator cocks are to be fitted to each end of each cylinder, and separate gear for working the indicator is to be provided for each engine. Provision to be made for attaching an indicator to the air and circulating pumps and to the intermediate steam reservoir.

The design and tender of Messrs. Marshall, Sons & Co., Limited, of Gainsborough, was finally accepted. The arrangement adopted was that of two ordinary horizontal engines placed side by side and working the same crankshaft. The high-pressure cylinder is 8½ inches in diameter, and the low-pressure 14 inches in diameter, the stroke in each case being 21 inches. With the exception of the front covers, the cylinders have jackets all over which drain through a steam trap into a graduated tank below the floor level. Each end of each cylinder has a vertical port, which is closed by a blank flange when the engine is at work. The flange is cast with a flat plate which more or less completely fills up the port. A number of these flanges with displacing plates of different dimensions are provided so that the clearance of the engine can be varied within somewhat wide limits. Steam can be shut off from either cylinder at will, and either engine worked independently by uncoupling the connecting and eccentric rods of the other. The governing of

the engine is effected by an automatic expansion gear, in the case of the high-pressure cylinder, and by a throttle-valve in the case of the low-pressure. The throttle-valve is of the Cornish equilibrium type, fitted in the same casting as the steam stop-valve to the low-pressure cylinder. In order to be in a position to make experiments on the effect of varying the angle between the cranks, the crankshaft has been made in halves, which are connected together by a flanged sleeve. The coupling on the high-pressure side is made with six bolts, and on the low-pressure by seven, so that the cranks can be placed at 42 different angles. A rope-driving pulley has been fitted on this sleeve. In the design of the surface-condenser every precaution has been taken with the object of making it absolutely steam-tight. This point is of the utmost importance for scientific purposes, as a comparatively slight leakage may seriously affect the correct interpretation of the indicator diagrams. The circulating water enters the condenser at the top, flows down the central pipes, and up through the spaces between the inner and outer tubes, and is finally discharged into a measuring tank. The steam, of course, flows round the outer tubes. As all the joints between the tubes and the tube-plates can in this design be made by expanding the tubes, perfect tightness is secured. The air-pump discharges into a calibrated tank, and when this is full the discharge can be turned into another similar tank, while the first is emptied by opening a valve. The discharge from the circulating pump passes into another tank, and thence through a series of baffle-plates of wire gauze out through a carefully calibrated orifice, the head over which is measured by the reading of a scale carried by a float in the tank. The advantage of this method over the plan of discharging over a weir is that small errors in the determination of the head over the orifice do not affect the result to so great a degree. All these tanks are supported on the wooden stand, and each is fitted with an accurate thermometer.

The brake dynamometer is of the internally cooled type, the distinctive feature of which is that the brake-wheel rim is made trough-shaped, and into this trough a constant supply of water is introduced on one side of the wheel and skimmed off by another pipe on the other side of the wheel as it gets hot. It is intended to take 50 horse-power, but could probably absorb considerably more. The compensated gear is fitted with a spring balance, and allowance is made for the reading of this in estimating the brake horse-power. The break shaft is driven by a link from the low-pressure crank-pin, and can be entirely disconnected from the engine when not in use. The engine can be worked, as (1) compound condensing; (2) compound and non-condensing; (3) high-pressure engine only and non-condensing; (4) both engines with high-pressure steam and non-condensing; (5) low-pressure engine only and non-condensing; (6) low-pressure engine only and non-condensing.

Lean & Blair, of Pittsburgh, inform us that they have closed a contract with the Union Rolling Mill Company, of Cleveland, Ohio, for the remodeling of their blast-furnace plant, including the erection of two of their Ford & Moncur hot-blast stoves. These two stoves are to blow a furnace of 200 tons daily capacity, and it is claimed that the blast for two of the largest modern blast furnaces can easily be heated with three of these stoves, and kept at an absolutely even temperature throughout the blow, and the stoves kept perfectly clean for all time. If these claims, which are backed up by letters from many of the most prominent British iron masters who have these stoves in use,

can be substantiated, a most valuable step in the right direction has undoubtedly been made. We hope to give our readers further information on this point before long, after these stoves and those now in course of erection at Talladega, Ala., have been blown in.

Southern Pig Iron Freights.—The Queen and Crescent route via the Alabama, Great Southern and the Cincinnati Southern Railway have issued a new pig iron tariff which went into effect on the 1st of December. It shows a reduction of 20 cents a ton. The rate to Chicago is \$3.70 from Dayton and Rockwood, \$3.90 from Chattanooga, \$4.15 from Rising Fawn, Attalla, Bessemer, Birmingham, Gadsden and Wheeling, Ala.; \$3.90 from Florence and Sheffield, \$4.40 from Anniston, Clifton, Ironaton and Jenifer, Ala. To Cleveland the rates are 25 cents less than these. To Cincinnati the figures are: From Dayton and Rockwood, \$2.20; Chattanooga, \$2.40; Rising Fawn, \$2.65; Attalla, Bessemer, Birmingham and Wheeling, Ala., \$2.90, and Florence and Sheffield, \$2.65. The Kansas City rate is \$5.78 from Dayton and Rockwood and \$5.98 from the other furnaces. The St. Louis rates are \$2.95 from Rockwood and Dayton, and \$3.15 from Chattanooga, and \$3.40 for the Birmingham district.

A Buffalo man claims to have solved the problem of "harnessing" the Niagara River, for which Buffalo business men have offered a reward of \$100,000. A model of the invention exhibited in the Board of Trade shows two massive piers on each bank of the river. Heavy shafts stand up obliquely by the piers. At the bottom of the shafts an endless belt runs from shaft to shaft across the river, made of two strands of 2-inch cable. Fitted to this cable every 5 or 6 feet are sheet-iron plates, 3 x 5 feet, pivoted at one end, opening either way, but chained so that they open but a short distance. The full force of the current pressing on these plates forces the belt around at a great rate, and by ingenious arrangements the current is felt equally both going and coming. The shafts revolving drive a cable and furnish power on the banks. The inventor, Mr. Edward Suckrow, figures that 16,000 horse-power can be secured in this way.

Joseph Colby, of Milwaukee, has been elected treasurer of the Penokee and Gogebic Development Company, which owns the famous Colby mine, as also the Ashland and Tilden, on the Gogebic range. When the Colby mine was opened three years ago it was leased to Mather, Morse & Co., of Cleveland, for three years. The lease expired November 1, and the Development Company will now work it themselves. Pickands, Mather & Co. will handle the ore. Mr. Colby said in a recent interview that there had been about 750,000 tons of ore taken from the Colby, and that this amount had been taken from an area of about 20 acres. Capt. William Dickinson, an experienced mining man, has taken the superintendency of the Colby. The lessees of the mine, Mather, Morse & Co., left the mine in good working order, and work will be commenced without any delay. Mr. Colby says that there are a number of other properties on the Gogebic range that were closed when the collapse came that it will pay to invest money in, as soon as they can be gotten out from under the present burdens of litigation.

The first cotton mill erected in Iowa was put in operation at Des Moines on the 26th ult., with interesting ceremonies. The factory has a daily capacity of 10,000 yards.

Compressed Air for Power Transmission.

Prof. W. C. Unwin recently contributed to the transactions of the British Institute of Civil Engineers a paper on conveying power by compressed air, with the aim of stating in a simple form the laws governing such power transmission. From it we quote as follows:

In examining some of the calculations on which schemes for using compressed air have been based it appeared that they were unnecessarily tentative and cumbrous. In one not unimportant respect calculations about the transmission of power by air appeared to be based on a wrong principle. By analogy with the transmission of power by water it has been tacitly assumed that the frictional work in the mains is entirely wasted work. But with air it is not so. Under practically realizable conditions the whole of the frictional work in the mains may be expended in heating and expanding the air. What the air loses in pressure it gains in volume. The fall of pressure does involve a loss in transmission, because the efficiency of the pump or of the motor is affected. But in spite of this secondary loss an advantage remains to the air, and part of the frictional work is recovered.

After many years of experience the system of hydraulic transmission has been carried to a high degree of perfection, and the conditions of success are well understood. To transmit power economically and efficiently by water a very high pressure must be adopted, and a moderate velocity in the mains. That moderate velocity in the mains is dictated not only by considerations of friction, but also more imperatively by the necessity of limiting the stresses due to the inertia of the incompressible mass of water in the mains when the velocity changes. The whole mass of water in the mains must change velocity simultaneously, and hence the shocks due to sudden changes of velocity are very serious. Now both the high pressure and the low velocity limit the size of mains which can be used, and therefore the amount of power which can be transmitted.

Systems for transmitting power by compressed air are not as yet so completely worked out, nor are the conditions of economy and efficiency so well understood. The unavoidable heating losses in compression limit the pressures which can be used in air transmission, and it is doubtful if in any case efficiencies quite so great as those attained with water can be realized with air. Nevertheless there are cases where the moderate pressures used in air transmission are far more convenient than the high pressures required for water transmission, and there appears to be no definite limit to the size of the main which can be used, or the amount of power which can be transmitted, if necessary, by air. For three reasons the velocity of flow in the mains may be very much greater with air than with water. The friction in the mains is less with air than with water in the ratio of their densities. The frictional work is less an evil with air than with water, because part of that frictional work is recoverable. Lastly, the elasticity and small density of the air makes the danger of shocks or inertia stresses to practically vanish. Water can only afford work less than the product of its pressure and volume, but air used expansively gives an amount of work greater than the product of its pressure and volume. Hence it turns out that with a given size of main a considerably greater amount of power can be transmitted with air of moderate pressure than with water of very great pressure.

As the air flows along the main the resistance of the surface of the main has to be overcome and the pressure falls. In

correspondence with this the volume of the air and its velocity increases, and it is necessary to know the law of expansion. The work expended in friction in the pipe generates heat, and if all this heat is retained in the air then the expansion would be exactly isothermal. Thus, in a perfectly non-conducting main the temperature must remain constant, however rough the main and however great the fall of pressure due to frictional resistance. Actual mains are not non-conducting, and, no doubt, if air entered the main at a higher temperature than the surrounding soil, some heat must be lost by conduction. If, however, as has been assumed, the air enters the main at 60°, which may be taken to be practically the temperature of the soil, no heat can be lost by conduction. The main is for air at that temperature incapable of conducting away heat, and the expansion in the main must be isothermal.

It follows from this that there is an essential difference between the transmission of power by water and the transmission by air. In the former case the frictional work in the main is wasted and lost. The heat produced in the water does in no way add to the effective work of the motor driven by the water. But with air the heat generated expands the air, and the air does more work in the motor in consequence of its expansion. However long or rough the main the energy of the air per pound remains constant. To the extent to which the pressure falls the air may be less serviceable in doing work in actual motors. But this does not destroy the advantage of air in transmission, though it may reduce it.

The project of a trip of the American engineering societies for a joint visit to Europe is beginning to take tangible form. E. N. Carbutt, president of the Institution of Mechanical Engineers, of London, has tendered an invitation to the American Society of Mechanical Engineers, and the latter have now issued a preliminary circular asking members of the three societies, the Civil, Mechanical and Mining Engineers, to inform the committee, W. R. Hutton and W. R. Wiley, whether they can attend.

The Chicago, Rock Island and Pacific Railway have issued a circular calling the attention of shippers to the completion into Colorado of the lines of their Western extension, the Chicago, Kansas and Nebraska Railway. A new route has been formed to Denver, Colorado Springs and Pueblo from Chicago, without transfer. A fast through freight service has already been inaugurated, while the passenger facilities provided over the new line are of the very best character. A New Joint Through Freight Tariff, comprising a pamphlet of 121 pages, which took effect on November 10, has just been issued. This tariff, besides showing through rates to the West from Chicago, presents a basis upon which through rates may be figured from points on the Atlantic seaboard and also from the manufacturing centers in Indiana, Michigan and Ohio, as well as other sections of the Middle and Western States. Freight from the East is delivered to the company at Chicago, outside the city limits, thus avoiding the delays and annoyances from the transfer of freight through the crowded Chicago yards.

In a recent article entitled "Dynamical Terminology," commenting on the rapid multiplication of new dynamical units, such as the "kine," the "bole," and the "barad," the London *Engineer* very appropriately says: "The world has for some time been acquainted with the erg, the velo, the cello, and other words of cognate

import. We may say, for the benefit of our younger readers, that engineers never use these words; but it does not follow, therefore, that they are useless or inappropriate. In the first place, certain minds find an innocent pleasure in inventing such terms, and it is so seldom that we find the physicist inventing anything that we should be slow to step in and try to put a check on his efforts. Indeed, we should not criticise boles, barads, and ergs, in any way, were it not that time may unfortunately be spent to little purpose by engineer students in learning how to use them, and the student has so much of importance and value to learn that every hour is an object."

The question whether the pressure of a saturated vapor is the same in a vacuum as in the presence of a gas is still a disputed one. Regnault attributed the differences observed by him to secondary causes, such as the deposition of condensed vapor on the walls of the containing vessel. Mr. F. Braun describes a series of careful experiments on sulphurous anhydride, from the results of which he arrives at the conclusion that the pressure of this vapor at the temperature of condensation is diminished by at least 3.0 mm. of mercury by the addition of an equal volume of carbonic anhydride at the same pressure and temperature, and by 1.8 mm. by the addition of an equal volume of nitrogen under similar circumstances. He infers in general that the pressure of a saturated vapor is not the same in the presence of a gas as in a vacuum, even when all disturbing causes are absent. The question is of importance in relation to the dissociation of gases, and up to the present it has not been found possible to decide it on theoretical grounds.

The December stock sheet of Joseph T. Ryerson & Son, of Chicago, contains some special features in connection with steel plates which are worthy of notice. Inasmuch as many boiler-makers use for flanging purposes any steel that they find capable of standing flanging tests, even though it was put on the market as tank steel, this firm have determined to make an effort to fix a standard of quality under which flanging steel may be sold with a full knowledge of its character. They have, therefore, had their Juniata flange steel made to conform to the United States Government requirements for marine boilers. Plates from the mill will be furnished when wanted, with coupons or test pieces attached for testing. This new departure will be appreciated by a large class of boiler-makers as well as boiler users. The stock sheet just issued contains a large addition of odd sizes not frequently carried in stock by plate merchants.

The Stonefield and Factory Iron Works, Bilston, Staffordshire, England, the property of the executors of the late Joseph Sankey, and for upward of a quarter of a century carried on by the Bilston Iron Company, have been leased to William Molineaux, who will carry them on in conjunction with Edward Jordan, and will trade under the old style of the Bilston Iron Company. The new firm have also purchased the good will and brand of the old firm, and will immediately put the works in operation, and continue to supply the White Swan brand of sheet iron. The works stand on about eight acres, and comprise five sheet mills, 17 puddling furnaces, and all the necessary plant for the manufacture of galvanizing, working up and other sheets. A steam hammer will at once be put in, and a railway siding is being arranged for. The negotiations have been conducted by Mr. John E. Perry, of Wolverhampton, England.

THE WEEK.

The new building for the Progress Club, to be erected on Fifth avenue and Sixty-third street will cost \$500,000. The architectural plans are those of Alfred Zucker & Co. The material used in the *façade* will be fawn-colored brick, terracotta and gray rock, with ornamental iron-work for balcony, railings and window guards.

A trades school for colored boys is about to be established in Philadelphia under the auspices of the Institute for Colored Youth, which has about 300 pupils. A large three-story brick building will be erected and fitted up with all necessary tools and appliances.

President Diaz, newly elected as chief executive of the Mexican Republic, has entered upon a new term of official existence, and important results from the standpoint of trade and industrial enterprise are predicted for his administration. He proposes to carry forward to a successful issue two great undertakings—one, the drainage of the valley of Mexico, and the other the building of a railway line to connect the national capital with the rich State of Oaxaca. Together, these projects are expected to absorb some \$40,000,000, and, as the President and General Pacheco, the Minister of Public Works, are both exceedingly friendly to citizens of the United States, contractors outside of the Mexican republic will watch developments with special interest.

By the decision of the Court of Appeals at Albany Cornell University is deprived of \$1,500,000 willed to it by Jennie McGraw-Fiske, wife of Professor Fiske and heiress of the McGraw estate. The decision is based on the fact that Cornell University was limited by its charter to property possessions not exceeding \$3,000,000, and that it had that amount before the bequest of Mrs. Fiske. The decision does not determine the future distribution of the money.

It is reported in Chicago that an agreement has been made by representatives of Western and Southwestern roads to form a railroad clearing house, which is another name for a "trust." It is believed, however, that the trust or clearing-house plan is in conflict with the Interstate law, as it is nothing more or less than a pooling of all the railroad interests in the West.

The Common Council of Reading, Pa., has passed an ordinance making it unlawful for any contractor on public works, such as sewers, reservoirs, public buildings and the like to employ any but citizens of the United States. It is said that the ordinance emanates from labor organizations in Reading, and that it is part of a concerted effort to be made in all the leading cities to put a stop to the importation of foreign contract labor.

The old material of the Great Eastern realized \$290,000, thus disproving the old maxim that a live jackass is worth more than a dead lion.

A powerful new labor organization, to deal with political questions, is said to be in course of formation in Pittsburgh, under the lead of John Jarrett, Charles Litchman and others who do not precisely agree with the methods of Mr. Powderly. Thomas Barry, ex-K. of L., has still another scheme in embryo.

The Emperor of Brazil is contemplating large railway projects and offers valuable concessions to any syndicate prepared to enter into engagements for construction.

The jute bagging trust is said to be falling to pieces, owing to the shrinkage in sales. There are, in all, 24 bagging factor-

ies in the United States, and of these 16 are shut down, having been leased by the "combine" and closed to lessen the production and to stiffen prices. The first day of January these leases expire, and the 16 factories are ready to start up again unless once more leased by the trust, for which thus far there has been no arrangement made.

The new court house at Evansville, Ind., just commenced, will be a thoroughly fire-proof structure, costing \$500,000.

Commercial travelers are endeavoring to have the Interstate Law amended so as to permit concessions by railroad companies in favor of recognized merchant drummers.

Pittsburgh glass manufacturers have received an order for 1000 boxes of lamp chimneys for China, equal to 6000 dozen.

Commodore Walker, Chief of the Bureau of Navigation, says: "It is a matter of national satisfaction that it has fallen to the United States to take the initial steps which it may be confidently hoped will lead to a codification of the rules of navigation, and thereby promote immeasurably the safety of ships at sea."

It is stated from Washington that there is a great deal of influence being exerted to bring about a special session of Congress to authorize the admission of the Territories as States, and to begin the work of tariff revision.

The street railway service in the city of Mexico is to be done by American locomotives similar to those on the New York elevated roads.

A Bradford, Pa., correspondent makes the statement that the great oil fields of that State are being rapidly and surely exhausted. Hundreds of wells are being drilled, with indifferent success. The writer says: "If none of the 500 wells now drilling find a rich spot, the Ohio fields must become the center of the great petroleum industry, and Ohio oil is pretty sure to take its place as an illuminant as well as the fuel of the future. The Ohio field exceeds in area any field yet found in the world, and its possible daily yield is placed by practical men as high as 100,000 barrels a day. The work of removing the monster iron tanks from the Pennsylvania fields into the Lima district still goes on. A dozen crews of men are at work every day cutting down the empty tankage in the Bradford district, all of it being intended for Ohio. The amount of oil now held in iron tanks in the Ohio field exceeds 9,000,000 barrels."

Russia for some months past has been attempting to effect a national loan in the European markets, without success, the object being ostensibly to prosecute railway enterprises and systems of internal improvement, but her ultimate purpose is believed to be to push her territorial claims in the direction of India. A prominent New York broker is reported as saying that the Rothschilds had first been offered the loan or any part of it, but the offer was promptly declined, and overtures to two well-known English houses resulted in like manner. "Something was then decided upon," the account runs, "which was decidedly out of the usual run of financial operations. The New York banker received a letter from his correspondent in Berlin, telling him of the difficulties experienced by the Russians in the European money markets, and asking him if he thought he could do anything with the bonds in this country. He at once returned word that there was no hope of such a thing. Then he explained why there was not. He said it was true that money was very low in this country, and that there was plenty of it, but that the peculiarity of the American investor was

that he wanted to see something tangible in which he was to invest. There were plenty of chances in the American markets for investments—chances, too, where the element of risk was reduced to the minimum, and it was in such, and such alone, that American money would find its natural outlet. Unless the rate of interest on the Russian bonds was equivalent to 7 per cent., and based upon some surer foundation than other loans to that Government had been, there was no chance of raising \$1,000,000 in the United States. A reply to this letter was that the highest proposed rate of interest was 5 per cent. Thereupon negotiations were declared closed." The prediction is made in Wall street that within three months Russian bonds bearing interest of 7 and 8 per cent. will be offered in the money markets of the world, with no takers, and that the country will find itself in a very perplexing situation.

The fact that the leaves of pine trees can be manufactured into bagging, and compete successfully with jute for baling cotton, is information of inestimable value to all who are engaged in cotton growing in the South. There are other uses also for which pine leaves may be used, such as the manufacture of paper pulp, pine wool for stuffing mattresses and pillows, quilts, upholstering furniture and a hundred other things unthought of at present.

A number of the Southside glass manufacturers in Pittsburgh are in revolt against the alleged extortionate prices of natural gas, and are combining to establish an independent gas company to make their own fuel. Manufacturers who paid \$700 a month last year now have to pay \$900, \$1000 or even more than that per month in some cases.

The Commissioner of Internal Revenue has made an elaborate report, showing that the total receipts for the fiscal year were \$124,326,475, an increase of \$5,489,174 over the receipts of any year since 1883, when the receipts aggregated \$144,553,345. The receipts for the year were also \$4,326,475 more than the estimate. The estimated receipts for the current fiscal year are \$125,000,000, provided no changes are made in the existing rates of taxation. The cost of collection of internal taxes for the year was \$3,978,288, being less than 3.2 per cent. of the amount collected.

The scourge was driven out of Jacksonville by Jack Frost, after 408 persons died. There were 4677 cases of fever.

Among new industrial enterprises in the South reported last week is a \$5,000,000 company composed of New England capitalists, organized at Fort Payne, Ala., to develop mineral land, build furnaces, a rolling mill, &c.

The Gansevoort Market Building, in this city, which cost \$477,000, will be formally opened 17th inst. It is pronounced the finest structure of its kind in the United States. The location is on West street and Thirteenth avenue. A portion of the west-side wholesale trade is expected to follow the market building.

The season of navigation on the Erie Canal has proved well-nigh disastrous, chiefly on account of railroad competition, for notwithstanding about 40,000,000 bushels of grain were transported by the water route, surpassing the total of 1886, the average freights have been so low that few boatmen have realized any profit. "Even when we were taking oats at 1½ cents to New York," said a leading boat owner, "the roads cut under that ruinous rate and took the grain away from us. They must have carried oats for about 1 cent a bushel, and that, too, when no one was in a hurry to get grain to the seaboard. I have never seen the roads fight us the

season through as they have done this year. Here is a point that the friends of the canal should ponder well. Do they suppose that the roads were willing to run a car through to New York for less than \$10 from a spirit of mere day-by-day competition? Was it not rather a part of a deep-seated policy, never quite lost sight of, to beat out and ruin the canal interest in the end?" It was stated within a week from the time the canal shipping season closed that the roads were already getting 11 and 13 cents a bushel on corn and wheat respectively from Buffalo to New York. "If the roads keep on fighting us like this," said the boatman quoted above, "it is only a question of time when our property will be rendered worthless and our business gone."

The line of American steamships plying between New York and ports in Venezuela has had uninterrupted prosperity, and now comprises a fleet of the first class. The owners, Boulton, Bliss & Dallett, coffee importers, have just placed another contract for a steamer of about 3000 tons with the Cramps, of Philadelphia, making the third contract of this character within the last six months, together representing an additional investment of nearly \$1,000,000.

About 3000 men are at work completing the Poughkeepsie bridge and its connections.

It is proposed to remove the New York Mercantile Library from Clinton Hall, Astor Place, where it has been located for 30 years, to a site at Broadway and Thirty-seventh street.

The Mexican Southern Railway, to extend from Puebla to the State of Oaxaca, will open a tropical region of great fertility, and, aside from local advantages, will shorten by five or six days the time from New York to Lima, Valparaiso and other points on the West Coast of South America.

The extent to which the foreign trade of New York is being monopolized by British vessels appears from the fact that of a total of 322 arrivals at this port during November 187 were British. In all classes of vessels, excepting steamships, there is a falling off.

The most important points in the reports from the several Territorial Governors, as bearing on their prospective admission as States, relate to population, which is estimated as follows: Alaska, 49,850; Arizona, 83,000; Dakota, 600,000; Idaho, 100,000; Montana, 140,000; New Mexico, 175,000; Utah, 210,000; Washington, 167,982, and Wyoming, 85,000.

The gross damages to be paid by the elevated railway companies on account of injury to property on the line of their roads in this city is estimated at \$12,000,000, in case the recent awards by Commissioners appointed to adjust claims of owners serve as a precedent for future decisions.

The second step in the commercial conquest of Zanzibar is a joint blockade of the coast by the English and German fleets.

An experimental paper stock mill at St. Louis has demonstrated that the waste or refuse lint of mills that make cotton-seed oil is almost as valuable as the oil itself, this substance being convertible into paper. The receipts of the cotton-seed oil mills, it is said, will be almost doubled from that source, while expenses will not be greatly increased.

The latest scheme for the extension of the foreign commerce of the Dominion is to establish a line of steamers between Montreal and New York and Para, in conjunction with a steamboat and railway

system extending to the headwaters of the Amazon. Brazil is prepared to make valuable concessions. Thus far the various proposals for lines of steamships to France, the West Indies, &c., emanating from Canadian sources have come to naught.

The Director of the Mint, in his annual report just submitted, estimates the amount of the precious metals in the United States on July 1, 1888, either coined or awaiting coinage, at \$1,100,000,000 in round numbers. Of this \$700,000,000 is in gold and the remainder in silver, as follows:

Coin:	
Gold.....	\$595,349,637
Silver dollars.....	299,708,790
Subsidiary coin.....	76,406,876
Bullion:	
Gold.....	110,469,016
Silver.....	3,950,388
Trade dollars.....	6,545,564
Total.....	\$1,092,429,761

The Florida orange crop this year is equal to 3,000,000 boxes, or at least double the yield of any previous year. This aggregate would load 14,000 cars, for which the railroads will get 60 cents a box, over \$1,800,000.

The New Orleans *Times-Democrat* has interviewed the leading Spanish and Cuban merchants in that city in regard to the question of Cuban annexation to the United States. While nearly all agree that annexation might prove highly advantageous to both, Spain would never acquiesce in such a proposition, on any terms possible.

The future of the United States was pictured in roseate hues by Mr. Gladstone in a recent interview with Minister Phelps. He said: "America has a magnificent future if the American people are only true to their possibilities. Before the close of the Twentieth Century the vast continent embraced within the limits of the United States, stretching from the Atlantic to the Pacific and from the Gulf of Mexico to the great lakes of the North, will be the home of 300,000,000 of freemen, representing every nation upon earth; vaster in extent and population than the Roman Empire in its palmy days, but free from the danger that attended the extension of that empire among barbarous peoples, which was the primary and potent cause of the decline and fall of the greatness of Rome. Every true Englishman should be proud of the progress of the United States, for the Americans are our kith and kin, and having the same literature, the same language and the same sturdy love of political independence. The wresting of Magna Charta from King John prepared the way for the battle of Bunker Hill and the Declaration of Independence." Nothing would give him more pleasure than to visit the United States, he added, but he had never been able to find the time.

Car Demurrage.—Considerable annoyance is being experienced at Chicago by a new rule governing demurrage on cars which has been adopted by the railroads centering at that point. A charge of \$2 per car is now made for each 24 hours after the first 48 hours expiring upon its arrival at Chicago. This new rule has been rendered necessary by the scarcity of cars and the consequent imperative need of having them unloaded as promptly as possible. The inconvenience of such a regulation is felt principally by those who receive coal and coke, but it also extends to consignees of iron and steel. A considerable quantity of pig iron is handled by some dealers on consignment, and the quick sales thus occasioned will prevent them from getting as good prices as would otherwise be the case.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., December 4, 1888.

Senator Allison called up the Senate Tariff bill to-day and will press its consideration until the opposition have developed their position. His purpose, if possible, is to get a vote before the holidays. The bill will require considerable amendment to adapt it to the wishes of certain interests which were assured, before the adjournment, of recognition. This relates notably to the tin-plate duty and to the correction of the coal slack or culm error on the free list. The Senator will make an effort to close general debate without delay and begin the consideration of the bill for amendment.

The Senate Committee on Finance at their meeting to-day decided to grant certain hearings which were omitted or crowded out before the adjournment. Yesterday the Forehand Arms Company, of Worcester, and Colt's Arms Company, of Hartford, were heard. A hearing has been assigned for the razor interests, represented by Mr. Torrey, of Worcester, which may be had after the adjournment of the Senate to-day.

The President's message has materially stiffened the friends of the administration in their determination to adhere to the policy advocated in the message of last year. There is now no doubt that the tariff reformers of the House will renew their fight as soon as the Senate bill reaches their body, which may be regarded as a conclusive indication that there will be no concurrent legislation on the tariff at this session of Congress.

The prospects of a deadlock in the House on the Direct Tax bill makes it more than probable that no business, except the passage of the appropriation bills, will be accomplished at this session, and it may even be doubtful whether they will get through if much time is consumed in parliamentary skirmishing over the direct tax question. If no tariff legislation be reached an extra session may be regarded as a certainty. That question and the admission of the four new States are matters which the Republicans are determined to settle without delay.

Philadelphia advices deplore the gradual disappearance of the grain trade from that port, until at the present time the total shipments are insignificant. The *Record* says: "During the five years between 1883 and 1887, inclusive, Philadelphia held about equal sway with Boston, while during the present year it will fall far below Boston, and both the receipts and exports will be but a tithe of those of New York and Baltimore. The big grain elevators at Girard Point and at Richmond, and elsewhere, are put to but little use, while hundreds of vessels that might otherwise load with grain at Philadelphia are forced to go away with empty holds, or loaded with ballast, to other Atlantic ports."

The Lehigh Coal and Iron Company have erected a plant of 50 beehive coke ovens at West Superior, Wis., in which they are using the screenings of their Connelville coal. A number of the ovens are now in operation producing a very good quality of coke. The managers of the company contemplate introducing the process of the National Coke and Fuel Company to utilize the waste gases and other by-products thrown off by the coal in being coked. The experiments of the company are being watched with much interest by the manufacturers of Duluth and its vicinity, as they will go far toward establishing the advantages to be realized from hauling coal to Duluth and coking it at the point of consumption.

MANUFACTURING.

Iron and Steel.

Announcement is made that the National Tube Works Company, of McKeesport, Pa., has purchased the plant of the Cartwright Iron and Steel Company, at Ali-kanna, near Steubenville, Ohio. The purchasers will begin at once to renovate the plant for the purpose of manufacturing muck iron. They will put in a mill and six double puddling furnaces in addition to the 11 singles and scrap furnace now there, making their capacity 60 tons per day. The works will give employment to upward of 200 men, including 45 puddlers. The muck iron made will be principally 8-inch, and will be used at the tube works.

The new lap-weld furnace now in course of erection in the pipe mill of the Riverside Iron Works, at Wheeling, W. Va., is almost completed and will be fired up in a few days. This additional furnace will give the pipe department facilities to meet the steadily increasing demand for this product.

Wm. Swindell & Bros., engineers and builders of regenerative gas furnaces, Pittsburgh, are engaged in the erection of a large Siemens gas furnace for the Moorhead-McCleane Company, proprietors of the Soho Iron and Steel Works, in that city.

The Valley Iron Works, at Coatesville, Pa., formerly operated by C. E. Pennock & Co., but recently purchased by W. W. Kurtz & Sons, are being repaired and will probably be started up about the 1st of January next, operating one set of rolls, and a full complement of hands will be employed as soon as trade will warrant.

The Pittsburgh Tuyere Works, Limited, formerly the Pittsburgh Smelting Company, Limited, manufacturers of wrought copper and bronze tuyeres, coolers and bosh plates, brass and bronze castings, have removed their office and works to Nos. 83 to 95 Main street, Allegheny.

The 24-inch mill department of the National Tube Works Company, at McKeesport, Pa., has closed down for the winter, and 150 men employed there will find work in other departments of the plant. The demand for 24-inch pipe is over for the present, which accounts for the closing of that department.

On Saturday, the 22d inst., Jones & Laughlins, Limited, of Pittsburgh, will apply for a charter under the name of the Jefferson Gas Company, with a capital of \$100,000. The firm has secured a quantity of natural gas territory in Jefferson township, Washington County, and will drill wells there and pipe the fuel a distance of over 15 miles to Pittsburgh to supply the American Iron Works and Eliza furnaces. A member of the firm states that they will probably not have any gas in Pittsburgh before next summer, but that they eventually are insured against the frequent shortages which have proved so expensive in the past.

We are informed that the report that the Kittanning Iron Company, Limited, of Kittanning, Pa., have been compelled to close down their rolling mill and blast furnace for an indefinite period on account of a shortage in natural gas is without foundation. The firm manufacture only pig and muck iron, and the output of the latter product of October was 1782 gross tons, and for November was 1550 gross tons. The plant was closed down for three days in November on account of the election and Thanksgiving.

For the first time in some years the Glendon Iron Company, of Easton, Pa., have their space nearly a mile long, free of stacks of pig iron. Six months ago the

company had this space occupied by between 20,000 and 40,000 tons of iron, all of which has since been shipped. The amount of iron on their wharf along the railroad has also been reduced, and the supply on hand is now believed to be less than 500 tons. Some of the iron on the mile space was made when the price of rails was \$40 per ton and a large share of it when between \$25 and \$35. Two months ago the company started to prepare three of their furnaces for blast, but it is doubtful if any of them will be in service before spring.

The Andrews Brothers Company, of Youngstown, Ohio, under date of the 27th ult., write us as follows: "We are building four new double-puddling furnaces. These we require to supply our increased finishing capacity."

Some days ago the rim at the top of the Himrod Furnace, which is operated under lease by the Mahoning Valley Iron Company, of Youngstown, Ohio, broke, and allowed the bell to fall. The furnace as a consequence has chilled above the tuyeres.

James P. Witherow, of Pittsburgh, has received a contract for the erection of a blast furnace for the Jefferson Iron Works, of Steubenville, Ohio. The furnace will be 18 x 80 feet and will have a capacity of about 200 tons per day. Work on the foundations has already been commenced.

It is ascertained on good authority that the new rail mill of the Allegheny Bessemer Steel Company, now in course of erection at Duquesne, Pa., may not be put in operation before March 1, 1889. Nearly all the machinery has arrived and is being put into position, but there is a vast amount of work yet to be done, so much so that it is evident that the works will not get started before the time stated above.

The Swindell Construction Company, of Pittsburgh, have about completed a contract for the Riverside Iron Works, of Wheeling, W. Va., which included the erection of one four-hopper gas-producer, each hopper with a grate surface of 24 square feet, one binding furnace, hearth 6 x 24 feet, and a welding furnace with a hearth 7 x 24 feet. Nearly 800,000 fire-brick were used in the construction of these furnaces.

The blast furnace of the Bellaire Nail Works, at Bellaire, Ohio, has been in continuous blast for 26 months, and in that time has produced over 100,000 tons of Bessemer pig iron, and is apparently good for six months longer. The steel plant of this firm is also in continuous operation and is producing an average amount of slabs and billets per day, the larger portion of the output being made in the form of billets for wire rods, sheets, &c. The nail factory department has been idle for some months and will not resume operations until there is a decided improvement in the nail market.

The new furnace of the Cameron Coal and Iron Company, at Emporium, Pa., Joseph Hunt, general manager, was blown in on Tuesday, the 27th ult.

An Associated Press telegram from Joliet, Ill., states that ground was broken there on the 26th ult. for a large steel plate mill, which will employ 1000 men when completed. We are advised by those in a position to know the facts that this statement is premature, and the intention of the projectors is exaggerated. A steel plate mill is contemplated, and perhaps other departments may be added to the works for the manufacture of specialties, but thus far nothing has been settled with sufficient definiteness to warrant the publication of the plans of the projectors. The works will be located near the plant of the Joliet Steel Company, who will ex-

pect to furnish the steel to be manipulated. But a separate company will be organized, the name of which has not yet been announced.

A press dispatch from Springfield, Ohio, under date of the 2d inst. says: "Hon. John Bookwalter, of this city, has been engaged in perfecting and introducing a new process for the manufacture of steel. Steel of all grades and even wrought iron of the highest purity and quality can be produced from the pig iron in eight and one-half minutes and at a cost even less than by any process hitherto known. One great feature of the process is that it can be run with certainty into castings of all forms and sizes, producing castings true to the pattern, remarkably sound and free from pores and bubbles and possessed of extremely high tensile strength and ductility. The Bookwalter plant here is capable of turning out 100 tons per day."

Mr. I. Droege, Sr., has resigned the position as general manager of the Maumee Rolling Mill Company, at Toledo, Ohio, on account of poor health, and has returned to Cincinnati. The board of directors have elected as his successor George F. Russell, of Zanesville, Ohio, who was connected with the old and successful mill of the Ohio Iron Company at that point for a number of years. They have also chosen Mr. Chas. A. Borts, recently superintendent of the Youngstown Rolling Mill, as mill manager. The capacity of the Maumee mill is about 125 tons of finished product per day, consisting of bar, band, angle and shafting iron, flange, boiler, tank and sheet iron and steel. This company will also make a specialty of agricultural iron. The fuel used is natural gas. A blast furnace will be erected at Toledo the coming year, which will be a great advantage to consumers of foundry iron in that locality.

E. S. Cook, manager of the Warwick Furnace, Pottstown, Pa., writes to us that that famous record-breaker has outdone its own past achievement. For the week ending November 24 the furnace made 702 tons of iron, 250 tons being No. 2 foundry and 452 tons open gray forge, using three-quarters anthracite coal and one-quarter coke. So far as we are informed, this exceeds any product yet obtained, with anthracite coal as the principal fuel, from stacks of moderate size. Warwick furnace is only 55 feet high, and has a 15½-foot bosh.

Machinery.

The Marion Steam Shovel Company, of Marion, Ohio, under date of the 26th inst., write us as follows: "We are now running on full capacity and have placed our order for quite an additional line of machinery to be placed in our shops, so as to be able to double our present capacity, which is necessary to fill our immediate demands."

Morse, Williams & Co., manufacturers of elevators at Philadelphia, in addition to their office at 108 Liberty street, New York, have recently established a branch office at 14 High street, Boston.

The Freeport Machine Company, of Freeport, Ill., made an assignment on the 27th ult. The assets are roughly estimated at \$40,000, of which \$24,000 is in notes and bills receivable, while the liabilities are put at \$27,000. The failure was precipitated by dissensions among the stockholders. The company have been in existence about seven years, had a capital of \$50,000, and were engaged in the manufacture of windmills, feed mills, cultivators and other agricultural implements.

The Gordon & Maxwell Pump Company, of Hamilton, Ohio, are at present working on a contract for three sewage pumps for Hyde Park, Ill., with aggregate

capacity of 9,000,000 gallons, two water works pumps for Troy, Ala., with capacity of 2,000,000 gallons, and two for Gladwin (Mich.) Water Works, with a capacity of 1,000,000 gallons. The company have thus far this year sent out over 40 pumps for water works in various parts of the United States.

The Heine Safety Boiler Company, of St. Louis, have been asked to bid on boilers, heaters, pumps and piping for 1000 horse-power steam plant for London, England.

The Crescent Foundry Company, of Allegheny City, Pa., who started a foundry in Brady's Bend, Pa., some months ago, have been compelled to shut down permanently on account of scarcity of natural gas and raw material which is used in making castings. The company occupy a section of the old Brady's Bend Iron Company's property, and had extensive buildings erected. Forty men were employed. The works will soon be removed to Allegheny.

Mr. J. W. Angell has been appointed to represent Russell & Co., of Massillon, Ohio, agricultural machinery manufacturers, in St. Louis, and will have his headquarters at No. 609 Pine street, in that city.

The Miller Chemical Engine Company have been incorporated at Chicago, with capital of \$300,000, for the manufacture of fire engines. The incorporators are A. Montgomery Ward, G. R. Thorne and J. W. Miller.

Miscellaneous.

Among recently authorized corporations in Illinois are the following: Lion Mfg. Company, East St. Louis; capital, \$75,000; incorporators, H. F. Fellows, George A. Bannantine and Charles K. Paddock. Colby Cook County Testing Machine Company, Chicago; capital, \$100,000; incorporators, George L. Hogg, Addison E. Shaffner and Everett W. Kibbe; to manufacture a weighing machine, lung tester, lifting machine and measuring machine for light, all combined in one. International Construction Company, Chicago; capital, \$50,000; to build and equip railroads; incorporators, Lawrence C. Boyle, John R. James and John Ritchie. Rouse, Hazard & Co., Peoria; capital, \$80,000; to manufacture agricultural implements, carriages and type-writers; incorporators, Harry G. Rouse, Samuel B. Hazard and Sylvester Doubet. Certificate filed to increase the capital stock of the Machinists' Supply Company, Chicago, from \$25,000 to \$100,000; also, Illinois Malleable Iron Company, of Chicago, to \$50,000.

A company under the name of the American Catalogue Company has been formed at Minneapolis, Minn., for the purpose of arranging and binding under cover several catalogues of the same class. The object of this is to furnish the purchaser of machinery a complete and well arranged reference book of the class of machinery that he is likely to use. Another important object is to place the manufacturers' catalogue in the hands of those who will likely be his customers, and in such a way that when once placed it will be preserved from loss or damage. A few of the bound volumes of catalogues, we understand, have been in use for the past three years, and their usefulness and value have been such as to cause the formation of a company for the classification and binding of them for general use. The company are now collecting a large assortment of catalogues, so as to make the classification as complete as possible, and will probably send out the first volumes about the first of the year.

A company embracing a number of Chicago, Cleveland and other capitalists have been incorporated at Lima, Ohio, under the name Lima Lock Mfg. Company. The

capital is put at \$250,000, and the company will erect a factory, which it is stated will employ 500 hands.

Silver Coinage and Coin Certificates.

In his annual report Secretary Fairchild dwells as follows on the silver coinage and on the system of coin circulation by means of silver certificates:

The ownership of silver by the Government again was largely decreased, in spite of the increase of the total stock of silver dollars in the country, by the coinage of 16 months. During the past few years the decrease of circulation caused by the cancellation of national bank notes and by the deposit of money with the Treasurer by the banks to redeem their notes when presented for that purpose has been but little exceeded by the increased circulation of silver certificates and of standard silver dollars; thus silver seems to have filled the vacuum caused by the retirement of national bank circulation. The circulating medium in small denominations has been largely converted into silver certificates. And finally business has largely increased in the South and in portions of the country where there are few banking facilities. All of these causes have co-operated to postpone any evil effects which might arise from a continued and excessive coinage of the silver dollar; but the danger still exists and should be guarded against. This can be done by the adoption of the recommendation of my last report, viz., by fixing the maximum of silver which shall belong to the Government and by providing that when it was exceeded by \$5,000,000 the purchase of silver bullion should cease until the amount owned by the Government should be again reduced to such maximum, or by canceling United States notes to the amount of the excess over the maximum, provided the Government held the notes; if not, then by ceasing the purchase of bullion. Such plan, if adopted, would provide a safety valve which would be self-operative, and would assure the country against any possible danger from silver, for as soon as it exceeded the amount which could be absorbed in the business of the country it would begin to flow into the Treasury in payment of taxes and would be there held until business called for it, and when the Government's ownership fell below the maximum the purchase of the bullion would again begin.

Thus the country's business demand would regulate the country's silver circulation and there would be little danger of depreciation in the value of the silver dollar as compared with the gold dollar. I venture to predict that if some such safeguard is not adopted and if thereby the silver dollar is suffered at some time to lose a part of its purchasing power, that the people will demand the absolute stoppage of the silver bullion purchase, and, furthermore, the use by the Government of the whole or a portion of the silver coinage profits for the redemption of the silver dollars which are held by them. It is to be hoped that before such crisis is reached that the nations of the world will have agreed upon some standard of bimetalism which will forever maintain a fixed ratio between gold and silver, but in the meantime there is no occasion to burden ourselves with a stock of silver which may be troublesome.

The system of coin circulation by means of certificates has certain conveniences and advantages, but it is a costly form of money; last year the cost of the \$105,000,000 silver certificates issued was about \$421,000, and as more and more of these certificates are converted into smaller denominations this cost is likely to increase.

There are also certain dangers connected with it—for example, in time of war, the possession by the Government of such vast stores of the precious metals might prove embarrassing, and at a time when the Government was in financial need the temptation to spend the coin held against outstanding certificates might prove too strong. The loss by the abrasion of the coin, if it was in circulation, would not equal the cost of the certificates; on the whole, I think it may be said that the currency of the country would be more safe and more economical if the coin were in actual circulation instead of being held by the Government on pledge against outstanding certificates, as is now the case. But whatever may be thought about the wisdom of the certificate system there can be no doubt that with it the further coinage of gold and silver, except subsidiary coin, is not necessary or wise. Far more gold and silver coins are now in the possession of the Government than probably ever will be needed for the redemption of certificates. Future accumulation of the precious metals should be only in the form of bullion, which can be kept more safely and counted more easily than the coin. If this suggestion was adopted all but one of our mints might be closed, and large, useless expense be saved annually. I earnestly call the attention of the Congress to this subject.

Heating Buildings by Exhaust Steam.

At a recent meeting of the New England Railway Club, John A. Coleman said:

I have had a long experience in heating buildings by steam. When the matter of using exhaust steam was agitated, and most people were opposed to it, we took a number of mills, using then a 16-foot tubular boiler, and averaged a ton of coal a day. We heated the mill by using large pipes, having the circulation as straight as possible, open and free, with about 2 pounds back pressure on the engine, using no direct steam except in the morning in starting up and on Sundays. I had similar experience in heating the building of the Providence Tool Company during the war. The building was 70 feet wide by more than 200 feet long, the rooms with 15 foot studs, and large windows in an exposed situation, then heated by small pipes all around the walls, and using about a ton of coal a day for the boiler. In reconstructing we took out the small pipe, cut it up into coils, which we placed in the center of the building, using a 6-inch pipe as the main artery through the building, and a 2-inch socket-pipe for the condensed water, avoiding bends everywhere as much as possible. Result was that the building was overheated by using only exhaust steam, and about 2 pounds back pressure and no extra coal was used for the fires. My idea in heating is to use large pipes and carry a large body of steam to the point where you want to use it, and not strangle it on the way.

Morris J. Lippman, late of Graff, Bennett & Co., has been appointed agent for A. and P. Roberts & Co. Pencoyd Iron Works, Philadelphia, Pa., and has opened an office in the Commercial Building, southeast corner of Sixth and Olive streets, St. Louis, Mo.

The Metric Metal Company, of Beaver Falls, Pa., a recently chartered corporation, have leased a portion of the cutlery works at Beaver Falls, and machinery is now in place, and operations begun in the manufacture of natural gas meters and natural gas burning appliances. The company are largely interested in natural gas enterprises.

The Crisis in the Steel Rail Trade.

A good many contradictory statements have been published in the newspapers during the past week about the steel-rail trade. To some extent they echoed some of the opinions expressed at the recent meeting of manufacturers in this city, pet plans being thus ventilated as though they had received general acceptance. During the meeting held a week since there was a general and a free interchange of opinion, but very little that was definite was agreed upon. It was proposed to so modify the association that minimum prices be agreed upon. That proposal met with an emphatic rejection by a number of the active manufacturers. The plan of establishing a common sales bureau, through which the orders would be distributed, met with a similar fate, so far as all the mills outside of the Chicago district are concerned. The only action finally taken was to allow of the sale of tonnage allotment by one mill to another.

The condition of the steel-rail trade is a sad commentary on the inadequacy of trusts and combinations. The rail manufacturers have been violently assailed during the past year as members of an iniquitous ring, and yet they have not even had the consolation of reaping the pecuniary rewards which trusts are supposed to confer upon their unscrupulous members. The fact is that the ties binding the members of the steel-rail association have had the strength only of the traditional rope of sand. So long as there was work enough for all at good prices, allotments were sacred. When business fell off the fact that the quantity allotted it was sold did not always deter a mill from securing a desirable order. The contest grew fiercer and fiercer until finally steel rails sold in the West at \$25 at mill. This has been done in more than one instance in the past two weeks, and while there is no direct proof that it has been done since the New York meeting, there is evidence that low prices are still being made.

There are those among the steel-rail manufacturers who believe that some plan can be devised by which the ruinous competition now going on can be ended. They are urging further conferences, which probably will be held. But others frankly acknowledge that natural causes alone can bring improvement. Railway managers acknowledge that rails are too cheap. They admit that the cost of renewal of track is ridiculously low, but many of them must confess that they have not got the money to take advantage of the opportunity offered. If the interests of the carriers of the country were not so thoroughly disturbed as they are the demand for rails would quicken most rapidly. There are many who insist that the railroad companies, for purposes of their own, are not adverse to having their

sufferings pictured in dark hues. But while these somber tints prevail it is difficult, if not impossible, for railroad managers to negotiate paper or for those who are building new roads to place bonds. The situation to some extent, therefore, appears worse than it really is. It may improve very rapidly so far as the Western mills are concerned. A few large orders may cause a recovery of a few dollars a ton, but, until that has occurred, the Eastern mills cannot hope to take any business. They are cut out of the whole West, and for the time being are driven out of the Southern market by Pittsburgh mills. They do not expect any new business in their own territory, east of the Allegheny Mountains and north of the Potomac River, simply because nearly all of it has been placed in the past two months. So far as the possibility of securing new orders are concerned, the Eastern mills have a barren future before them. Whether it is a matter much to be deplored by them may be questioned, since every sale of rails at competitive prices to-day involves a loss of a round sum to even the best-equipped and best-located mills in the country. We have heard of managers of some mills claiming to be able to produce rails at very low figures, but usually they themselves have acknowledged the inaccuracy of their statements, when the occasion which gave rise to them passed. While the crisis in the rail trade is not yet over, there are some indications which point to the return of more reasonable prices.

Progress in the Navy.

Secretary Whitney's annual report, which was issued last week, is in many respects an interesting document, and affords, undoubtedly, the most complete and trustworthy measure yet given of what has been accomplished in the Navy Department during the present administration. The accounts published from time to time during the past few years, reviewing the work done, have necessarily been of a fragmentary character, and information on the exact state of the navy has been more or less uncertain. The facts and figures now given, however, are entirely comprehensive and cover not only the results more recently attained in the United States, but refer also to what has been done in some lines by some of the foreign powers.

Briefly stated, the efforts of the Navy Department in ship construction have, since March, 1885, been devoted to unarmored vessels, the importance of this branch of naval armament having been very widely appreciated. As a result we have now the cruisers Boston and Atlanta and the dispatch boat Dolphin in shape for service, while the Chicago is practically completed, and several other vessels, like the Baltimore, Charleston, Yorktown and the dynamite cruiser Vesuvius, have been launched, and are being rapidly fitted out. In the line of torpedo boats also a good beginning has been made. With armored ships, on the other hand, but little has been done, the armored cruiser Maine having just been commenced at Brooklyn, and work on a few of the monitors having been carried on only in a desultory manner for several years. In the design of the battleship Texas some

changes, we understand, are yet to be made. With reference to the criticisms which have been liberally bestowed upon Secretary Whitney because of disappointing performances of some of the vessels already completed, and defective material and injudicious design in some of the others, it must be admitted after all that the work done is, in the main, satisfactory, and reflects credit upon the department. The severe attacks which have been made upon the alleged policy of the Department of building an English-American navy have but a slim basis and are scarcely worthy of consideration. For years the ships of the British navy had been held up as standards of excellence, and the question why their designs could not be profitably followed or adopted in modified forms in this country had been brought prominently forward on more than one occasion. The question has been practically answered by carrying out several such designs, which, moreover, appeared to be of special merit, and if the results have not been particularly flattering, they have at least taught a lesson worth knowing, and perhaps have effectually put a stop to the floods of non-professional advice which, only a short time ago, poured in upon the Navy Department. The last year alone has brought many surprises to naval authorities and to the public at large, and some of the features which in the near past were regarded as eminently desirable in the construction and outfit of a warship have since been condemned by practical test. It is impossible that, under such circumstances, ships and machinery can be constantly kept up to the requirements of the present.

The question of speed of warships, and particularly of cruisers, is an important one, and has deservedly been given much attention. The rate of speed has gradually been raised from 12 and 13 knots to from 14 to 22 knots per hour, and to secure these higher figures reduction of weight of machinery has been carried out almost wholly regardless of the results consequent upon reduced strength and rigidity, and of ultimate serviceableness. This applies not only to English ships, which have of late been more specially noteworthy for breakdowns, but with equal propriety to all of modern design—a fact borne out by the narrow time limits which it has been found necessary to adopt for trial trips. As at present constructed a vessel, with the best possible management in the engine-room, is barely enabled to go through a six-hours' trial satisfactorily, and, as has frequently been pointed out, will probably never again, under ordinary circumstances, be called upon to go through a similar performance. Should such a requirement present itself, even though the time of running at full speed be not more than two or three hours, a breakdown, as experience has shown, will be the inevitable result. Yet the vessels are rated according to their trial-trip speeds. What dependence, therefore, can be placed upon ships, classified under the present system as capable of developing, say, 18 or 19 knots, can be readily imagined.

The position has been repeatedly taken, and with good reason, that it were better the vessels were rated lower, in accordance with their actual capabilities, so that there would be the assurance at all times that the speeds counted upon could be attained

without difficulty. It is a dangerous folly to deceive one's self with the belief in a reserve of power which in point of fact is only imaginary. It is not reassuring, therefore, to find in Secretary Whitney's report the conclusion that "the machinery of naval vessels ought to be so designed as to produce 10 horse-power for each ton of machinery; and it was determined to make that the standard, and to enter into no contracts that were not based substantially thereon." This would correspond, at the outside, to a weight of only 224 pounds per horse-power. Whether or no this includes the boilers is not quite clear, but we presume it does not. If it does, the figure is ridiculously low, much lower than the weight ruling in the British navy—360 pounds per horse-power—and which itself has been found entirely insufficient to secure the strength necessary for the work required of the machinery. Assuming the 224 pounds to represent engines alone, and adding, say, 196 pounds per horse-power for boiler capacity, we would get 420 pounds per horse-power. This represents an increase over the British weight perhaps just sufficient to make all the difference between success and failure. Still it falls considerably short of the weight per horse-power ruling in high-class merchant steamers, which, as is well known, head the record of good performances, considered from whatever standpoint—speed, durability and economy. There is not now, so far as we know, a warship afloat which has been known to steam, or which could, in case of necessity, steam at full power for several days consecutively, nor even for a few hours, while in commission. In this respect they all fall entirely below comparison with what is being accomplished day after day, without intermission, by any one of a number of Atlantic steamers, and in these, it may be safely assumed, the weight of machinery has been kept down to a minimum consistent with safe working. There is only the one previously mentioned conclusion to be drawn from all this, that marine engines in the several navies are much too light for the power which they are supposed to be able to develop. It is only fair to admit here that the design of the machinery for a merchant steamer and that of the machinery for a man-of-war do not present parallel cases. In one instance, ample head room is available, while in the other, compactness is of the first importance, and the whole machinery, or as much of it as is at all possible, must be placed below the water-line. This condition alone often entails the necessity of having smaller and lighter parts in the design than would otherwise be desirable. Still, an effort should be made to adhere as closely as the circumstances will permit to examples of established success.

Secretary Whitney has evidently not lost sight entirely of the shortcomings of the engines designed for naval purposes, for to a table which he has compiled of foreign high-speed cruisers he appends a note to the effect that the speeds given are trial speeds and that a reduction of from 10 to 12 per cent. should be made to get corresponding maximum sea speeds. It would have been more correct to say simply that on regular cruises the engines could not be worked up to their full power or anything approaching it; but even as it is

the qualification is suggestive. The point cannot be made too prominent that a 19-knot cruiser on paper is not a 19-knot cruiser in practice, and that what up to the present time has been gained in speed on the trials by reducing the weight of machinery has been a gain so-called which can never be realized in actual service, and which even if attainable would have been secured at the expense of reliability and general efficiency. The conditions laid down for the designer of the naval marine engine of the present day in most of the cases directly invite disaster, though they might, we think, be easily modified so as to effect general improvement, Secretary Whitney seems to fully realize this when he says that "too much has heretofore been sacrificed to reducing weights of machinery beyond the limit necessary to secure desirable results. An increase of weight and machinery found necessary properly to maintain the desired speed entails either a reduction of ordnance, coal and other weights or an increase of displacement in each type; and this latter is the direction in which designs of cruisers (not especially built for police duties in time of peace) are now advancing." This would seem to show that Secretary Whitney, at least, is in favor of a very desirable departure from the policy now followed, though the developments will depend largely upon his successor. Taken altogether, what has been done thus far in adding to the navy has, for obvious reasons, been somewhat in the nature of experiment, and the results have been all that could be reasonably expected. The work, we believe, has been conscientiously done and constitutes a good basis for further operations.

The Copper Situation.

The copper and brass manufacturers have again made their contracts for copper for delivery during the next three months, the quantity, it is said, being larger than was involved in any previous sale. Manufacturers evidently have been punished in the past by the syndicate for taking less than they needed. They have been forced to pay anywhere from one-eighth to quarter of a cent above the contract price for additional copper. Manufacturers have been taught that it is very difficult, if not practically impossible, to secure any metal equivalent to Lake from outside sources, and that there is no superabundance of other grades not controlled by the ring. So far as we can gauge the situation the brass and copper manufacturers have been whipped into line and have practically given up any opposition to the syndicate. In spite of the editorial broadsides fired at regular intervals at the latter, its position is securer to-day than it has been for a long time. Well-informed men in the copper trade estimate that the syndicate must be carrying a stock to-day of not less than 125,000 gross tons. The European statistics are not complete. It is known that they do not include copper in some private French warehouses. They do not count accumulations of precipitate at the Spanish mines. Then the syndicate was until lately piling up copper at a lively rate in this country. It is reported that the stock at tidewater includes 6000 gross tons of Lake copper, 2000 gross tons of Arizona and other in-

gots and bars, 5000 tons fine of Boston and Montana matte, and 2000 tons fine of Anaconda matte. Here we have 15,000 tons alone. It is evident, therefore, that even if the Calumet and Hecla fire did cut off the whole supply of that mine there would be no danger of scarcity, except that the supply of shapes—that is, wire bars and slabs, of which the great concern has almost a monopoly—would be temporarily light. But, as a matter of fact, the misfortune of the bonanza mine is of little interest to anybody but its stockholders. We are officially informed that the Black Hills ground is open, as before, and that this part of the property is capable of furnishing 4,000,000 of pounds monthly—that, in fact, the greater part of the product has come from that section, even during the past few months. The possible small restriction in the supply from that source may be considered insignificant.

But of late another matter has developed which opens up very serious possibilities to the manufacturers of this country. We have lately dwelt upon the embarrassments and perplexities of brass-makers who are paying tribute to the syndicate and to the mining companies. It appears that recently domestic brass manufacturers have found themselves undersold in this country by foreign makers. Partly manufactured brass has been imported. Now, the Société des Métaux is the largest brass and copper manufacturing concern in Europe, controlling the French trade and having branch works in other Continental countries. It is evident that the Société will do all in its power to keep its own mills going to full capacity, and that it has a great advantage in so doing in the cheap copper it has at command. While American brass and copper manufacturers are paying 16½ cents, the syndicate gets copper in Europe equivalent in quality at about 13 cents, and makes a profit of about 1 cent on every pound it sells to other manufacturers. In reality it can deliver its own copper to its own mills on the basis of, say, about 12 cents. The spelter used in the brass is cheaper; its labor is lower, so that it can easily sell in this or any other country, where it has no mills, at a lower price than the home manufacturers, in spite of a tariff.

We do not charge directly that the Société is the one which is doing the selling of manufactured brass in this country. Possibly it may be somebody else crowded out of his own market by it. But with a concern as large as the Société is as a manufacturer, the temptation is great to seize the trade of others when its own is affected adversely in volume by restricted consumption. This is one of the possibilities of serious injury which may be inflicted upon a great industry, sorely pressed now by being forced to pay tribute to a gigantic gamble. There is little sense in wasting time now over predictions of ultimate disaster to the gamblers themselves. Every one sincerely hopes that they may not be successful in slipping out of some side door finally. No one has any sympathy with the syndicate except those who are its beneficiaries now, and the majority of whom will probably be nimble enough to get out before the crash comes. But opposition to the syndicate should not blind us to a correct appreciation of its power. Its grip seems as firm now as it has ever been.

and, as we have indicated, it has opportunities for mischief in other directions which may lead to invoking legislative protection.

Basic Versus Acid Wire Rods.

Always excepting tin plate and spiegel-eisen, there has been no branch of the iron and steel trade in which foreign material has played so important a part as it has in wire rods. With the rapid growth in popular favor of the barb-wire fence, and latterly of wire nails, the demand for wire developed enormously. The importations of foreign wire rods assumed very great proportions. Unfortunately the import statistics did not specially enumerate this article until 1884. Since then the quantities brought in have been as follows:

Imports of Wire Rods.

Year.	Gross tons.
1884.....	129,933
1885.....	93,882
1886.....	136,965
1887.....	149,350
Nine months 1887.....	122,263
Nine months 1888.....	82,098

It will be observed that the imports during the first nine months of the current year indicate imports of about 100,000 gross tons, a falling off of about 50,000 tons. The statistics of the production of wire rods are not obtained by the American Iron and Steel Association, the only cue to the quantity made being furnished by the statement of G. T. Oliver, before the Senate Finance Committee, that in 1887 the output was 188,738 tons, the capacity of the American mills being placed then at 285,000 tons. Since that time it has expanded further, and more mills are building or contemplated, so that the claim has been seriously made that in 1889 the United States will come to the front with a product of 800,000 tons at least, and possibly 925,000 tons. Importers concede that they expect to do comparatively little business in foreign common rods in the future. They have been crowded out of the great Western markets, and have only a moderate trade to look for east of the Alleghenies, and at or near tidewater. The capture of so great a trade by American producers is naturally a source of much gratification.

There is one point in connection with the progress of American industry in this particular branch which we have believed it to be of interest to investigate. When the basic process rushed into prominence in Germany it was soon found that the product of the new process was particularly well adapted for wire purposes. Until lately no basic Bessemer or open-hearth steel was made in this country, and of what little is made none, so far as we know, is drawn into wire. Unless imported basic billets are used, the wire rods rolled in American mills are of acid Bessemer stock. Now, importers have steadily claimed that the latter was not as suitable for wire purposes as the basic material. The latter they urge is so much softer that it can be drawn down further without annealing. Some have insisted that, therefore, basic rods are worth at least 50 cents more a ton, and possibly \$1 per ton.

We have made inquiries on the subject from manufacturers of barb wire, of wire nails and of market wire. Those among them who have no affiliations whatever

with steel works or American rod mills frankly state that they prefer the basic material, one of them putting it in the following words: "We find that the basic rod will draw down much easier and will not cold, harden like Bessemer. It is easier on the tools, and for uniformity is much more desirable than the acid rod." Another wire manufacturer expresses the opinion that since the basic rods have come into use there has been a decided improvement in the quality of acid rods, so that now the latter are used by the wire-makers in many grades of wire for which they were formerly not considered suitable. One wire drawer informs us that some of the domestic material he has received was poor in quality—that he would not have any of the same make at any price, while other American rods were equal to any of the imported stock. He reports that as long as imported No. 6 basic rods of uniformly good quality can be bought for the same money which No. 5 domestic rods bring he will continue to purchase the foreign.

The managers of a number of the leading rod mills, all of them manufacturing wire also, write in very much the same strain. The majority of them admit that the foreign basic rods are a little softer, and agree in recognizing that there is some advantage in its being smaller—that is, the foreign rods are No. 6, while the domestic rods are No. 5. One of them, however, states that in his experience the slight difference between the two is entirely overcome in drawing by the intelligent use of a proper coating. Others insist that the rustiness of foreign rods more than makes up the difference in cost gained by their being softer and smaller.

This point has been brought out very clearly in our correspondence, that wire manufacturers do not consider the differences in quality of foreign basic and domestic or good foreign acid rods important enough to warrant any material difference in the price. Fifty cents a ton, or a maximum of 75 cents is as much as the majority of them seem willing to pay. This result has a significance beyond the question immediately at issue. If ever the United States is to become a producer of basic steel on anything like a large scale, the first channel into which its product is likely to go is the wire trade.

Argentine Loans and the Gold Drain.

The gold drain, which for months past has been going on from Europe toward the Argentine Republic, being the proceeds of loans floated, has at length begun to cause considerable uneasiness among financial men, not only in Europe, but in New York. While Buenos Ayres has drained London and the Continental money centers New York has in its turn been drawn upon by these. Thus, during the week ended November 24, Wall street bankers shipped no less than \$4,142,000, gold, supposed to be bought, most of it by the Bank of England, which is fortifying itself in order not to be obliged to raise the discount still further. As Hamburg had bought German gold coin and bars in the Bank of England, and shipped \$2,000,000 thereof to Buenos Ayres on November 19 and 20 by two steamers, the bank raised the price of such coin to 76/8, and bars to 77/11. From January 1

to November 24 the gold shipments from the United States amounted to \$36,500,000, as compared with \$14,000,000 for the corresponding period of 1887, while the receipts have been but \$7,500,000, as against \$39,000,000 for the same period last year—in other words, we have shipped \$22,500,000 more, and received \$31,500,000 less than last year, in a little less than 11 months, a difference of \$54,000,000, gold. Last month an experiment was even made for European account, and \$500,000 gold were shipped from New York to Buenos Ayres per steamer direct, as it was thought this might prove a cheaper method. Should the drain on New York continue, it would unquestionable lead to a stringency in our money market, and something of an upheaval in Wall street.

Fortunately, the stock of gold in bank in Europe and America on November 1 was about \$100,000,000 larger than at the same date last year; the drain is, therefore, for the moment less felt than it otherwise would. Reduced to millions of francs, it was as follows, compared with the year before:

	Nov. 1, 1887.	Nov. 1, 1888.
Bank of England.....	502	514
Bank of France.....	1,146	1,022
German Federal Bank.....	475	732
German Banks of Issue.....	137	192
New York Banks.....	394	462
Bank of Holland.....	101	128
Austro-Hungarian Bank.....	160	190
Italian National Bank.....	178	205
Italian Banks of Issue.....	128	149
Belgian National Bank.....	98	86
Bank of Portugal.....	16	29
Russian State Bank.....	844	964
Totals.....	4,183	4,682
Increase.....	499	

As the Argentines have to pay interest in gold in Europe for the enormous amount of money they owe, something like \$50,000,000 gold will have to flow back to Europe during a twelvemonth on that account, but this counter-current is nourished from month to month, while the proceeds of loans are drawn for from Buenos Ayres on Europe in big lots. Between January 1 and November 15 of the current year no less than 28 Argentine loans were placed on the markets of Europe, aggregating £28,702,766, or \$143,500,000 American gold. For the latter half of 1888 \$40,000,000 gold were expected from Europe, the Bank of England alone having shipped during the first six months £3,500,000 to the Argentine Republic. Nobody denies that the Argentine Republic is flourishing now more than it ever did before, but the paper basis on which the finances rest at home and the extraordinary inflation of the value of real estate and wild speculation generally centering at Buenos Ayres, recommend caution. Thus one of the leading newspapers in the latter city expresses itself about the general condition of the country in the following manner, under date October 18 last: "The Argentine Republic grows, blossoms and thrives not only from a material point of view, but morally and intellectually. New schools are springing up in all directions, and the Argentines themselves are becoming more and more laborious; formerly they, most of them, used to despise work. New banks, manufacturing and colonizing enterprises are being founded almost daily. At the same time mechanics, many of whom for some time past Argentines, and shopkeepers begin gradually to form a more and more solid middle class. Trade and traffic are

getting livelier all along in consequence of the fine cereal crops we have and the remunerative prices our grain fetches in Europe. The only dark cloud in the horizon is the high gold premium, which does not decline in spite of the extraordinary amounts of gold we are receiving from Europe; the premium is indeed a constant source of uneasiness for us. Why the premium remains so high is to us an impenetrable mystery, which it would be difficult to explain."

With the experience we have had with an irredeemable paper money, and the gold premium in the United States during and after the war, the mystery alluded to does not seem to us so deep; it is in reality more confidence which brings down a gold premium than a stock of gold which does not circulate in the country, flooded as the Argentine Republic is with paper currency. The latter has now taken hold to such an extent among the people down there that a return to specie payment cannot now be thought of, because it would bring down the inflated values, city real estate included, with a rush, and precipitate a big financial and monetary crisis. Hence the premium on gold will only begin to decline if a resumption of specie payment can be prepared for gradually, and thereby confidence in the paper tokens of many forms which have been cropping up restored. With us it was confidence in the intrinsic value of greenbacks and national bank-notes that brought down the gold premium, because our Federal debt was rapidly being reduced instead of increasing all along, as has been the case in the Argentine Republic. With their great enterprise in all directions, and insatiable loan absorption, the Argentines have created a situation which is, and remains, dangerous, their great present prosperity and heavy immigration notwithstanding.

Pittsburgh Freights.—The following new reduced freight rates from Pittsburgh to St. Paul and Duluth, Minn., went into effect on Saturday, the 1st inst. The new rates are via the Duluth, South Shore and Atlantic Railway, and are as follows: First class, \$1; second, 90 cents; third, 70 cents; fourth, 45 cents; fifth, 35 cents; sixth class, 30 cents per 100 pounds. Iron will be 35 cents in less than carload lots and 80 cents in carloads.

George A. Schuler, a member of the well-known firm of McClure & Schuler, engineers and contractors, Pittsburgh, Pa., died at his residence in that city on Sunday, the 2d inst., in the 61st year of his age. Mr. Schuler was in his usual health until the Saturday evening preceding his death, when he was suddenly stricken with apoplexy while attending to business. He was taken home and died the next morning, as stated. Mr. Schuler had an extensive acquaintance among the iron and steel manufacturers of the country, and had an enviable reputation for honesty and integrity in all his dealings. His funeral took place on Tuesday, the 4th inst., from his residence in the above-named city.

Quite an unusual proceeding among railroad corporations is the action of the Atchison, Topeka and Santa Fé and the Chicago, Santa Fé and California railroad companies, in filing certificates at Springfield, Ill., on the 30th ult., decreasing their capital stock. The capital of the former was cut from \$10,000,000 to \$5,000,000, and that of the latter from

\$30,000,000 to \$15,000,000. A great many other companies would doubtless more nearly approximate the actual investments made by the original stockholders if they were to follow the example set by these two companies.

The Message and Accompanying Documents.

President Cleveland's message, to a very considerable extent, is an epitome of the reports from the several departments. Respecting foreign relations the President has the satisfaction of announcing that: "there is no existing subject of dispute between the United States and any foreign power that is not susceptible of satisfactory adjustment by frank diplomatic treatment." By the cessation of Chinese immigration it is hoped, in reference to our relations with China, that a cause of unkind feeling has been permanently removed. The recommendation as to a treaty of reciprocity with Mexico is renewed, and the reorganization of the consular service is referred to as a serious matter. Little favor is shown to the contemplated Congress of American States to be held in Washington next year, the President expressing the opinion that "commercial policies inducing freer mutual exchange of products can be most advantageously arranged by independent but co-operative legislation."

The total revenues of the Government for the fiscal year ended June 30, 1888, amounted to \$379,266,074.76, of which \$219,091,178.63 was received from customs duties and \$124,296,871.98 from internal revenue taxes. The total receipts from all sources exceeded those for the fiscal year ended June 30, 1887, by \$7,862,797.10. The ordinary expenditures of the Government for the fiscal year ended June 30, 1888, were \$259,653,958.67, leaving a surplus of \$119,612,116.09. The decrease in these expenditures as compared with the fiscal year ended June 30, 1887, was \$8,278,221.30, notwithstanding the payment of more than \$5,000,000 for pensions in excess of what was paid for that purpose in the latter mentioned year. The revenues of the government for the year ending June 30, 1889, ascertained from the quarter ended September 30, 1888, and estimated for the remainder of the time, amount to \$377,000,000; and the actual and estimated ordinary expenditures for the same year are \$273,000,000, leaving an estimated surplus of \$104,000,000, exclusive of the requirements of the Sinking Fund, amounting to \$47,000,000 annually. The estimates of the appropriations required for the Government service for the fiscal year which will end June 30, 1890, aggregate \$323,467,488, which is \$3,063,305 less than the estimates for 1889 and \$3,530,511 more than the appropriations for the current fiscal year. The cost of collecting the customs revenues for the last fiscal year was 2.44 per cent.; for the year 1885 it was 3.77 per cent. The excess of internal revenue taxes collected during the last fiscal year over those collected for the year ending June 30, 1887, was \$5,489,174.26, and the cost of collecting this revenue decreased from 3.4 per cent. in 1887 to less than 3.2 per cent. for the last year. The tax collected on oleomargarine was \$728,948.04 for the year ending June 30, 1887, and \$864,139.88 for the following year.

With regard to the surplus devoted to the purchase of bonds, the President remarks: "If this surplus, under the operation of just and equitable laws, had been left in the hands of the people it would have been worth in their business at least 6 per cent. per annum. Deducting from the amount of interest upon the principal and premium of these bonds for the time they had to run at the rate of 6 per cent.

the saving of 2 per cent. made for the people by the purchase of such bonds, the loss will appear to be \$55,760,000. This calculation would seem to demonstrate that if excessive and unnecessary taxation is continued and the Government is forced to pursue this policy of purchasing its own bonds at the premiums which it will be necessary to pay, the loss to the people will be hundreds of millions of dollars." The purchases of bonds have been (par value), up to November 30, \$94,700,400, and the premiums have amounted to \$17,508,613. Counting the money as worth in the hands of the taxpayers 6 per cent., there is on this transaction a net loss of \$55,760,000. On November 30 the silver coinage amounted to \$312,570,999, of which \$60,970,990 were in actual circulation, together with \$237,418,346 in the form of certificates. The suspension of silver coinage is earnestly recommended.

Of more direct interest to manufacturers are the references made to the plans and specifications of the Board of Ordnance and Fortifications, as provided for in the act of September 22 last, calling for forgings for heavy guns and mortars. The bids for the steel forgings are to be opened on December 20, 1888, and for the mortars on December 15, 1889. A board of ordnance officers was convened at the Watervliet Arsenal on October 4, 1888, to prepare the necessary plans and specifications for the establishment of an army gun factory at that point. The preliminary report of this board, with estimates for shop buildings and officers' quarters, was approved by the Board of Ordnance and Fortifications November 6 and 8. The specifications and form of advertisement and instructions to bidders have been prepared, and advertisements inviting proposals for the excavations for the shop building and for erecting the two sets of officers' quarters have been published. The detailed drawings and specifications for the gun factory building are well in hand and will be finished within three or four months, when bids will be invited for the erection of the building. The list of machines, &c., is made out, and it is expected that the plans for the large lathes, &c., will be completed within about four months, and, after approval by the Board of Ordnance and Fortifications, bids for furnishing the same will be invited. The machines and other fixtures will be completed as soon as the shop is in readiness to receive them, probably about July, 1890. Under the provisions of the Army bill for the procurement of pneumatic dynamite guns the necessary specifications are now being prepared and advertisements for proposals will issue early in December. The guns will probably be of 15 inches caliber and fire a projectile that will carry a charge each of about 500 pounds of explosive gelatine with full caliber projectiles. The guns will probably be delivered in from six to ten months from the date of the contract, so that all the guns of this class that can be procured under the provisions of the law will be purchased during the year 1889.

The business methods of the Navy Department have been improved by consolidating the purchasing of supplies under a single responsible head, so that at the present time about 90 per cent. of the total purchases are made by contract and after competition.

The continued growth and prosperity of the country is in nothing shown more forcibly than the statistics of the Post-Office Department, whose revenues have increased from \$19,772,000 in 1870 to \$52,700,000 in 1888, despite reductions of postage which have enormously reduced rates of revenue while greatly increasing its business. Taken together, the reports present a cheerful record, barring the mischievous tendencies of combined capital, the surplus problem and silver glut.

TRADE REPORT.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St. }
PHILADELPHIA, Pa., December 4, 1888. }

Pig Iron.—The market remains in much the same condition as reported for some time past, and, so far as can be seen, is neither better nor worse. But it is very dull, and consumers decline to buy beyond what is necessary to carry them to the end of the year. On the other hand, furnaces are so well sold ahead that they suffer no inconvenience from a period of dullness, which is believed to be only temporary. Local brands of standard quality are unusually scarce, so that as far as they are concerned the chance of lower prices appears to be somewhat remote. Other descriptions can be had in moderate quantities at \$16, \$17 and \$18 at tide for the three grades, and if the demand does not soon improve they may possibly be had at slight concessions from these figures, but as yet the quantity is not large enough to cause serious anxiety on that point. Nevertheless, the market is a waiting one, and likely to be influenced by developments within the next two or three weeks, be they favorable or the reverse. As to the probabilities, it is almost impossible to form any decided opinion. The large and increasing output in the face of a dull market usually indicates lower prices, but in the present instance there is the singular accompaniment of comparative scarcity, firmness and increasing cost of production. Ores are scarce and dear, and likely to be still more so, so that many furnaces it will be impossible to continue making iron, even at present prices, and come out whole. The question of consumption, therefore, is a most important consideration. If consumption can be maintained somewhere near what it has been during the past three months prices of Pig Iron (owing to higher cost, &c.,) ought to advance. Should there be even a slight falling off in consumption, it will be impossible to maintain prices with so many furnaces competing for business. As to the chances for consumption it is not easy to form an opinion. For the next month, possibly for a longer period, there is sure to be some shrinkage, owing to the holidays, stock taking, &c., and whether prices will suffer in the meantime is somewhat uncertain. A large business is considered a certainty in many leading departments, but to steadily absorb at the rate of 7,000,000 tons of Pig Iron a year will not permit any important interest to lag very far behind. Considerations of this kind cause buyers to hesitate, and, for the same reasons, sellers are not inclined to force matters, as chances in their favor may be quite equal to those on the other side. Sales in the meantime are at prices varying from \$16 to \$16.50, at tide, for Gray Forge; \$17 @ \$17.50 for No. 2 Foundry, and \$18 @ \$19 for No. 1. A few favorite brands command a premium of 50¢ @ \$1 per ton, and by the same rule unknown brands or off grades have to be sold at similar concessions, but for standard qualities prices are steady as above quoted.

Blooms.—There is a good demand and sales are on a somewhat large scale at prices within the limits named, varying with analysis, delivery, &c., say: Steel Nail Slabs, \$29 @ \$29.50, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 per "bloom" ton of 2464 lb.

Muck Bars.—The market is easier, and, while there is no great pressure to sell, prices have not been fully maintained.

Good qualities command about \$30, delivered, or for deliveries f.o.b. cars; at mill, \$29 @ \$29.50 is generally quoted.

Bar Iron.—The market has not changed appreciably either way. Mills that were a little short of work have, in some instances, quoted low prices to secure orders to run them during the balance of the month, while others have remained firm at the old prices. There is a great deal of work in prospect, and it is thought that several important orders will be taken in the course of a few days, but there are plenty of bidders at 1.7¢ @ 1.8¢ for good qualities of Bars, and 1.85¢ @ 1.9¢ for the best. The store demand is said to be satisfactory, and, on the whole, the outlook is not discouraging. Car builders are again in the market for large lots, but very low quotations are necessary to catch business of that kind. Skelp Iron is dull, although mills are generally full of work for the present, and additional orders could be had for fair sized lots at 1.85¢ @ 1.87½¢, although sellers ask about 1.95¢ for Grooved Skelp.

Plate and Tank Iron.—The demand is fair, and considering the large amount of work in hand manufacturers ought to feel satisfied. Prices are very unremunerative, however, and in bidding for a good-sized order it is necessary to quote very close figures to stand any chance of getting in. But there is a good deal of small work sent in from day to day, so that the average is perhaps better than appears on the face. Quotations are irregular, but in most cases asking prices are as follows: Ordinary Plate and Tank Iron, 2.05¢ @ 2.15¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.25¢ @ 2.3¢; Shell, 2.7¢; Flange, 3¢ @ 3½¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—Reports are a little at variance in this department. Some of the large mills appear to have secured additional orders of considerable importance, while others are doing comparatively little. The fact that prices show weakness and irregularity is pretty good evidence that somebody wants business. Quotations nominally as follows: 2.05¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—The heavy demand is about over for the season, so that there is only a retail business for the present. Small lots of best makes are quoted as follows:

Best Refined, Nos. 26, 27 and 28....	3¼ @ 3½¢
Best Refined, Nos. 18 to 25....	3 @ 3½¢
Common, ¼¢ less than the above.	
Best Bloom Sheets, Nos. 26 to 28....	4¼ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....	4 @ 4½¢
Best Bloom Sheets, Nos. 16 to 21....	3½ @ 3¾¢
Blue Annealed.....	2.8 @ 3 ¢
Best Bloom, Galvanized, discount.....	62½ ¢
Common, discount.....	87½ ¢

Merchant Steel.—The demand is not as brisk as it has been, but prices are unchanged, as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Rails.—Business continues dull, and, while prices are probably a little steadier, there is not much disposition to place orders at present. It is understood that \$29 at tide and \$29 at Pittsburgh are the prices agreed upon by the Pennsylvania mills, but it is not unlikely that most of the large orders have been placed, so that only a small business can be expected for the present.

Old Rails.—The market is a trifle easier, although the few in store here are held at high figures. Interior deliveries are quoted \$24.50 @ \$25, but the offerings are somewhat larger, so that buyers are less urgent to place orders, and the general position is hardly as strong as it was a little while ago.

Scrap Iron.—Market somewhat easier, as consumers are not buying to any extent, while the offerings are more liberal than they have been. Nominal quotations are about the same as last week, although the feeling is slightly weaker, at the following prices asked: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Nails.—The position does not improve, and while prices are nominally unchanged there are a good many Nails for sale at less than quoted prices, which are from \$1.90 to \$2 for standard makes. Outside lots are offered in carload lots at from \$1.80 to \$1.85, and while they do not meet with much favor they tend to unsettle the market for such Nails as are considered of desirable quality.

Wrought-Iron Pipe.—The market is extremely dull, and to effect sales in quantity very considerable concessions would be necessary. Some of the mills that were unable to make deliveries when the market was in better shape are now overloading the market with goods that ought to have been delivered several weeks ago, hence the weakness. Discounts nominally as follows: Black Butt-Welded, 52½ ¢; Galvanized do., 42½ ¢; Black Lap-Welded, 62½ ¢; Galvanized do., 52½ ¢; Boiler Tubes, 60 ¢.

Mr. Edwin R. Mann, 147 South Fourth street, Philadelphia, has been appointed sales agent for the Acme Low Phosphorus Pig Iron, made at the Norristown Furnace. This Iron is made from special foreign Ores, and is expected to meet the needs of manufacturers of the finest grades of Steel.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, December 3, 1888. }

The condition of trade in numerous lines has been somewhat disappointing during the past week. Hence an outcropping of bearish sentiment is noticeable, and predictions of lower prices are frequent, especially among those whose interests are directly connected with the cruder forms of Iron or Steel. This is traceable not so much to the attempts of manufacturers to force trade as to the shrinkage in the demand. It is argued that if buyers hold off for even a short time there will be such an accumulation of stocks in makers' hands, or such a cleaning up of orders, that manufacturers will make vigorous efforts to secure business, with, of course, the usual result. On the other hand, there are reasons for taking a cheerful view of the situation, which are not wholly disregarded by watchful buyers. This being the time of the year when trade is usually very dull, the present quietude is not particularly ominous. Should it extend into January, good reason for apprehension would then exist. The railroad companies are still buying cars, orders for several hundred having been placed last week, and 2000 more will be purchased this week. The demand for Iron in that quarter will be large. It will be still larger if the Western railroad companies are able to agree upon a plan which will not only put a stop to their reckless competition with one another, but will enable them to establish remunerative freight rates. The effective settlement of the railroad problem would radically change the condition of business in very many branches of the Iron trade. While the situation is unsettled in Crude Iron and heavy forms of Iron and Steel, the reverse

is the case in manufactured products. The manufacturers of Steel goods, such as are handled by the Hardware trade, are getting matters in shape preliminary to an advance in prices. Steel Nail manufacturers, having sounded the lowest depths, now have hopes of better times. The Barb Wire trade will probably be the next to follow. Those in a position to test the course of the current are anticipating an advance in Screws. Another twist upward is to be made in Nuts. As the demand for Hardware is very active at present, these expected advances may be sustained, at least until another dull period intervenes.

Pig Iron.—The volume of business declined last week as compared with the preceding week. An increased quantity of Strong Coke Foundry Pig was sold, and the prospects are bright for considerably larger transactions in that line, but for other kinds the demand was very light. The Calumet Furnace and the remodeled Bay View Furnace were blown in last week to make Pig Iron for the general market, and the prospective addition to the local supply from those furnaces has had a weakening effect on prices, but not decided enough to cause a change in quotations. It is asserted that the Jackson County furnace companies are selling very little, if any, Iron in this market at their advanced price, other Soft Ohio Irons which are available at \$17.50 @ \$18 receiving the preference at the lower rates. Southern Coke Iron is very quiet at present, the higher prices asked for low grades being due to the demand for them in other markets. The large orders expected for Lake Superior Charcoal Iron have not yet been placed, but they cannot be deferred long, in view of the past and prospective orders for cars. Some complaint is made on the score of collections from the general foundry trade, which is an element of discouragement that has quite recently made its appearance. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, Nos. 1 and 2, \$20; Nos. 3 to 6, \$20.50 @ \$21; Alabama Car Wheel, \$26.25; Jackson County Softeners, No. 1, \$18.60; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Blackband), No. 1, \$19.50 @ \$20.50; other Ohio Soft Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$18.50; No. 2, \$17 @ \$17.50; No. 3, \$16 @ \$16.50; Coke Bessemer, \$17.50 @ \$18; Southern Coke, No. 1 Foundry, \$17.25; No. 2 Foundry and No. 1 Soft, \$16.75; No. 3 Foundry and No. 2 Soft, \$16.50; Gray Forge, \$16.

Bar Iron.—More good orders from manufacturing consumers are in the market, including some from car builders. The Pennsylvania Company will open bids for 2000 cars on the 7th inst. The Bar Iron manufacturers are still maintaining a firm front and quote full prices for deliveries next year, but some of them are now offering to make very prompt shipments, showing that they are not so well supplied with work as they have been. They quote 1.72¢ @ 1.75¢, half extras, for Common Iron, f.o.b. Chicago, and ask 50¢ @ \$1 per ton more for Car Iron, although merchants are able to do somewhat better in placing assorted orders. Small lots from store are now selling at 1.90¢ @ 2¢, according to quantity and quality, with stocks in warehouses badly broken.

Structural Iron.—Although plenty of work is in prospect it is taking shape very slowly, so that the past week has been exceedingly quiet. Mill orders can be placed at the following rates, f.o.b. Chicago: Angles, 2.15¢; Universal Plates, 2.20¢ @ 2.25¢; Tees, 2.55¢ @ 2.60¢; Beams and Channels, 3.40¢. Store prices for small lots are unchanged at 2.35¢ @ 2.50¢ for Angles, 2.60¢ @ 2.70¢ for Tees, and 3.80¢ for Beams.

Plates, Tubes, &c.—There is a notable lack of large orders for Plates, but a very active business is still being done in small lots, which are needed for marine repair work. Store prices are very firm. Boiler Tubes are weaker from mill, but with small stocks here prices are well maintained on store lots. Quotations on small lots from store are as follows: Heavy Sheets, Nos. 10 to 14, 2.60¢ @ 2.70¢; Tank Iron, 2.55¢ @ 2.65¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron, 4.25¢; Flange Steel, 3.75¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢. Boiler Tubes, 60 % off.

Sheet Iron.—The demand from store is very heavy, jobbers generally reporting an excellent trade. They quote small lots at 3.10¢ for No. 24; 3.20¢ for Nos. 25 and 26, and 3.30¢ for No. 27. Mill lots are selling on a basis of 3¢ at mill for No. 27, but on large orders or favorable deliveries this price would be slightly shaded.

Galvanized Iron.—Jobbers' stocks are as badly broken as ever, while the demand keeps up from all classes of consumers. Small lots are selling at 60 % and 5 % off on Juniata, and 60 % and 10 % off on Charcoal.

Merchant Steel.—A quiet week is reported in this line. Prices are now very much unsettled in Bessemer Bars, and it is impossible to make a quotation, as each transaction is conducted on an independent basis. Store prices are as follows: Tool Steel, 8.50¢ @ 9.50¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢ @ 2.75¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—The situation as to prices is not so demoralized as the daily papers allege. The parties in interest will endeavor to sustain the old rate of \$30 here and \$28 at Pittsburgh, and it looks as if they will succeed. Business is not very heavy, but the local mills are picking up small orders every week. Last week they booked something over 5000 tons, mainly for delivery next year. Orders for a considerable quantity are now in the market from the Southwest.

Old Rails and Wheels.—The condition of the Old Iron Rail market is perplexing. A sale of 1000 tons was made to a local consumer at \$23, and another lot of 1000 tons is reported to have been sold at \$23.50. At the same time a considerable quantity has been secured at \$22 @ \$22.50, delivered at Milwaukee, from the Northwest, and the Mahoning Valley mills seem to be able to get a supply of Rails from other points at the equivalent of \$22.50 here. Sellers insist that \$23 @ \$23.50 should be the Chicago quotation, as the supply is limited. Car-Wheels are quiet and nominally quoted at \$19.50.

Scrap.—General business has been very quiet, particularly in No. 1 Forge. Some 200 tons of Mill Iron were sold for \$16, and a large quantity of Mixed Steel was disposed of at \$12.50. Cast Scrap is utterly lifeless. Some strictly No. 1 Railroad Cast was offered at \$14 without takers. Mixed Country Scrap is quoted at \$14 @ \$15. The railroads are offering considerable quantities of Scrap for sale. Dealers' prices for selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$20.50 @ \$21; Track Scrap, \$19.50 @ \$20; Fishplates, \$22; Horseshoes, \$20; Axles, \$26; No. 1 Mill, \$15.50 @ \$16; Pipes and Tank, \$13.50; Light Wrought, \$10; Cast Machinery, \$13.50 @ \$14; Stove Plate, \$11.50; Cast Borings, \$9 @ \$9.50; Wrought Turnings, \$11; Axle Turnings, \$13.50 @ \$14; Coil and Leaf Steel, \$17; Locomotive Tires, \$16.

Hardware.—The demand for Shelf Hardware continues very strong, the

Thanksgiving holiday having made a break merely in interrupting the work of getting out orders and throwing a heavy press of business on the latter part of the week. The demand is very general, but at the same time it is running largely into Shelf Goods. Shot has declined further to \$1.10 regular. No other change in prices worthy of mention has been made, but there is a probability of higher prices in a number of lines. The manufacturers of Steel Goods issued a notice requiring specifications to be sent in before December 1 on all unfilled contracts, or they would be canceled at that time. This is regarded as preliminary to an advance in price. Screws are very firm, and the trade now seems to be in shape to sustain an advance. Nuts are to be marked up very soon. The Tackle-Block manufacturers have also about adjusted their differences, which will correct irregularities in price. Heavy Hardware is quiet and without special feature.

New Car Axles.—The manufacturers of Car Axles have agreed to advance the price of Common Axles to 2.20¢.

Nails.—Heavy quantities of Steel Nails are now being sold by the manufacturers whose prices come nearest to buyers' views, and jobbers here and at points further West are laying in good stocks. As far as can be ascertained manufacturers are refusing to quote on deliveries next year, but are only selling for immediate or early shipment. It is reported that arrangements will probably be completed by the middle of the month for a combination of the Wheeling and other Ohio River manufacturers, when prices will be advanced. A guarantee fund is to be put up by each manufacturer, to be forfeited in case of cutting. The Wheeling manufacturers have given up for the present the hope of establishing a national pool, and, as the bulk of the Steel Nails produced in the country are made in the Ohio River Valley, they will try the experiment of controlling prices there, in the belief that some benefit can thus be obtained. Prices now are undoubtedly below cost, and this is a very good time to arrange for an advance in anticipation of the spring demand. The Chicago and Southern Illinois manufacturers have agreed to co-operate with the Ohio River manufacturers in sustaining prices, although they have not joined the combination. They are heartily tired of the unsatisfactory situation of the Steel-Nail trade, and assert their intention to do their utmost to improve it. Small lots of Steel Nails are still being sold at \$1.95 @ \$2 from store, and \$1.90 for carloads on track, but large lots are 10¢ lower. Wire Nails are a shade lower, being now obtainable at \$2.55 in small lots, but if Steel Nails advance they will also firm up again.

Barb Wire.—The demand is a little better. A noticeable feature of the current business is the occasional receipt of an order for a considerable quantity from merchants who write that they are buying it not to meet their immediate wants, but because they consider it cheap, and therefore good stock to hold until the spring demand sets in, if, indeed, the manufacturers do not advance the price in the meantime, in which case the purchase will be a still better one. Some manufacturers are already asking a better price, believing that the outlook warrants it. Small lots are unchanged at 2.90¢ for Painted and, 3.60¢ @ 3.65¢ for Galvanized, with the usual difference for carloads.

Pig Lead.—This market has been very active for the past few days. Over 900 tons of Common and Corroding Lead were sold to consumers for delivery this month and next, at prices ranging from 3.42¢ to 3.55¢ at the close, the greater portion going at 3.50¢.

Geo. S. Hall & Co. succeed W. S. Kessler & Co. as Western sales agents of the Toledo Bolt and Nut Company. Their office will continue to be at 115 Dearborn street, Chicago, Room 53. Mr. Hall was formerly a partner of Mr. Kessler, who has retired from this firm to engage in another line of business.

B. L. Keen & Co., manufacturers' agents for the sale of Bar Iron, Steel, Beams and Channels, Railway Supplies, &c., have removed from 184 Lake street to Room 545, Rookery Building, Chicago.

The Allegheny Bessemer Steel Company, of Pittsburgh, have appointed B. B. Kerr Western agent for the sale of their Steel Rails. Mr. Kerr is well acquainted with the railway fraternity, having been connected with Pettibone, Mulligan & Co., of Chicago, for the past six years, handling railway supplies. His office for the present will be located at 243 Lake street, Chicago.

The Chicago Crucible Steel Casting Company have established city offices in a fine suite of rooms on the second floor of 154 and 156 Lake street, Chicago.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts.,
CINCINNATI, December 3, 1888.

Pig Iron.—The tenor of the local Pig-Iron market has changed but little during the week under review, but there has been a less heavy business, although the market has been by no means dull. A strong tone has prevailed and full prices have been realized. Southern furnaces, being so largely sold ahead, have figured less prominently, while Ohio and Pennsylvania Irons have sold more readily. The curtailment of production to some extent in Jackson County Irons has resulted in higher prices for some grades. The demand has continued to be largely for Mill grades, but there have been larger inquiries for Car-Wheel, Mottled, White and "off" grades of both Mill and Foundry make. Some of the local houses have experienced during November the heaviest month of their history, but this has been due to exceptional conditions and is not indicative of the trade at large, but reflects rather the entrance of new capital into the Iron interest. Among the sales have been 1200 tons Southern Car-Wheel Iron for delivery next year at the rate of 200 tons per month at outside quotations. Sales of Mill grades are reported in lots of 700, 3000, 1000, 2000 and 500 tons, and Foundry grades in lots aggregating 4000 tons. One contract for 12,000 tons Cold Forge Iron is about to be closed to-day between \$14.25 and \$14.50 per ton. The following are the approximate quotations for the local market, cash, f.o.b. Cincinnati:

Foundry.

Southern Coke, No. 1 (new classification).....	\$16.25 @ \$16.75
Southern Coke, No. 2 (new classification).....	15.50 @ 16.00
Southern Coke, No. 3 (new classification).....	15.00 @ 15.25
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	18.00 @ 18.50
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.50 @ 18.00

Forge.

Strong Neutral Coke.....	15.00 @ 15.25
Mottled Neutral Coke.....	14.00 @ 14.25
Gray Forge.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Old Material.—There has been a little stronger tone prevailing for both Old Rails and Wheels under moderate offerings, and

a better demand; 400 tons Old Rails sold at \$19, cash, here and Old Wheels have sold at \$23, spot, cash.

Manufactured Iron.—There has been a fair volume of business during the week and a firmer tone has prevailed. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, 3½¢ @ 4½¢ per lb.

Nails.—The market has remained steady, with a moderate jobbing trade. Jobbing prices are based upon 12d @ 40d, which sell at \$1.95 per keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$1.95 and Steel Wire Nails at \$2.65 per keg.

Louisville.

LOUISVILLE, KY., December 3, 1888.

Pig Iron.—The market has been quiet during the week, and sales only in small quantities have been effected. There is a disposition to make slight concessions to buyers for large quantities, and it is thought that prices will improve after the first of the year, as at present there are few buyers who desire to make purchases for future delivery until after they have taken stock and this year's business is closed up. We think the weakness of the market is attributed to the close of the season rather than to large quantities of Iron being offered, as Southern furnaces are well sold up, and very little Iron is offered by furnaces that were expected to have been in blast before this. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$16.50 @ \$17.00
Southern Coke, No. 2 Foundry, new classification.....	16.00 @ 16.50
Southern Coke, No. 3 Foundry, new classification.....	15.50 @ 16.00
Gray Forge.....	15.00 @ 15.50
White and Mottled, different grades.....	14.00 @ 14.50
Silver Gray, different grades.....	15.50 @ 16.50
Southern Charcoal, No. 1 Foundry.....	17.75 @ 18.25
No. 1 Mill.....	16.00 @ 17.00
Southern Car-Wheel, standard brands.....	22.75 @ 23.75
Southern Car-Wheel, other brands.....	19.00 @ 21.00
Hanging Rock Coke, No. 1 Foundry.....	17.00 @ 17.50
Hanging Rock Charcoal, No. 1 Foundry.....	20.75 @ 23.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Hanging Rock, Warm Blast.....	19.00 @ 20.00

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, December 4, 1888.

The general Iron situation remains much the same as noted in our report of a week ago. December is usually a dull month, when buying is done sparingly, so that the year may be closed with as little stock as possible.

Pig Iron.—A fair degree of activity prevails, although there is not the volume of business there was some time ago. Consumers generally are pretty well covered for the rest of the present year, and furnacemen are well sold up; some of them will be off the market not only for this month, but for two or three months, having contracts sufficient to absorb their entire production during that time. It is intimated, however, that there is a disposition on the part of some furnacemen to talk bearishly in order to beat the Ore market, as the time is now approaching when it is customary with many of them to make contracts for Ore; it is not uncommon for some furnacemen to contract in January for a year's supply of Ore to be delivered along as they need it, and they strive to get the market for Ore down to the lowest point possible before they buy. It is doubtful whether as large contracts for Ore will be made as formerly. It is probable a good many furnacemen will feel more like buying as they need it in preference to contracting for a six or twelve months' supply. However this may be, some fur-

nacemen are refusing to contract for future delivery at present time, and the outlook generally warrants the belief that there will be a good healthy market for some time to come. We quote prices for immediate or near-by delivery as follows:

Neutral Gray Forge.....	\$15.75 @ \$16.25, cash.
All Ore Mill.....	16.75 @ 17.00, "
White and Mottled.....	15.00 @ 15.25, "
No. 1 Foundry.....	18.00 @ 18.50, "
No. 2 Foundry.....	17.00 @ 17.50, "
No. 3 Foundry.....	16.50 @ 16.75, "
No. 1 Charcoal Foundry.....	23.50 @ 24.00, "
No. 2 Charcoal Foundry.....	21.00 @ 22.00, "
Cold Blast Charcoal.....	25.00 @ 28.00, "
Bessemer Iron.....	17.25 @ 17.50, "

Included in the sales reported were several thousand tons of Gray Forge at \$16, cash, 1000 tons at \$15.75, cash, and some smaller lots at \$16.15 @ \$16.25.

Muck Bar.—There is still considerable inquiry for immediate delivery, and, with but little offering, the market may be quoted at \$29 @ \$29.50, cash, with a sale of 1000 tons reported on January delivery at \$29.60, cash. So far as your correspondent can learn there have been no actual sales above the prices quoted.

Spiegel.—Is quoted at \$27.50 @ \$28 for 20%, cash, and Ferromanganese at \$56.50 @ \$57, cash, for 80%.

Manufactured Iron.—The demand is not as active as it was a month or more ago, but the mills are still pretty fully employed in working old contracts. There is not the inquiry for Skelp Iron that there has been, but it always drops off this month, if not before, and the effect will be to increase the capacity for making Merchant, as those mills making a specialty of Skelp and doing but little else since early in the summer will now be wanting orders for any kind of Iron they can make in order to keep their mills going. Prices remain as last quoted: Bars, 1.80¢ @ 1.85¢; Plate, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢; all 60 days, 2% off for cash. Skelp Iron is weaker, but may still be quoted at 1.85¢ @ 1.90¢ for Grooved, and 2.10¢ @ 2.12½¢ for Sheared.

Nails.—There is no improvement to report in the Nail trade, and not likely to be until toward spring. Pittsburgh manufacturers are still asking full card rates upon a basis of \$1.90 for 12d @ 40d, 60 days, 2% off for cash, but they are not able to effect sales, nor is it to be expected, as long as they can be bought from 25¢ to 30¢ less per keg elsewhere. Pittsburghers say they prefer to let their factories stand idle to running them at a loss, and they claim that even at the full card the margin for profit is small. In regard to the price for the 10,000-keg order recently placed in the Wheeling district, we learn authoritatively that it was \$1.66, net, cash, showing that the report made in regard thereto in *The Iron Age* two weeks ago—\$1.65 net, cash—was not far from the mark.

Wrought-Iron Pipe.—The demand continues light, as it always is at this particular time, and no improvement can reasonably be looked for until toward spring; trade is nearly always light during the winter season, and the Pipe mills will no doubt curtail their production considerably for some time to come. Prices remain unchanged. Discounts on Black Britt-Welded Pipe, 52½¢; on Galvanized do., 45¢; Black Lap-Welded, 62½¢; on Galvanized do., 52½¢; Boiler Tubes, 60¢; 2-inch Tubing, 13¢ per foot, net; 5½-inch Casing, 40¢ per foot; all in large lots.

Old Rails.—Sales of American Tees at \$25 @ \$25.25, at which price the market is fairly active and steady. Now that the cold weather has set in the work of lifting will soon be very much curtailed, if not suspended, and a firmer market is not unlikely.

Steel Rails.—Heavy sections are still quoted at \$28 @ \$28.50, cash, at mill, and while the market is reported firmer it is said that there is no difficulty in placing desirable orders at \$28. The new mill of the Allegheny Bessemer Steel Company will not be ready to start for some time to come, although the company have booked some orders.

Billets, &c.—Bessemer Steel Billets are quoted at \$28.50 @ \$28.75, cash, at makers' mill, and ditto Nail Slabs at \$28 @ \$28.25. Some of the mills, including Carnegie, Phipps & Co. and Park Bros., have large contracts for Ship Plates. Domestic Rail Crops may be quoted at \$19.50 @ \$20; sale of 1000 tons Domestic Bloom Ends at \$19.50.

Railway Track Supplies.—Spikes are still quoted at \$2.20, 30 days, but this, we believe, means delivered where the freight rates do not exceed 10¢ @ 15¢ per 100 lb; brokers report sales at 2.05¢ f.o.b. cars, Pittsburgh. Splice Bars remain unchanged at 1.85¢ @ 1.90¢, and Track Bolts at 2.85¢ with square, and 2.95¢ with square and hexagon Nuts.

Old Material.—There is a fair business, but prices remain unchanged. Sales No. 1 Wrought Scrap at \$21 per net ton; Wrought Turnings, \$18 @ \$14; Car Axles, \$25.50 @ \$26.50; Old Car-Wheels, \$20 gross; Cast Scrap, \$15.50 @ \$16. Sales short pieces Steel Rails at \$18.50; Open-Hearth Scrap Steel, \$18.50 @ \$19.25.

Naylor & Co., of 99 John street, announce that they have opened an office in the Lewis Block, where they will receive inquiries and orders for domestic as well as imported Iron, Steel and Metals. They suggest that their customers west of the Allegheny Mountains correspond with their Pittsburgh office.

Detroit.

WILLIAM F. JARVIS & Co., under date of December 3, report as follows: The market is more active than it has been for the past month, and a number of buyers are casting about for round lots of Car-Wheel and other grades, but sellers are generally holding firm at present prices and there is a strong upward tendency. There is usually an active trade in December, and from the inquiries received from different parts of the country it looks as if this month would be an exceptionally good one. Numerous small orders have been placed, and some of considerable magnitude. Car-Wheel Irons are most in demand, but a good trade is being done in the best brands of Mahoning Valley Coke Iron, with a few good sales of Southern. We report an active market and quotations as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.50 @ 19.00
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 1.....	17.75 @ 18.25
Southern Silvery.....	17.00 @ 17.50
Southern Gray Forge.....	16.25 @ 16.75
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.50 @ 21.50

New York.

Office of *The Iron Age*, 66 and 68 Duane street, New York, December 5, 1888.

Pig Iron.—The local market is without any new features, except that consumers are, on the whole, showing considerable apathy, while some sellers are not quite so confident as they have been lately. On the whole Southern furnacemen are those who are most enthusiastic on the future, and are acting up to their convictions by declining to sell for longer delivery than the first quarter of 1889 at any notable concessions. Some agents report that they are making deliveries now which were delayed in the past, when they substituted other Irons. Our blast-furnace returns are

not yet sufficiently complete to enable final figures to be presented thus early in the month, but the reports thus far indicate a further increase. Among the furnaces which have blown in during November and early in December we may name two Hudson, one Troy, in New York; Union, in the Upper Susquehanna district; a second Allentown, in the Lehigh Valley; Mount Laurel, in the Schuylkill Valley; Spearman and Stewart, in the Shenango Valley; the new Cameron, at Emporia, Pa.; the second Cherry Valley, in Ohio; Akron, one Floodwood and one Fannie, in the Hocking Valley; one Union and Calumet, in Chicago; the remodeled Bay View, at Milwaukee; a third Ensley, at Birmingham and No. 3, South Pittsburgh, Tenn. Merion and Montgomery, in the Schuylkill Valley, are to blow in soon, and the first of the famous new plant of the Pennsylvania Steel Company, in Maryland, is soon to be ready. Against this we can only enumerate the blowing out of one of the Lock Ridge furnaces of the Thomas Iron Company; of one of the Bethlehem plant; of the Lebanon Valley, which is to resume on the 18th of this month, and of one of the Bird Coleman furnaces. We continue to quote Standard to Choice No. 1, \$18 @ \$19; No. 2 Foundry, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—The market is weaker. We quote: Coltness, \$21, nominally; Shotts, \$20.25 @ \$20.75; Langloan, \$20.50 @ \$21, and Dalmellington, \$19.50 @ \$20.

Spiegeleisen.—We quote nominally \$27 for German 20 % Spiegeleisen, and \$54 for Ferromanganese, 80 %, prompt delivery.

Plates.—We quote Iron Tank, 2.1¢ @ 2.2¢; Shell, 2.3¢ @ 2.4¢; Steel Tank, 2.2¢ @ 2.3¢; Shell, 2.4¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3.5¢ @ 4¢.

Structural Iron.—It is reported that very low prices are being made by at least one Western producer in Plates and Structural Iron and Steel, with the exception of Beams, the evident purpose being to keep a large capacity employed. Still, there is considerable work coming up, one Eastern mill reporting that in one day they put in bids for \$450,000 of bridge work. We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2.1¢ @ 2.15¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢. Foreign Beams are 2.65¢ @ 2.75¢.

Bar Iron.—We quote: Carload lots, half extras, Common; 1.70¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢; Refined, 1.8¢ @ 2¢.

Steel Rails.—The situation is not quite clear. There have been no large sales in the East which may serve as the basis of quotations, nor is there any business of any consequence in sight. The Eastern mills are cut out of the Western market entirely, and while low prices are being made in the West, they are being underbid in the South, which is the only territory of any consequence in which they can hope to place much tonnage. Facts are constantly cropping up which prove how low prices went two weeks since. Thus, a large order was placed for delivery at Omaha at \$30.50, which would be equivalent to about \$25 at Pittsburgh. In the last week sales have been made by Pittsburgh and Chicago mills, aggregating about 30,000 to 35,000 tons, and additional orders are in the market, including a large block for a Southwestern system. The prices at which these sales were made are not given out, but it is claimed that an advance over the lowest was realized. The reports of an agreement among the Western mills are without any foundation, the only fact giving color to it being the alliance of the Chicago mills, which will have the good effect, at least, of narrowing down the

number of contestants. To this must be added the fact that for the present, at least, the new Pittsburgh mill has withdrawn from the market on everything but small lots for convenient delivery. As many large orders have been taken by it as its managers deem expedient until they know definitely when they will again work, and how soon they will overcome the hitches which invariably accompany the starting of any great manufacturing plant. The personal element enters so largely into shaping the policy of the near future, so far as the Western mills are concerned, that any moment may bring the demoralization to a close, if in fact that time has not already come. It is asserted that to-day \$29 is the bottom at Chicago, and \$28 at Pittsburgh, and it is possible that some of the quotations cited to controvert that statement were made prior to last week. The losses entailed by the low figures at which Rails have been sold are so heavy that they are not likely to rule long in any case. They may or may not be a thing of the past before this report reaches our readers. It should be remembered that the number of active competitors has narrowed down very considerably. Four Eastern mills and two Western concerns are turning their Steel product into other channels, two mills have booked enough Rails to keep them out of the market for the present, and two are entirely idle. We discuss the situation editorially.

Slabs and Billets.—Although there has been a slight weakening in Slabs and Billets, it has not been so much as may have been expected in view of the recent demoralization in Steel Rails.

Merchant Steel.—Well authenticated reports indicate that the prices fixed by the Merchant Steel Association have been sharply cut, and that the combination is practically inoperative. Agricultural and Merchant Steel have been sold at low prices for 1889 delivery.

Old Rails.—Outside of one sale of 700 tons at private terms there has been no business. We quote, nominally, \$23.25 @ \$23.50.

Financial.

Cuts in railroad tariffs, gold exports, a decreasing bank surplus and contradictory reports respecting conferences among railroad managers have had an unsettling effect in monetary circles, and have not been without their influence in some departments of business. The prevailing feeling is the improbability of an early adjustment of differences respecting freight charges, owing to the refusal of railway lines in the Northwest to enter into the clearing-house plan favored by several of the Southwestern roads. Nevertheless, there are signs of progress. The railroads that are members of the Central Traffic Association were notified on Monday that on December 17 they must, in accordance with action taken by the association at Chicago on Saturday, advance rates on east-bound freight to a basis determined by an advance in the rates between Chicago and New York, as follows: Grain, from 18¢ to 25¢ per 100 lb; provisions, 25¢ to 30¢; live stock, 15¢ to 22½¢, and dressed beef, 35¢ to 50¢ per 100 lb. The Grand Trunk is allowed a differential rate of 45¢ per 100 lb on dressed beef via Montreal, the Chicago and Atlantic also a 45¢ rate, and the Wabash and "Nickel Plate" roads a differential of 48¢ per 100 to New York and Boston. It is understood that this advance will be followed by a restoration of west-bound rates to the figures that were scheduled before the New York Central made its wholesale reduction two weeks ago, but respecting this last supposition there is room for conjecture. Nor is there much hope of relief from the Interstate law.

The Transcontinental Association before adjourning agreed upon a system of graded rates on the traffic to the Pacific Coast. The highest class differential rate in favor of Chicago will be 3¢ less than from New York, while the lowest class rate will be 10¢ less. The St. Louis rate will be 99 % of the Chicago rate; Missouri River rates, 60 %; Buffalo and Pittsburgh, 20¢ less than New York on first class and 5¢ on the lowest class; Cincinnati, Toledo and Detroit, 25¢ less than New York on the highest class and 5¢ on the lowest. Commissioner Fink said that, with the exception of a few details that remained to be arranged, all matters connected with fixing the rates have been practically settled.

Weakness in the Stock Exchange markets was more pronounced. On Friday Lake Shore was a prominent feature, in anticipation of the agreement to advance rates on Eastern business. An unfavorable influence was a sharp break in copper stocks. On Saturday, despite the improved trunk line situation then announced, a selling movement carried the whole list downward. The free sales were attributed to reported difficulties in the Southwest, arising from failure to obtain the assent of a majority of stockholders in the various lines to the clearing-house plan. On Monday there was a drop in Atchison, Topeka and Santa Fé, also a break in New England, coupled with reports of financial trouble in Boston, and the coal shares were weak, owing to orders for restricted production at the mines. On Tuesday a fall in Atchison, Topeka and Santa Fé and in Missouri Pacific had an unsettling effect and the market became feverish. The injunction suit of the Oregon Transcontinental Company against the Oregon Navigation Company was decided in favor of the plaintiff. This decision compels the cessation of construction on the part of the Oregon Railway and Navigation Company and the Union Pacific of lines in Washington Territory competing with the Northern Pacific.

According to the Custom House report the exports of specie from this port during the week were \$2,333,000; total since January 1, \$38,065,000, of which \$12,000,000 is silver, as compared with \$16,988,000 for the same time in 1887. The imports were \$142,000, and since January 1 \$6,989,000, against \$39,283,000 for the same time last year.

The imports of merchandise at this port during the week amounted to \$7,841,000, and the total since January 1 is \$427,761,000, as compared with \$432,979,000 for the same time last year. The exports were valued at \$6,288,000, and included 56,000 packages flour, 586,000 bushels of corn, 31,400 bales of cotton and 10,500,000 gallons of oil. Total exports since January 1, \$274,871,000, against \$287,977,000 for the same time last year.

Government bonds were dull but firm. Quotations as follows:

U. S. 4½, 1891, registered.....	108
U. S. 4½, 1891, coupon.....	108
U. S. 4, 1907, registered.....	127½
U. S. 4, 1907, coupon.....	128½
U. S. currency 6s.....	118

The gross exchanges of 40 cities for the week ended with December 1 showed a decrease of 17.5 % compared with last year. Outside of New York the decrease is 14.4 %. New York decreased 19.1 %, Boston, 7.7 %, Philadelphia, 21.1 %, Chicago, 27.5 %, St. Louis, 18.9 %, San Francisco, 14.2 %, Baltimore, 19.1 %, Cincinnati, 11.8 %, New Orleans, 25.4 %, Duluth, 50.2 %, and Los Angeles, 56.2 %. Kansas City increased 12.4 %, Memphis, 28.9 %, and Topeka 29.1 %. The clearings of 37 cities for the month of November decreased 4.5 %.

In the general markets trade was slow, but, allowing for holiday interruption, the volume of business was fair. On the Produce Exchange prices were inclined to

drop. A break in spot wheat on Monday of 2½¢ a bushel, caused by a large increase in the visible supply, was followed by depression in breadstuffs, and there was more export at the decline. Lisbon took out of this market on Friday 72,000 bushels wheat, the first export trading of consequence in a long while. Foreign markets are still 5¢ @ 10¢ below New York. Cotton was unsettled, with sales of spot limited to special orders. Coffee tends upward, with some excitement. Provisions are irregular, as packers are hammering the market. A new lard refinery in this city is talked about. Dry goods jobbers notice a fair demand; prices generally firm. The result of the action of the Liverpool Salt Trust in advancing prices about 25¢ per sack is lighter importations here on fresh purchases. The weekly bank statement showed a decrease of \$2,235,325. This makes the surplus now held \$10,076,550, against \$5,845,725 at the corresponding time last year and \$6,165,950 in the first week of December, 1888. In spite of the heavy decrease in the reserve the comparison with the figures of preceding years is still favorable. The loans show a gain of \$590,200; specie is decreased \$4,872,900; the legal tenders are up \$1,643,200. The money market has been free from disturbance and the ruling rate on call is still 2½ %. The demand is comparatively limited owing to dullness in the speculative markets. The currency movement also tends to keep rates low. There was a marked falling off in the exports of specie and exchange on London weakened. A favorable indication is the increasing exports of cotton. The interest payments December 1 on \$570,608,963 of bonds amounts to \$14,972,327, and the dividend payments on \$337,609,628 of stock amounts to \$6,228,855; total payments, \$21,201,182, for an off month.

E. E. Gedney was appointed to the presidency of the North River Bank to succeed Levi Appar, deceased, and Daniel Barnes succeeds the late Henry P. Marshall as cashier of the Seamen's Bank for savings.

The Empire State Bank, James W. Conron, President, corner of Broadway and Bleecker street, commenced business yesterday.

Coal Market.

The Anthracite Coal trade is dull in wholesale lines, as little eagerness to buy is manifest in the presence of ample supplies. The Coal producers, in deciding between the alternatives of lower prices or lessened production, are resolved to restrict the output at the mines, beginning December 1. The Reading Coal and Iron Company, on Saturday, shut down some 18 collieries, besides reducing the working hours at the others to three-quarters time. At a meeting of sales agents in this city, on Tuesday, while no formal action was taken, probably for prudential reasons, a tacit understanding is supposed to have been reached, recognizing the necessity for restriction. Contrary to anticipations, the production for the week ending December 1 is only 50,000 tons less than for the previous week, scarcely reflecting the Thanksgiving-day interruption, the total being 780,015 tons, as compared with 770,845 tons for the corresponding week last year. The aggregate since January 1 is 35,528,753, against 31,981,628 for the same time in 1887, an increase of 3,545,000 tons. Quotations remain as before, but actual sales are said to range from 25¢ to 50¢ below the schedule: Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.65; Pea, \$2.75.

Bituminous Coal is in good supply, only temporary embarrassment having been caused by the loss of Coal-laden barges in the bay, and prices are still based on the pool figures, \$3.25, f.o.b. Cumberland reports for the week 76,522 tons and Clearfield 78,700 tons.

The Pennsylvania Railroad reports for the week 252,000 tons of Coal and 99,867 tons of Coke. Reading's shipments were 166,000 tons, of which 58,000 went to Port Richmond and 7000 to Port Liberty.

A new railroad is projected between Scranton and Forest City, 22 miles long, designed to connect with the line at Binghams, and is understood to be backed up by the Central New Jersey and Lehigh Valley railroads. The Delaware and Hudson Canal Company broke ground for a new mine in Forest City on Monday.

Freights to Boston are quoted \$1.101, with less demand.

Metal Market.

Copper.—The London market has again come lower since our last week's report, spot Chili Bars declining from £77. 17/6 to £77. 10/, futures from £78. 5/ to £78, and good merchantable brands from £77. 17/6 to £77. 10/ for spot, futures being £78 and Best Selected £82. Sales, 550 tons. The fire which broke out at the eighth level of No. 3 shaft of the Calumet and Hecla mine on the morning of November 30 was at latest accounts still burning, but even if the stoppage at that point be long the decrease in production will probably not exceed 10,000,000 to 15,000,000 lb during a twelvemonth, hence the little effect this incident has exercised in England and here. The visible supply in England and France is, indeed, swelling so fast that it overshadows everything, being on December 1 95,790, against 91,740 tons on November 1 and 45,130 on December 1, 1887. Adding to the above the about 30,000 tons accumulation of Copper on this side, including large stocks at New Orleans, and it will be seen that some 120,000 to 125,000 tons are thus set aside to maintain prices. And this at a moment when the Panama Canal Company seems to be breaking down and causing great uneasiness in financial circles in Paris. Later advices from the Calumet and Hecla are more reassuring; the temperature at the surface is decreasing and an early resumption of work expected. It appears that a pool sale was made by the syndicate to manufacturers for a three months' supply from January 1 next at a price not transpired, but supposed to be 16½¢. Our market has meanwhile been 'dull at 17½¢ Lake, nominally, in the open market, and 16¢ @ 16½¢ casting brands. Accounts from Germany are to the effect that the Brass manufacturing branch suffers considerably from the high price of Copper. Perhaps the Brass works of M. Secrétan of the syndicate also interfere at their lower Copper prices with their other Continental competitors, and it is stated Brass goods from that source also begin to be imported here, a gloomy prospect for our manufacturers should the syndicate possess greater longevity than many suppose. The import into Liverpool and Swansea from the United States the first 10½ months has been 21,465 tons fine, against 12,864 tons last year.

Tin.—The statistics are so unfavorable just now that a break has occurred both in London and here. On December 1 the visible supply in Europe and America was 12,478 tons, against only 11,913 on November 1 and 14,058 on December 1, 1887. London gave way in consequence from £100. 17/6, spot Straits, to £99. 10/, and futures from £101. 10/ to £100. Sales, 260 tons. Here 20 tons spot sold from 22.25¢ down to 22¢; 10 tons March

at 22½¢, and 10 January at 22.10¢. *Tin Plates*.—The demand has been moderate only for spot goods, and prices are a shade easier. A good many orders and inquiries have been cabled to the other side, but in most cases business has not resulted, the makers' order books being tolerably well filled for the next three months. We quote at the close, large lines, per box: Siemens-Martin Steel, Charcoal Finish, \$4.85 @ \$5.75; ditto, Coke Finish, \$4.70; Terns, \$4.05 @ \$4.25; Bessemer Cokes, \$4.25 @ \$4.35; and Wasters, \$4.15. Liverpool comes 13/3 @ 13/6.

Lead—Has been gradually looking up again, because the available supply for consumptive purposes at this point is momentarily well held and not overabundant. Some 300 tons Common Domestic were taken at 3.70¢ @ 3.75¢, and at the close 3.80¢ @ 3.85¢ is asked, while 3.75¢ is offered. St. Louis is 3.50¢ @ 3.55¢. In London Soft Spanish is steady at £13. 2/6, and English Pig at £13. 5/.

Spelter.—Nothing of special interest has occurred in our own market, which has been dull at 5¢ @ 5½¢ for Common Domestic, and Silesian, nominally, 5½¢. London gave way with the latter to £17. 17/6. The rumors about a new German-Belgian syndicate amount to nothing. The International Syndicate expires on July 1, 1889, when it may possibly be renewed for five years, but this will only come up for consideration next spring.

Antimony—Has continued strong at 12½¢ @ 13¢ for Cookson and 10½¢ @ 11¢ for Hallett; the demand is good and the stock light. Hallett remains unaltered, £44, in London.

New York Metal Exchange.

The following sales are reported:

SATURDAY, December 1.	
10 tons Tin, spot	22.25¢
10 tons Tin, March	22.50¢
MONDAY, December 3.	
16 tons Lead, March	3.80¢
TUESDAY, December 4.	
10 tons Tin, January	22.10¢
10 tons Tin, spot	22.00¢

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from November 23 to November 30, inclusive, and from January 1 to November 30, inclusive, were as follows:

Iron and Steel.		Nov. 23 to Nov. 30.	Jan. 1 to Nov. 30.

Notwithstanding all that has been said against the great Eiffel Tower, at Paris, the work is being steadily carried forward. On the first of last month it had attained a height of 178 m. (587 feet), and the present rate of progress is at the rate of 36 feet per week. If this be maintained, the whole of the principal parts of this immense structure will be erected by the end of January, 1889. Meanwhile the decorative and accessory parts of the work are not neglected, and there is every prospect that the tower will be completed in all its details at the opening of the exhibition.

Vulcanized fiber for mechanical purposes has for some time attracted attention. As a material for cogs, where the moist from ordinary gearing is inconvenient, it has, according to all accounts, given very satisfactory results. In one case gutta percha cogs are known to have been used for 20 years. When the wheels became worn, the material was utilized for casting fresh ones.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Dec. 5, 1888.

Copper has been quieter the past week. Consumers have purchased sparingly, and, as a rule, only when supplies might be secured at less than the "syndicate" prices. Speculation has been on a smaller scale, with the buying still confined mainly to the "syndicate" agents. There are again reports of a new company forming to carry out the proposed extended contracts with the several mining companies, but nothing definite regarding the success of the project appears to be known in "outside" quarters.

Negotiations are under way in Paris for the sale of the Anaconda mine's 1889 product by the "syndicate," but at last accounts the sale had not been consummated. The product of the last six months of the current year was placed at 15/ per unit.

Accurate data just made public shows that the importations of Matte into England the past 11 months aggregated 26,000 tons.

Block Tin has declined about 15/ owing to free offerings for distant future delivery, especially by importers, and a more or less general belief that that fact indicates fuller supplies later on. The available stock here is low, however, and in few hands.

Pig Iron warrants have undergone a further advance, and the market for these and for Makers' Iron continues to harden. The upward tendency of prices, however, is due to the banking down of furnaces, consequent upon scarcity of fuel, and not to increased demand. Purchases for consumption and export are of somewhat restricted volume, as is not unusual toward Christmas time. The demand for Hematites has shown considerable spirit and liberal purchases have been made for consumption at 1/ @ 2/ advance. Most brands of Scotch Pig are 6d to 1/ higher, and 3d advance has been paid for Middlesboro'.

A good trade is doing in nearly all descriptions of Steel, and makers, as a rule, have sufficient orders to keep their works actively employed over the turn of the year. In Siemens-Martin Plates and Angles the activity has been remarkably prominent during the past 30 days. The large capacity of the Steel mills in operation serves, however, to check any considerable advance in prices. There have been numerous inquiries the past week on Steel Blooms and Billets for the American market. The West Cumberland Iron and Steel Company has suspended, labor disputes having seriously interfered with the carrying out of contracts.

The Tin-Plate trade has been very quiet. Buyers operate cautiously and with a view to purchasing at lower prices. On the other hand, the majority of makers who have closely sold their output are indifferent to current offers in view of the firmness of prices for Plate Bars and probabilities of an advance on the same.

Cleveland Pig.—Transactions have been larger, and prices are a fraction higher. No. 1 Middlesboro', G.M.B., 36/6; No. 3 do., 34/.

Scotch Pig.—The market has shown a fair degree of spirit, and prices are higher on nearly all brands.

No. 1 Coltness, f.o.b. Glasgow	50/
No. 1 Summerlee, " "	50/
No. 1 Gartsherrie, " "	48/6
No. 1 Langloan, " "	49/8
No. 1 Carnbroe, " "	43/6
No. 1 Shotts, " at Leith	49/
No. 1 Glengarnock, " Ardrossan	47/6
No. 1 Dalmellington, " "	43/6
No. 1 Eglinton, " "	42/3

Steamer freights, Glasgow to New York, 3/6, Liverpool to New York, 10/.

Bessemer Pig.—There has been a large business and prices have advanced about 2/ during the week. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen.—The output is closely absorbed and prices remain very firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Business in this branch continues brisk, but prices are no higher. Standard English sections quoted at £3. 18/9, and light sections £4 @ £4. 10/, f.o.b. at N. W. England shipping point.

Steel Blooms.—There is a fair demand, but new business moderate. We quote £3. 18/9 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—For these the demand is still fairly active and prices firm. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—There has been more doing, but at somewhat modified prices. Bessemer, £3. 18/9, f.o.b. at N. W. England shipping point.

Old Rails.—Demand runs fair, and prices are quite firm. Tees quoted at £3. 6/ @ £3. 7/6, and Double Heads, £3. 7/6 @ £3. 10, c.i.f. New York.

Scrap Iron.—A fair business reported at steady prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—The market steady, with fair demand. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—Buyers operate cautiously, but sales have been larger than during the preceding week. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/6
IC Bessemer steel, Coke finish	13/6 @ 13/9
IC Siemens	12/3 @ 14/
IC Coke, B. V. grade	13/3 @ 13/6
Charcoal Terne, Dean grade	12/ @ 12/3

Manufactured Iron.—Business in most departments is still of good volume and prices remain firm. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
" Common	@ 5 10 0
Staff. Bl'k Sheet, singles	@ 7 10 0
Welsh Bars (f.o.b. Wales)	5 0 0 @ 5 2 6

Tin.—The market weak under freer offerings for future delivery. Straits quoted at £99. 10/ @ £100, spot, and £100 @ £100. 10/ for three months' futures.

Copper.—Dealings have been moderate at slightly lower prices. Chili Bars, £77. 10/, spot, and £78 @ £78 2/6, three months' futures. Best Selected, £80. 10/.

Lead.—The demand has been slow and the market rather weak. Soft Spanish, £13 @ £13. 2/6.

Spelter.—Transactions have been larger and the market is stronger. Silesian, ordinary, £18. 10/ @ £18. 12/6.

The H. C. Frick Coke Company, of Pittsburgh, recently shipped 900 tons of coke to New Brunswick, N. S. It went over the Baltimore and Ohio Railroad to Locust Point and thence by ocean steamer.

WEST INDIES.

PORT OF SPAIN, TRINIDAD, October 26, 1888.—*Asphaltum.*—There has been a steady demand at firm figures, Boiled bringing \$14.04 per ton, f.o.b., and Crude \$6.84. The export since January 1 sums up 44,207 tons, against 36,000 last year and 34,241 in 1886. *Exchange*, 90 days' sight, \$4.80 @ \$4.86.—*E. P. Masson.*

EAST INDIES.

SINGAPORE, October 16, 1888.—*Tin.*—Has been active at \$37.75 @ \$38.25, with sales of 610 tons since the 1st inst., closing firm at \$38 per picul. The export from January 1 to the 10th inst has been: To England, 130,221 piculs, against 62,085 in 1887 and 42,587 in 1886; to the Continent, 14,971, against 20,647 and 21,219, and to the United States 36,366, against 52,322 and 28,496. *Gum Damar.*—A few lots Malacca have been taken at \$4.90 per picul. *Gum Copal.*—A sale of 100 tons was made at \$6.50 @ \$8.50 per picul. *Gutta Percha.*—Fine quality is wanted and rising; prime may be quoted \$95 @ \$115, and seconds \$55 @ \$85. *Exchange.* Four months' bank, 31¼.—*Giffillan, Wood & Co.*

PENANG, October 16, 1888.—*Tin.*—Receipts for the fortnight aggregate 9000 piculs; sales to Europeans, 420; to Chinese, 7000. The market opened at \$36.18 per picul, rose to \$38.45 and declined to \$37.75, winding up at \$37.90. China pays considerably above London parity. The export from January 1 to the 14th inst. was 110,076 piculs to England, 338 to the Continent, and 7316 to the United States. *Gum Benjamin.*—No. 1 has been selling at \$34 @ \$69, No. 2 \$30 @ \$50. *Gutta Percha.*—Prime may be quoted \$60 @ \$100. *India Rubber.*—\$70 @ \$75 per picul, as to quality, has been paid. *Exchange.*—Four months' bank bills 31¼.—*Schmidt, Kustermann & Co.*

COLOMBO, CEYLON, October 18, 1888.—*Plumbago.*—Has been selling to a moderate extent as follows, in rupees, per ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust 40 @ 65. Following are the shipments made since the 1st inst.: To England, 16,098 cwt.; to Hamburg, 851, and to the United States 2380—together, 19,329, against 4508 in 1887, 22,457 in 1886, and 17,555 in 1885. *Exchange.*—Six months' sight, 1/4 15-16.—*Volkart Brothers, through their agent, John W. Greene, 82 Wall street, New York.*

MANILA, November 26, 1888.—*Hemp* has been dull at nominally \$11.50 per picul, against \$9.50 same date last year, equaling per ton, cost and freight, \$37. 17/6, against \$33. 12/. The clearances for the United States since last cable amount to 11,000 bales, against 7000 in 1887; since January 1st, 222,000, against 238,000; loading for the United States, 25,000, against 14,000; cleared for England since January 1, 312,000 bales, against 210,000; loading for do., 15,000, against none; cleared for all other ports, 65,000 bales, against 41,000; receipts at all ports since last cable, 16,000, against 19,000; since January 1, 600,000 bales, against 496,000 in 1887 and 365,000 in 1886. *Freight*, \$7, against \$5.50. *Exchange*, six months' sight, 3/7½, against 3/8.—*Ker & Co., per cable to Mr. Charles Nordhaus, East India agent, 89 Water street, New York.*

JAPAN.

YOKOHAMA, October 14, 1888.—*Coal.*—Japan produces at present 1,000,000 tons, and exported last year 704,935 tons, worth \$2,337,804. The Takashima mines turn out the best Coal, and produced in 1887 370,000 tons; the Muki mines, 240,000 tons; the Poronai mines, 60,000, and the remaining ones, 310,000.—*Japan Mail.*

TURKEY.

CONSTANTINOPLE, November 18, 1888.—*Mining.*—A Government decree is published in the official Gazette sanctioning a concession made the Société Minière de l'Empire Ottoman, or to the company's representative, Signor Leonidas Baltazzi, of working 14 mines situate in different localities in Turkey.—*Pera Gazette.*

PORTUGAL.

LISBON, November 22, 1888.—*Copper.*—The Barancannes Copper mines are situated four miles from Almodovar and 20 miles from the Carregueiro station on the direct railroad line to this city. A company has just been formed at London for the working of these mines with a capital of £120,000 in £1 shares, the Barancannes Copper Mining Company, Limited.

The concessions cover an area of 246 acres.—*O. Commercio.*

SPAIN.

BILBAO, November 17, 1888.—*Iron Ore.*—The Campanil mines are owned by five proprietors, and these, in view of the perceptible gradual exhaustion of these mines, have held a meeting and agreed to reduce the output for next year to one-half, and fix the price at 8/3 @ 8/6; at the same time 8/6 was offered for a superior lot, but declined, the owner not feeling disposed to part with the same for less than 9/ per ton. Some business was done in single cargoes Rubios at 6/10 @ 7/3. Total shipment to date 3,222,181 tons, against 3,789,123 in 1887.—*Bilbao Marítimo y Comercial.*

GERMANY.

HAMBURG, November 24, 1888.—*Iron.*—Pig Iron has been moderately active, and the only change occurring has been the raising of Forge Pig 1 mark per ton. Spiegel has been steady at 53 marks per ton for 10 to 12 %. Merchant has been the reverse of brisk in Rhenish-Westphalia, both the home and export demand being slack. The entire Wire branch is flat. The quotations are, per ton, Merchant, 125 @ 127.50; Beams, 135; Hoop Iron, 125; Boiler Plates, 170; Tank do., 150; Siegen Thin Sheets, 148 @ 150; Steel Sheets, 150, and Steel Rails, 117.50 @ 120. Exportation of Iron and Steel from Upper Silesia to Russia has been resumed on a very large scale, especially since the financial improvement in that country. Hence, there is not a single branch in Silesia in the line which does not flourish at present, the Wire branch included. *Metals.*—The rumors about a new Spelter syndicate of Belgian and German makers are without foundation. The international Spelter syndicate will expire on July 1 next year, and in spring efforts will be made to renew it for five years. It merely restricts production, and does not control prices. Brass manufacturers complain that they cannot obtain prices sufficiently high for their goods to correspond to the high price they have to pay for Copper, there being no margin left to speak of. Consumers of Tin make similar assertions. At 210 marks for Tin, they say they cannot make any money.—*Borsenhalle.*

The Wear of Rails.

The comparative wearing qualities of iron and steel rails formed a very fruitful topic of discussion at one time in railroad circles, but the question suddenly lost its vitality when the price of steel rails fell below the cost of production of iron rails. It is, therefore, a matter of much less interest than would have been the case, say ten years since, to note the experience in this respect of the Wabash Railway, which has just been made public. The company removed from its tracks this fall some iron rails which had been first laid down in 1856, and about the same time they took up some English steel rails which were first used in 1873. The iron rails, after a life of 32 years, were sold to be remanufactured, and the steel rails, which had been in use for 15 years, were relaid on a branch road, where they are expected to last for 12 to 15 years more. The "expectation of life" in either case would therefore seem to be nearly the same, with the difference in favor of the iron rails, probably due to the fact that the latter began their career in an era of less traffic, slower trains, lighter locomotives and smaller freight cars. Nevertheless, the facts cited go far to sustain the position of the erstwhile advocates of the continued use of iron rails, that well-made iron rails would sustain the wear and tear of regular railroad traffic as well as steel rails. It is worthy of note, in this connection, that the Wabash steel rails cost \$103 per ton, in gold, in 1873, and that the old iron rails were sold this fall for more than three-fourths the price of new steel rails, ton for ton.

Western merchants and commercial travelers are agitating the adoption by all lines of railroad of a 5000-mile interchangeable ticket. It is urged that if a few lines can arrange to use such a ticket, as they have done, it would be perfectly feasible to make it general.

Hardware.

There is only a moderate amount of trade, orders for the most part being limited to small lots required for completing assortments, and comprising a good many seasonable goods. Prices remain remarkably steady, the narrow margin of profit not permitting further reductions. Business throughout the country is generally reported as quite satisfactory, and anticipations of a good winter's trade are entertained.

Wire Nails.

Business in Wire Nails is limited for the most part to small lots and the aggregate of the transactions is not large. Prices are well maintained by the manufacturers, there being, however, a disposition to offer less than carload lots at carload prices, and some of the manufacturers are apparently more solicitous than they have been to book orders. The condition of the market is, however, satisfactory, and considering the large quantities of Nails purchased at the low prices lately ruling, the market is remarkably firm.

Barb Wire.

The volume of business in this market is quite limited and confined for the most part to small lots, notwithstanding the fact that some Western Wire is offered in this market and some sales effected. The Eastern makers are holding quite firmly to the following quotations, which include delivery: Four-Point Galvanized, small lots, 3.9 cents; 3-ton lots, 3.7 cents; carload lots, 3.9 cents.

The Freeman Wire Company, of St. Louis, Mo., report a fair volume of business at steady prices, as per the following quotations: 2 or 4 Point Painted in carload lots, 2.8 cents; less than carload lots, 2.90 cents, with advance for Galvanized of 6 to 7 cents.

Cut Nails.

The New York market has developed a little more activity, but prices remain at \$1.80 to \$1.90 for carload lots. The stories of heavy buying at Pittsburgh, with a view to cornering the market, telegraphed to the daily press in this city are regarded as absurd by the Nail trade in this city. A leading merchant suggested that 50,000 keg, the quantity spoken of, would not make much of an impression in the stock of the Wheeling district and the Mahoning Valley.

From Pittsburgh we receive the following: An important meeting of the Western Cut Nail manufacturers was held at the office of the Benwood Iron Works, Wheeling, W. Va., on Tuesday, the 27th ult. W. H. Wallace, of the Jefferson Iron Works, Steubenville, Ohio, presided, while C. E. Irwin, of the La Belle Iron Works, Wheeling, W. Va., acted as secretary. The attendance was large, every Nail concern west of the mountains being represented either in person or by proxy, with the exception of the Pittsburgh concerns. The Nail manufacturers of that city have about retired from the Nail business, which will account in part for their failure to be present. The present demoralized condition of the trade was thoroughly discussed, and the expression was unanimous that some plan be devised to stay the general demoralization that now characterizes the trade. A plan was drawn up and presented looking to the close association of the factories, the establishment of a guarantee fund and the creation of more harmonious relations between those engaged in the trade. The details of the plan were not fully arranged, but it seemed to be the impression of those present that with certain changes it could be made to operate successfully. As some of

the members present did not care to bind themselves to it without consulting the officers and directors of their works, it was informally laid over until Tuesday, the 11th inst., when an adjourned meeting will be held to take action upon it.

Miscellaneous Prices.

Copper Rivets and Burrs are held pretty steadily at the prices which have recently been prevailing, but the goods are being offered by some makers at figures which are a concession from those regularly made.

There has been no material change in the Sandpaper market, which continues low and uneven. The Springfield Glue and Emery Wheel Company, Springfield, Mass., are quoting Flint Paper at discount 50 per cent., with freight prepaid, on orders amounting to five reams or rolls or more. They also refer to the quality of the paper, and also to their Garnet Paper and its superior excellence.

The change in the price of Shot, to which we referred in a recent issue as likely to occur, was made by the manufacturers December 1, a further reduction of 7 cents per pound being announced. Prices are as follows, subject to a discount of 2 cents per bag of 25 pounds for cash within five days:

Drop, per 25-pound bag.....	\$1.16
Drop, per 5-pound bag.....	.20
Buck and Chilled, per 25-pound bag.....	1.41
Buck and Chilled, per 5-pound bag.....	.34
Dust, per 25-pound bag.....	1.75
Dust, per 5-pound bag.....	.40

It is considered, at these revised prices, that Shot about corresponds with the price of Lead, and the present condition does not appear to give any reason for a further decline. It will also be observed that the above prices for Shot are exceptionally low, and it is thought probable that somewhat advanced prices will be named within a few months.

The market for Steel Squares shows but little change, except that somewhat lower quotations are named by some of the manufacturers.

For some time Fence Staples, Galvanized and Plain, have been regularly sold at the same price as Barbed Wire, but recently manufacturers have shown a disposition to make slight concessions on the Staples when sold in good lots.

The jobbers are giving attention to the Wire Cloth market, and beginning to place their orders for the coming season. The figures which are quoted by the manufacturers on this line of goods are regarded as slightly lower than those that prevailed a year ago, indicating that purchasers will obtain slight concessions during the coming season. It will, however, be the part of wisdom for the trade not to force prices below a profitable level, as in this line of goods there is a liability that the quality will suffer if the prices are unremunerative.

The market for Lead Pencils is in an unsettled condition, and prices, owing to the termination of an understanding between the manufacturers, are considerably lower than heretofore.

Stuart & McLean, Iron and Steel factors, Hamilton Building, Pittsburgh, Pa., issue from time to time quotations on varied lines of goods which they are prepared to supply to the trade. They intimate that they are now in a position to furnish Square Nuts at terms which are deserving of attention.

The following is our report of the Louisville market, dated December 8:

The Hardware trade of Louisville, Ky., during the past week has been a little improvement over the previous one. Some jobbing houses report business as slow, but then we are to expect a hold-up now for a while. Others,

again, are very busy, especially those handling heavy goods.

Cut Nails have in a measure recovered, a good feeling prevailing, and the trade which has lent a willing hand to the mills must be protected by them. A general stiffening up individually seems to be going on, without concert of action, and if this is kept up it will be more satisfactory to the trade than the nominal association advances. Wire Nails are in good demand, and are held firm by the mills.

Barb Wire has made the greatest cut ever known to the trade, and has reached a point never before dreamed of, and the worst of it is some manufacturers have given prices to the small trade, buying not more than one car, same as to jobbers who take five to ten carloads. There is no telling where prices will go to. Through the upper cotton belt territory reached by Louisville nearly one-half the cotton crop, which is a large one, is still unpicked in the fields. This is apt to lead to tardy remittances, and is caused by two factors, the long and heavy rains and the demoralization of the negro labor by the result of the election, they not realizing that they will have to work just as hard for a living as last year, and the cotton crop is dependent entirely on them for artisans.

We have received the following details concerning the new Hardware jobbing house to be started at Omaha, Neb. It will be conducted by the

Omaha Hardware Company.

a corporation organized under the laws of Nebraska, for which articles were filed with the county clerk of Douglas County on the 15th of November. The authorized capital is \$500,000, divided into shares of \$100 each. Stock to the amount of \$200,000 was issued, which will be fully paid up. The indebtedness will be limited to 60 per cent. of the amount of stock issued. The affairs of the business will be governed by a board of seven directors. The officers of the company are as follows: T. H. Taylor, general manager; P. C. Himebaugh, president; I. A. Miller, vice-president; W. H. Hulshizer, secretary; A. S. Carter, treasurer. They have leased the new Ames building, situated at the corner of Ninth and Jones streets, Omaha. This building is 44 feet front by 132 feet deep, containing six floors, which will give the company ample room for the present. It is in the heart of the city, yet is located on the railroad tracks, and thus possesses unusually good facilities for the prompt and speedy transaction of business. The company have already secured the services of a corps of old and experienced traveling salesmen, who are thoroughly acquainted with the territory and trade tributary to Omaha. The active officers of the company are young men of recognized ability and long experience, and have an extensive acquaintance throughout the East and West that will prove valuable to the concern. They are backed by men whose names are a guarantee of the stability of the new undertaking, and they will have ample capital with which to conduct a successful business. The present condition of the Hardware market is regarded as very favorable for the purchase of a new jobbing stock, because prices on many staple articles are now ranging lower than has ever before been known in the Hardware line. At the same time the prospect for business in the coming year in that section of the West is remarkably bright, so that altogether the new house will start out under most encouraging auspices and with very bright anticipations of a prosperous career.

Items.

Kellogg, Johnson & Bli.s, 108 and 110 Randolph street, Chicago, have issued an illustrated price list of Woodworkers' Tools. It is a handsome volume of 154 pages, bound in stiff paper covers, and presents a bewildering variety of illustrations of Tools used by carpenters, cabinet-makers, carvers, bridge builders, ship carpenters, lumbermen, &c. Large as the list of contents is, the firm say that it falls

far short of what they carry in stock, as they make a specialty of Tools. Full directions how to order are printed in the preface. An excellent feature of the book is an alphabetical index giving the names of all the Tools mentioned and the pages on which they are to be found described. The last 15 pages are devoted to a full list of special net cash prices, in which the several sizes of each article are quoted separately. The book is an extremely valuable publication for mechanics, who will find in it many Tools not frequently brought to their notice, but whose value to them will at once be recognized. The firm have printed a limited edition of the work, and therefore prefer to confine its distribution to the Northwest, including Michigan and Indiana, that portion of the country being their natural territory.

The Sanford Fork and Tool Company, Terre Haute, Ind., of which Robert Nixon is president, H. A. Urban secretary and H. S. Deming treasurer, have issued a new catalogue of their line of Forks, Rakes, Hoes, &c. It is a handsomely printed pamphlet in two colors on excellent paper and shows effectively their well-known line of goods.

Gaston, Weston & Ladd, Torrington, Conn., issue circulars relating to Prestoline, a liquid metal burnisher, for use on brass, bronze, copper, steel, zinc, tin, nickel, German silver, &c. Another circular is devoted to Gaston's Silver Compound for silver plating, cleaning and polishing. This is described as a preparation of pure silver and chemicals, and is warranted to contain 12 grains of sterling silver per fluid ounce of solution.

Lufkin Rule Company, Cleveland, Ohio, issue a striking sheet in which their Rules, Perfection Glass Board and other manufactures are illustrated, and also a separate circular devoted to the Glass Board, for which a number of testimonials are given.

Rector & Wilhemy Company, Omaha, Neb., issue a circular of IXL Ventilator, manufactured by M. F. Koenig & Co., explaining its construction and giving testimonials in regard to it.

William T. Valentine & Son, Albany, N. Y., issue a circular entitled "What is Felt Weather Strip?" in which they give a description of their manufactures, enumerating the advantages possessed by them. Their illustrated catalogue shows the different patterns in which they are putting the goods on the market.

William C. Vajen, who is well known to the Hardware trade, has branched out into a new line of business, having opened an office at 79 East Market street, Indianapolis, Ind. Real estate, loans and insurance will here receive his attention.

Bennett & Shirk, manufacturers' agents for a variety of specialties handled by the Hardware trade, have removed from 154 Lake street to 112 and 114 Lake street, Chicago. Their removal was caused by their desire to secure sufficient room to carry a stock of the goods which they sell. In their new location they secure ample facilities to make this change in their system of transacting business. By shipping from stock in Chicago they will be enabled to meet the demands of a large class of merchants who desire to be served more promptly than if they were obliged to await shipments from factory.

The John Pritzlaff Hardware Company, Milwaukee, Wis., have issued their No. 3 price current under date November 27. It illustrates Skates and Sleigh Bells, including Saddle and Shaft Chime Bells. Illustrations, list prices and discounts are given.

Stanley's "Odd-Jobs," a very unique tool, first manufactured by the Stanley

Rule and Level Company in June last, has already proven its right to be. The manufacturers report sales of 6000 of these tools at this date, and that without diminishing the demand for their other tools, of which this single one embraces 10 or 12 different kinds. The artistic form given to the tool, and its nickel-plate finish, commend it as a holiday present for mechanics or amateurs.

The Gooch Freezer Company, Cincinnati, Ohio, issue a circular calling attention to the Peerless and Giant Ice-Cream Freezers, in which their special features are explained and some of the advantages claimed for them enumerated.

Peavey Brothers, of Sioux City, Iowa, are about to retire from the jobbing trade, and their traveling salesmen are now seeking other connections for next year. It is understood that the members of the firm have invested in a street railway, and propose to devote their time and energy to operating it.

The Peters Cartridge Company, Cincinnati, Ohio, issue a circular relating to their Crimped Cartridges, concerning the loading of which they give information. It is stated that until their new catalogue is issued the Crimped Cartridges may be ordered by the same old numbers as the Indented if it is stated which are desired, Crimped or Indented. The prices and discounts are the same in either case.

Hamblin & Russell Mfg. Company, Worcester, Mass., advise us that they carry a stock of Wire Goods and Hardware Specialties at 20 Cliff street, New York, where they are represented by J. A. Boughan.

Clark, Quien & Morse, Peoria, Ill., have issued a 60-page pamphlet, well arranged and neatly printed, relating to Metals, Stamped Ware, Tinners' Trimmings, Japanese Ware, &c., and showing an interesting and well-assorted line of these goods, all of which, we are advised, are carried in stock.

Hamblin & Russell Mfg. Company, Worcester, Mass., have adopted the method of representing their goods in miniature on the back of their letter paper, thus in a small space giving illustrations and bills of a large variety of Hardware specialties.

Joseph Churchyard's Sons, Buffalo, N. Y., are about issuing an attractively printed catalogue relating to their Refrigerators, Ice Chests and Bellows. The address to the trade refers to the characteristics of, and claims for, their line of Refrigerators, which is referred to as having been very favorably regarded by the trade during the past season, when they were first put on the market. They have added a number of new designs to their line, which are appropriately illustrated.

The St. Joseph Iron Company, St. Joseph, Mo., issue a convenient sheet of prices representing their line of Iron and Steel, Heavy Hardware, Wagon and Carriage Hardware, &c. The different lines are classified and net prices given.

The Ross & Fuller Association, 88 Chambers street, New York, have been appointed general salesmen by the Elizabethport Cordage Company, Elizabethport, N. J., for the sale of their products, such as Manila and Sisal Rope, Binders' Twine, &c. A full line of samples can be seen at their sample-room. All orders will be filled at factory prices.

The following from the Australasian *Ironmonger* refers to the position in the Colonial markets of American Cutlery:

The efforts made by American manufacturers of Cutlery to open a market here have been few and far between, and sufficient energy has not been shown in pushing a trade. Finding the competition very great in this class of

goods, and not by any means an easy job to have it all their own way, they have neglected this for other markets where a larger business can be done and better profits realized. The failure here is because the prices are a shade higher and the effort required to alter the current of an established trade has not been properly made. The only firm I have heard of as well known here is the Henry Seymour Cutlery Company, New York City, manufacturers of Tailor Shears, Shears and Scissors, although other firms are no doubt heard of through indentors. The John Russell Cutlery Company is one of these. An exception to the above is to be found in Butchers' Knives, which are highly appreciated and have a good sale.

Nathaniel Jacobi, Wilmington, Del., announces that he has taken his son Marcus W. Jacobi into partnership, and that hereafter the business will be conducted under the name and style of the N. Jacobi Hardware Company.

The Gibbs Lawn Rake Company, Canton, Ohio, have appointed John H. Graham & Co., 113 Chambers street, New York, their general agents for the United States, from whom their goods may be had at all times at factory prices. The company are manufacturers of the Gibbs and Canton Lawn Rakes and Gibbs and Imperial Post-Hole Diggers, Grub Hoes and Lawn-Hose Holders. This agency went into effect November 24, and the company announce that all quotations prior to that date not under contract are withdrawn.

Paine, Diehl & Co., Philadelphia, have secured the control of the Keystone Beater, which is so favorably known to the trade. They are making arrangements, we understand, for its manufacture on an enlarged scale and for the effective marketing of it in all parts of the country. Orders and inquiries from the trade should, therefore, be addressed to them.

Alfred Field & Co., 93 Chambers street, New York, are calling attention in their announcement on page 66 to their Improved Double Action Acme Skates, No. 5. The point which they emphasize is that the lever works both right and left, so that each Skate can be used for either foot, and all parts are screwed, not riveted.

The Proposed Hardware Syndicate in England.

The movement for the organization of an association of ironmongers in England for the consolidation of their purchases, to which we referred in our last issue, is evidently regarded there with much interest, and a number of letters on the subject appear in the English journals. From the tenor of many of these it is evident that trade there is interfered with to a large extent by the competition of co-operative stores, the handling of Hardware by houses engaged in other lines of business, and the selling by the manufacturers direct to the consumers. At the same time there would appear to be on the part of the Hardware trade in that country a lack of enterprise and push, which, from the American standpoint, are regarded as essential to the successful prosecution of any business. There are also indications that the trade are in the habit of purchasing on time instead of for cash, and without that promptness in payment which is so important a factor in profitable buying. On this point a retired manufacturer publishes the following letter in the London *Ironmonger*, and it will be observed that the considerations to which he refers are equally applicable to trade on either side of the ocean:

There are certain classes of tradesmen—ironmongers in particular—who "wonder how it is they cannot sell as cheaply as, and compete with, others selling the same class of goods as themselves." The solution of the problem is easy and simple. The "Co-operative Stores," "Supply Associations," and "Give Away" tea shops are their greatest enemies, and these they have to compete with. How are they to

do it? Simply by trading in the same spirit, and under the same conditions, as their rivals—viz., liberal purchases, prompt payment, with "small profits and quick returns." But the grand secret lies in the buying and mode of payment. The three classes named above, as a rule, order largely and pay promptly, and thereby secure advantages from the concessions made to them by the manufacturers. It is only reasonable to infer that a manufacturer will gain a greater advantage from a liberal order with prompt payment than from several small orders with a deferred payment, though in the former case he may allow a greater discount; and this discount is the profit to the purchaser. But when the manufacturer supplies goods in small quantities, and is compelled to submit to deferred payment, has to pay a collector, and keep his books open for an unlimited time, it is surely unreasonable to suppose that his customer can compete with those trading under opposite conditions, as the manufacturer must reimburse himself for his loss of time, collector's fees, and loss of interest on his money by allowing his customer no discount at all; so that a sum must be added by the retailer to the price of the goods for his profit, instead of getting it off the manufacturer in the shape of discount. Under these circumstances the parties complaining cannot expect to be able to compete.

Another correspondent, referring to the proposed co-operation of ironmongers, suggests that a syndicate or society of subscribers or shareholders be formed, the objects of the association being as follows:

1. Open a central office or establishment in London, where samples and price lists of such manufacturers as confine themselves to the legitimate trade may be seen and consulted.
2. To supply the names of all so-called wholesale houses who have been known to sell to retail buyers.
3. To enter into arrangements with manufacturers for the supply for cash of large consignments of some (beginning with a few) of the leading articles regularly kept by ironmongers, to be distributed, also for cash, to the members.
4. To admit to membership those only who are *bona-fide* ironmongers and have served an apprenticeship to the trade.
5. To hold regular meetings, quarterly or otherwise, at which all members should be free to discuss matters of interest to the society and exchange ideas and information for their mutual benefit.

Business Tendencies.

The widespread interest in the questions suggested by the table of Fred. P. Straub & Co., Evansville, Ind., which we published several weeks ago, is evidenced by the communications we have in successive issues laid before our readers. In several of these this table was referred to, and suggestions were made in regard to the scope of the business done by the Evansville house, with the intimation that the significance of the table would depend somewhat upon the precise line of goods handled, and especially as to whether it related to a strictly Hardware business, or included also some of the related lines, which are frequently combined with the regular Hardware stock. As giving more precisely the import of the table, Fred. P. Straub & Co. advise us that they do not deal in Iron, Stoves, Farm Machinery, Wagons, Paints, Oils, Glass, &c., but confine their business strictly to Hardware, and sell at retail only. They add that as they pay cash (10 days or less) for all their goods they are in a position to buy where they can to the best advantage, whether from jobbers or manufacturers. It will thus be seen that the table refers to a representative Hardware business, and does not reflect the influence of dealing in other lines.

The St. Louis Screw Company, recently incorporated, at St. Louis, have elected the following officers: President, W. H. Hass; vice-president, C. Hafinger; secretary and treasurer, E. J. Miller. Additional machinery for their factory, consisting of automatic screw machines for the manufacture of set cap screws, has arrived from the East and is now being set up.

Chicago as a Hardware Center.

The great advantages possessed by Chicago as a point for the distribution of goods of all kinds over a vast territory are felt no less in the Hardware trade than in any other line. The vast system of inland navigation in which the great lakes constitute the most important part contributes its share toward keeping down the rate of freight on goods received at Chicago from the East, while no other city in the world has such a magnificent system of important railroads connecting it with the surrounding country. So many of these railroads compete for traffic over the same territory that a reasonable rate of freight is almost positively assured, with an almost equally positive guarantee that their rivalry will frequently cause wars in rates, reducing them still lower and always insuring to the benefit of Chicago business interests. The extension of Chicago trade has been co-equal with the extension of railroad facilities from Chicago to the West and Northwest, competition from other jobbing centers interfering to a considerable extent with its growth toward the East and South. But from Ohio to the Pacific Coast there is hardly a hamlet which is not regularly visited by some traveling salesman in the interest of a Chicago Hardware house.

I.—The Jobbing Trade.

The regular jobbers of Hardware in Chicago comprise six houses—namely, HIBBARD, SPENCER, BARTLETT & Co., THE WELLS and NELLEGER COMPANY, MARKLEY, ALLING & Co., A. F. SEEBERGER & Co., EDWIN HUNT'S SONS and HORTON, GILMORE, McWILLIAMS & Co. These houses transact a strictly jobbing business, making Shelf Hardware their leading line and adding to it such specialties or auxiliary branches as they find can be most easily or profitably handled. A large number of branch houses and manufacturers' agencies for handling Hardware specialties are located in Chicago, but they are not properly classed with jobbing houses and are separately enumerated below. Other Hardware houses, such as KELLOGG, JOHNSON & BLISS, ORR & LOCKETT, BULLARD & GORMLEY, S. J. SURDAM & Co., HODGE & HOMER, STANDART & Co., C. CARR & SONS, KEENE BROS., F. A. OSWALD & Co., ANDREW REAM, RENDTORFF HARDWARE COMPANY and F. A. STAUBER & Co., confine their attention mainly to the retail trade, but also sell large quantities of goods to contractors, builders and other heavy consumers, identifying themselves to that extent with the wholesale trade. In the same way GIBSON, PARISH & Co., E. N. BERBECKER, THE CHICAGO FURNITURE SUPPLY COMPANY, HENER & BROCK-SCHMIDT and MARSHALL FIELD are connected with the Cabinet Hardware trade. A specialty of Cutlery is made by the HENRY SEARS COMPANY, RANDALL, HALL & Co. and C. B. JAMES, while a few firms, such as COLTER & Co., SCHUTT & Co., BUTLER BROS. and C. M. LININGTON, handle Penknives and one or two other lines of Cutlery in connection with other goods. In Tinware and House Furnishing Goods generally C. SIDNEY SHEPARD & Co., THE CHICAGO STAMPING COMPANY, DENNISON & HAMILTON and KIECKHEFER, BARTLING & Co. job a considerable line in addition to their own goods. GORDON M. RICHARDSON is also a jobber of Tinware.

The jobbers of Heavy Hardware, Wagon Stock, &c., comprise PARKHURST & WILKINSON, S. D. KIMBARK, KELLEY, MAUS & Co., MICHAEL GREENEBAUM'S SONS and CARRUTHERS & Co. Quite a number of special lines are represented in a wholesale way—as, for instance, Locksmiths', Bell-hangers' and Electrical Supplies—by J. F. WOLLENSAK, and Tools and Machinists' Supplies by C. H. BESLY & Co., but the entire list would be too long for the purposes of this article.

Recurring to the strictly Hardware jobbing houses, the following is a bird's-eye view of their character, the departments into which they are divided, the assortment of goods which they carry, the exclusive lines handled by each and the specialties made most prominent.

Hibbard, Spencer, Bartlett & Co. are jobbers and importers of Builders' Shelf and General Hardware, of Pressed, Pieced and Japanned Ware and of all kinds of Agricultural Implements, not including Machines. They are exclusive jobbing agents for the Ashtabula Tool Company's Diamond Steel goods. A large department is entirely devoted to American, English and German Cutlery. Silver-Plate Ware is carried in every variety. The line of staple goods embraces Steel Nails, Wire Nails, Sheet Iron, Metals, &c. One of the largest features of their business is the trade in Tin Plate, the stock being imported direct and sold largely to the jobbing trade. Their Gun department contains Guns, Rifles, Revolvers, Ammunition, Fishing Tackle, Base Balls, Bicycles and every variety of sporting goods known to the trade. Their own importations of Belgian and English Guns, as well as all the leading American makes, are always in stock. They have recently taken the Chicago agency for the Rochester Lamps, and it has already proved a large business in itself. They are large buyers of Yerkes & Plumb's and Blood's lines of Hatchets, Yerkes & Plumb's and Maydole's Hammers, Henry Disston & Sons' Saws, Bailey and Stanley Iron Planes, the Sandusky Tool Company's Wood Planes, the American, Disston and Nicholson Files, Bradford Lock Works' complete line of Locks, Knobs, &c., Yale & Towne Mfg. Company's Yale Locks, Eagle Lock Company's Chest, Till, Trunk and Cabinet Locks, Wm. Wilcox & Co.'s Padlocks, Burden's Horsehoes, the Northwestern, Globe, Champion, Star, Putnam, Maud S. and C. B. K. Horse Nails, Western agents for Barney & Berry's Skates, sole United States dealers in the C. H. Conover Socket Strap, Scoops, Shovels and Spades, and also handle Ames' and Chisholm's Shovels, Spades and Scoops, Blood's and Maine Scythes, Vermont Snaths, Rowlett's Champion Lawn Mower, Philadelphia Mowers, &c. Their line further embraces Snaps, Bits and other Saddlery Hardware, Whips, Curry Combs, Brushes, &c., Sleigh Bells, Hand Sleighs, Rope and Mixed Paints. Barb Wire is a very important line, their jobbing trade in it being especially large. They carry the Welch Clock Company's complete line of Clocks and the Lalance & Grosjean Mfg. Company's Agate-Ware. Their line of dairy supplies, such as Railroad and Factory Can stock, Cream Pails and Gauges, Tin Plate for Milk Cans, &c., is particularly complete. In connection with this come Tinnners' Tools and Machines and Tinnners' Trimmings and a full line of Iron Stove Hollow-Ware, Brushes and Wooden-Ware. They are general Western agents for the Belding Mfg. Company's new Perfection Hardwood Refrigerator, agents for Heintz & Munchauer's complete line of Bird Cages, and carry a stock of Lanterns in great variety. They are represented by traveling men in every State and Territory from Ohio to

Pacific Coast, and their trade is each year increasing.

Markley, Alling & Co. have a full line of General Hardware, and also carry a stock of Ammunition and Fishing Tackle. They pay special attention to Cutlery, Tinner's Stock and Tin Plate. They also give considerable attention to smaller agricultural tools, the goods of the Otsego Fork Company being handled exclusively by them in the Chicago market. They sell goods in Missouri, Dakota, Montana, Idaho and Washington Territory, closely covering the States nearer home, reaching into Indiana.

The Wells & Nellegar Company, in addition to the general line of Hardware, are exclusive agents for Batcheller & Sons' Steel Goods, Jefferson Steel Cut Nails, Wetherald Wire Nails, and make specialties of Lyman Barb Wire, Guns, Ammunition, Sporting Goods, Fishing Tackle and Cutlery. It has always been the aim of this house to confine their assortment of goods to strictly first-class brands, such as Sargent's Shelf Goods, Disston's Saws, Nicholson and Disston Files, Branford Locks and Knobs, &c. Within the past 18 months this company have disposed of the entire stock of the late firm of Keith, Benham & Dezendorf, and now claim as complete an assortment as can be found in the stocks of their competitors. They state that their trade has increased throughout the whole of the present year, which speaks well for their energy and enterprise. They have representatives on the Pacific slope as well as in each of the States and Territories between that section and Chicago, their trade extending down into Arizona.

A. F. Seeberger & Co.'s house was established in 1864, and has built up a large trade in general Hardware, Metals, Tinner's Stock, &c. They are agents in the Chicago market for the Kelly Axe Company, Grand Rapids Refrigerator Company, Continental and Forest City Lawn Mowers, Great American Meat Choppers, Iowa Farming Tool Company, Empire Wringers, Hero Spring Hinges, Lawrence Steel Barn-Door Hangers, Marshall Sheep Shears, and the Tacks, Brads, &c., of the Stanley Works. Their stock embraces the American Screw Company's Screws, Sargent & Company's Shelf Hardware, Maydole's and Selsor's Hammers, Disston's Saws, Wheeler, Madden & Clemson's Saws, the Locks, Knobs, &c., of the Nimick & Britton Mfg. Company, Russell & Erwin Mfg. Company, and Mallory, Wheeler & Co., &c. In their Sporting Goods department they sell the celebrated Henry Leigh Guns, also all the leading makes of Fire-Arms and Ammunition. They carry stocks of the Norwich Cutlery Company's Pocket-Knives, Nonpareil Razors, &c. Their trade extends from Western Ohio to the Pacific Coast, while they receive orders for Sporting Goods, including Fishing Tackle and other belongings, from all over the South.

Edwin Hunt's Sons date their business back to 1833, when their house was founded in New York. It was removed to Chicago in 1847. They carry a general line of Hardware, Metals, Cutlery, Nails, &c., making a specialty of Shelf Goods. They are Northwestern agents for the Ice Tools manufactured by Wm. T. Wood & Co., of Boston, and maintain an ice dealers' supply depot. Their trade extends from Indiana to Dakota, over all the country naturally tributary to Chicago.

Horton, Gilmore, McWilliams & Co., as the successors of William Blair & Co., have a reputation for fair dealing, first quality goods, and low prices, which naturally gives them a very large mail order business. They carry a very large assortment of goods, embracing the lines of leading makers, covering new and de-

sirable goods in Hardware. The following fill a prominent place in their stock: Russell & Erwin Mfg. Company's Locks and Latches; Sargent & Co.'s General Hardware, Henry Disston & Sons' Saws and Files, Nicholson's Files, E. W. Gilmore's and Stanley Works' Hinges and Butts, Stanley Rule and Level Company's Tools, Charles Parker & Co.'s Line, Peck, Stow & Wilcox Company's Hardware and Tinner's Tools and Machines, D. Maydole & Co.'s Hammers, Lamson & Session Mfg. Company's Bolts, Union Steel Screw Company's Screws, Central Stamping Company's Stamped and Japanned Tinware, St. Louis Stamping Company's Granite-Ware, Douglas Axe Company's Axes and Tools, Oliver Ames & Co.'s Shovels, Spades and Scoops, and a host of other manufacturers' goods the names of which are familiar to all Hardware dealers. They are agents for the Jackson Steel and Wood Goods, and handle all descriptions of Farming Tools, but no machines. They control within the trade the sales of certain kinds of Farming Tools, House-Furnishing Goods, Horse Nails, Safety Bicycles, Door Hangers, Lawn Mowers and the Peerless Refrigerator, which will make its first appearance next season and in which they are preparing for a large business. They also deal largely in Wheeling Top Mill Nails, Wire Nails, Tin Plate, Sheet Iron, Burden's Horse Shoes and all kinds of heavy goods usually sold by the trade. They carry a large line of Lamps, Lanterns, common and fancy Clocks, Silver-plated Ware, Oxydized Silver and Gold-plated Jewelry, and Cutlery of every variety. They make a specialty of Revolvers and Ammunition, and not being members of the ammunition association sell largely of these goods at their own prices. They are now preparing a catalogue which will present some new features, and will prove valuable to the trade. The enterprise of the new firm has resulted in the extension of the trade of this house throughout all the Western States and Territories.

It may be said of all these houses, without exception, that they are not resting on their laurels, satisfied with past achievements and feeling secure in the possession of a large part of the Hardware trade of the country. They are alert, enterprising and progressive, ready to accommodate themselves to new conditions, and ever on the watch to introduce the newest and freshest ideas in the management of their business.

II.—Branch Houses and Agencies.

ST. LOUIS STAMPING CO., 16 Lake street, branch house.—*Granite-Ware*.

P. & F. CORBIN and CORBIN CABINET LOCK CO., 63 Washington street, Wm. G. Miller and John R. Scott, managers. Works at New Britain, Conn.—*Builders' Cabinet and Trunk Hardware*.

READING HARDWARE CO., 73 Wabash avenue, W. H. Bennett, manager. Factory at Reading, Pa.—*Builders' Hardware*. Also agents for Buffalo Hammer Co., Buffalo, N. Y.—*Hammers*.

E. Jencks Mfg. Co., Pawtucket, R. I.—*Bright Wire Goods*. Gwinner, Downey & Co., Hamilton, Ohio.—*Casters*.

YALE & TOWNE MFG. CO. (owning and operating the Yale Lock Mfg. Co., the Emery Scale Co. and the Western Crane Co.), 152 and 154 Wabash avenue., Wm. F. Donovan, manager.

ANSONIA BRASS AND COPPER CO., 64 Washington street, Gilbert M. Smith, agent.—*Brass and Copper Goods*.

LALANCE & GROSJEAN MFG. CO., Julien, P. Cordier, manager, 81 Michigan avenue.—*Agate-Ware*.

C. SIDNEY SHEPARD & Co., 23 and 25 Randolph street, branch of Sidney Shepard & Co., Buffalo, N. Y.—*Tin and Japanned-Ware*. Agents for Austin, Obdyke & Co., Philadelphia.

—*Corrugated Conductor Pipe*.

Hatten, Galpin & Co., Binghamton, N. Y.—*Eave-Troughs and Miters*.

New Haven Wire Goods Co., New Haven.—*Wire Broiler and Toaster*.

H. Clayton & Co., Cincinnati.—*Alcohol Stoves*.

Stuart-Peterson Co., Philadelphia.—*Enameled Kettles and Saucepans*.

H. R. Streeter & Co., Groton, N. Y.—*Sensible Sad Irons*.

Yates & Co., Rockford.—*Stove Polish*.

New Union Mfg. Co., Freeport, Ill.—*Coffee Mills*.

Heins & Munschauer, Buffalo.—*Refrigerators and Ice Chests*.

Fred. W. Baker, Rochester, N. Y.—*Kedzie Water Filters*.

They also job quite a variety of goods for which they do not have the exclusive sales agency.

J. J. CLEARY & Co., 154 Lake street, agents:

Clauss Shear Co., Fremont, Ohio.

Penna. Saw Mfg. Co., Philadelphia.

American Bit Brace Co., Buffalo.

St. Louis Refrigerator and Wooden Gutter Co.

W. H. Parkin, Cleveland, Ohio.

Rock Falls Mfg. Co., Sterling, Ill.

MORTIMER McROBERTS, 115 Lake street, agent:

The Plume & Atwood Mfg. Co., Waterbury Conn.—*Brass and Copper Wire, &c.*

Henderson & Harker Mfg. Co., Columbus, Ohio.—*Oil Cans, Elbows, &c.*

American Ring Co., Waterbury, Conn.—*Furniture Trimmings*.

C. T. Ham Mfg. Co., Rochester, N. Y.—*Tubular Lanterns, &c.*

Ridgway Refrigerator Mfg. Co., Philadelphia, Pa.—*Refrigerators and Ice-Cream Freezers*.

American Wick Mfg. Co., 26 Broadway, New York.—*Kerosene Wicks*.

COOK LEVEL CO., 154 Lake street; factory, Watertown, N. Y.—*Levels*.

M. HECKLINGER, JR., 139 Lake street, agent:

Philip Townsend & Co., Philadelphia, Pa.—*Wire Nails*.

O. L. BEARDSLEY, 92 Dearborn street, agent:

Payson Mfg. Co., Chicago.—*Sash Locks, &c.*

Belmont Nail Co., Wheeling, W. Va.

Pittsburgh Wire-Nail Co., Pittsburgh.

Anderson Bolt Works, Anderson, Ind.

H. BUTMAN, 137 Lake street, agent:

Clinton Wire-Cloth Co., Clinton, Mass.

J. C. BENNETT, 121 Lake street, manager:

Western File Co., Beaver Falls, Pa.

L. G. BEERS, 148 Lake street, manager:

Gilbert & Bennett Mfg. Co., Georgetown, Conn.—*Wire Goods*.

C. R. LAMENA, 154 Lake street, selling agent for

S. N. Brown & Co., Dayton, Ohio.—*Wheels, Hubs, &c.*

OTIS, SKILLMAN & Co., 154 Lake street, agents:

The Mallory-Wheeler Co., New Haven, Conn.—*Door Locks, &c.*

The Wm. Rogers Mfg. Co., Hartford, Conn.—*Silver-Plated Ware*.

Ten Eyck Edge Tool Co., Cattaraugus, N. Y.—*Hatchets, &c.*

Cleveland Twist Drill Co., Cleveland, Ohio.—*Drills, Taps, &c.*

Nashville Spoke and Handle Co., Nashville, Tenn.—*Axe Handles, &c.*

Union Mfg. Co., New Britain, Conn.—*Butts, &c.*

Skillman Hardware Mfg. Co., Trenton, N. J.—*Door Knobs, &c.*

- Palmer Hardware Mfg. Co., Troy, N. Y.—*Sash Pulleys*.
 Chicago Sewing Machine Co., Chicago, Ill.—*Registers, &c.*
 Hamblin & Russell Mfg. Co., Worcester, Mass.—*Wire Goods*.
 Dunn Edge Tool Co., Oakland, Me.—*Scythes, Axes, &c.*
 New Philadelphia Iron and Steel Co., New Philadelphia, Ohio.—*Sheet Iron and Steel*.
 Geo. N. Pierce & Co., Buffalo, N. Y.—*Refrigerators, Cages, &c.*
 Felix Sliding Door Hanger Co., Chicago.—*Hangers*.
- DENNISON & HAMILTON, 144-146 Lake street:
 Simonds Mfg. Co., New York.—*Registers, &c.*
 Palermo Mica Co., New York.—*Mica*.
 Nubian Iron Enamel Co., Chicago.—*Iron Enamel*.
 American Oil Stove Co., Gardner.
- BENNETT & SHIRK, 112-114 Lake street, agents:
 Ball Bros., Glass Mfg. Co., Buffalo, N. Y.—*Cans, Tanks, &c.*
 Ottumwa Cutlery Co., Ottumwa, Iowa.—*Cutlery*.
 Geo. C. Beals, Buffalo, N. Y.—*Wire, &c.*
 The Indiana Mfg. Co., Peru, Ind.—*Refrigerators*.
 Standard Fiber-Ware Co., Mankato, Minn.—*Pails, Basins, &c.*
 Reliance Edge Tool Co., Indianapolis, Ind.—*Axes, &c.*
- C. H. GURNEY & Co., 247-249 Lake street, agents:
 Atha Tool Co., Newark, N. J.
 Benjamin Atha & Co., Newark, N. J.
 Newark Steel Works, Newark, N. J.
 Jersey City Steel Co., Jersey City.
 Northwestern Screw Co., Chicago.
 Wm. H. Haskell Co., Pawtucket.
 Penn Hardware Co., Reading, Pa.
 Boston and Lockport Block Co., Lockport, N. Y.
 The J. Barton Smith Co., Philadelphia, Pa.
 H. Chapin's Son, Pine Meadow, Conn.
 James Carter, Lockport, N. Y.
 Syracuse Hardware Co., Syracuse.
 Fisher & Norris, Trenton, N. J.
 The Triumph Wringer Co., Keene.
 Cronk Hanger Co., Elmira, N. Y.
 Ryther Mfg. Co., Carthage, N. Y.
 Joliet Iron and Brass Foundry Co., Joliet, Ill.
- ANTHONY FREEMAN, 139 Lake street, agent:
 Canastota Knife Co., Canastota, N. Y.—*Pocket Cutlery*.
 J. Wiss & Sons, Newark, N. J.—*Shears, Scissors, &c.*
 A. F. Bannister & Co., Newark, N. J.—*Table Cutlery, &c.*
 E. Andrews & Sons, Williamsport, Pa.—*Saws*.
 Ray Hubbell Mfg. Co., Northville, N. Y.—*Oil Cloth Binding*.
 Birmingham Plane Mfg. Co., Birmingham, Conn.
- Low & WOODRUFF, 121 Lake street, agents:
 Braddock Wire Co., Rankin, Pa.
 Lambert & Bishop, Wire Fence Co., Joliet, Ill.
- M. A. MIHILLS, 166 Lake street, agent:
 Wetherald Wire Nail Co., Findlay, Ohio.
 Wm. Schollhorn & Co., New Haven, Conn.
 Sterling Wrench Co., Sterling, Ohio.
 Ellrich Hardware Mfg. Co., Plantsville.
- A. Y. McDONALD MFG. CO., 168 Lake street.
 Factory Dubuque, Iowa.—*Pumps and Plumbers' Supplies*. Also agents for Haines, Jones & Cadberry, Philadelphia.—*Plumbers' Supplies*.
- GEO. B. KERR, 208-210 Lake street, agent:
 Scoville Mfg. Co., Waterbury, Conn.—*Metal Specialties*.
- THE UPSON NUT CO., 232 Lake street, branch house.
 Factories Cleveland, Ohio, and Unionville, Conn.—*Nuts, Bolts and Carriage Hardware*.
- THE OSHKOSH PUMP CO., 154 Lake street, Eugene Smith, president.
 Factory at Oshkosh, Wis.—*Iron Pumps and Well Specialties*.
- H. H. & C. L. MUNGER, 142 Lake street, agents:
 E. C. Stearns & Co., Syracuse, N. Y.—*Door Hangers, &c.*
 Syracuse Twist Drill Co., Syracuse.
 Phoenix Caster Co., Indianapolis, Ind.
 A. F. Pike Mfg. Co., Pike's Station, N. H.—*Oil Stones*.
 Lufkin Rule Co., Cleveland, Ohio.
 A. M. Bristol, Rochester, N. Y.—*Registers*.
 Samson Cordage Works, Boston.
 Moore & Barnes Mfg. Co., Phoenix, N. Y.—*Specialties*.
 Hollenbeck Lock & Knob Co., Jordon, N. Y.
 Lovell, Tracy & Co., Hartford, Conn.—*Oil*.
 Climax Curry Comb Co., New York.
 F. A. Reiher, Chicago.—*Transom Lifters*.
 Wm. Gerwien, Chicago.—*Locks*.
 J. H. Brown & Co., Chicago.—*Hog Rings*.
 Michigan Wire Shovel Co., Niles, Mich.—*Picture Hangers*.
 The Brinkerhoff Co., Auburn, N. Y.
- MARINETTE IRON WORKS CO., 212 Lake street:
 Cameron Steam Pump Co., New York.
 Cleveland, Brown & Co., Cleveland.
 Kilbourne & Jacobs Mfg. Co., Columbus, Ohio.
 Hart Mfg. Co., Cleveland, Ohio.
 Mnfr's Governor Co., New York.
 Michigan Lubricator Co., Detroit.
 Detroit Lubricator Co., Detroit, Mich.
 Edinburg Pulley Co., Edinburg, Ind.
 Wiley & Russell Mfg. Co., Greenfield, Mass.
 Montgomery Brass Mfg. Co., Cleveland.
 Reliance Gauge Co., Cleveland.
 Taunton Crucible Co., Taunton, Mass.
 Bonney Vise Co., Clinton, Iowa.
 Josiah Gates & Son, Lowell, Mass.
 C. N. Coe, Worcester, Mass.
 Challenge Machinery Co., Philadelphia.
 Sterling Emery Wheel Co., New York.
 Star Machine Co., Buffalo.
 Newman Clock Co., New York.
 Jenkins Bros., New York.
 Celluloid Emery Wheel Co., New York.
 Holland & Thompson Mfg. Co., St. Paul.
 St. Paul Iron Co., St. Paul.
 Claffen Mfg. Co., Cleveland.
 Penberthy Injector Co., Detroit.
- W. MCARTHUR, 25 Lake street, manager Western branch,
 R. E. Dietz Co., New York.—*Lanterns*.
 Steam Gauge and Lantern Co., Rochester, N. Y.—*Lanterns*.
- HENRY A. TAYLOR, 19 Lake street, manager Western branch American Screw Co., Providence, R. I.
- HENION & HUBBELL, 55 and 57 North Clinton street, agents, Silver & Deming Mfg. Co., Salem, Ohio.—*Pumps*.
- H. S. WALKER, manager Western department Hall Duplex Steam and Power Pumps, 8 and 10 South Canal street.—*Pumps*.
- GREGORY & DONOVAN, agents, 154 Lake street.—*Hardware Specialties*.
- NELSON B. WILLIAMS, Rookery Building, agent:
 Hartman Steel Co., Beaver Falls.—*Wire, Wire Nails, Barb Wire, Steel, &c.*
 Apollo Iron and Steel Co., Apollo, Pa.—*Sheet Iron and Steel and Galvanized Iron*.
- CLIFFORD J. ELLIS, Phenix Building, agent:
 Gautier Steel Department of Cambria Iron Co., Johnstown, Pa.—*Wire, Barb Wire, Steel, &c.*
- UNION INDURATED FIBRE CO., general Western office and warehouse, 45 to 49 Wabash avenue; A. H. Prescott, manager. Factories: Portland and Skowhegan, Me.; Watertown, Mass.; Mechanicsville, N. Y.; Oswego, N. Y.; Lockport, N. Y., and Winona, Minn.
- FAIRBANKS, MORSE & Co., Lake and La Salle streets, branch house, for sale of Fairbanks' Scales. Sole agents for Eclipse Wind Mills, Sheffield Hand Cars, &c.; Hancock Inspirator, Smith-Vaile Pumps, Williams' Engines, Chandler & Taylor Engines, Snell & Maharg, Standard Electric Health Lift Co., &c.
- THE ANDREWS BROS. CO., 53 Dearborn street, John McLauchlan, manager Western office. Works at Haselton, Ohio.—*Sheet Iron, Bars, Bands, Hoops and Pig Iron*.
- T. S. CASEY & Co., 115 Dearborn street, agents for manufacturers of Steel Nails, Wire Nails, Roofing, &c.
- W. G. TALCOTT, 89 Lake street, agent for Alfred C. Rex & Co., Variety Iron Works, Philadelphia.
- J. W. CROSS, 115 Dearborn street, secretary H. C. Hart Mfg. Co., Detroit.—*Car Hardware*.
- WASHBURN & MOEN MFG. CO., 107 and 109 Lake street, H. B. Cragin, agent. Works at Worcester, Mass.—*Plain and Barb Wire, Bale Ties, &c.*
- HENRY DRISTON & SONS, 259 Randolph street, H. D. Nicholls, manager. Works at Tacony, Pa.—*Saws*.
- C. K. LUCE, 154 Lake street, agent:
 Globe Nail Co., Boston.—*Horse Nails*.
- CHARLES HAWKINS, Phenix Building, agent for:
 Brown, Bonnell & Co., Youngstown, Ohio.—*Nails, Bar Iron, &c.*
- PUTNAM NAIL CO., 235 Lake street, E. Brubaker manager.—*Horse Nails*.
- D. R. SPERRY & Co., 235 Lake street. Works at Batavia, Ill.—*Hardware Specialties*.
- S. L. BIGNALL HARDWARE CO., 233 Lake street. Works at St. Charles, Ill.—*Sad Irons, &c.*
- W. & B. DOUGLAS, 197 Lake street, Works at Middletown, Conn.—*Pumps*.
- M. T. MILES & SON, Phenix Building, agents for:
 Anderson, Du Puy & Co., Pittsburgh; John C. Schmidt, York, Pa.; also represent manufacturers of Nails, Springs, Carriage Axles, &c.—*Steel Chains*.
- A. GUSTORF, 92 La Salle street, agent for manufacturers of Hardware Specialties.
- JOHN A. ROEBLING'S SONS COMPANY AND NEW JERSEY WIRE CLOTH CO., 171 and 173 Lake street, George C. Bailey, manager. Works at Trenton, N. J.—*Wire, Wire Rope, &c.*
- GOULDS & AUSTIN, 167 and 169 Lake street, agents for:
 Goulds Mfg. Company, Seneca Falls, N. Y.—*Iron Pumps, &c.*
- P. HAYDEN SADDLERY HARDWARE CO., 45 and 47 Lake street. Works at Columbus, Ohio.
- W. A. COMSTOCK, 31 Lake street, manufacturers' agent for sale of Hardware Specialties.

W. H. WALBRIDGE, 31 Lake street, manufacturers' agent for sale of Hardware Specialties.

KILMER MFG. Co., 543 State street. Works at Newburg, N. Y.—*Bale Ties*.

JONES & LAUGHLINS, West Lake and Canal streets. Works, Pittsburgh.—*Nails, Bars, Sheets, &c.*

WM. E. STOCKTON, 16 West Lake street, agent for:
Moorehead McCleane Co., Long & Co. and Singer, Nimick & Co., Pittsburgh.—*Galvanized Iron, Bar Iron, Steel, &c.*

JAMES W. ROSS, 123 Dearborn street, agent:
Whitaker Iron Co., Wheeling, W. Va.—*Sheet Iron*.

W. S. KESSLER & Co., 115 Dearborn street, agent for:
Toledo Bolt and Nut Co., Toledo, Ohio.—*Bolts, Nuts, Bars, &c.*

J. P. DABNEY, 239 and 241 Lake street, agent:
Taunton Tack Co., Taunton, Mass.—*Tacks, Nails and Rivets*.

W. M. MOONEY & Co., Western office 241 Lake street; factories, Montreal, Canada, and Ausable Chasm, Essex County, N. Y.—*Horse Nails*.

CHARLES HOWARD, 226 and 228 Lake street, manager Chicago office:
Deane Steam Pump Co., Holyoke, Mass.—*Pumps*.

A. W. KINGSLAND, 142 Lake street, general agent:
Ausable Horse Nail Co., New York.—*Horse Nails*.

WM. T. EGAN, 40 Dearborn street, agent:
P. L. Kimberly & Co., Sharon, Greenville and New Castle.—*Iron and Nails*.

A. French Spring Co., Pittsburgh.—*Springs*.

SAMUEL E. BROWN, Phenix Building, agent for Cleveland Hardware Co., Cleveland.—*Wagon and Carriage Hardware*.

The Rights of Employees.

A writer in a recent issue of the *Merchants' Review* presents the following views on the treatment which should be accorded salesmen in the employ of retail merchants in all branches of trade:

As a retail business of any magnitude cannot be conducted without the help of clerks, and as the proprietor must depend upon these assistants in a large measure as his representatives, it follows that the treatment of these important adjuncts of

the retail business must be a matter for serious consideration with the merchant. Clerks have it in their power to increase the business of their employers by proper attention to the wants of their patrons and those small acts of politeness to the fair sex, which are as a rule so highly appreciated, or they can drive away the very best class of customers by surly or inattentive conduct, and at the same time escape reproof because the fact does not come to the notice of the employer. Some young men are so incapable naturally that the most rigid training can never fit them for a position behind the counter, though they may shine in other occupations. The merchant employing a large staff of clerks sometimes finds specimens of each class among them—the ill-tempered, the thoughtless and the willing but incapable. Then it is that his capacity for management, his executive ability and knowledge of human nature must come into play, and the worthless clerks be weeded out, while the capable but thoughtless are reproved and instructed.

The easiest plan at first thought would seem to be summary dismissal of every assistant not first class, but the experienced retainer is aware of the difficulty of obtaining a staff of good assistants ready to his hands, and knows that he must train them himself in many cases. Some clerks are ruined by harsh and tyrannical treatment, others by slack discipline, but the employer who is firm yet considerate of the rights of his employees should have little trouble in protecting his business against the injury resulting from the shortcomings complained of by many retailers. Constant vigilance is necessary or the merchant will never detect the faults that give offence to his patrons, but he ought not to expect too much from his assistants, as for instance that they will take the same interest in the business that he does himself. They ought, of course, to do so, but human nature is such that hardly one in a thousand will be found perfect in this respect. When a merchant finds his clerks willing, industrious, honest and affable to his patrons, he should by all means cherish them, for he is more fortunate than the majority of his fellow merchants. The minor faults of young men can generally be eradicated by careful training, which, if successful, will repay the dealer for his trouble. In all cases, kind and considerate, but firm treatment gives the most successful results, and it is not to be wondered at that employers who adopt a different policy are the loudest in complaint of the faults of the whole race of clerks.

The H. C. Frick Coke Company, of Pittsburgh, have purchased within the last few days a valuable piece of property at the corner of Garrison and Penn avenues, in that city. It is the intention of the firm to erect on the site a costly and extensive office building, the lower part to be used by the H. C. Frick Coke Company as offices, while the upper floors will be rented out for the same purposes. Work on the building will probably be commenced in a short time.

The Adams Coke Oven Bottom Mfg. Company was organized in Pittsburgh last week, with a capital stock of \$50,000, and a charter will at once be applied for. The object of the company is the manufacture of a false bottom for coke ovens, patented by Mr. A. Adams. The bottom is to be opened by hydraulic pressure, and by its aid it is claimed that one man will be able to draw 40 ovens per day. At present the most that one man can draw in a day is four ovens. The company propose charging \$15 per year royalty for the use of their invention. The members of the company are A. Adams, Lehman Suear, John Donahoe, John Adams and Samuel Truby.

The Eureka Spring-Toothed Harrow.

This harrow is manufactured by the Eureka Mower Company, Utica, N. Y. It is illustrated in the cut, Fig. 1, given herewith. The manufacturers call atten-

tion to its light draft, which is not, however, at the expense of strength or durability, as the channel form of steel used in the draft bars is referred to as giving it exceptional strength. They also claim that the harrow has light draft, from the fact the frame is 3 inches higher from the ground than other harrows, and will not bury itself. The two parts of the harrow are hinged together with an oblong loop upon one side and an eye or stud upon the other, fastened with a spring key and

Fig. 1.—The Eureka Spring-Toothed Harrow.

ment of the teeth, so that in removing one or all of the teeth the frame remains the same.

ent of the teeth, so that in removing one or all of the teeth the frame remains the same.

Lawn Rakes.

We represent herewith the Champion Wheel and Champion Reversible Lawn Rakes, which are put on the market

teeth, and of such a form as to prevent their tearing the sod. The length of the teeth and the width of the rake are also alluded to. The point is also made that they will not rust, as all the metal parts are galvanized. Fig. 1 represents the Champion wheel rake with reversible handle. The manufacturers explain that the handle, being reversible, gives the rake the desirable feature of being both a grass and a leaf rake, the pointed teeth being adapted to grass and the back rake reversed on handle forming a set of bowed teeth principally adapted to raking leaves in the fall of the year. The wheel is alluded to as adding to the ease of working the rake, also protecting the sod. Fig. 2 represents a similar rake, the wheel being omitted and the handle differently attached. The rake, as shown, is reversible and the teeth on either side can be used. Its special adaptation as a lawn rake is mentioned by the manufacturers, as well as the low price at which it is offered to the trade.

Pan and Griddle Greaser.

The accompanying illustration represents an article put on the market by Woods, Sherwood & Co., Lowell, Mass.

Pan and Griddle Greaser.

It is designated as Mrs. Gray's Patent Pan and Griddle Greaser. As indicated in the cut, it is made of wire and is about 7½ inches in length. It is so constructed as

Fig. 2.—Form of Hinge.

washer, Fig. 2. The advantage of this joint is referred to as being that upon rough or uneven ground either half of the harrow is conformable to the surface. The tooth is fastened with a malleable-iron clip, shown in Fig. 3, by means of two bolts, the tooth seated upon the walls of the channel bar and the clip spanning it and fitted into the channel, but not resting upon the bottom of it. When the bolts are drawn the clip secures the tooth

Fig. 3.—Method of Attaching Teeth.

firmly. In fastening the frame together malleable-iron saddles are used, in which the draft bars and wood cross-beams are secured by bolts. These saddles have flanges upon the upper and lower sides to take the channel steel draft bar and the wood pieces at each intersection. This

by the Champion Lawn Rake Company, Canton, Ohio. The teeth of these rakes are made of steel wire and are

to hold firmly the greaser proper and permit the substitution of a new one when desired. It is referred to by the manu-

Fig. 1.—Champion Wheel Lawn Rake.

Fig. 2.—Champion Reversible Lawn Rake.

inserted, it will be observed, through a tube, in which they are securely fastened. They are made of the shape represented to prevent the clogging of the

facturers as giving satisfaction and serving a convenient purpose, making it a desirable article in the kitchen and securing a ready sale.

Herrick's Patent Tool Rack.

The accompanying illustration represents Herrick's Patent Tool Rack, which is manufactured by F. A. Herrick & Co., 228 Second street Jackson, Mich. This

12 Long Shovel Handles, 12 Long Spade Handles, 12 Long Rake Handles, 12 Hoe Handles, 12 Long Manure-Fork Handles, 12 Long Hay-Fork Handles, 8 D-Fork Handles and 8 D-Shovel Handles. It will thus be seen that the rack accomodates a

Herrick's Patent Tool Rack.

rack is made entirely of iron, except the posts and platform, and is mounted with heavy truck casters so that it can be moved at will to any part of the store. The shovel and fork brackets slip into a dovetail on the rack, and can be interchanged at will by simply lifting out of socket. They are notched, it will be observed, on top so that each tool is held securely in its space. The handles are intended to stand on end on the platform, and are held in place by the V-shaped brackets. The rack is described as strong, thoroughly screwed and bolted together, the woodwork being neatly painted a bright red, and all ironwork japanned, making it very attractive in appearance. The room necessary for the accomodation of the rack is a space about 5 feet square. The capacity of the rack is stated to be as follows: 32 D-Handle Shovels, 12 Long Handle Shovels, 48 Long Handle Forks, 16 D-Handle Forks, 24 Rakes, 36 Hoes, 18 Potato Hooks, 18 Manure Hooks,

large assortment of the goods for which it is intended.

Heavy Sleigh-Shaft Coupling.

The accompanying illustration represents a new heavy sleigh shaft coupling,

Heavy Sleigh Shaft Coupling.

which is put on the market by Butts & Ordway, 145 and 147 Pearl street, Boston, Mass. Its general construction is clearly shown in the cut. Special attention is called to the fact that it is made of heavy

iron of the best quality and well-finished and fitted. The couplings are made so that they can be fitted to almost any heavy sleigh or single or double runner pung. In order to give a clear idea of the size and adaptation of the coupling we would add that from A to B is 8 inches, from A or B to C, 6½ inches, from C to D 10 inches, from A or B to D 15½ inches, diameter at E 1½ inch.

Wing's Improved Pail Ear.

I. A. Weston & Co., Syracuse, N. Y., are putting on the market Wing's Improved Pail Ear, which is represented in the accompanying cut, Fig. 1, its use being indicated in Fig. 2. The ear is

Fig. 1.—Wing's Improved Pail Ear.

formed of bent metal and perforated as shown in Fig. 1. The object of this pail ear is to provide a support by which the pail can be held while milking, thereby preventing it from coming in contact with the ground and also guarding against its being tipped over. The curved arm projects outward away from the pail and forms

Fig. 2.—Wing's Pail Ear Applied.

a support by means of which the pail may be held in position between the knees of the milkman without the necessity of much pressure on its sides.

The fate of the railway tunnel between Denmark and Sweden has practically been decided, the joint Swedish-Danish Commission appointed to report upon the project having recommended its rejection, at all events in its present form. The proposal for a tunnel was made by a syndicate of French financiers, and provided for a railway tunnel from a point in the island of Amager, near Copenhagen, to a point near Malmo, on the Swedish coast, the ap-

plicants for the concession maintaining that such a connecting link between the railway systems of Denmark and Sweden could not fail to develop the traffic between the two countries.

The Improved Easy Copying Press.

This article is made by the Easy Copying Press Company, Detroit, Mich., for whom Danforth & Pike, Boston, Mass., are agents. The bed is made of hardwood, 1½ inches thick, provided with wrought angle irons on each end to strengthen it, the follower being treated similarly. The arched frame is steel, thus giving the requisite strength, and the top screw piece riveted to the frame is forged steel. The four jointed pieces and other connections are wrought iron. The man-

The Improved Easy Copying Press.

ufacturers make the point that thus there is no cast iron about the press except the wheels. It will be observed that the press is easily adjusted to books of different thickness. Its strength, simplicity and the ease with which it is worked are the advantages which are especially mentioned. It is made in different sizes, ranging from 10 x 13 to 18 x 22, and finished either painted plain, painted and striped, half nickel or full nickel.

New Metallic Lathing.

Prominent among the exhibits at the American Institute Fair, New York, now in session, is a miniature building, lathed and plastered, in the construction of which is employed what is known as the Hayes System of Metallic Lathing, Furring, &c., an invention that has recently

Fig. 1.—Back Elevation of a Portion of Perforated Sheet for Lathing.

been introduced by George Hayes, the well-known manufacturer of skylights and other glazed structures, of 71 Eighth avenue, New York. From even casual inspection it is evident that the improvement possesses more than ordinary merit.

Briefly, the invention consists of a sheet of iron or other metal perforated in such a form as to provide holes for the clinch of the plaster, and with burrs turned outward in a way to use the punching, to still further hold

Fig. 2.—Elevation of Front of Portion of Perforated Sheet.

the mortar in place. Referring to the engravings, Fig. 1 shows a back elevation of the lathing, and indicates how the holes are punched. Fig. 2, on the other hand, is a section of the front elevation of a sheet of the lathing. The lathing is manufactured out of sheets of metal 40 x 96 inches or less in size, over the surface of which, at near intervals, are openings ½ inch wide by ¾ inch long, produced by puncturing, as already mentioned. The flanges around the openings are pressed forward and curled outward, forming lips or hooks which clinch or hold the mortar to the surface of the sheets, while at the base of each opening there is formed a matrix into which the mortar is pressed, and by which perfect dovetailed clinches or bonds are obtained. The process, it is pointed out, imparts to the sheets an undulated surface, giving additional strength thereto. The mortar or plastering material is spread over the surface of the sheets, embedding the lips and hooks and filling the matrix, thereby, it is claimed, permitting a degree of coalescence which insures perfect and substantial work. The inventor points out that there is an entire freedom from expansion or other organic action, which would be liable to disrupt, strain or in any

being hard finished. In connection with this invention Mr. Hayes has perfected various architectural features which will be appreciated by builders in general. The lathing sheets can be readily bent to internal and external angles, and when so bent adapt themselves to any form of combined lathing, furring and screeding, and also to meet certain features in architecture, such as pilasters, columns, niches, groins, cornices, bases, angles, trimmings, &c. In the pamphlet which the inventor has issued, several engravings are presented which illustrate this feature. One application of this improvement, which will be very generally appreciated by those of our readers who have to do with office buildings and similar structures, is in the construction of fire-proof partitions.

Fig. 4.—Vertical Section through Finished Portion.

In his description, the inventor says that this system of lathing admits of the construction of strong partitions of from 1½ inches thickness, upward, with double-plastered faces. The partitions are made by forming in the lathing sheets which, by virtue of the peculiar punctures, already have rigidity, a series of ribs such as are made for furring, and which are secured to each other back to back, and, when necessary for an

Fig. 3.—Horizontal Cross Section Corresponding to the Above.

other way injure the bond. Cracking or falling away of the surface of the wall or ceiling, under any circumstances, it is claimed, is impossible. So solid is the coating that it can only be removed by picking it off in particles. Among the advantages to which attention is prominently directed we note the following: Less mortar is used than upon any other fire-proof lathing; the mortar may be applied stiffer than is the ordinary practice; scratch coating is entirely dispensed with; for one coat work this lathing affords an effectual finish; less hair, and shorter hair than commonly employed, may be successfully used. It is claimed, further, that by plastering with a good quality of gauged material a good result may be obtained without any hair. Figs. 3 and 4 of the engravings show a section of the lathing, a portion being covered with the first coat, and a portion of this, in turn,

increase in strength, reinforced with a framework of band or bar iron or with angle or T-iron. The lathing is secured to the frame by wire or suitable clamps. The plastering on both sides aids in binding the whole together, so that very substantial walls are the results. The sheet, punctured as above described, are furnished in plain iron dipped in a lime coating, or dipped in asphaltum, or galvanized. As lime is a well-known preservative of iron, it is claimed that plain iron with a coating of lime is the most advantageous to use. The merchantable size of the sheets is 30 x 96 inches. It is claimed that the labor in applying this material to the walls is very much less than what is required in putting in plaster, wooden lathing, and it is further claimed that the employment of this material greatly adds to the strength of the building, in the fact that it braces and stiffens the walls.

CURRENT HARDWARE PRICES.

DECEMBER 5, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers. at the figures named.

THE IRON AGE

THURSDAY, DECEMBER 13, 1888.

Improved Drainage Pump.

We show on this page one of a line of improved pumps for drainage, dredging and other similar purposes, built by the Morris Machine Works, of Baldwinsville, N. Y. It is known as their No. 12 direct connection pump for irrigation and drainage, and was originally intended to be used as a bilge pump for use on vessels. Having a capacity of 10,000 gallons per minute it was thought that it would serve a valuable purpose in case of collision. A hori-

pressure in its seat. The union would seem to make a tight joint with comparatively light pressure.

A New 38-Inch Lathe.

Lodge, Davis & Co., of Cincinnati, Ohio, are building a new 38-inch lathe which embraces several novel features. Among these is the depth of bed, with liberal amount of metal in the upper and lower portions especially, and having the two sides tied together by diagonal braces

either direction. There is also automatic cross feed, these two feeds being so arranged that one cannot interfere with the other. The feed rod may be driven by gearing when desired, so that feeds can be obtained, ranging from 100 per inch to 5 per inch, in either carriage or cross feeds. No worm gear is used in the carriage apron. The feed rack is cut of steel. A stop is provided for automatically disengaging the feed at any predetermined point. The lead screw, as in all lathes built by this firm, is inside of the

DRAINAGE PUMP, BUILT BY THE MORRIS MACHINE WORKS, BALDWINVILLE, N. Y.

zontal engine is used for driving. It has a 17-inch cylinder, with 10-inch stroke, and can be safely run at a high speed. The whole outfit is compact and substantial.

Metallic Wire-Packed Unions.—Mr. John A. Prindle, of the Worswick Mfg. Company, Cleveland, Ohio, has brought out a novel and effective wire-packed union for pipes, &c. The essential feature of the device consists in a recess in the union with its interior wall perpendicular and its exterior wall inclined and a metallic wire packing with open ends, conforming in size and shape to this recess. The wire is preferably brass spring wire, and is bent into circular form. The ends of the wire are dressed accurately, so as to abut fairly, the wire being of such length that the ends meet when it is laid without

crossing each other, the object being to secure rigidity in resisting torsional as well as other strains. The head stock has a bearing upon, and is bolted securely to, the bed throughout its length instead of at the ends only, and the inside web is carried up as near as possible to the back bearing, which has to resist the thrust. The spindles are of steel, the main bearing being $5\frac{1}{4} \times 9$ inches and the back bearing being $5 \times 7\frac{1}{4}$ inches. The tail stock also has a bearing on the bed along its entire length, and is clamped by four bolts. For convenience in handling it is provided with a crank handle, by means of which, in connection with a pinion, the feed rack is employed for moving it. In addition to the inherent stiffness of the saddle the apron is secured to it in such a manner as to still further stiffen it. The compound rest has automatic feed at any angle in

bed immediately under the inside V and nearest the point of resistance. The nut is in two parts, which close upon it in the usual manner, working in a box, which forms a support for the screw as well. The screw is of steel, and geared to cut from 12 threads per inch to one thread in 2 inches. The nut, as well as all manipulations of the feed, including the reversal, is operated from the front of the carriage, special attention having been paid to ease and convenience of handling. A steady rest accompanies the lathe. It has four jaws, and is proportioned in keeping with the general design of the lathe. The countershaft has tight and loose pulleys, 24 inches in diameter for a 4-inch belt.

The lathes are made with various lengths of beds, advancing by 2 feet up to 24. The weight with a 12-foot bed is 12,000 pounds.

Collieries Between the Cumberland River and the Tennessee Valley.

The Cincinnati, New Orleans and Texas Pacific Railway passes over and alongside greater areas of coal and iron-ore bearing land than any railroad in the United States. Coming from Cincinnati it enters the great Cumberland coal field, a mile south of the Cumberland River, thence for 91 miles its track is entirely upon coal-bearing strata, and thence for 72 miles further south its track is never over a mile from coal-bearing strata, and a less distance from the well-known persistent vein of red fossil iron ore. Then passing Chattanooga and Wauhatchie for 198 miles, one side or the other, and frequently on both, are within 1 to 2 miles of veins of iron ore and coal. From Emory Gap to Dayton, 41 miles, is an unbroken vein of iron, ranging from 3 to 5 feet in thickness, and while it exists in many hills high above water level, actual mining operations have proven that it exists without diminution in quality over 225 feet below water level.

When the Cincinnati Southern was originally planned it was thought that Cincinnati might regain the trade which Louisville had drawn from her. A few enthusiasts told of the coal and iron, but the practical merchants of the Queen City thought that a mere nothing. Selling goods and buying produce was in their minds and eyes, yet it is probable that one-third of the traffic of the road is on these minerals. The facts which have been stated as to the Cincinnati-Southern Division are also true of the Alabama Great Southern Division, the coal, however, being nowhere in such close proximity to the ore, but the amount of ore is much greater. The vein of ore is continuous for very nearly 198 miles, and is at some points on both sides of the line, and is for a long distance from 20 to 25 feet thick.

We have stated that the line of the Cincinnati, New Orleans and Texas Pacific enters the coal-bearing strata about a mile south of the Cumberland River. The coal in section belongs to what is known in geology as the sub-conglomerate coals, being those seams existing in the shales and sandstones, between the lowest and greatest conglomerate and the limestone. These coals are wanting in many sections of country, but in the region now alluded to reach an unusual degree of excellence and regularity. The coal from what was called the Cumberland mines, on the river above the railroad bridge, was for many years boated down the river to Nashville, where it sold in the market for considerably more than any other coal. The first mine on this railroad is at Happy Hollow; the elevation of the track there is 998 feet above sea level, and the coal seam is 100 feet higher. The first well-defined show of the conglomerate is at Flat Rock, ten miles south of Happy Hollow. The track is there immediately upon it, and its elevation above the sea is 1300 feet. There is a general dip of all the strata and of course of the coal seams to the southeast. The elevation of track at Greenwood, three miles south from Happy Hollow, is 1200 feet, the Greenwood seam is a little higher, but the Beaver Creek mines are much lower. The natural inference from these data would be that the coal of all these mines, Happy Hollow, Greenwood, Beaver Creek and Barren Fork, are all below the great conglomerate which shows so plainly and so massively at Flat Rock.

As there has never been any thorough survey of the Tennessee coal field the exact dip of the strata to the southeast is not known, but it disappears forever among the horizontal strata after its well-defined appearance at Flat Rock, but is to be found in the vertical pitched-up strata of Walden's ridge. The disappearance of

this great geological age-mark demonstrates the fact that all coals to the southeast belong to the series above it and may be more certainly depended upon for permanence in area and regularity in thickness. As already stated, the first mining operation on the line of this railway coming from the north is that of the Cleveland Coal Company, at Happy Hollow. Compared with many others this mine is small, but there are none anywhere more elegantly located for handling coal quickly and cheaply. The track which goes to the coal-tipple is only 400 yards long, and the main entry is only about 150 feet from the top of the incline. The seam of coal ranges from 3½ to 4 feet in thickness. There are three entries into the mountain. The output is now about 150 tons per day. Fifty miners and 16 outside men of all kinds are employed. This mine is 172½ miles from Cincinnati. The chief market of their coal is Kentucky towns and cities. The capital invested amounts to \$50,000.

The next mine is Greenwood, 175½ miles from Cincinnati. This was one of the first mines on the road, having been opened in 1878, and it has been worked many years with varying fortune. The Greenwood seam of coal appears to be different from any other in the neighborhood; it is in an isolated series of knobs. In and around this mine about 440 men are employed. From Greenwood Station a wide gauge railroad runs down 6½ miles to Beaver Creek, where there is another mine owned by the same company. At this place 65 men are employed. Two miles east of Beaver the same company is opening a new mine, with which it is connected by a narrow gauge railroad. This coal and that at Beaver is much lower than the track at Greenwood, therefore the cars are lifted up to a tipple on an incline. Three steam engines are used in getting the coal from the mines to the main line at Greenwood. The total product is about 280 tons per day, of which Greenwood supplies about 180 tons. The entire output is taken by the railroad for its own use. The area of land owned by this company is 20,000 acres. The coal of the new seam being opened by this company is said to be identical with the famous Cumberland coal previously alluded to. An incident of the perils of old boating times is related by one of the men at the mine: On one tide 24 boats started out loaded with coal and only six reached Nashville. The great trouble lies with the falls of the Cumberland. A peculiarity in mining this coal is that no powder is used, the coal being prized out in cubical blocks. The seam will average 4 feet in thickness.

The next mine is Barren Fork. It is about 3 miles from the main line of the road, and is near Flat Rock Station. At this mine machines are used for mining. The output is about 10 cars per day, which is entirely sent to Kentucky markets. The Hellenwood Mine is 211 miles from Cincinnati in the State of Tennessee. It is the first of the mines that may be assumed to be above the great conglomerate. As the line of road comes into Tennessee, there is to be seen on the eastern side, rising to a very high elevation, a series of peaks and ranges, all of which contain coals above the conglomerate, and many rising high enough to contain some of the upper measure seams. This is especially true further south on the line, as in Morgan County only a few miles east rise the high mountains of the Crooked Fork country, which contain many valuable seams of coal. The Hellenwood has been opened for many years and worked with poor results. It is now leased by Mr. Fry. The cause of former trouble was a seam of bony coal in the middle, which was very hard to get rid of, but Mr. Fry writes that this has almost entirely gone out. The output is now about 60 tons per day. From 18 to 20 men are employed. This

mine is owned chiefly by parties in Chattanooga. The next mine is near Robbins Station, 218 miles from Cincinnati and 117 miles from Chattanooga. This operation is known as the Robbins Coal Mining Company. The same seam of coal is worked here as at Glenmary. The mine was opened July, 1887, and they have driven in a main entry 2300 feet. The seam ranges from 3 to 4 feet in thickness. The output averages 240 tons a day; 70 miners and 30 outside men are employed. The property is owned by persons in Chattanooga. It is their intention to erect ovens and manufacture coke. At Hoffman's Switch a small operation has been commenced, which will be of considerable importance when gotten into the hands of persons with capital sufficient to develop it. It is called the Ottburg Coal Company, and they have a lease on 1000 acres at the remarkably low price of \$100 per year.

The largest coal-mining operation on this division of the Cincinnati, New Orleans and Texas Pacific Railway is that of the Glenmary Coal and Coke Company. The mines of this company are located near Glenmary Station, 223 miles from Cincinnati and 112 miles from Chattanooga. The mines are 7300 feet from the main line, near the station-house. Of this distance 3500 feet is a standard gauge railroad to the coke ovens and tipple; thence a narrow gauge 3800 feet to the main entry. This mine was opened in 1880, and had a somewhat precarious existence for some years, but has been made a success under the excellent management of Col. John H. Clarke. The stockholders of the company reside principally in Kentucky, but some are in Chattanooga. Mr. Geo. W. Darnell, of Lexington, Ky., is president of the company, and Colonel Clarke is still superintendent. In 1881 there were shipped from this mine 45,000 tons, and 175 hands were employed, no coke being made. For the present year, 1888, the shipments of coal will average 400 tons per day, and of coke from 65 to 70 tons per day, while an average of 300 miners and 100 outside hands are employed. The length of the main entry, out of which the coal is brought, is but a poor indication of the system of underground railways inside, it being only 3300 feet, while one cross entry is 5000 feet long, and the total length of entries is 7½ miles. The seam of coal has improved in thickness the further under the mountain, and at 3000 feet is very regularly 4 feet thick. The coal is all brought to this main entry by mules, thence it is pulled out by wire rope. When "a trip" of 50 to 60 cars is made up, the little locomotive on the narrow gauge hauls them down to the tipple. In this handling so large a quantity at a time is one secret of the profitable operation of the mine.

This coal is very highly esteemed, and sells readily everywhere from Lexington, Ky., to Macon, Ga. The coke made is probably the best south of Virginia. Large quantities have been sent to Colorado and Arizona. It is made entirely from unwashed slack, and its analysis shows: Carbon, 91.00; ash, 9.00, and sulphur, 0.480. The company have not gone into the wild craze, too common in the South, of owning a large acreage not available for many years, but own only 3000 acres, a very large proportion of which carries the seam they are now working.

This is the last mining operation immediately on the road line until the railway passes into the Tennessee Valley.

It is estimated that nearly 40,000 square miles of the State of Colorado are underlain with coal, embracing every variety, from the soft, clean and beautiful lignites to the highly bituminous, semi bituminous and all grades of anthracite.

New Stationary Blast Forge.

The accompanying cut illustrates a new stationary blacksmith's forge, which was especially designed and built by the Buffalo Forge Company, of Buffalo, N. Y., for the Burton Car Company, Wichita, Kan., to meet their requirements for extra heavy work. It has a large deep fire-pan, 62 x 48 inches by 10 inches deep, with fire-pit 4 inches lower still, giving a depth of 14 inches from top of bowl to bottom of fire-pit, thus making it especially adaptable to handling large and heavy work. For light work the gates on side can be opened and fire lowered 4 inches.

The tuyere iron is extra heavy with a 3½-inch blast gate, fitted with an improved anti-clinker triangular ball for regulating the blast, and is designed especially to withstand heavy service without burning out. The water and coal boxes are cast in one piece with the fire pan, with a sloping partition dividing the two for easy removal of coal. Although the patterns for these forges have been completed only a short time, we understand that they have

Engineers and others, who have taken special interest in the work, and who know that a wind pressure of 56 pounds per square foot has been allowed for over the whole structure, would not expect any other result; but to the uninitiated the gale should certainly be reassuring. It is greatly owing to the necessity of providing for a large wind pressure that the bridge presents such a massive appearance, for the surface exposed to wind action is so large that there is a pressure of 8000 tons allowed for between the two cantilever end piers, due to wind alone; the stresses on the steel, however, from this and all other causes do not exceed one-fifth of the amount that would actually cause any part to fail.

The method of recording the force of the wind at the works is very complete. On the Island of Inchgarvie are placed three wind gauges or pressure boards, the larger one, 300 square feet in area, is fixed square to the east and west winds, and of the two smaller ones of 1½ square feet area, one is fixed as above, and the other is free to swivel square to the wind in any direc-

date of sales. The term 'regularly authorized agents,' used in the letter, was intended to apply only to agents who are practically officers of the furnace companies, and not to commission merchants, who are, I suppose, in a certain sense agents for all the furnaces. To avoid duplicate reports or misunderstandings of any kind, it is desired that sales made by commission merchants shall be reported through the furnace companies for whom they are made."

Rope Driving.

There are three types of grooves used in various works—one is the U-shaped groove for binder pulleys only, where the rope rests in the bottom of a semicircle large enough to hold it; another is the V-shaped groove, and a third is where the groove is approximately in the shape of an ellipse, the radius of the bottom groove being about 60 per cent. of the radius of the rope. The speed of such ropes is limited to about 5000 feet per minute, at which velocity the centrifugal force becomes a very important element in the capacity of the system for the transmission of power. The working stress of the ropes varies very widely in practice. As high as 500 or 600 pounds have been applied on a 2-inch rope, although the best practice limits the stress upon such a rope to about one-half of that amount. The following figures give the result of what has been shown to be good practice:

Diameter of ropes. Inches.	Working stress on one rope. Pounds.	Diameter of ropes. Inches.	Working stress on one rope. Pounds.
1½	247½	2 1-16	256
1 11-16	220	2 1-16	330
1¾	278½	2 1-16	349
1¾	330	2½	205
1¾	363	2½	330

The advantages claimed for rope driving are the absence of slip, the ability to turn the corners and to run to any desired distance; the cheapness of cost, it being about two-thirds that of leather, and also economy of maintenance. On the other hand, it is claimed that the mechanical efficiency of rope driving is not so high as by belt driving, that the power required to press the rope into the grooves, and then to pull it out as it leaves the pulley, is a large element in the problem, and also that the ropes are subject to a greater degree of wear than is estimated by their advocates. There is also a difference by reason of the fiber used, and ropes made of manila will not give results equal to those of cotton, unless the manila has been laid and treated especially for the purpose.

The contract for the ironwork of the reconstructed Chamber of Commerce building, on the corner of La Salle and Washington streets, Chicago, has been awarded to Vierling, McDowell & Co., of the same city. They have sublet the contract for the beams, girders and other wrought work to Jones & Laughlins. Steel alone will be used, and from 1200 to 1500 tons will be required. The original building has been remodeled to contain five stories, and a new superstructure of eight stories and an attic will be added. The whole building will then consist of thirteen stories, a basement and an attic, and will be one of the tallest buildings in Chicago, or probably the tallest. The alterations are to be completed by the 1st of August next. The building will be exclusively used for offices. Baumann & Huehl are the architects. The Chamber of Commerce Vault Company are the owners.

The connecting-rod of the new Puritan is a forging 40 feet long and weighing, finished, 21 tons.

NEW STATIONARY BLAST FORGE, BUILT BY THE BUFFALO FORGE COMPANY, BUFFALO, N. Y.

already been supplied to the American Brake Company, St. Louis, Mo.; Binghamton Wagon Company, Binghamton, N. Y.; Mexican National Railroad Company, and others, thus indicating their advantages for wide range from light to heavy work.

Wind Pressures on the Forth Bridge.

Mr. I. E. Tuit, of the Forth Bridge Works, writes as follows in the *Scotsman* with reference to the effect of the recent gales in Scotland on the Forth Bridge:

That the high winds that have prevailed for the last few days could in any instance have been serviceable is not easy to believe, yet they should be the means of inspiring confidence in a great number of minds when it is known that the Forth Bridge has withstood their power without sustaining the least damage. Of course some part of the timber stagings used for the purposes of erection, and also small wooden houses built for shelters for the men, which were situated on exposed parts of the structure, have been damaged; but the steelwork of the bridge itself has not suffered at all, and although about 100 cranes are distributed over the work, not one has sustained any injury. The total damage, indeed, can be made good with two loads of boards.

There are, in addition to these, some half-dozen others distributed over the works. The greatest pressure recorded during the present gale was on Friday, the 16th inst., when it was 27 pounds per square foot on the large board of 300 square feet area; 41 pounds on the small fixed; and 35 pounds on the movable boards. The wind, being southwest, did not strike the fixed board at right angles. At the other parts of the bridge an average pressure of 32 pounds per square foot was recorded. It will therefore be seen that the greatest pressure during the present gale, as recorded by the largest pressure board at the bridge, was not quite half that which has been allowed for in proportioning the various members of the Forth Bridge.

T. H. Carter, Commissioner of the Southern Railway and Steamship Association, has issued the following circular: "I am advised by a number of the furnace companies that it will be impracticable to report sales of pig iron within three days from date thereof, and there is a general expression of opinion from furnaces thus far heard from that the time within which sales may be reported should be extended to ten days, instead of three days, from date of sales. My letter of the 17th inst. is, therefore, modified so far as to allow, when necessary, as much as ten days from

Copper for Electrical Purposes.

Referring to the Elmore process of turning out electrically deposited copper pipes, *Engineering* says:

The advantage to be derived by obtaining the best copper was perceived in the early days of submarine cable enterprise, and over 20 years ago Dr. Matthiessen carried out a series of careful and valuable experiments in order to fix a standard to which the various samples of commercial copper could be referred. By using elaborate precautions he obtained the purest copper that was then practicable, and determined that a pure hard-drawn copper wire 1 m. in length and 1 gram in weight should have a resistance of 0.1469 ohm at the temperature of 0° C. This standard has been in use up to the present and has been believed for many years to be the extreme limit of conducting power for copper. But, owing to the great care that has since been bestowed by copper manufacturers, this standard has occasionally been surpassed, and by the introduction of the improved method under consideration has been rendered obsolete. Some of the early cables possessed a very low conductivity, but year by year steady improvement has been shown, until at the present date copper having a lower conducting power than 96 or 98 is rarely accepted.

In order to obtain the best quality of copper for cable and other electrical purposes the practice of late years has been to get electro-deposited copper in the usual manner, and then to exercise the greatest possible care in melting it for casting into "wire bars," which are then drawn into wire. A very small amount of an impurity, such as arsenic, antimony, sulphur, phosphorus, &c., gaining access to the metal at once greatly reduces the conductivity. At Birmingham, Swansea and other places dynamo machines and tanks are at work depositing scores of tons of copper weekly, but the metal produced, although pure, is of the usual granular or crystalline texture of electro-deposited copper, and possesses very little tensile strength and cohesiveness. Therefore, as above stated, it is necessary to melt it into "wire bars," and even if the greatest care is exercised the metal must deteriorate in the process.

The new method has the important advantage that impurities have no opportunity of gaining access to the metal. By the nature of the process it is necessarily and unavoidably pure. Special machinery has been arranged so that an electro-burnished tube of any desired length, diameter and thickness can be cut spirally into a square wire, which can then be drawn down in the usual manner to any required diameter. The wire being drawn directly from the electro-burnished tube obviates entirely the necessity for melting, and thus constitutes altogether a new departure in the manufacture of pure copper wire. Some of the tests to which it has been subjected are very interesting. Two large coils of the new wire were taken, the wire of the first having a diameter of 0.113 inch (about 12 B. W. G.), and the second a diameter of 0.05 inch (about 18 B. W. G.), both being extremely hard-drawn. In order, however, to be perfectly satisfied that the practical limit of hardness had been reached, the larger wire was drawn through 13 holes in a draw-plate (the last hole being of agate) without annealing, until the diameter of the wire was reduced to 0.057 inch. Its hardness may be judged of by the fact that the breaking strain was 29 tons per square inch with an elongation of only $\frac{1}{4}$ per cent. The No. 18 B. W. G. wire had a breaking strain of nearly 29 tons per square inch, with an elongation of only $\frac{1}{4}$ per cent. When these wires were annealed they showed an elongation of 25 to 33 per cent. before breaking.

The hard wire is admirably adapted for overhead telegraph wires, possessing the

two requisites of great strength and high conductivity. The efficiency of dynamo machines and electrical instruments can be increased because a greater number of "ampère turns" can be got within a given space. The copper tape or ribbon used so extensively for lightning conductors can be cut direct from the tube of any length and sectional area by the special machinery before mentioned.

Lister's Tuyere Iron.

Messrs. Peter Lamp & Co., of Davenport, Iowa, have just brought out an improved form of tuyere iron, of which we annex a cut. This clearly explains the construction adopted. No. 2 is the air chamber; 1, the tube where the blast is forced in from the bellows; 3, the air passage where the arrows are marked, and through which the air is forced up into the basin; 6 shows where the fire is placed; 5 is the cup which is placed under the basin, and is held in place by a rod, 4, crossbar 10 and runs down through the bottom of chamber 2, and is raised and lowered by lever 9. The latter is held in place by post 8; 7 is a tube put in close at the bottom of the chamber, so as to blow out any particles of dust or melted iron that might overflow the cup. This tube is stopped up with a plug when the fire is being used. When the fire is

Lister's Tuyere Iron.

not in use the plug is removed, and draft enough will pass through the tube and up the chamber and into the fire, and will, it is claimed, keep the fire alive for two or three hours. By removing the plug the fire is always ready for use. No. 11 is a check-valve placed close to the nozzle of the bellows, so that the cup 5 can be set in a fixed position, and the blast can be regulated by the check-valve to suit the kind of work. The flange around the basin is left with a flat surface, so that a wrought-iron band can be shrunk on to prevent the casting from cracking with the heat, making the whole tuyere iron more lasting and durable.

The device is made in five sizes, the smallest for use by common horseshoers, and the largest in railroad shops, &c. It is in use at the United States Arsenal, Rock Island, Ill.

There were up to last June three blast furnaces in operation in all Canada. Within a year from now there will be ten working full time. Two of them will be situated in Montreal, and the other five scattered, principally through western Canada. The *Pittsburgh Times* says, the places where they will be located are so far kept quiet, as the contracts are not yet definitely concluded. The principal firms so far interested are J. P. Witherow and the Swindell Construction Company.

The Pratt & Whitney Company have lately put on the market a most ingeniously designed automatic grain scale, which will be found a very convenient machine for warehouses, mills, elevators and other places where means of weighing grain quickly and accurately are needed. A large bucket hanging in a frame receives the grain, and when a certain weight is in

the stream is automatically shut off and the load dumps the bucket. No springs of any kind are used in the machine, the movements being operated by gravity alone.

The Temple Water Tube Boiler.

A recent issue of *Industries* contains illustrations of a type of water tube boiler which, although introduced in France more than two years ago, is but little known in this country. It is the invention of M. Felix du Temple, a French naval officer, who devised it with the primary object of replacing the boilers of the locomotive type generally used on torpedo boats. The boiler was first tried on the torpedo boat No. 20 in the French navy, and appears to have given complete satisfaction, inasmuch as 27 trial runs were made with this boat without necessitating repairs of any kind to the boiler; and in view of this performance, the French Government have ordered a 500 horse-power boiler of the same type, for their torpedo boat No. 54. The heating surface consists of a large number of drawn steel tubes 0.4 inch in external diameter, and bent into a zig-zag form, with their upper ends connected to a steam collector, and their lower ends to a rectangular water tube. The latter is outside of the furnace; but the steam collector is heated by the escaping fire gases, by which means thoroughly dry steam is produced. The boilers are made either with two water tubes or with one water tube only, and are accordingly classed as double or single boilers. The furnace of the boiler is protected by a fire-brick setting contained in an iron casing, which is carried up and forms the boundary of the flues. The feed water is introduced at the forward end of the rectangular water tubes. These tubes are also joined by a breeches pipe in front with the lower part of the steam collector. As the water in the small tubes is evaporated, and ascends in the form of steam into the collector, its place is taken by water flowing down the breeches pipe into the horizontal water tubes, and thus a very efficient circulation is kept up. The inventor claims that by making the zig-zag tubes very small in diameter the danger of any of these tubes exploding is greatly minimized, while the rapid circulation due to the small diameter prevents the accumulation of sediment. The deposition of sediment is limited to the collector and rectangular water tubes, and can be removed by the blow-off cock shown at the back of the boiler. The zig-zag shape of the small tubes provides for their expansion and contraction, without putting any sensible strain on the other parts of the boiler. Owing to the small quantity of water contained in the boiler, steam can be raised very quickly. The inventor claims that a 500 horse-power boiler can be put under pressure in three-quarters of an hour, and that its total weight does not exceed 5½ tons, or about 25 pounds per horse-power.

In relation to the reported delay in the work upon the battle-ship *Texas*, Secretary Whitney says the plans of that ship are not wrong in any respect. After Mr. Bryce-Douglas, the great engineer who designed the engines of the *Etruria*, went to the Barrow Shipbuilding Company as designing engineer, he began to overhaul the designs of the *Texas*, and asked for more displacement. The Department deemed it wise to add to her length from 10 feet to 15 feet for the sake of getting more speed. With the 10 feet additional length the *Texas* will be only up to the displacement of the *Maine*, her sister ship. The delay in her construction, Secretary Whitney says, is rendered necessary by the fact that the new tools and machinery have been delayed in delivery.

The Deane Duplex Pump.

We illustrate on this page a duplex steam pump, as built by the Deane Steam Pump Company, Holyoke, Mass. It is designed for fire service or other uses where a heavy and uniform pressure is required. Prominent features in this design are strength, compactness of arrangement and convenience of access to the working parts. When used upon sprinkler systems an automatic device can be obtained with the pump for controlling its action. The internal arrangement of these pumps

40-ton guns which are to be exhibited by the Minister of Marine. The track will be of the Decauville system, the steel rails being riveted to steel cross-ties. A part at least of the line will be laid with the "portable" track.

Iron Making at Bilbao.

One of the British consular reports contains the following data in iron making at Bilbao, Spain: The Altos Hornos Company have three blast furnaces, producing

tion broke up in February last through the Vizcaya Company producing in excess. The export of pig iron will probably fall off through producers not being able to compete in foreign markets—Italy excepted—and through the home demand, Bilbao pig iron having already driven out the English. The attention of producers is now more particularly directed toward promoting in the country various metallurgical industries.

The Altos Hornos Company, established in the year 1885, built the first Bessemer mills and rail mill. The works are now busily engaged for home supply, and already rule the home market. During 1887 the company were also putting up new plant for making open-hearth steel plates. The Vizcaya Company are erecting plant for a similar purpose, and also for the manufacture of galvanized buckets, sheets, tin plates, &c., a new industry in Spain. It is doubtful whether, in spite of the duties protecting this industry, it will be able to compete with English manufactures. The Spanish Government have called for tenders for the construction of three cruisers, on the understanding that preference would be given to local shipbuilding yards, foreign or native. The offers are three from the Bilbao iron works, two English and one French. Without waiting for the decision, an English company, the Naval Construction and Armament Company, have commenced the construction of a shipyard close to the Altos Hornos works, relying on the support of some Spanish firms, and expecting to obtain orders for cargo, mail and passenger boats from the steam navigation companies in Spain. From the many new lines of railway, the animation of different industries and the general satisfactory prospects there appears to be a good field for British enterprise here. Except mining, all industries in the Basque provinces are exempt from taxation, and foreigners enjoy the same immunities, privileges, &c., as natives. Many of the frontier mines in the districts of Galdames, Gallarta and Sommorostro, hitherto contributing largely to the exportation of ore, are becoming exhausted, and probably will be worked out in a few years. As they decline rich mines in the adjoining Sopueto district will be developed. Extensive preparations are being made for their working and the shipment of the ore via Castro, Povenena or Bilbao-luir.

The most favored project of several is to bring the Santander Railway to Bilbao via Trucios, through the Sopueto Valley—12 miles—and join the Deputacion Railway. If the scheme does not succeed capitalists and mine owners of the district purpose to make this railway by a private company, and in anticipation some mine dealers are getting hold of mining properties. Capitalists should be on their guard, and satisfy themselves through trustworthy sources as to the real ownership, importance and value of any mining property offered for sale. The works for the construction of a port outside the bar are to be commenced according to the plans, and under the direction of the engineer of the port, Don Evaristo de Churrua. The port, though not so spacious as those proposed by Sir John Coode and Mr. C. Vignoles, will be one of the finest commercial and naval ports in the world, and a harbor of refuge for the whole of the Cantabrian coast. A breakwater is to be made from the southwestern coast, starting at a point 2025 yards from the old signal tower of Portugalete, running in a north-westerly direction 1039 yards, then turning at an angle of 160° for a distance of 547 yards. From Begona Rocks, on the northeastern side, a counter breakwater is to proceed in a west-southwesterly direction for 1172 yards. The entrance will be between the breakwater and counter-break-

Fig. 2.—Longitudinal Section.

THE DEANE DUPLEX PUMP, BUILT BY THE DEANE STEAM PUMP CO., HOLYOKE, MASS.

is shown in the sectional view. In the steam piston may be seen the means for adjusting the packing rings. The action of the valve motion is also clearly indicated. In the water cylinder, it will be noticed that all the passages are direct and of ample size.

Small compound locomotives are to be used for hauling freight to the Paris Exposition of 1889. M. Decauville, the builder of portable railway plant and equipment, has issued a circular stating that there will be about 12½ miles of track of 22.68 inches gauge laid with rails weighing about 14 and 20 pounds per yard. The cars will be hauled by compound engines weighing 6½ tons empty and 12 tons in working order. Over these lines will be transported the

on the average 1800 tons a week, and export only the quantity produced in excess of their own requirements. To make 1 ton of pig iron requires from 17 to 18 cwt. of coke. The San Francisco Company have four blast furnaces with 13 Whitwell stoves. The pig iron produced amounts to 1200 tons a week, requiring from 19 to 20 cwt. of coke to the ton. The Vizcaya Company possess two blast furnaces, producing 1200 tons of pig iron a week, requiring about 18 cwt. of coke per ton. In 1887 the exportation of pig iron from these works increased by 76,368 tons, or 178½ per cent. Of this amount seven-tenths went to Italy, one-tenth to France, one-tenth to Russia. The above three works formed a syndicate for the sale of pig iron in Spain, but the associa-

of a box. Seven of these are provided, representing the ship-building yard of the company at St. Nazaire, the embarkation of emigrants, and various scenes on board one of the great vessels during a voyage. All of them are interesting, and the visitor moves slowly through the darkened passage-way, looking successively into the lenses, until his eyes have become accustomed to the feeble light, and the pupil has expanded so much as to be quite overwhelmed with the brilliancy of the great cyclorama, on emerging on the platform.

Lake Ore Shipments.

The *Marquette Mining Journal*, summing up the Lake Ore season from the shippers' standpoint, says:

Lake shipments for the season are practically at an end, and the figures show that the Lake Superior mines have sent more ore to market by water this year than in any previous year in their history. At this date a year ago, the last cargo for the season had gone forward. This year's shipments to date are 210,577 tons in excess of the total for 1887, and this will be slightly increased by a few cargoes yet to be reported from Escanaba. Compared with the shipments of 1886, the difference in favor of the current year is 1,107,248 tons. The rail shipments this year are known to be larger than ever before, so that it is entirely safe to estimate the output of the Lake Superior mines for 1888 at 5,000,000 tons, or about 300,000 tons more than their production in 1887.

The depression that prevailed during the earlier months of the season, and the improvement that set in later can be traced from the following figures, showing how the shipments of this year and last compared, month by month: On June 1 the mines were 90,837 tons behind the shipments by water on the corresponding date in 1887; on July 1, 161,905 tons; and on August 1, 245,065 tons. The reaction then set in, and September 1 saw the difference in favor of last year reduced to 222,887 tons. By October 1 it was cut down to 139,880 tons, and by the 1st of November it was not only wiped out, but a gain of 27,973 tons over last year had been made. This has since swelled to 210,577 tons, with the shipments yet to be reported to be added, to make the full excess over last year.

By ranges, the shipments are as follows:

Range.	1888.	1887.
Menominee	1,111,220	1,154,110
Marquette	1,815,402	1,755,328
Gogebic	1,223,334	1,081,872
Vermillion	433,607	302,081

Total,

By port shipments have been:

Port.	1888.	1887.
Marquette	844,604	803,411
Escanaba	2,181,452	2,072,708
St. Ignace	107,390	91,544
Ashland, Wis.	1,016,414	1,040,727
Two Harbors, Minn.	450,475	390,467

Total

Fourteen of the larger mines of the Marquette, Menominee, and Gogebic ranges have shipped by lake this season a total of 2,658,066 gross tons of iron ore, the shipments of each being as shown in the appended statement:

Name of mine.	Tons.
Lake Superior, Marquette range	228,593
P. & L. A., Marquette range	223,414
Republic, Marquette range	201,382
Cleveland, Marquette range	181,706
Champion, Marquette range	167,143
Chapin, Menominee range	267,729
Florence, Menominee range	139,421
Vulcan, Menominee range	120,541
Dunn, Menominee range	112,358
Iron River, Menominee range	107,143
Norrie, Gogebic range	379,204
Colby, Gogebic range	202,435
Aurora, Gogebic range	176,777
Ashland, Gogebic range	141,218

Total

This is over half the entire quantity shipped by water this season from all the mines in the Lake Superior region. The mines of the Vermillion range are omitted from this enumeration of the larger mines and their work, for the reason that we get only a "lump" report of the shipments from Two Harbors, Minn., and cannot, therefore, give the shipments of any of the mines on that range separately.

NEW PUBLICATIONS.

NOTES ON THE COMPRESSIVE RESISTANCE OF FREE STONE, BRICK PIERS, HYDRAULIC CEMENTS, MORTARS AND CONCRETES. By Q. A. Gilmore, Ph. D. Published by John Wiley & Sons, 8 vo. \$3.50.

This was the last published work of the author, general and engineer. At the time of his death he was probably the highest authority in the United States on the subjects of limes, cements, concretes and building stones. He had been employed by the Government on the reconstruction of the seacoast defenses, and on important river and harbor improvements, and had written several valuable treatises on these subjects.

The first chapter of this work gives a brief history of what had previously been done in testing these materials. It appears that a machine that would weigh no more than 100,000 pounds had not sufficient capacity to determine with sufficient accuracy the law of resistance, since crushing would be confined to small pieces. In Chapter II, notice is made of the A. H. Emery testing machine at the Watertown Arsenal, which weighs 800,000 pounds with extreme accuracy, and of the preparations made to use this machine for his tests. There are about 95 pages of experimental work upon various stones, cements, &c., and of various sizes, followed by a "summary", consisting of conclusions and suggestions. There are also eight folding strain sheets, which show to the eye the general law of resistance.

There is little to criticise and much to commend in the treatise. The extreme delicacy of the Emery machine, enabled the experimenter to measure with accuracy the amount of compression for the corresponding loads, and thus determine the elastic limit and the resistance of the specimens, which quantities were determined for the first time in the history of this science. (See pages 92 and 93, and elsewhere.) The elasticity of mortar and concrete is far from being perfect, and the term "elasticity" can be used, in regard to them, only in a restricted sense (page 91). Taking for the elastic limit that value beyond which there is a very decided change in the rate of compression, it is found that the modulus of elasticity of the mortar tested varied from 437,000 to 653,000 pounds per square inch, giving a mean of over 500,000 pounds. And concrete gave a mean of over 650,000 pounds. Dyckerhoff Portland cement gave a modulus of elasticity of 1,525,000 pounds to the square inch. This approximates to the value for good timber. The author finds a great difference in the resistance of cubes of stone and cement depending upon the beds, or substance interposed between the specimen and the machine. He finds that wooden cushions are not favorable, since they induce cleavage along the direction of the fiber. A thin coating of some material like plaster of Paris is essential, in order to secure uniformity of results. It was found by earlier experiments with Bera sandstone that the strength of cubes varied as the cube root of their edge; but this law was not confirmed by experiments upon larger cubes of Haverstraw freestone. Indeed, the question whether the compressive strength per square inch is greater for small cubes exceeding 1 inch than for larger cubes

if the material be homogeneous remains undecided. For a prism of less height than a cube having the same base, the resistance is greater. All the conditions of the experiments are clearly set forth, the results tabulated, and the conclusions properly based on the results of the experiments. De V. W.

TWENTY YEARS WITH THE INDICATOR. By Thos. Pray, Jr. Size, 6½ x 9 inches. 284 pages. Published by John Wiley & Sons. Price, \$2.50.

We need not refer at any great length to Mr. Pray's work on the indicator, the book having been before the public for several years, and having, at the time of its first appearance, been widely noticed. The point to which attention is to be specially directed is that the two volumes of which it consists, and which have heretofore been published separately, have been combined, and are now offered under one cover. The greater convenience of this, in several respects, will be readily appreciated. The lessons in the book are drawn from actual practice, a circumstance which materially increases their interest and value over purely imaginary cases, and a large number of diagrams, taken under the most widely varying conditions, are presented. In addition to the subject proper, other details of steam engineering, such as feed water tests for boilers, measuring chimney draft, safety valve problems, &c., are considered, and steam and hyperbolic logarithmic tables are added.

BOILER CATECHISM. By Robert Grimshaw. Size, 4 x 6 inches. 402 pages. Published by the Practical Publishing Co. Price, \$2.00.

Mr. Grimshaw's "Boiler Catechism" is similar in character to his several pump and steam engine catechisms published within the past few years, and noted by us in earlier issues. It is intended for what are currently known as practical men, boiler attendants in other words, and the more advanced reader will therefore, scarcely find in it what he might be led to expect in a work on boilers. The information is given in the shape of answers to questions, such as are apt to suggest themselves to one in charge of a boiler in the course of every-day work. It will be apparent from this alone, that the book must necessarily contain considerable material of practical value, and an examination will, in a great measure, confirm this. Altogether, the end aimed at has been fairly well accomplished, and the information given will, no doubt, prove serviceable to many.

Referring to the exception which has recently been taken by English papers to the statement that the 335-foot boiler chimney of the Clarke Thread Company, at East Newark, N. J., is the tallest in the world, it may not be amiss to point out that the chimneys at St. Rollox and Port Dundas, near Glasgow, Scotland, which rise to 436 and 454 feet, respectively, are not boiler chimneys, but were designed and built simply to carry off noxious vapors from chemical works. The East Newark chimney, therefore, still stands unparalleled as a means of producing draft for steam boiler furnaces and the original claim to distinction is fully substantiated by facts.

According to *Engineering*, the recent sale of the hull and fittings of the steamer Great Eastern realized over £43,000, the copper bringing £2960, the gun-metal, &c., £4480; brass, £3980; lead, £4185; outer iron plates, £12,500; inner iron plates, beams and rivets, £12,230, and anchors about £300. The breaking up of the steamer will commence on January 1, will occupy a year and will probably cost in labor from 10/ to 15/ per ton of material.

New Lake Tonnage.

The Cleveland *Plain Dealer* publishes tables showing the new tonnage for 1888 in the great lakes and the losses of lives and shipping during the season. It says: The season of 1888 will be memorable in the history of lake navigation for many reasons, not least of which is the light loss of life and property from shipwreck. Old mariners fail to recall the time when the season, as a whole, has been so free from disastrous storms. November, the month most dreaded by mariners, passed without a blow worthy of being called a gale. A list of lost boats foots up 48, with a carrying capacity aggregating 17,700 tons, and a total valuation of \$439,400, but these figures represent barely half the losses of 1887, when 70 boats, capable of carrying 34,400 tons, and valued at \$777,700, went out of existence. A year ago 116 souls went to the bottom in a series of ruinous storms that swept over the entire chain of lakes, while this year only 16 lives were lost from actual shipwreck.

The season of 1888 has gone, and the surroundings capable of indicating the prospects for next year are of prime interest. For three years past the strides made in navigation on the great inland water has been a surprise to this whole country, and it is only of late years that this national industry has received a fair part of the attention which it deserves. In the winter of 1886-87, when 31 boats, valued at something more than \$4,000,000 were turned out of the shipyards of the lakes, the attention of the whole country was directed in a measure to the importance of a business that interests Cleveland particularly, and when a year ago the large volume of new work was followed by 60 more ships, capable of carrying 108,525 gross tons, and costing \$8,325,000, grave fears were expressed by the vessel owners and shippers as to "whether the thing was not being overdone." The vessels were floated, and their owners have tied them up for the winter abreast of sister ships that have seen more time of service with a profit for all that will compare favorably with that of any other branch of business in this country. It is sufficient to say that the earnings of lake carriers during the past season, together with prospects of the future, are such as to cause arrangements for a duplication of last winter's work in the shipyards of the lakes during the winter at hand. Fifty-nine boats, with a carrying capacity of 100,950 gross tons a trip, and costing \$7,124,000, will be put afloat some time between now and the middle of next summer.

One big craft, worthy of mention, but not included in the list, on account of the peculiar business to which she is adapted, is a big steel ferryboat, now about completed at the yard of the Cleveland Shipbuilding Company. This remarkable steamship will cost, when complete, about \$325,000. She will be used to convey the trains of the Michigan Central Railway across the Detroit River. Twenty-four loaded cars is her capacity. She will be propelled by monstrous power, and she is constructed so as to go through ice of 2 feet in thickness. The owners of this boat will send her across Lake Erie about January 1, and they express no fear of the ice obstructing her passage.

Bronze for Copper.—*La Nature* gives the following receipt for bronzing copper: "Dissolve in 50 litres (11 gallons) of hydrochloric acid as much as possible of iron in fine wire or scales. When the liquid is saturated a deposit will form at the bottom. Then add 1 kg. (2.2 pounds) of arsenious acid, and stir vigorously. When the acid is dissolved the bath is complete. The objects to be bronzed are connected to the negative pole of a battery, the oppo-

site electrode being formed of rods or plates of retort carbon. Articles of copper or brass become black at once, but those of iron are attacked by the bath. It is therefore necessary to nickel the latter. In order to preserve the deposit of iron the surface must be lacquered."

Improved Emery Wheel Tool Grinder.

An improved form of emery wheel tool grinder is at present being turned out by the Springfield Glue and Emery Wheel Company, of Springfield, Mass. As shown in the cut on this page, it is a very heavy machine, weighing over 2200 pounds, and the base

sight (except when the doors are open). Having the pump connected to only the lower tank leaves the upper tank free from pipe connections, so that it can be quickly emptied.

The table has sufficient pitch from all sides toward the wheel to prevent the water standing on the machine. It has self-oiling bearings 8 inches long, a 24-inch steel spindle and carries an emery wheel 36 inches in diameter and 4 inches thick, with a 24-inch hole. The wheel is held by large collars. Owing to the large hole there is no wheel-hub or center to throw away, making a large saving in the cost of future wheels. The collars are arranged so that the wheel can be quickly

IMPROVED EMERY WHEEL TOOL GRINDER, BUILT BY THE SPRINGFIELD GLUE & EMERY WHEEL CO., SPRINGFIELD, MASS.

has sufficient flare to give it a very solid floor foundation, which prevents vibration when being used.

An iron tank, easily reached, is placed inside of the base under the wheel to receive the water coming from it and catches the waste ground off, which quickly settles to the bottom. When sufficient collects the tank can easily be drawn out and emptied. The water overflows from this tank by means of a syphon, which takes the water enough below the surface to prevent its collecting any oil or scum, and, conducting it into a second tank directly underneath, to which a centrifugal pump is attached, arranged to carry water to the wheel, where valves regulate the flow to any desired amount. The water flows onto the wheel through a small opening on the under side of the water spreader, which is made of brass, giving an even sheet of water across the width of the wheel. The tanks, being inside of the base, are out of

balanced. There is a hinge door on the back side of the hood, easily arranged, so that long, heavy tools can be ground on that side in good shape, the water coming on just below this opening to prevent any heating of the work. The machine stands 36 inches high from floor to center of spindle, and covers a floor space of 24 x 48 inches.

John Baird, of Philadelphia, was chosen president of the board of trustees to carry into effect the will of the aged philanthropist, Isaiah V. Williamson, for the proposed Free School of Mechanical Trades, and a site will soon be selected.

The Finance Committee of the Philadelphia Councils recommend the expenditure of \$3,700,000 for permanent improvements the coming year, in addition to the regular appropriations. The largest item is for a reservoir.

THE WEEK.

The Chamber of Commerce of New Orleans and the Produce Exchange have declared in favor of consolidation and the organization of a strong Board of Trade that will be able to work more successfully than the present commercial bodies working separately.

Representative Stewart, of Georgia, introduced a bill in Congress to establish a graduated income tax, the proceeds of which are to be applied to the payment of pensions. It provides that all individuals, corporations and estates receiving an annual net income of \$5000 and upward shall be assessed in proportion to said income. Incomes from \$5000 to \$10,000 are to pay 2 per cent.; from \$10,000 to \$25,000, 3 per cent., and so on. Most people have been of the impression that the Treasury receipts were already large enough for practical purposes.

A prominent shipping-house of this city has received numerous replies to recent inquiries from this side addressed to various parties in the United Kingdom respecting the outlook for American wheat and flour in British markets. The inference is drawn that, owing to the high price of the American product, mainly due to speculation, it is not improbable that our foreign trade in cereals may continue to suffer. Besides liberal supplies of Russian wheat of a fine quality, the finest qualities of Hungarian patents can be bought considerably below Minnesota patents. Both Hungarian and North German mills have taken advantage of the situation and sold heavily. As to future supplies, London dealers profess to anticipate no important rise in prices, to meet the American level. While it is admitted that England can expect little or nothing either from India or Australia before another season, it is obvious that the United States encounter sharp competition in all the European food markets, not only as respects grain, but in provisions, dairy products and other leading staples. Furthermore, artificially "pegging up" prices by unscrupulous speculators of the "Old Hutch" pattern is calculated to make foreign purchasers more independent so long as this vicious course is continued.

Consul-General Bassett, the Haytian representative in this city, is of Spanish descent, but is a native of Connecticut, and resides with his family in New Haven because of the social and educational advantages afforded to his family there. His oldest son is a student of Yale. Mr. Bassett has represented Hayti in this country since 1879.

The old Erie building, on West street, at the junction of Duane and Reade streets, was leased to Deane & Co., bankers and warehousemen, for a term of ten years, at \$31,000 per annum. The Erie Railway Company had been paying the city, by whom it is owned, \$17,000 and taxes. It is proposed to convert the first story into butchers' stalls.

Vessels navigating the lakes are allowed a reduced premium by the marine insurance companies if they are provided with oil to lessen the dangerous effect of heavy seas. Two quarts an hour is all that is needed under ordinary circumstances, although in the case of long tows that amount could be doubled. Experience on the ocean has demonstrated that thick and heavy oils are generally the best.

The Nicaragua Canal project is again brought into prominence by a bill introduced in Congress to incorporate the Maritime Canal Company, of Nicaragua. It is thought in Washington that the bill has little chance of becoming a law. The

vested interests of the Pacific railroads and of the Panama Canal are well represented, and although there appears to be a majority of the House favorable to the measure the minority is strong enough to defeat it.

The pneumatic gun cruiser just completed for the United States Government will be able, according to Park Benjamin, to throw against an enemy, 1500 yards distant, 1800 pounds of nitro-glycerine, the explosive energy of which equals that of about 3400 pounds of dynamite, or more than ten tons of gunpowder, and this can be repeated every two minutes.

Geo. Westinghouse, of Pittsburgh, instead of bringing natural gas to the manufacturers now proposes to take the furnaces to the natural gas. With this object 600 acres have been purchased as the site for a new town, 6½ miles from Murrysburg, whence Pittsburgh derives its present supplies, by means of a pipe line 22 miles in length. The new town of Turtle Creek property will be occupied by mills and factories.

A number of prominent merchants in this city in a debate before the Chamber of Commerce discussed the proposed removal of the custom house, and the weight of opinion favored the enlargement of the building now in use; and in reference to the location for the new Government buildings a resolution was adopted, after some opposition, in favor of an uptown site rather than one near the Battery.

A Constantinople dispatch says: "The Porte has signed a convention with Seligman's banking firm permitting the junction of Turco-Greek railways, English, German and French tenders for which were rejected by the Porte for political reasons." Messrs. J. & W. Seligman & Co. confirm this, but say they have as yet no details. The project, which is to build a road to the boundary line of Turkey, will involve the expenditure of about £5,000,000.

The Secretary of the Navy has appointed Captain W. T. Mahan, Commander C. M. Chester and Lieutenant-Commander C. H. Stockton a board to select a site for a navy yard on the northwest coast of the United States.

The subject of industrial education was discussed by Dr. Samuel Eliott, Dr. John G. Blake, Prof. J. D. Runkle, of the Institute of Technology, and several others at a meeting of the Boston Boot and Shoe Club, held last week, and a resolution was passed favoring the extension of the public school system of that city so as to offer advantages to those who desire to fit themselves for mechanical occupations, as well as for professional or commercial pursuits. In Pennsylvania the Commissioners of Industrial Education and the principals and trustees of the State Normal Schools had a conference in Harrisburg on the subject of manual training in the public schools, and a resolution was unanimously adopted declaring that the principals were heartily in favor of the object.

Refugees from Jacksonville, Fla., may return December 15.

The State of Nevada is losing inhabitants. The total vote in 1886 was 21,660. This year it has fallen to 12,278. The question is asked with much pertinence—"What population does that indicate in a State entitled to one Representative in Congress, and to equal representation with New York, Pennsylvania or Ohio in the Senate of the United States?"

The Inter-oceanic Railway, the only line in Honduras, extends from Puerto Cortez, the chief port on the Atlantic Coast of the republic, to San Pedro, a distance of 37 miles. As it controls the bulk of Ameri-

can trade with Honduras, an effort is making in New Orleans to put it in good working order under a Government lease to General Kraft for 26 years.

The American Federation of Labor, which met in annual convention at St. Louis, on Tuesday, is now the largest and most powerful labor organization in the United States. It has a membership of 650,000, which is still increasing. The Knights of Labor have but 200,000, and, from present reports of the recent withdrawal of the miners and others it is growing less.

The effects of the Sugar Trust are shown definitely in figures. The prices of the two leading grades of raw sugar and of three grades of refined sugar on October 1, 1887, a few days before the trust was completed, and on October 1, 1888, one year later, are as follows:

	Oct. 1, 1887.	Oct. 1, 1888.	Advance.
Fair refining.....	4½%	5½%	%
Centrifugal.....	5 7-16	6½%	1 1-16
Cut loaf and crushed	6%	8½%	2
Granulated.....	6	7½%	1½%
Coffee A. standard..	5½%	7%	1½%

It will be seen that the price of cut loaf and crushed sugars was 2 cents a pound higher on October 1, 1888, than it was one year earlier, and that the advance for the other grades had been 1½ cents.

A short outlet for coal from the Clearfield region to Eastern New York and all of the New England States will be provided by a railroad now building between Binghamton and Williamsport. Large quantities of coal are being moved at Bernice at a low cost. The new road also penetrates a tract of country heavily timbered.

A contract has been executed between the Hudson Suspension Bridge and New England Railway Company and the Lehigh and Hudson River Railway Company, by which the latter is to send over the Hudson Suspension Bridge, now being constructed from Anthony's Nose to Fort Clinton, all freight, passengers and mail and express matter and other railroad traffic and business originating west of the Hudson River and destined to points on the east which the Lehigh and Hudson River Railway Company may be able to control, and which can be practically and profitably carried by that route. The contract covers a period of 50 years.

The stockholders of the Shipowners' Dry Dock, at Cleveland, have raised their capital stock to \$200,000, for the purpose of establishing a shipbuilding plant.

A monster 200-ton gun, to carry a projectile weighing 2 tons, is being made at the Woolwich arsenal for coast defense. It is expected to prove effective within a distance of 15 miles.

Joseph Oat, whose name has been prominent in the coppersmithing business of Philadelphia for many years, died in that city last week, aged nearly 93 years.

In the case of Brown & Bros. against Wm. H. Brown and the executors of the estate of Philo Brown, Judge Fenn, of the Superior Court, in Waterbury, Conn., holds that the plaintiff shall receive \$125,000, the amount of a note given by Philo Brown for money and assets of Brown & Bros. loaned to Wm. H. Brown when he was manager of the New York Star.

The annual report of the Chief of Treasury special agents on the operations of the Immediate Transportation service says that during the past fiscal year 1,738,653 packages of merchandise, of the invoice value of \$38,929,000, and estimated duty of \$21,218,538, were forwarded without appraisement under this system. Of \$38,929,000 of merchandise handled, \$25,012,000 was imported at New York, \$3,751,-

000 at San Francisco, \$2,777,000 at Baltimore, \$2,679,000 at New Orleans, \$2,481,000 at Philadelphia, \$585,000 at Port Townsend, and smaller amounts at the eight other ports named. Of this aggregate, \$11,496,000 was finally delivered at Chicago, \$5,029,000 at Philadelphia, \$4,182,000 at San Francisco, \$3,205,000 at St. Louis, \$2,614,000 at Cincinnati, \$2,515,000 at New York, \$1,912,000 at Boston, and smaller amounts at the other ports mentioned in the list.

The chief of the alleged Burlington dynamite conspirators, John H. Bauers, was on trial at Geneva, Ill., last week, and John A. Bowles, the most important witness, testified that on a number of occasions he had been hired by the defendant and received various sums of money with which explosives were purchased and used in the destruction of rail tracks and other property.

Cotton mills in New England are enjoying a period of exceptional prosperity. The annual statements of several Fall River concerns are significant. During the past year the Wampanoag Mills have earned \$157,000 on \$750,000 capital, and have paid \$86,350 in dividends. The Union Cotton Company earned \$237,000 and divided \$187,500 on \$750,000 capital. The Granite Mills cleared \$136,000 and distributed \$64,600 on \$400,000 capital. The Sagamore Company, capitalized at \$600,000, earned \$133,000 and divided \$78,000. The balance between the earnings and dividends, save what is carried to surplus, represents allowance for depreciation of plant, improvements, &c. The Amoskeag Company, the great Manchester concern, which, on the whole, is probably the most profitable corporation in New England, has cleared \$425,000 this year, out of which it has paid 25 per cent. dividends, leaving over 4 per cent. in addition for surplus.

The United States dynamite cruiser Vesuvius made her first trial trip this week and succeeded in making a speed of over 21 miles an hour, 1 mile and more faster than required by the contract with the Government.

Discouraging accounts are received from Central and Western Kansas, caused by the abandonment of farms in consequence of losses of crops and cattle from the protracted drought of last summer. A letter from Salina, Kan., says: "As a whole, Central and Western Kansas did not this year make one-fourth of a corn crop. All through the desolate, scorched region wheat made a fair crop and the grain fetched a remunerative price, but there was not sufficient quantity of that grain raised to tide the farmers over their financial embarrassments. Bankruptcy stalked over the plains of Western Kansas and struck down hundreds of farmers. The financially ruined agricultural people who till arid-zone land have very generally decided to fight no longer against nature. It is estimated that at least 5000 mortgaged farms in Central and Western Kansas have already been abandoned, and the exodus has been commenced. It is not a mortgaged farm here and another yonder, as it is in New York, but almost all farms are mortgaged. In the western counties of Kansas the mortgages are of small face value, but in the 'Golden Belt' region of Central Kansas as high as \$3000 has been frequently loaned on 160 acres of agricultural land. But when a farmer tills incumbered land with incumbered tools that are drawn by mortgaged teams, and a fiery wind burns up two consecutive corn crops, it is evident that he cannot pay interest money—it matters not the size of his mortgage—pay taxes, and live."

The report and findings of Referee John A. Shields in the suit of the Webster Loom Company against Elias S. Higgins & Co.,

the carpet manufacturers, involving the patent-right of the wire motion weaving machines, was made to the United States Circuit Court in this city on the 6th inst. The defendants placed the invention on 61 of their looms in 1873, and after manufacturing 82,000,000 yards of carpet the Webster Loom Company secured an injunction and put in a claim for royalties. The Webster Loom Company claimed \$2,631,575.64 damages, and expert testimony without end has been produced. The report of the referee just made was again in favor of the defendants. "I am forced to find and report," said the referee, "that the complainant has failed to establish by trustworthy legal proof any basis upon which the gains, profits or advantages realized by the defendants by reason of the infringement complained of can be computed."

Representative Butler proposes that Congress shall appropriate \$1,000,000 for a 60-inch telescope. The largest instrument in the world, in Lick Observatory, has a glass 36 inches in diameter, but the Tennessee man will be satisfied with nothing less than 5 feet. With reference to this proposition, Alvan Clark, the renowned maker of lenses, says that he does not believe any better results can be obtained by constructing so large a glass—that is, provided it is located on the Atlantic slope. As to the possibility of constructing such an immense lens, Mr. Clark will only say that it can be done if the glass can be cast, but such a thing was never before dreamed of.

The largest coal dock in America will be built at once at West Superior by the Eastern Railway Company. It will be 2000 feet deep and 800 feet wide, with a central vessel slip 2000 feet long and 100 feet wide, giving 8700 feet of dock frontage for unloading. Car tracks will run all through the structure, which will have a storage capacity of 1,500,000 tons of coal.

Cleveland, Ohio, seeks coal direct from Martin's Ferry, W. Va., and local capitalists are about to extend the Cleveland and Canton Railroad to form a part of the South Pennsylvania and Ohio scheme.

A contract was closed on Saturday with the East End Electric Light Company, a Westinghouse concern, to illuminate the entire city of Pittsburgh. To do this it will require 2000 400-candle-power arcs and 2800 25-candle-power incandescent lights, at a cost of \$120,000 per annum.

Forty large English steamships, the Philadelphia Record says, have within the past week been chartered to bring iron ore from various Mediterranean ports to that port. These steamships, which are of that class of sea rovers known as ocean tramps, have a tonnage capacity of 55,000 tons and carrying capacity of 75,000 tons.

Consul Loening, of Bremen, in a report on the commerce of that port, shows that the value of the imports from the United States has increased from \$22,083,250 in 1871 to \$42,881,312 in 1887, and the exports to the United States increased from \$16,607,188 in 1871 to \$20,058,175 in 1887. The imports from the United States are more than four times as great as from Great Britain or from Central and South America combined, while the exports to the United States are four times as great as to Great Britain and more than nine times as great as to Central and South America combined. The importance of Bremen as a cotton port appears from the fact that she imported from the United States in 1887 cotton to the value of \$29,610,500, an increase of more than \$10,000,000 over 1886. Out of 2879 vessels, with a total of 1,444,683 tons, only one vessel of 1270 tons carried the American flag.

MANUFACTURING.

Iron and Steel.

The citizens of Jefferson, Tex., have donated property to secure the building by John Kruse, of Chicago, of a blast furnace

Under date of the 6th inst. S. McClure, agent of the Stewart Iron Company, Limited, at Sharon, Pa., writes us as follows: "Our No. 1 stack was put in operation on Monday last. We now have our two blast furnaces running, and 13 puddling furnaces in our mill running single turn of five heats per turn—product, blooms, muck bar and billets—the same being used for making open-hearth and crucible steel. All the iron works in the Shenango Valley, with the exception of the Wheatland Mill, are in operation."

The Bessemer department of the plant of the Columbia Iron and Steel Company, at Uniontown, Pa., will be put on double turn as soon as the necessary arrangements can be made. The other departments have been running night and day for some time past.

James P. Witherow, engineer and contractor, of Pittsburgh, is bidding on seven new iron and steel plants to be erected in the South during the next year, with good prospects of securing them. Mr. Witherow states that the next year promises to be the biggest year in the erection of iron and steel works this country has ever seen. These seven contracts will in the aggregate amount to over \$1,000,000, and are to a large extent being erected by Northern capital. The extensions now being made at the works of Mr. Witherow, located at New Castle, Pa., are almost completed, and will increase the capacity of the works about one-third. They will then give employment to some 200 new men, making a total of about 600 men employed. The firm have already work on hand that will keep them busy for the next three months.

A rumor was published in the Pittsburgh papers last week to the effect that a wholesale discharge of employees had taken place at the works of the Edgar Thomson Steel Company, at Braddock, Pa. Upon investigation we find that there is little truth in the rumor. About 40 men have been discharged, the majority of them being metal-handlers. The reason given for the discharge of these men is that navigation has closed, and, consequently, their services were not required.

A rumor is published that the old Wampum Furnace, at Wampum, Pa., which has been out of blast for some years, has been purchased by some capitalists of Pittsburgh and the Shenango Valley, and will be rebuilt throughout and again put in blast. Among the advantages set forth are the excellent railroad facilities and the fact that native ore and limestone can be procured in the vicinity of the furnace. It was erected in 1856, and has already been partially dismantled.

The officers of the Pottstown Iron Company, at Pottstown, whose nail factory has been lying idle during the past two or three weeks, have requested the nailers to accept a reduction of 25 per cent. The feeders are already working at bottom figures. At a conference of the employees held on the 7th inst., the men gave the company to understand that they would prefer a reduction of working hours instead of a reduction in wages as contemplated, if the company found it necessary to make a change after January 1.

The Findlay Rolling Mill Company, of Findlay, Ohio, are operating their new chain works in all departments, and are working thirty-four fires on coil and cable

chains, $\frac{1}{2}$ to 2 inches. This firm some time ago purchased the plant of the Stirling Chain Company at Cuyahoga Falls, Ohio, and removed it to Findlay.

Chester Furnace, at Chester, Pa., operated by the Chester Rolling Mills, which has been idle since March last, resumed operations last week. It has a capacity of about 125 tons per day.

Plans and specifications have been drawn up by Carnegie Brothers & Co., Limited, proprietors of the Edgar Thomson Steel Works, at Braddock, Pa., for the erection of a foundry and machine shop at Braddock. The intention of the firm in putting up this structure is to make all their own castings for the blast furnaces, &c., which work they have always been obliged to get done by outside firms. A 15-foot boring mill has been ordered for the machine shop.

Oley Furnace, at Semple, Pa., owned by the Clymer Iron Company, which has been idle for some years, is being dismantled. It is one of the oldest furnaces in the country, having been erected in 1772.

North Penn Furnace, of the Bethlehem Iron Company, at Bingen, Pa., was blown out last week and will remain idle for an indefinite period. The limestone quarries in that vicinity have also ceased operations.

When the large blast furnace of the Etna Iron Works, Limited, at Ironton, Ohio, was erected in 1872 only one of the twin stacks was completed. The Alice stack was finished, but Blanche was left unlined and incomplete. Blanche has recently been relined and was blown in last week. The work of lining has been going on for months. It has cost about \$23,000, including all necessary changes and additions, and over 400,000 brick, including red and fire brick, have been used. Meanwhile Alice has been blown out and the engines and Whitwell ovens used for that furnace have been connected with Blanche. It is probable that the Alice stack will be blown in again after the first of the new year. Sarah furnace, also owned and operated by the above-named company, has been blown out and will be relined and repaired at once, with a view of blowing in again about the first of the year.

Thus far about 125 employees of the pipe mill of the Reading Iron Works, at Reading, Pa., have been discharged, and it is said that others will follow.

The Keystone Rolling Mill Company, of Pittsburgh, are erecting two new puddling furnaces at their plant on Second avenue in that city.

Etna Furnace, of the Etna Iron Works, Limited, at Newcastle, Pa., has broken twice recently her best previous record. In 24 hours her output in the two turns included in that time was respectively 85 and 83 tons, making a total in the 24 hours of 168 tons. The furnace surpassed even this record subsequently. In 24 hours the furnace produced 170 tons of iron. These records are more remarkable from the fact that the Etna has but two engines and two hot-blast stoves. The furnace, when the above was accomplished, used soft Lake ores.

The new blast furnace of Laughlins & Co., of Pittsburgh, now in course of erection, will be one of the largest blast furnaces in Allegheny County. It will be 22 feet bosh and 80 feet high. There will be four hot-blast stoves 21 feet in diameter and 80 feet high. The foundation for the furnace is finished and the ironwork is being put up. The ironwork for the stoves is nearly finished. The engine-house, stockhouse and boiler-house are all in course of construction. It is expected that the entire plant will be completed by May 1, 1889. The furnace is the same

size as Furnace F, at the Edgar Thomson works, which is the largest, and which has broken the world's record. Riter & Conley are the contractors and engineers of the ironwork, and W. G. Wilkins is the engineer in charge of construction of foundation and buildings.

Lynchburg Furnace, at Lynchburg, Va., which has been undergoing repairs for the past five months, has resumed operations. The repairs which have been made to the furnace are extensive, and consist of entire new fire-brick, from hearth to hopper, new bosh and crucible jackets, new bell and hopper, new sheet-iron roofs. All the machinery, boilers and pumps were overhauled, and new trestles and floors were made to the stackhouse. The capacity of the stack has been increased to 50 tons per day. The furnace and plant, which belong to the Lynchburg Iron Company, have been leased for a term of years by J. Risque Hutter, who will have immediate charge of the business.

The Terre Haute Iron and Nail Works will, in all probability, soon abandon the manufacture of nails, the owners of the works having had a sufficient experience in that line. They have some material on hand to work up, which will keep the factory running for some little time. The fate of the plant has not yet been decided, but a portion of the rolling mill may be adapted to other uses, now under consideration by neighboring manufacturers. The owners, it is understood, will entertain proposals from parties desiring to engage in any branch of manufacture for which the remainder of the works may be found suitable.

The new furnace at Trussville, Ala., is practically completed. It will go in blast in January. It has been erected by Pennsylvania men of life-long experience in iron and coke making, and is one of the best built coke furnaces in Alabama. Its blowing, heating and boiler power is much greater than actually required, giving ample reserve in case of need. It will make 100 tons per day.

The second stack of the Woodward furnace plant in Alabama has gone into blast, and both furnaces are now running successfully, making an average of 200 tons per day. The Woodward has been one of the most successful of all the Southern iron-making enterprises, owing to able and energetic management.

The new furnace of the Gadsden Alabama Furnace Company, making the Etowah brand of coke iron, has got up to 120 tons per day. It is handled by the widely-known founder, John Dowling, formerly of Rising Fawn Furnace. The iron is very tough and dark, resembling charcoal iron. It is rumored that L. S. Colyar, president of the company, will retire in December.

There is a large charcoal furnace under construction at Attalla, Ala., which is built to make high grade Alabama car-wheel iron, like Woodstock and Shelby. It is near Anniston, and will use the same class of ores as the well-known Woodstock. The aim will be to make chilling grades only. It will be completed by February 1.

Nearly all of the leading Alabama coke furnaces have very decidedly improved the character of their iron in the past year or two. Some of the iron now being made by Sloss, Woodward, Mary Pratt, and Etowah will rank with the best produced in the country for color, toughness and high grading.

The Chicago Crucible Steel Casting Company have been delayed and disappointed with their new furnaces and gas-producers at their works, located on Elston and Webster avenues, in Chicago. They

had already put in eight crucible steel furnaces and one open-hearth furnace, with five gas-producers, of a construction strongly recommended to them; but the system turned out to be a total failure for melting steel, and caused great loss and delay to the company, as well as to their numerous customers. The company have now pulled down these furnaces and entrusted Lean & Blair, of Pittsburgh, with the contract for new Siemens furnaces of the most approved and well-tried construction. This firm have gone very energetically to work, and will have the first five sets of crucible furnaces and the large drying ovens, together with Siemens producers for the same, ready for use by the 15th of this month, to be followed by a large 48-pot furnace and a 10-ton open-hearth furnace of the Lash pattern. The customers of the Chicago Crucible Steel Casting Company will, therefore, be able to get their castings during the last half of the month of December, as the company will work their furnaces night and day to catch up with some of their orders.

The Central Iron and Steel Company, of Brazil, Ind., have added a department to their works for the manufacture of turn-buckles used by bridge builders and others. The new department consists of a train of rolls, with the necessary heating furnaces, four presses, a special machine, with six spindles to tap the buckles right and left, a large bolt cutter, lathes, &c. It is housed in a neat ironclad building, erected for the purpose, and is under the special management of Mr. Williams, formerly with the Cleveland Forge Company. A feature in the work introduced by him is the manufacture of the buckles in two pieces instead of four, which has hitherto been customary.

Isabella Furnace No. 1, of the Isabella Furnace Company, at Etna, Pa., near Pittsburgh, is 18 feet bosh, 75 feet high, 11 feet hearth, and 14 feet at the top. This furnace has made the following number of tons of Bessemer pig iron for the weeks ending as noted below:

	Tons.		Tons.
October 6.....	1,655	November 10.....	1,503
" 13.....	1,564	" 17.....	1,798
" 20.....	1,685	" 24.....	1,778
" 27.....	1,665	December 1.....	1,522
November 3.....	1,698	" 8.....	1,766

This is a total of 16,634 tons in ten weeks, or an average of 1663 tons per week. It is certainly a very creditable record.

The Philadelphia and Reading Railroad Company have purchased the property of the Allentown Iron Company, at Allentown, on which will be located the terminal, which the company will build as a connection between the East Penn and Jersey Central roads through Allentown. The property purchased contains three blast furnaces, two of which are in operation. As soon as the transfer was made George F. Baer, of Reading, a Philadelphia and Reading director, was elected president, and Albert Broden was chosen general manager of the Allentown Iron Company.

At a recent meeting of the stockholders of the Decatur Land Improvement Company, of Decatur, Ala., Mr. C. C. Harris was elected president of the company, to succeed Major E. C. Gordon, who recently resigned.

On the night of the 28th ult. the explosion of a lamp in the engine-room of the nail factory of the Duncannon Iron Company, at Duncannon, Pa., caused a fire which totally destroyed the factory and its contents, including 64 nail machines. The blast furnace, rolling mill, foundry, nail warehouse, &c., were not injured. The loss is estimated at over \$30,000, about covered by insurance. The factory was an old wooden building, and

the company expect to replace it with a fire-proof structure with all the newest appliances for nail manufacture.

Machinery.

The Montreal Rolling Mills Company, Montreal, have decided to enlarge and improve their mills. S. T. Williams & Co., Philadelphia, being appointed contracting and consulting engineers.

The New York Belting and Packing Company, manufacturers of rubber belting, packing and hose, have recently opened a branch house in San Francisco, Cal., which will be under the control of Messrs. Arnett & Rivers and located at 17 and 19 Main street, that city.

A press dispatch from Susquehanna, Pa., under date of the 7th inst., reads as follows: "The New York, Lake Erie and Western Railroad Company having decided to have the work performed in Buffalo and elsewhere by outside contractors, the extensive foundry and steam hammer department of their shops here will be closed. About 200 men are employed."

The Ohio Brass Company, of Mansfield, Ohio, have been incorporated; capital, \$25,000.

The Main Belting Company, of Philadelphia, are running very full on their cotton belting, for which they have a steadily increasing demand. The electric light companies are using these belts very largely and with entire satisfaction, judging from the number of commendatory letters which they are receiving.

Byram & Co., of Detroit, Mich., exclusive manufacturers of the Colliau cupola furnace, have recently placed four of their large-sized Colliau cupolas in the new shops of the United States Rolling Stock Company, Anniston, Ala., and besides other orders have a contract with the C. A. Treat Car-Wheel Works, now locating plant at East Chicago, for two large size Colliau cupolas.

Among the recent sales of the Sioux City Foundry and Machine Works, Sioux City, Iowa, are two of their 75-horse-power Corliss engines, for the Pioneer Press building at St. Paul, Minn.; also two 75-horse-power Corliss engines, sold for electric-lighting purposes, one going to James Bell, David City, Neb., and the other to the Storm Lake Electric Lighting Company, at Storm Lake, Iowa. The first of the new line of sizes, a 10 x 16, of Giddings' single valve automatic engines, also built by the works, was sold some time since, together with a boiler, to go to the Chillicothe Water, Gas and Electric Light Company, Chillicothe, Mo. They have also a large force of pattern makers at work, bringing out a full line of sizes of this engine, which is known in the East as the Russell Automatic. In addition to this, the works have recently sold several large boiler plants, together with a number of combined outfits, for the Erie Engine Works, manufactured by Cleveland & Hardwick, of Erie, Pa., for whom they are Western agents. They are busy improving their works, and are putting in at present a 90-inch fly-wheel lathe, also an overhead traveling crane, 30-foot span and 7 tons capacity. Their foundry department is driven to its utmost capacity, being obliged to work evenings in order to get out steam engine-work, in addition to a large amount of architectural ironwork.

President Acheson and Secretary Painter, of the Tubular Wheel Mfg. Company, have been at McKeesport, Pa., to look into the question of locating at Bissell, near McKeesport.

The Hussey Re-Heater and Steam Plant-Improvement Company, of No. 15 Cortlandt street, New York, have just issued a

number of circulars and catalogues setting forth the advantages of their system of reheating exhaust steam and superheating live steam. A number of engravings are given, showing the details of their reheater and its application to existing plants, the whole forming a very interesting exposition of the subject.

The Hughes Steam Pump Company, of Cleveland, Ohio, have sent us a copy of their new catalogue, which will be known as No. 9, and is dated 1889. It is devoted to their various lines of steam pumps and gives illustrations, price lists, tables of dimensions and brief descriptions. In addition, short chapters are given containing directions for connecting and running pumps, miscellaneous paragraphs of general interest relating to pumping work, tables of areas of circles, loss of fluid pressure by friction, with different diameters of pipe nozzles, &c.

Messrs. Thos. Carlin's Sons, of Allegheny, Pa., have sent us a copy of their catalogue devoted to stationary, hoisting and winding engines, pile-driving machinery, boilers of various types, centrifugal pumps, grinding pans, &c. The catalogue is profusely illustrated, and the different designs are briefly described. Tables of sizes are also given.

The Chesapeake and Ohio Railroad is about to erect extensive shops and a round-house at Gladstone, near Lynchburg, Va., on the line of the Richmond and Alleghany Railroad. Employment will be given to about 500 men.

Among recent orders billed by the Revere Rubber Company, of Pittsburgh, may be mentioned a belt for the Westmoreland Paper Company, at West Newton, Pa., which was 48 inches wide, tenply thick, 110 feet long and weighed 1709 pounds. It is to be used for transmitting 750 horse-power.

The Montana Coal and Coke Company, on the Morgantown branch of the Baltimore and Ohio railroad, are erecting a new crusher and washer that is to cost \$40,000. The company have fired their full plant, consisting of 169 ovens. About 200 men are employed. It is said that a company has purchased 10,000 acres of coal land on the West Fork River, near the New England mine, and will at once commence the construction of 200 coke ovens. The company will also build a railroad from Fairmont to Clarksburg to intercept the Baltimore and Ohio at that place.

F. R. Phillips, 407 Walnut street, Philadelphia, reports November sales of Post's Zero metal to be the largest on record. The continued increasing demand and large repetition orders are pointed to as sufficient evidence of its quality for heavy pressure and high speed machinery.

The Columbian Iron Works and Dry Dock Company have under construction an iron frame, iron plated, side-wheel steamer, which is to be used as a harbor iceboat. Her dimensions are 210 feet in length, 34 feet beam and 14 feet depth of hold; she will have horizontal engine of 1200 horse-power, jet condenser, and large double end boiler to carry 60 pounds. The prow of the boat is so formed that, when breaking ice—which will be its principal occupation—the boat will ride upon and, by its weight, crush the ice. The cost will devolve jointly on the city and State.

Hardware.

The Universal Horseshoe Machine Company have erected their plant at Anniston, Ala., within a few rods of the bloomery between the tracks of the Georgia Pacific and the Atlanta and Anniston railroads. The building is 150 by nearly 100 feet. Anniston was selected that the company might use the blooms made by the bloom-

ery, which are referred to as especially adapted for horse and mule shoe purposes. The company intend making six different kinds and sizes of horseshoes and two different kinds and styles of mule shoes, which will possess features entirely different from any heretofore in use. The three-calked and four-calked are especially alluded to. These calked shoes are made by a machine lately patented, by which they are turned out at a rapid rate. In regard to the special features of these shoes the company advise us:

The calks are left in the bar and spaces of the material are rolled out between these calks. The rolls of the machine receive this bar of the required size as it comes from the train hot, and, passing through these grooved rolls to the necessary length, it is then cut off and bent into the horse or mule shoe shape. A clip is then put upon the toe of the shoe, and, after the nail-holes are punched, the shoe is complete, ready to nail on. The company are called Universal because they intend, and can make by this machine, any kind or style of horse or mule shoe required or designed, with or without calks or a continuous calk, or a plain flat shoe, or a shoe partly calked and other parts swedged up, &c.

It is the intention of the company to make from 15 to 25 tons of shoes per day. The 12-inch merchant train, together with engine and rolls, are being made by the Lewis Foundry and Machine Company, of Pittsburgh, Pa., and the horseshoe machines by the Delamater Iron Works, New York. The company have a capital of \$300,000, and, with their improved machinery, expect to furnish these different varieties of horse and mule shoes, made complete, at a lower price than the shoes now in use are put on the market. The present officers of the company are J. D. Billings, president; T. B. Everett, treasurer, and C. L. Suffern, secretary.

The Buhl Stamping Company, Detroit, Mich., are at present manufacturing brass and japanned bird cages, cheese factory can trimmings, railroad shipping can trimmings and the Buhl safety lock tubular lanterns.

We are informed that the report that the Leng Wire Nail Company, of Belleville, Ill., would shortly increase the number of nail machines in their factory and also increase their capital stock is without foundation. The company at present are operating 14 machines.

E. C. Atkinson & Co., saw manufacturers, of Indianapolis, Ind., are about to place upon the market the largest saw, as they claim, ever made in this country. It is to be 88 inches in diameter and No. 12 gauge, the rim being about 8 inches in diameter; will admit sawing 40-inch lumber without the necessity of double saws. During the past year this company have invested about \$50,000 in a plant for the manufacture of band saws.

The Tubular Wagon-Wheel Mfg. Company, recently chartered at Pittsburgh, with a capital stock of \$200,000, are seeking a location for a factory in the vicinity of McKeesport, Pa. No definite arrangements have yet been made as to the new plant.

The factory of the Mallory & Wheeler Company, lock manufacturers, New Haven, Conn., after a shut down of two weeks, has resumed operations. The factory will run three days a week until further notice.

The Canadian Government has granted the Canadian Pacific Railway Company the power to bridge the St. Lawrence River at Coteau. This will complete a thorough line to Boston and New York from Ottawa. The total length of the bridge, including abutments, will be 405 feet. The Central Missouri Railroad will commence work on its bridge at Alton in January.

The Iron Age

New York, Thursday, December 13, 1888.

The Beam Combination.

Some very erroneous statements have been allowed to go unchallenged in the recent debate in the Senate on the duty on iron and steel beams, by both friend and foe. The most serious of these errors is that the producing capacity of this country has been insufficient to meet the largely increased demand; that as a result thereof beam manufacturers are indifferent sellers; that, in fact, they were unwilling to enlarge their production, preferring to manufacture a limited supply at an enormous profit. As a matter of fact, the producing capacity of the country has steadily increased. During the past few years the Homestead Mill has developed a very large output; Jones & Laughlins entered the ranks, both of them for a time remaining outside of the combination. At this writing the new Columbia mill is underselling the combination, and the North Chicago Rolling Mill Company have been gradually working their way into the beam business. At least two Eastern mills, long in the trade, are contemplating, or have under way, the erection of additional machinery. We need only add that two mills alone have been actually producing 40 per cent. of the entire quantity of beams made in the country, mills which are by no means much greater than the other six in the combination. The charge that an artificial scarcity is fostered for the sake of wringing extortionate profits from consumers is therefore absurd. It is not denied that the manufacture of beams has been fairly profitable. It has been the one branch of the trade in which brief seasons of exceptional prosperity have not been followed by protracted periods of depression and ruin. Prices have been uniform for long spaces of time. They have been sufficiently remunerative to encourage American manufacturers to be progressive far beyond anything which their European rivals have attempted. In finish, excellence of workmanship and high quality of material American beams, with a few rare exceptions, have led the world. The standard of quality has been so high that prudent builders and bridge engineers have given very little encouragement to importers, although the prices of foreign beams have been generally \$10 to \$12 per net ton lower. In structures upon the integrity of which the lives of many people are dependent absolute safety is purchased cheaply at the price demanded by manufacturers of a good article. American beam-makers can look back with pride upon their record in this respect. They have deserved the prosperity they have enjoyed, and can face the public with confidence. They have kept abreast in progress, and are leading in the important changes which are going on in the direction of substituting steel for iron. On

the whole, it has been done conservatively, without the dangers which would have accompanied wild competition.

In 1876 beams were selling at 6½ cents to 7 cents, according to size, and ¼ cent was charged for punching holes. To-day the price is about one-half, 3.3 cents per pound, with ⅞ cent added for punching. The lowest price which they ever reached was 2½ cents per pound, during one of the periods of the disruption of the combination, which have occurred at frequent intervals. In fact, the present association is the one which has enjoyed the longest life, having been formed in 1885, and even it was critically near a break at one time. The price, too, is only apparently high, as any one connected with the iron trade will appreciate when we state that it abolishes size extras entirely, and that it means free delivery. The combination price is the same for all sizes of beams, large or small. In every other department of the manufactured iron trade certain standard sizes constitute the base price, and extras are charged for odd or unusual sizes, difficult to roll, or called for only in small quantities. These extras often double the base price. The price of beams is placed to represent the average, so that in reality the purchaser of extra sizes is getting very much the better of his bargain. The expediency of such a system may be a matter for considerable discussion, into which we do not propose to enter now, but we do insist upon pointing out the fact that it gives the average price an appearance of an unduly high level. Then, the highest combination price is 3.3¢ to 3.4¢, delivered at any point east of the Mississippi River. This, again, causes it to seem high, when in reality, the mills net considerably less, the freight in some cases being as high as ½ cent a pound.

There is another charge against which a protest should be entered. A good many in the iron trade, and a far greater number outside of it, have the most exaggerated notions concerning the profits in beam manufacture. It has tempted a few into the business, who have dearly bought the experience that the rolling of beams cannot be learned in a day, that it involves large amounts of capital to carry stock, that the labor accounts are heavy and that the waste, through cutting to lengths required, is very large. It has become a favorite argument of those who are catching at popular favor by crying down the beam combination to draw parallels between steel rail making and beam manufacture. With a fine show of liberality, they generally add a few dollars a ton to a mythical estimate of cost of rails and proceed to figure out the exorbitant profits of the beam monopolist. We need only state in reply to these arguments that the same train of rolls will turn out, with the same number of men, at least five times the tonnage on rails of standard section, which it can produce of beams of average size, taking the orders for the latter as they come.

We are convinced that unbridled competition in the manufacture of beams would be a public misfortune, since it could only too quickly tend to introduce that element of false economy in the choice of raw materials and in the methods of manufacture which follows a wild struggle for existence.

Prison Convict Labor.

Mischievous labor agitators, through the operation of what is known as "the Yates law," passed by the Legislature of New York at their instigation about four months ago, have utterly paralyzed the prison labor system of this State. This law supersedes both the "contract" and "State account" systems, throwing into disuse a valuable and expensive plant of special machinery, and at the same time restricting the sale of the products of prison labor simply to the supply of the needs of public institutions. Thus 6000 convicts are plunged into idleness, with the most pernicious effects, physically and morally, and burdening the taxpayer as never before. Instead of yielding a net revenue, the costs to the State are not less than \$400,000 for the current year and for the year to come, according to intelligent estimates, these figures will be increased to \$1,000,000. All eyes are turned to the Legislature in hopes of relief. It is well understood that the State account plan was abolished and the Yates bill passed because labor organizations complained that prison-made goods competed with honest labor and wages were affected. By the use of machinery large quantities of manufactured goods were crowded on the market. In Sing Sing Prison, for example, 433 men were employed in the stove works, and as recently as last August were turning out 200 stoves a day. The Yates bill, however, abolished motive-power machinery, and in addition confined the labor of men to the narrow sphere of making only such articles as are required in our penal institutions. The labor of a few score of convicts now suffices, where under previous conditions thousands were profitably employed.

There are grave reasons for doubting the expediency of employing machinery to any general extent as a substitute for manual labor in prison management. On this point the testimony of Richard Vaux, ex-Mayor of Philadelphia, and for many years past president of the Board of Inspectors of the State Penitentiary for the Eastern District of Pennsylvania, is highly suggestive and worthy of serious attention. Mr. Vaux says: "Every convict should work, but he should not for prison profit, or with machinery, or for the payment of interest on the cost of it, nor interest on the cost of the prison plant, be worked with machinery to pay the debt account of prison expenses and call that punishment. He should be taught a trade and the use of tools; be hand-trained and head-trained, so that he can be self-supporting when he gets out of prison. He must be taught individually. If he has been employed with a gang of fellow convicts working steam-run machinery he gains no knowledge that will be useful to him when released. He has been taught only a small portion of manufacturing and what does that benefit him? His time has been wasted. He ought to be self-dependent when he leaves prison, for the chances are against him in seeking employment in a private factory like the one he worked for in prison, because he would have to give the State Prison for reference when he applied for work." It is claimed that there is no similar institution in the country better managed than the peniten-

tiary of Eastern Pennsylvania. The general plan there adopted stated in brief is to teach the whole mode of making anything that can be made by one person, so that the discharged convict may be qualified to obtain a subsistence through honest industry. The experience of the New York State reformatory at Elmira forcibly tends to corroborate these views. Fortunately for the usefulness of this institution, although Attorney-General Tabor decided that under the Yates bill all shops must be closed, the trade schools, at which hundreds of young men are being taught, may remain undisturbed so long as nothing is made in them to sell in the open market. In this reformatory are classes which receive instruction in machinery, blacksmithing, plumbing, &c., so that every man when released has command of a useful trade. It is now proposed to introduce into the New York Legislature at the coming session a bill recognizing some of the most valuable features of the Elmira Reformatory, with the object of converting Auburn or Sing Sing prison into a similar institution, while others, like Dannemora, are reserved for more depraved offenders, with the State account plan practically restored. As explained by Mr. Round, of the Prison Association, who is one of the committee charged with the preparation of the bill, one object is to make the prisons as nearly self-supporting as possible. "A limited number of men should be employed in each prison in the larger industries in the smallest possible ratio to those working in the same industry outside. The ratio should not exceed a certain per cent. That would reduce competition to the lowest possible point. Really there is no competition, for if the prisoners earn anything, the expense of keeping them is reduced just that much. It costs the State at least \$100 to support a criminal in idleness in jail for a year. When he is turned out without a trade and no means of support, it costs the State just \$3500 a year to keep him out of prison. That is based on the estimate of what it costs the State to take care of its criminal class. All that amount has to be raised by taxation, and if taxes are high wages are low and rent and supplies are high. Does the laboring man, who is in favor of keeping the prisoner in idleness, ever think of that? Now, if the criminal had work in prison, his cost would be practically nothing in jail, and he would become self-supporting when out, providing the trades unions let him earn his living at a trade learned in prison."

It is generally admitted that the wretched slough into which the prison system of this State is plunged by the Yates bill is intolerable. A four months' trial of the experiment is sufficient to condemn it, excepting so far as experience may demonstrate the wisdom of restricting the employment of machinery within certain prescribed limits. One thing is certain, that the common sense of the people revolts against any system that takes our convicts from profitable work and consigns them to indolence, while all productive labor of whatever kind is taxed for their support. From the standpoint of morality, stepping higher and beyond considerations that are merely pecuniary and politic, the condemnation is still more emphatic. The whole subject demands careful reconsideration at Albany.

Railroad Associations.

The interest taken by the people in the tariff discussion of the late election seems in some quarters to be almost equaled by the interest taken in the railroad problem. The difficulties of the situation have been dwelt upon in the daily papers, and various remedies suggested. There is one phase of the question, however, which has not received quite the attention it deserves, and that is the intimate commercial relationship between dull business in trade and in transportation. It is very clear that competition between railroads cannot be encouraged to the same extent as between rival business houses in any line of trade. Railroading is a business by itself, having its own economic laws. Bankruptcy will always prevent a too disastrous rivalry in commercial affairs, but not in transportation. This is the lesson of the present railroad troubles as expounded by the managers, and, no doubt, it has been learned; but on the other hand it would be equally bad to eliminate the commercial features from transportation. Railroads can find their highest usefulness to investors and to the mercantile public when their profits follow to some degree the scale of profits in the communities which they serve. Practically this is often done unconsciously, but under the present discussion it is well to state it more dogmatically. This truth is really the underlying cause of much of our so-called "rate-cutting." Men and newspapers frequently charge all lowering of rates to the vindictiveness or foolishness of railroad managers, but this is very unjust. Managers like other business men are controlled by commercial conditions. As well might we say that all manufacturers are foolish when any article falls in price. Take the case of wheat. The Pennsylvania reduced the rate from Chicago to New York, because the short crop and high price had well nigh stopped the export traffic; that road and the steamship lines it controls could not afford to shut off the carriage of breadstuffs, and hence reduced the rate to stimulate the movement. Every retailer who reduces the price on unsaleable goods acts on the same principle. We cannot expect in so complicated a matter as transportation to be able to trace every reduction in tariffs at once to this source, and undoubtedly some railroad wars have no such excuses. But plain business reasons, such as influence merchants the world over, can be given for a larger part of tariff breaking than is generally supposed. There comes a time to every railroad manager when traffic for his road at reduced rates or no traffic at all is the alternative. In such cases there is but one wise choice. Occasionally we have men wondering why railroad rates are steady when the volume of traffic is large, but weak when tonnage is light. Here is the simple and ample explanation: the laws of trade operating to make the business of transportation no more profitable than any other business.

At the present time the stock market represents the general state of trade as well as the condition of our railroads.

These facts should be borne in mind in any attempts to remedy our railroad troubles by legislation. The Interstate Commerce Commission in their report speak of

the need of regarding our railroad system as a whole and we think the public mind is more favorable to associations between carriers for this purpose than heretofore. But it does not follow that a legalized pool is necessary for this, and in so far as such a rigid system would be out of touch with the commercial conditions of trade it would not be best for itself or for the community. An association of railroads strong enough to protect itself against combinations of shippers—the dressed-beef men, for instance—and strong enough to insure a reasonable degree of steadiness and impartiality to shippers' rates of freight, such an association is to be welcomed; but this should not include power enough to force rates upon merchants and manufacturers without regard to changing commercial conditions.

A Needed Convenience in the Machine Trade.

Builders of special machinery may be excused for not informing their clients how to order duplicate parts in case of breakage. Those who make standard machines, however, would confer a very great favor on their patrons if they would, in addition to cuts of machines, publish in their catalogues sectional or skeleton views with the different parts numbered. Then, when a machine breaks down the operator can order by telegraph, if necessary, giving the number of the part broken. Hardly any two machines from different shops will agree upon the technical name of an inferior or subordinate part of a machine, although they may always correctly designate the main working parts. Shop phrases and special terms are current in one establishment which are a totally unknown language when used in speaking to a workman employed in another shop. The language is still more mystical to the operator on the machine, who may not be a practical machinist, but in every other respect a trained workman, thoroughly competent and perfectly equipped to perform his task on it. Take for instance, a steam hammer. The hammerman may be an expert in the use of the tool, but know very few of the technical names of the parts. If his hammer breaks down he is at a loss how to describe the portion broken, unless it is one of the main parts or he has been so long in his position that he has somehow picked up the terms employed. In his ignorance of the names used he would probably have to make a sketch of the broken part and send that by mail, or forward the pieces by express or freight and lose a great deal of very valuable time, which would be saved if he could order by number by telegraph. This is assuming that builders of machinery issue catalogues. All of them do not, however, it being a remarkable fact that some very important engineering establishments in this country consider a catalogue superfluous. When written to for a list of their standard machines they can only furnish photographs of a few, and make their customers work in the dark if they desire to order other sizes or patterns. The catalogue is an essential in the systematic dispatch of business, and next comes the sectional views with numbered parts as an important chapter in the table of contents.

The Copper Syndicate and the Manufacturers.

The report, so quickly contradicted, of the closing down of the Anaconda mine under an arrangement with the syndicate has again given rise to a good deal of discussion. The story seemed plausible, because it was well known that negotiations between the two parties were in progress. The Anaconda is the only large producer which had a contract for only one year. This contract is about to expire, and the power of the owner of the mine, and the capacity of the latter, put him into a position where he can drive a very hard bargain. It is probable that the report alluded to foreshadowed to some extent the arrangement which may ultimately be made, though it would reduce the profits of the syndicate on its American mines to a very small amount, if, indeed, it did not swallow them entirely.

Those in sympathy with the syndicate express the greatest confidence in its strength. They insist that the most trying time, due to the appearance in the markets of the world of supplies invisible before the advance, is over; that consumption of new copper is increasing rapidly; that production has reached a maximum, and that it is not even up to the engagements of the syndicate. In this country, it is said, the Calumet and Hecla, Tamarack, Boston and Montana, and other leading mines are behind their deliveries to the French ring. The reported accumulations of Anaconda matte in this port at Baltimore and at New Orleans are claimed to be due to the rise in freights and the scarcity of tonnage some time since; they are merely stopped in transit, and are not held back to make the statistical position in copper in the world look less serious than it really is.

So far as the American manufacturers are concerned the syndicate insists that they have been treated very leniently. Some of them, it is said, have taken advantage individually of the fact that the raw material has been supplied to them at a price considerably below the nominal market price. Copper sold at 16½ cents has been put at the syndicate at the exchange market quotation, but not without the knowledge of the syndicate, which has traced its origin, and has shown that it possessed that knowledge. Attention is drawn to the alleged fact that in reality American manufacturers are getting their copper at a lower price than those abroad, that casting brands are cheaper here to manufacturers than G. M. B brands are to English makers, that Lake copper is lower at 16½ cents here than it is abroad. Although the threat is not uttered, the possibility of putting our makers on the same basis with the Europeans is pointed out. The idea is scouted that the syndicate would, as a manufacturer, spoil the market of its customers for ingot copper in this country. While it is conceded that prices are very low in some branches of the trade here, when taking the cost of the metal into consideration, this being the case notably in brass, which is selling at 16½ cents a pound, it is insisted that in other departments the prices of manufactured goods are kept at figures which leave exorbitant margins. American manufacturers, it is urged, have only themselves to

blame if they invite competition in spite of the fact that they get their copper cheaper than European rivals.

It is stated that at present prices on both sides of the Atlantic there is a possibility that large contracts for copper wire rods could be placed here from abroad. If such a business were done it would create a great outcry among the manufacturers on the other side of the Atlantic, and might lead to an adjustment by the syndicate of prices to consumers both in Europe and here. In other words, the syndicate has dealt leniently with the manufacturers. It has winked at the practices of some who have made it take back at a higher price copper sold with the express understanding that it was to go into consumption. It has kept the price of copper lower to them than to others. It has the power, and may possibly exercise it, of placing European manufacturers on a basis much nearer to that at which competition is possible.

Such are briefly some of the views expressed by those who are in sympathy with those who claim to have restored the metal to its proper position in the markets. We need hardly add that our sympathies are not enlisted on that side. We believe, with the conservative element in the trade, that the intervention of the syndicate is a misfortune to great interests, and that every day added to the period of its tenure of power must aggregate the evils of an artificial condition of affairs. We are as firmly convinced of the ultimate fearful collapse of the gamble as its most virulent opponents, but we hold that present conditions must shape the course of every one in the trade, and they, we repeat, point unmistakably to a continuance of the sway of the syndicate for some time to come.

Bolivia's Revolution and the Silver Supply.

Since November 27 silver has again declined in the London market from 43d per ounce to 42½d, due to the absence of demand for India, on the one hand, and to dearer money in Europe generally, on the other. The advance in silver in the summer has gradually been lost, but the outlook seems to point to higher rather than lower rates in the future. Both Russia and Brazil, in view of contemplated financial reforms, will be buyers of silver to a notable amount ere long, while silver production is not likely to exceed last year's but may be less. Since 1860 the world's silver production was shaped as follows, reduced to tons of 1000 kg.:

	1860.	1865.	1870.	1875.	1880.	1885.
	Tons	Tons	Tons	Tons	Tons	Tons
United States..	7	174	301	585	981	1,137
Mexico.....	457	473	521	602	656	754
Bolivia, Chili, &c.....	205	191	230	375	350	430
Germany.....	55	68	89	143	164	23
Other countries	172	195	198	285	300	308
Total.....	866	1,101	1,339	1,970	2,451	2,962

A quarter of a century has sufficed to raise production in the New World from 669 tons to 2321, almost quadrupling it, while Europe and other countries about doubled theirs. Last year we produced \$53,357,000, against \$51,000,000 in 1886, and the stock held on July 1, 1888, was:

Silver dollars.....	\$299,708,790
Subsidiary silver coin.....	76,406,376
Silver bullion for coinage.....	3,950,388
Melted trade dollars.....	6,545,554
Silver.....	\$386,611,108
Gold coin and bullion aggregated.	705,818,855
Total metallic stock.....	\$1,092,429,963

This was distributed as follows:

United States Treasury.....	\$594,533,172
National banks.....	105,435,492
Other banks and circulation.....	392,461,299
Total.....	\$1,092,429,963

Even supposing that during the year now drawing to a close our production increases a couple of million dollars, nothing threatens silver from this country so long as the Bland bill remains unrepealed. As the next Congress is constituted there is, it must be confessed, little prospect that the bill will be repealed in a hurry. Mexican silver production is on the increase, but the latter is not likely to exceed \$5,000,000 per annum in any year, as silver mining and access by rail are for the moment in the neighboring republic, whereas in Bolivia, the third country in rank as a silver producer, we have to deal with a widespread revolution which hampers production and absolutely stops exportation. Bolivia turns out in a politically quiet year no less than \$20,000,000 of silver. Potosi produced from 1544 to 1572 \$250,000,000, from 1572 to 1627 \$340,000,000; it then fell off to \$3,000,000 per annum, but gradually recovered till 1809, when the war of independence put a stop to mining for 16 years, since when there has been a steady increase in the silver-lode districts. The Cerro Rico de Potosi from 1544 to 1887 has yielded a little over \$2,000,000,000 in silver. As a general thing during the past 15 years war and revolution have interfered comparatively little with mining operations in the silver districts of Bolivia, but frequently for a while with export, the roads being bad and the distance from the Pacific great. Miners pay no taxes, and the export duty is only 58 cents on about ½ pound American on silver, gold being free, and mining machinery entering duty free. Timber is scarce, and with it better fuel than *tuquia*—llama dung—and *vareta*—moss. But these disadvantages have been somewhat diminished, for by means of the Mallendo-Arequipa-Puno Railroad, connecting with steam navigation on Lake Titicaca and the stage roads from Chililaya or Puerto Perez to La Paz, and thence to Corocoxo and Cruro, an extensive mining region has been made easier of access, while the steady advance of the railroad system now extending westward in the Argentine Republic toward Southern Bolivia is greatly facilitating the reopening of the Potosi mining district, which has lately been undertaken by an Anglo-Bolivian Company. The Huanchaca mine produced in 1885 \$4,819,146 worth of silver ore, netting the company for the year \$2,080,000. Even during the war on the Pacific \$20,000,000 were invested in new mining enterprises, and all this money was raised in the country.

Since the revolution broke out in September last railroad communication between Mollando and Lake Titicaca has ceased, the transportation of goods and bullion on mules' backs likewise, mine owners and merchants not wishing to expose their property to being plundered in transit and mule drivers refusing to run the risk of their lives. Bolivia mining shares suffered a serious decline in Valparaiso, but by latest accounts recovered part of it. President Aniseto Noce, elected last summer, and his cabinet are wandering from place to place, after fleeing from the capital, Sucre, and muster-

ing forces to resist the rebellion led by Pacheco and Rivadeneira. So far as accounts go, decisive engagements have not yet occurred, though a good many lives were lost in a street fight in Sucre. How long the struggle may last in a mountainous country 1,139,250 square kilometres in extent is doubtful. While it does the silver supply will be restricted from that important source.

The Blast Furnaces on December 1.

Again we can record a notable increase in the capacity of the blast furnaces at work, the principal advance being made in the coke plants. We accompany our report by diagrams, which show at a glance the general change for a period extending over a year in the case of the anthracite and the coke stacks. They convey a better impression than a brief study of the accurate figures reproduced in the summaries following the tables.

On the first of the month the condition of the anthracite furnaces was as follows:

Anthracite Furnaces December 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.
New York.....	24	10	3,264	14	4,095
New Jersey.....	10	4	1,492	6	2,992
Spiegel.....	3	3	230	0	0

U. S. Susquehanna Valley.....	17	10	3,199	7	1,606
Lebanon Valley....	16	12	5,706	4	1,815
L. Susquehanna Valley.....	22	12	4,384	10	2,266
Total.....	185	99	34,879	76	22,705

Diagram of Anthracite Furnaces.

For a year past our records show the following:

	Furnaces in blast.	Capacity per week.
December 1.....	99	34,879
November 1.....	95	33,645
October 1.....	95	33,728
September 1.....	92	33,541
August 1.....	93	33,397
July 1.....	92	32,478
June 1.....	99	32,418
May 1.....	96	31,003
April 1.....	94	30,496
March 1.....	98	28,598
February 1.....	97	29,989
January 1.....	118	38,206
December 1, 1887.....	122	39,487
November 1.....	124	40,028
October 1.....	123	39,440
September 1.....	125	38,338
August 1.....	129	37,960
July 1.....	138	40,742

Among the anthracite furnaces the principal events are the blowing in of the Hudson, continued heavy work on the part of Musconetcong, in New Jersey, the resumption on the part of Mount Laurel, No. 2 Brooke, the fifth Crane and Lochiel furnace. Among those which are prepar-

ing to go in, or have already done so since the 1st inst., are Merion, Montgomery, Chester, Marshall and Lebanon Valley. During November Bethlehem and the Thomas Iron Company each blew out one furnace. The Lehigh spiegel furnace was idle, relining, during a part of the month.

The status of the coke furnaces was as follows:

Coke Furnaces December 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

November 1.....	151	90,459
October 1.....	152	89,123

In New York, a second Troy furnace is about to go in on foundry iron. In Pittsburgh, for the first time, every furnace is in blast, the new Soho having gone in on the 15th ult. Two more furnaces are in course of construction, one by Laughlins & Co., and the other by the Carrie Company; with them the capacity will be little over 25,000 tons a week. In the Shenango Valley Spearman started in during November, and the second Stewart has since been blown in. The returns from nearly every furnace show a November product of 46,352 tons, against 46,530 tons in October, so that practically the district is close to its maximum capacity of 50,000 tons, taking into account that one or the other furnace is always likely to be out for repairs. There are no changes to note in the Juniata and Conemaugh Valleys, or on the Youghiogheny, the total product of the latter having been 7084 tons. To the furnaces grouped under miscellaneous has been added the new Cameron furnace at Emporia. Center is running, and so is Bellefonte, which, however, lost a week in making repairs. So far as West Virginia is concerned, we may note a particularly heavy product for the Riverside. In the Mahoning Valley Grace stopped on the 24th ult., and Himrod suffered from an accident, the product of the district falling off from 38,649 tons in October to 35,809 tons in November. Among the furnaces grouped under "Central and Northern Ohio," we may note the blowing in of No. 1 Cherry Valley on the 15th ult. This is, however, more than coun-

terbalanced by the stoppage of one of the furnaces of the Cleveland Rolling Mill Company, and the blowing out of Jefferson. The November product was only 40,810 tons as compared with 42,862 tons in October, and December is likely to show only 38,000 tons. In the Hocking Valley Akron went in and Gore, which has put in a new hearth and inwall, is probably at work again at this writing. In the Hanging Rock region the new Blanche blew in since the 1st of this month. In Illinois Calumet was lighted on the 29th ult., leaving only one Chicago and the smallest of the Union stacks idle. The November output was 43,957 tons, against 47,503 tons in October. In the South the principal event has been the blowing in of the third Ensley furnace, on the 29th ult., and the resumption of the third South Pittsburgh, which will bring the product of the Tennessee Coal, Iron and Railroad Company to over 20,000 tons a month and give it the lead of all the producers of foundry and mill irons. A few of the great steel companies only are

Diagram of Coke Furnaces.

producing more pig iron, though, of course, only for their own use. When the fourth furnace at Ensley is completed it will probably at times reach 25,000 tons a month. The second Woodward has gone in; the second De Bardeleben was not yet in blast, however. We estimate the November output of Alabama at 37,120 tons, which may be increased to close to 45,000 tons in December if all the plants do well. Tennessee and Georgia ought to add to it 23,000 tons. The Virginia furnaces made in November 13,970 tons; Lynchburg having blown in on the 8th, and Pulaski having run during all the month with only one engine, the other being under repairs. The furnaces ought therefore to come up to 15,000 tons in December. Kentucky turned out 4369 tons in November. Taking the furnaces grouped together as the Southern, nearly all of which work for the open market on foundry and mill iron, and we reach a probable December output of 87,500 tons. This is at the rate of over 1,000,000 gross tons annually. Now there are under construction and partly completed, to go into blast during the winter, 11 furnaces in Alabama, not counting plants on which work has recently begun. Taking the average of the furnaces blown in during the last two

years, 2800 tons a month is a very liberal allowance for them. In the spring of 1889, we may, therefore, arrive at a total product of between 110,000 and 120,000 tons monthly, providing the fuel supply is adequate. By way of comparison we may state that in December, 1887, Alabama produced 18,084 gross tons; Tennessee, 17,621 tons; Georgia, 3428 tons; Virginia, 13,448 tons and Kentucky 1620 tons, a total of 54,201 tons. The great increase has, of course, taken place in Alabama.

The production of charcoal iron has fallen off slightly, the details being given below:

Charcoal Furnaces December 1.

Location of furnaces.	Total number of stacks.	Number in blast.	Capacity per week.	Number out of blast.	Capacity per week.

In Maryland Muirkirk has been completely rebuilt since the fire, the plant having been modernized. It has probably blown in at this writing. In Virginia Beverly, Cave Hill, Cedar Run, Foster's Falls, Reed Island and Speedwell are running. In Ohio Jefferson produced only a few days in November. It will resume during the current month. In Michigan Eureka stopped on the 14th ult. but has again blown in. Fayette went out until the spring, and Pine Lake also blew out on the 20th ult. for the winter. Peninsular, too, is idle, thus reducing the output of Michigan charcoal pig considerably. In Wisconsin Hinkle is doing large work, and Minneapolis closed the first year of its present blast on the 5th inst., with a very large total product. In Missouri Midland lost two days as the result of an accident to the hoist, and Sligo was idle from the 13th to the 24th for repairs. In the South no notable changes have taken place. The second new Nashville had not blown in on the first, the first being still run on coke.

Among their late sales the Ball Electric Light Company, of New York City, report the following: Wilmington City Electric Company, Wilmington, Del., an increase of 75 arc lights; American Electric Light Company, of Kansas City, Mo., an increase of 75 arc lights. Each of these companies before purchased of them a K., 75-light, 2000 candle power arc dynamo complete, an increase as above with a second dynamo of the same size. This dynamo appears to be attracting special attention for street and commercial lighting. Like all other dynamos of their system it has required no foundation whatever, but is simply fastened lightly with wooden blocks to the floor. In addition to these the company report the following sales: Phoenix Woolen Company, East Greenwich, R. I.; Stoughton Lighting Company, Stoughton, Mass.; Kirksville Light, Heat, Power and Water Company, Kirksville, Mo.; Stetson & Post Milling

Company, Seattle, W. T.; Edison Electric Illuminating Company, of Hazleton, Pa.; C. S. Bradford, West Chester, Pa.; Newport Light Company, Newport, Ky.; Walworth Steam and Power Company, Boston, Mass.; West Coast Electric Light and Construction Company, San Francisco, Cal., or a total of about 600 arc lights.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., December 11, 1888.

The summary bursting of the big Bessemer-steel gun and the explosion of the great expectations of its projectors have been the events of the week in ordnance circles. The superintendent, Mr. Hainsworth, and the officers of the casting company are somewhat emphatic in their efforts to shift the responsibility of the explosion to the interference of the Government officials with the tempering of the casting. The officers, however, reply to this by saying that the only work done upon it by them was the rifling, placing of the breechpin and testing the castings. The tests, they say, did not come up to the contract specifications and the gun might have been thrown out entirely. There had been so much talk about the steel cast gun that they waived this point so as to allow the gun to receive a trial and vindicate or explode the theoretic claims of the champions of steel cast guns.

The explosion of the gun on the first firing test has sent that style of gun down below par most effectually, but the experiment has been a real service, as it will be likely to shut off the incessant agitation of all sorts of schemes by unscientific men and non-experts. Senator Gorman, who has been the champion of the private competition theory of securing improved styles of ordnance, is not at all discouraged and believes in going ahead in the same line.

General Benet, Chief of Ordnance, said to the representative of *The Iron Age* today: "I was not in the least surprised at the result. No reliance can be placed on simple castings to resist the enormous strain to which modern guns are subject. The outer surfaces may look all right, but it is impossible to tell the condition of the metal within. The air bubbles and other causes of weakness, cannot be overcome except by forging."

"The failure of the gun to stand a test of 16 tons to the square inch was only a minimum showing. The strain is oftener 18 tons, and, sometimes, in cases of obstructions caused by the projectile adhering or being retarded in the bore, it runs as high as 100,000 pounds to the square inch. A Bessemer steel casting, without forging and the application of other strengthening methods, would be a very unsafe gun, either for defensive use or on board ships."

"The test of the Bessemer gun will, doubtless, put an end to that idea, as the lack of confidence in the strength of such a piece of ordnance would be very demoralizing to the men expected to work it."

General Benet said further that increased interest would now be given to the open-hearth cast-steel gun. He expects it to show greater resistance to the enormous strain, but as to the practical use of that style of gun he does not express much confidence.

Commodore Sicard, Chief of the Bureau of Ordnance, speaking of the burst gun, said: "Our calculations to determine the power of the gun did not indicate that it would stand the test. It looked well enough. In fact, was a superb piece of metal and a great credit to the skill of the workmen, but the boring showed numerous little air spaces which were calculated to weaken the gun."

"The bursting was inevitable. It was not strong enough to resist the service charge. Built up guns, with rings of steel shrunk by heat around the core, alone can resist the pressure; a simple cast steel gun cannot resist the pressure, and no thickness capable of being handled by even mechanical appliances for practical use would enable them to stand."

The universal testimony of other officers is to the same effect. The statements of manufacturers of steel castings, who are authorities on the subject, agree that unless some new methods of treatment are discovered cast-steel guns will not be the guns of the future.

An elaborate report, with photographs, is being prepared by the officers in charge for the information of the Department. The officers of the line of the navy say that the Government could not expect either officers or men to stand by guns in action which would be liable to explosion at every discharge. Had not precautions been taken against accident in this instance there would have been serious results from the firing test of the cast-steel gun. Fortunately there were no disasters except to the gun. The Senate has been giving tariff hearings during the week on various industries. The tin-plate interests were heard, Messrs. Swank and Jarrett arguing in favor of a protective duty of 2 to 2½ cents a pound. The argument was an unnecessary consumption of the time of the committee, who courteously listened, however, as there was an agreement among them before the adjournment to incorporate an amendment into the bill in the Senate placing that duty on tin plate. This is one of the certain things that the committee does favor, and therefore the subject requires no further agitation. The reduction of the duty on tin plate was an inexcusable movement in the interests of foreign manufacturers which the committee will remedy. The wire interest is to be heard to-morrow, Wednesday.

The debate on the tariff bill in the Senate was attended with some surprises during the past week. The display of a lower duty tendency among certain Western Republicans indicates some uncertainty in that quarter. Senator Plumb was disposed to attack certain features of the tariff schedules. The letters and telegrams received by the committee for hearings are coming in daily, and in numbers which would run the committee into the summer.

Senator Allison is pushing the bill in the Senate with the utmost energy. He is still in expectation of securing the passage of the bill—it not before the holidays very soon after.

It is reported that the Coke Consumers' Association, which is composed of the furnace operators of the Shenango, Mahoning and Ohio valleys, will protest against an advance in the price of coke at the opening of the year. Mill iron is selling at \$16, and at this figure they claim that they can stand no advance in coke. On December 1 they gave their employees a 10 per cent. advance and ore has gone up 50 to 75 cents, which increases the cost of making a ton of pig iron from \$1 to \$1.50. If coke went up to \$1.50 it would increase this from 30 to 40 cents.

Joseph J. B. Frey, manager of the Martin Iron Works, of this city, was killed on Tuesday while returning home from a visit to a relative in Elizabeth, N. J. Mr. Frey's body was picked up on the Newark Bay bridge of the Jersey Central Railroad, and it is supposed he was accidentally thrown off the train.

Eight fires on cotton-laden vessels have already occurred this season, but the origin of these fires is as much of a mystery as ever.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, December 10, 1888.

In some respects the past week has been much more satisfactory than its immediate predecessors. As foreshadowed in previous reports, decided activity has suddenly become the feature of the trade in several lines, notably in Steel Nails, the increased demand being accompanied by higher prices. Even in the branches of business now experiencing dullness there appears to be no lack of confidence, and sellers manifest no uneasiness as to the future, believing that the generally healthy condition of business throughout the country will stimulate trade toward the close of the year, or, at furthest, early in January. More orders for cars are coming forward, and, although they are not so large as car-builders would like to see them, they are sufficiently numerous to impart a feeling of strength to the interests directly affected. The railroads are beginning to feel the effects of the enormous crop of corn, and their increasing earnings promise to furnish an important factor in the prosperity of the country in the coming year.

Pig Iron.—The demand for Strong Coke Foundry Iron continues to be the only feature of the market worthy of special notice. Good sales are being made of that class of Iron at very close to full prices. The lower grades are particularly firm, owing to the scarcity and high price of competing grades of Southern Iron. Very little movement is reported in Charcoal, Soft Coke or Southern Coke Irons. Charcoal is very stiff, with the inquiry principally for high numbers from the Car-Wheel manufacturers. As the time of the year is approaching in which season contracts are placed for this class of material the manufacturers are less inclined than ever to make concessions or to vigorously push sales. Reports are current of Southern Coke Foundry at concessions from regular quotations, but the lower grades are as firmly held as was reported last week. Cash quotations are as follows, f.o.b. Chicago: Lake Superior Charcoal, Nos. 1 and 2, \$20; Nos. 3 to 6, \$20.50 @ \$21; Alabama Car-Wheel, \$26.25; Jackson County Softeners, \$18.60; Hocking Valley Soft Foundry, No. 1, \$17.50 @ \$18; American Scotch (Black-band), No. 1, \$19.50 @ \$20.50; other Ohio Soft Irons, No. 1, \$17.50 @ \$18; Lake Superior Coke, No. 1, \$18 @ \$18.50; No. 2, \$17 @ \$17.50; No. 3, \$16 @ \$16.50; Coke Bessemer, \$17.50 @ \$18; Southern Coke, No. 1 Foundry, \$17.25; No. 2 Foundry and No. 1 Soft, \$16.75; No. 3 Foundry and No. 2 Soft, \$16.25 @ \$16.50; Gray Forge, \$16.

Bar Iron.—Orders for Bar Iron were placed during the week at 1.72½¢ @ 1.75¢, flat, Chicago, and further orders of the same character are in the market. The situation is unchanged as to prices, ordinary specifications for Common Iron ranging from 1.72½¢ to 1.75¢, half extras, Chicago. Some good orders for Splice Bars have been taken at about 1.85¢, Chicago, and other lots are now under negotiation. Small lots of Common Bars are still selling at 1.90¢ @ 2¢ from store.

Structural Iron.—The most important order placed during the week was the contract for 1200 to 1500 tons of Steel Beams and Girders for the reconstructed Chamber of Commerce Building, which was secured by Jones & Laughlins, and is described in greater detail elsewhere. The contract for building a mile of elevated railway in the city, on the so-called "Alley" route, will

probably be let this week. Mill lots are quoted as follows, f.o.b. Chicago: Angles, 2.15¢; Universal Plates, 2.20¢ @ 2.25¢; Tees, 2.55¢ @ 2.60¢; Beams and Channels, 3.40¢. Small lots from store command the following rates: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—A fair movement is reported in small lots of Plates, but orders for large lots have been lacking. Good orders are in sight, but they are slow to materialize. Quotations from store are firmly maintained as follows: Heavy Sheets, Nos. 10 to 14, 2.60¢ @ 2.70¢; Tank Iron, 2.55¢ @ 2.65¢; Tank Steel, 2.80¢; Shell Iron, 3¢; Shell Steel, 3.25¢; Flange Iron, 4.25¢; Flange Steel, 3.75¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢. Boiler Tubes, 60 % off.

Sheet Iron.—No change worthy of note has occurred in either Black or Galvanized, the demand continuing as active as at any time during the fall, except for Stove Pipe and similar common grades, for which the season is about over. Small lots of Black are quoted at 3.10¢ for No. 24; 3.20¢ for Nos. 25 and 26, and 3.30¢ for No. 27, and of Galvanized at 60 % and 5 % off for Juniata and 60 % and 10 % off for Charcoal.

Merchant Steel.—General business in this line has now been very quiet for two or three weeks, with but little prospect of an early change. Bessemer Bars have been sold at 2¢ from store. Other stock prices are as follows: Tool Steel, 8.50¢ @ 9.50¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢ @ 2.75¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—An increasing inquiry from leading Western roads is imparting a better tone to this branch of trade, and is causing the local manufacturers to take a more cheerful view of the situation. Some heavy contracts are pending, and if contemplated extensions in the Northwest are actually undertaken other heavy purchases will be made. New schemes are coming forward also, but the prospects of business for the Steel Rail mills in that direction are necessarily remote. Prices will be more firmly held in this market hereafter, as Eastern competition is now practically ended by either the filling up of mills or their withdrawal from the Rail trade, and the local companies have about completed an arrangement for the amicable division of business. They still name \$30 as the basis of negotiations.

Old Rails and Wheels.—Consumers of Old Iron Rails are unable to supply themselves at lower rates than those recently quoted. For a lot of 500 tons picked up in the interior of the State, the buyers were obliged to pay \$23. This is equivalent to about \$22 at Chicago, but at that price no Rails can be had here, holders asking \$23.50. Judging from reports received here, the supply seems to be larger at points further east. Old Car-Wheels are at a standstill. Parties are trying to buy a few hundred tons, for which they offer \$19.25, but holders ask \$19.50.

Scrap.—The outlook is considerably better. Carload orders for Wrought are fairly brisk, sales of No. 1 having been made at \$21. Large blocks of Railroad Scrap have been offered, and from \$21.50 to \$21.75 has been realized for No. 1 Wrought, and \$20.75 for Track. City dealers are firmer in their views. Mixed Country Scrap is unchanged at \$14 @ \$15. Dealers' prices for carefully selected Scrap are as follows, per ton of 2000 lb: No. 1 Forge, or Railroad Shop, \$21 @ \$21.75; Truck Scrap, \$20.75; Fishplates, \$22; Horseshoes, \$20; Axles, \$26; No. 1 Mill, \$16; Pipes and Tank, \$13.50;

Light Wrought, \$10; Cast Machinery, \$13.50 @ \$14; Stove Plate, \$11.50; Cast Borings, \$9 @ \$9.50; Wrought Turnings, \$11; Axle Turnings, \$13.50 @ \$14; Coil and Leaf Steel, \$17; Locomotive Tires, \$16.

Hardware.—Jobbers of Shelf Hardware are busier than ever, an immense trade now being conducted. The demand is heavier than it was last year at this time, although it was then far ahead of any previous year. The assortment of goods called for is general in its character, but Staple goods are now moving much more freely than they have been of late. This rush of business will hardly continue very long, however, as the jobbers will soon begin to call in their traveling salesmen to get matters in readiness to take account of stock. Collections are very good. In Heavy Hardware a fair business is reported, but no unusual activity prevails.

Nails.—In Steel Nails the situation has been radically changed since our last report. Manufacturers' agents have taken large orders, and the price has been advanced by most of the factories 12½¢ per keg. The bottom price for large lots now seems to be \$1.87½, Chicago. The jobbers are having a heavy demand from all parts of the West and Northwest, and some of them have taken more carload orders in the past week than for months. To check sales and prevent stocks in retailers' hands from reaching too large proportions, they are advancing prices. For small lots from store \$2 is now asked, and \$1.95 for carload lots on track, but these prices are not expected to hold good more than a few days. The belief is quite general that Steel Nails will be considerably higher before the advance is checked. Small lots of Wire Nails are quoted at \$2.55 @ \$2.60.

Barb Wire.—The demand is growing, and this branch of trade is gradually working into better shape, but the large manufacturers are still making more Barb Wire than they are selling. They anticipate a heavy demand, which may come as suddenly as the demand for Nails sprung up, and when it comes they will be well prepared to meet it with full warehouses. Prices are a little stiffer, but there is no quotable change, small lots of Painted selling at 2.90¢ and Galvanized at 3.60 @ 3.65¢.

Pig Lead.—While very little actual business has been transacted, prices have advanced in sympathy with the upward movement in other markets, and at the close of the week 3.55¢ was bid and 3.60¢ asked.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., December 11, 1888.

Pig Iron.—The market has been very quiet during the past week, and in spots some little weakness has been developed. Taking the market as a whole, however, the feeling may be considered steady to firm, notwithstanding dullness and occasional symptoms of weakness, as already mentioned. Really good brands are held with absolute firmness, while other descriptions are irregular, and in some cases might possibly be had at comparatively low figures if firm offers were made for good sized lots. The trouble is that the brands wanted are so far sold ahead that makers are not desirous of increasing their lines at present quotations, while those that can be had are not such as buyers care to have, unless at a wide disparity in prices. The consequence is that the feeling is firm in one direction, but weak and uncertain in another, so that the trade hardly know what to think of the position. Two or three weeks more of dull-

ness would probably start a decline, but on the present basis of cost it could not be of much importance. On the other hand, a moderately active demand would be likely to absorb all the low-priced lots and place the market in a very firm position for the first quarter of the incoming year. Under these circumstances, there is a degree of hesitancy somewhat unusual, considering the low price of Iron, the high cost of Ores, &c. Moreover, stocks of Iron are light in comparison with the large consumption, and it would not require much increase in the demand, nor much of a falling off in production, to cause quite a scarcity of desirable qualities of Iron. The immediate conditions, however, are not such as to encourage hopes of higher prices, neither are they so discouraging as to warrant expectations of a decline, so that for reasons already given leading makers are no more anxious to sell than consumers are to buy, until some definite idea can be formed as to the volume of business likely to be forthcoming during the early portion of the coming year. On this point there are not sufficient data to warrant very confident predictions, although the general idea is that 1889 will be a year of great activity; the uncertainty is more in regard to the near future than to the ultimate result. This uncertainty curtails business for the present, neither side being willing to make the first move. Prices, therefore, remain same as last week, say \$16 @ \$16.50, at tide, for Gray Forge; \$17 @ \$17.50 for No. 2 Foundry, and \$18 @ \$19 for No. 1. A little beyond the outside figure for choice brands, but nothing of standard quality below the inside quotation.

Blooms.—No change in prices, demand fair at about the following quotations, according to analysis, &c., say—Steel Nail Slabs, \$28.50 @ \$29, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 $\frac{1}{2}$ "bloom" ton of 2464 lb.

Muck Bars.—The demand is lighter than for weeks past and prices are easier all around. Holders ask from \$29, at mill, to \$29.50, delivered, but buyers show no disposition to take hold at present, unless in small lots for immediate use.

Bar Iron.—The market is quiet and irregular, with no chance of getting business unless at low prices. This, of course, may be only temporary, but, in the meantime, if one mill refuses an order because of the low price the chances are that others will take it sooner than miss the opportunity of work to start the new year with. Consequently 1.75¢ @ 1.8¢ are the usual quotations on lots of 100 tons and upward, although nominal rates are 1.85¢ @ 1.90¢ for Best Refined Iron. As a rule, a fair amount of business of this kind has been secured, so that if the demand should pick up again it might not be a matter of much difficulty to stiffen prices to 1.80¢ or 1.85¢ as a minimum. Skelp Iron is quiet, with sellers at from 1.9¢ to 1.95, but there is no demand of any amount, so that quotations are merely the asking prices.

Plate and Tank Iron.—The feeling is a little weaker in this department, sales of Plates having been made to shipbuilders at very low prices. There is an impression, however, that the weakness will not be of long duration, as a great deal of work is in sight for the new year. Meanwhile, some of the mills are still anxious for business, and, to secure orders for round lots, prices would be shaded a trifle for desirable deliveries. Quotations are irregular, but nominally as follows: Ordinary Plate and Tank Iron, 2¢ @ 2.10¢; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and

Ship Plate, 2.25¢ @ 2.3¢; Shell, 2.7¢; Flange, 3¢ @ 3.4¢; Fire-Box, 3.4¢ @ 4.4¢.

Structural Iron.—Business is very quiet, orders for large lots being unusually scarce. The dullness is not likely to be very protracted, however, although orders could be placed to good advantage if they were promptly offered. There is the usual talk of large operations to be undertaken at an early date, but there is more or less uncertainty on this point; hence, increasing weakness in prices, which are nominally as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.3¢ for Beams and Channels, Iron or Steel.

Sheet Iron.—Dull; only small lots called for at quoted rates, which are about as follows for the best makes:

Best Refined, Nos. 26, 27 and 28... 3 $\frac{1}{4}$ @ 3 $\frac{1}{4}$ ¢
Best Refined, Nos. 18 to 25... 3 @ 3 $\frac{1}{4}$ ¢
Common, $\frac{1}{4}$ ¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28... 4 $\frac{1}{4}$ ¢ @ 4 $\frac{1}{4}$ ¢
Best Bloom Sheets, Nos. 22 to 25... 4 @ 4 $\frac{1}{4}$ ¢
Best Bloom Sheets, Nos. 16 to 21... 3 $\frac{1}{4}$ ¢ @ 3 $\frac{1}{4}$ ¢
Blue Annealed... 2.8 @ 3 ¢
Best Bloom, Galvanized, discount... 62 $\frac{1}{2}$ ¢
Common, discount... 67 $\frac{1}{2}$ ¢

Merchant Steel.—There is not much demand, and prices are unchanged, as follows: Tool Steel, 8 $\frac{1}{4}$ ¢; Machinery, 2.6¢; Crucible Spring, 4 $\frac{1}{4}$ ¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Steel Balls.—There is not much business doing at the prices now asked, but makers seem to be firm at \$27.50 @ \$28 at mills. Western mills are said to have taken some large orders within the past few days, but for the present only small orders seem to be within reach of the Eastern mills. Sales for 1889 delivery aggregate about 500,000 tons up to this date.

Old Balls.—There is a fair demand, but any attempt to buy good-sized lots leads to an immediate stiffening in prices, showing that stocks are extremely limited. Sales of small lots have been made at from \$24 to \$24.50, delivered at mill in the interior, and \$23.50 is bid for Philadelphia deliveries, and \$24 @ \$24.50 asked.

Scrap Iron.—The market is steadier and sales have been at about the following quotations: \$21 @ \$21.50 for cargo lots; \$21.50 @ \$22.50 for carload lots, delivered, or for choice \$23; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26. Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought Iron Pipe.—There is a moderate demand, considering the season, and prices are fairly steady, although there is more or less irregularity in the case of large orders. Discounts nominally as follows: Black Butt-Welded, 52 $\frac{1}{2}$ ¢; Galvanized do., 42 $\frac{1}{2}$ ¢; Black Lap-Welded, 62 $\frac{1}{2}$ ¢; Galvanized do., 52 $\frac{1}{2}$ ¢; Boiler Tubes, 60 ¢.

Nails.—There is no change to notice in this line. Store prices are \$1.90 @ \$2, but carload lots of some brands are offered at \$1.80 @ \$1.85, and, although they are not such Nails as people want, they have a very demoralizing effect on the market.

Louisville.

LOUISVILLE, KY., December 10, 1888.

Pig Iron.—The market has been quiet during the week, with but few sales to report, and those for small quantities. Buyers are not willing to purchase freely until the close of the year. Advices from our customers, however, are to the effect that they expect to buy in January, and it is thought there will be no decline in the market. There has been no change in prices during the last week, and sales have been made at about the prices quoted

heretofore. Unless something unusual interferes it is thought January will bring buyers at present prices, and the tendency will be to steady the market and probably advance it. All grades of Iron can be obtained, and the scarcity of Softeners is no longer felt, as this grade of Iron is offered in considerable quantities. There is a growing demand in this section for Bessemer Iron, but Car-Wheel grades are rather quiet. We quote as follows:

Southern Coke, No. 1 Foundry, new classification... \$16.50 @ \$17.00
Southern Coke, No. 2 Foundry, new classification... 16.00 @ 16.50
Southern Coke, No. 3 Foundry, new classification... 15.50 @ 16.00
Gray Forge... 15.00 @ 15.50
White and Mottled, different grades... 14.00 @ 14.50
Silver Gray, different grades... 15.50 @ 16.50
Southern Charcoal, No. 1 Foundry... 17.75 @ 18.25
" " No. 1 Mill... 16.00 @ 17.00
Southern Car-Wheel, standard brands... 22.75 @ 23.75
Southern Car-Wheel, other brands... 19.00 @ 21.00
Hanging Rock Coke, No. 1 Foundry... 17.00 @ 17.50
Hanging Rock Charcoal, No. 1 Foundry... 20.75 @ 22.00
Hanging Rock, Cold Blast... 22.00 @ 25.00
Hanging Rock, Warm Blast... 19.00 @ 20.00

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. }
CINCINNATI, December 10, 1888. }

Pig Iron.—The feature of special prominence in the local market during the week has been the urgent demand for Car-Wheel Iron reflecting the large orders placed for new cars by some of the largest railroad companies in the country. The standard brands of Car-Wheel are reported to be sold well up, and of the other grades much difficulty is experienced in obtaining the numbers desired. A few round lots of Forge Iron are reported to have been sold in St. Louis by Cincinnati firms during the past few days, but in the aggregate there probably has been less doing. Many large buyers have already contracted for necessities for several months ahead, and the others disposed to await the turn of the year, while small buyers are not taking hold with the avidity which sellers anticipated. Although consumption is large, production is steadily increasing. Prices of most all kinds are well sustained, and a steady but quiet market is foreshadowed until after the holidays.

Manufactured Iron.—There is a moderate degree of activity at present, and orders for some time ahead are booked on the basis of old quotations, and, although there is a feeling of confidence and a spirit of firmness, it does not appear likely to result in any change of prices in the near future.

Old Material.—There has been some demand, and a firmer market for Old Rails, with sales in several hundred ton lots at \$23.50 $\frac{1}{2}$ ton, spot cash. Old Wheels have remained quiet, but steady, at \$19, spot.

Nails.—There has been a fair demand, but the market has been more freely supplied and prices have been barely sustained.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, December 10, 1888.

Pig Iron.—It is being claimed by some that the demand has fallen off to some extent during the past two or three weeks. This may be so, to some extent, which can be readily accounted for, from the fact that it being near the close of the year when all manufacturing concerns desire to put their stock and accounts in the most tangible shape, to enable them to ascertain their financial condition as near as possible at the close of the year; yet it is a fact that prices have been fully maintained, and there are no evidences of weakness as yet in sight. It may have been true, perhaps, that a very few holders have sold at a slight concession, but they are exceptions if they have occurred. The better way to judge of the true condition of the market is to refer to actual sales that have been made from time to time during the past two weeks. In this time several round lots of No. 1 Foundry have been sold to go East, netting the furnaces \$14.25, less 2½ % commissions. These sales aggregate 9500 tons, deliveries to run monthly to April 1. These sales were made for cash on delivery, but the cash is seldom realized under 30 to 40 days from date of shipment. We also note a sale of 2000 tons No. 3, at \$13, four months, at furnace bank, deliveries to run till May 1. Inquiries for spot cash Iron in 100 and 200 ton lots, free of commission, and immediate delivery, f.o.b., elicit from the Birmingham district the following quotations: No. 1 Foundry, \$13.50; No. 2, \$12.25; Open Bright, \$12.75; Gray Forge, \$12.

Bar Iron.—All the Southern mills are running to their full capacity, with about three months' orders ahead, at 1.80¢ rate in carload lots. One of the mills recently sold 2500 tons on private terms.

General business is good, and all the manufacturers are running full.

Cleveland.

CLEVELAND, December 10, 1888.

Iron Ore.—With the last cargoes of Ore for the season now being unloaded at lower lake ports buyers are turning their attention to 1889, and are speculating upon possible changes in lake freights and Ore quotations. It is now believed that the question of transportation rates will be settled by January 15th, and it would not be surprising if an active buying movement set in at that time. As nearly as can now be estimated the amount of unsold Ore on the docks at Cleveland, Fairport, Ashtabula, Toledo, Sandusky, Huron, Lorain, Erie and Buffalo amounts to 170,000 tons, as against 750,000 tons at the close of last season. The total amount of Ore received at these ports during the past season slightly exceeds 3,800,000 tons, as against 3,440,000 tons in 1887, 2,270,500 tons in 1886 and 1,500,000 tons in 1885. The shipments to the furnaces from the ports above named during the season aggregate 2,650,000 tons, leaving about 1,825,000 tons of Ore on the docks at the present time, 91 per cent. of which is sold. Buffalo seems to be increasing in importance as a shipping point for Ore, the receipts at that port for the past season being 240,000 tons, as against 28,000 tons last year. Several furnacemen are now negotiating for all-rail shipments of Ore during the winter months, and sales under this arrangement will be effected within a few days. Buyers are already asking for prices on the odds and ends comprising the 170,000 tons of unsold Ore on the docks.

Pig Iron.—The market is just now passing through the quiet period always experienced at the close of the year.

Orders in any considerable quantity are not looked for before the middle of January. The prices to be paid for next season's Ore will probably have been determined by that time, and any necessary alterations in Pig Iron quotations can then be made. The consumption of Iron continues at an almost unprecedented rate, and there is no thought of taking any of the furnaces that are fit for work out of blast. The quiet tone now prevailing is accounted for by the fact that buyers do not usually want any unnecessary stocks on hand when the annual inventory is taken. It is said that \$15.90, cash was paid during the week for 900 tons of Gray Forge at the furnaces, scattering sales of Mill Iron at about \$16.50 @ \$17, cash. The reported effort of millmen to force down prices is offset by the fact that the furnacemen have not only not accumulated stocks, but are quite unable to fill their orders. The following are cash quotations:

Nos. 1 to 6 Lake Superior Char-	
coal.....	\$20.50 @ \$21.50
No. 1 Strong Foundry, Bessemer	
quality, ½ ton.....	18.20 @ 19.00
No. 1 Strong Foundry, ½ ton.....	18.00 @ 18.50
No. 2 Strong Foundry, ½ ton.....	17.00 @ 17.50
No. 1 American Scotch, ½ ton.....	18.25 @ 18.70
No. 2 American Scotch, ½ ton.....	17.20 @ 17.70
No. 1 Soft Silvery, ½ ton.....	18.50 @ 19.00
Mahoning and Shenango Valley	
Neutral Mill Irons, ½ ton.....	16.00 @ 16.50
Mahoning and Shenango Valley	
Red Short Mills, ½ ton.....	17.00 @ 17.50

Scrap Iron.—Old American Rails are again held at \$25, with a few small orders reported. No. 1 Wrought also commands high figures.

Manufactured Iron.—Small lots of Common Bar are bringing 1.70¢, with the demand far in excess of the supply. The Sheet-Iron market is very firm, No. 27 being held at \$3 and other numbers correspondingly high.

Nails.—There is no change in the Nail market. Common Iron Nails are again selling freely at \$1.90, and Steel at \$1.95.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, December 10, 1888.

The general Iron situation has developed nothing of importance during the past week, but the mills and furnaces generally still have about all they can do in working up old contracts. As a great many jobbers, and consumers as well, make it a point to close the year with as little stock as possible the outlook for the coming year is very generally regarded as favorable. It is expected that there will be more miles of railroads built in 1889 than ever before, and that the consumption of Pig Iron will exceed that of any former year. A cargo of 1300 tons of Southern Pig Iron arrived here from the Cumberland River furnaces the past week, and additional shipments, it is said, will be made. It is brought here all the way by river, in barges, and the freight, it is evident, is very low. The distance is about 1200 miles, and it is probable the cost of transportation did not exceed a couple of dollars per ton. There is talk here of organizing a barge line for the transportation of Iron Ore and Pig Iron from Missouri, Alabama and Tennessee to this port, and they could be loaded back with Steel Rails, Coke, Coal, &c. Large shipments of Rails have been made from here to the South for some years past by river, the rate being much less than by rail, and shipments in not a few instances are delivered as quickly by river as by rail.

Pig Iron.—There has been no important change in the situation since our last report; business continues light, as it usually is at this time, and it is not likely that there will be any improvement until after the new year, as consumers generally will make it a point to close the old one

with as little stock as possible. It is customary with a good many furnacemen to make contracts in January for Ore; some of them may contract for a year's supply, but the probability is that there will not be the same disposition to contract so far ahead unless the price is reduced considerably below what the Ore companies are now expecting to realize. In regard to Pig Iron, there is no indication of any falling off in the consumption; on the contrary, there is a possibility that the requirements of this district in 1889 will exceed those of 1888; but be this as it may, it is generally conceded that Ores have been higher this year relatively than Pig Iron, and furnacemen want cheaper Ore or a higher price for Pig Iron, and of the two they think the latter the most preferable. Prices remain unchanged as compared with those of a week ago, as follows:

Neutral Gray Forge.....	\$15.75 @ \$16.25, cash.
All Ore Mill.....	16.50 @ 16.75, "
White and Mottled.....	15.00 @ 15.50, "
No. 1 Foundry.....	17.75 @ 18.00, "
No. 2 Foundry.....	17.00 @ 17.25, "
No. 1 Charcoal Foundry.....	23.50 @ 24.00, "
No. 2 Charcoal Foundry.....	21.00 @ 21.50, "
Cold Blast Charcoal.....	25.00 @ 27.00, "
Bessemer Iron.....	17.25 @ 17.50, "

Included in the sales reported was a lot of 1000 tons Bessemer at \$17.25, cash, at which it is now freely offered.

Muck Bar.—There is less inquiry, and the market is easier, although prices remain unchanged at \$29 @ \$29.50, cash; while there was a sale of 500 tons reported at the outside quotation, \$29.50, most of the trade receive it as an outside price.

Manufactured Iron.—While there is not much new business just now, mills generally are pretty well employed in working up former contracts. Prices without quotable change, although they are not as well supported as they were a month or so ago. We continue to quote Bars at 1.80¢ @ 1.85¢; Plate, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢; Skelp, 1.85¢ @ 1.90¢ for Grooved, and 2.10¢ @ 2.15¢ for Sheared, all 60 days, 2¢ off for cash. There is but little demand for Skelp Iron.

Nails.—There is no change in the situation here; Pittsburgh manufacturers are still holding out for card rates and refusing to sell for less, but they are not making sales. Wheeling is said to have stiffened, but manufacturers there are still below the card, and, as a matter of course, buyers will not pay full card rates as long as they can buy for less.

Wrought-Iron Pipe.—The demand continues to fall off, and, as competition is more active, prices are being cut to such an extent that it is difficult to give reliable quotations.

Old Rails.—There is less doing, but prices are still maintained; we continue to quote at \$25 @ \$25.25, cash, for American Tees, with a small sale reported at \$25.10.

Steel Rails.—While manufacturers still quote at \$28, cash, at mill, it is claimed that orders for delivery in the North and Southwest have been accepted at prices considerably below the one quoted. Competition is active, and for desirable orders prices are being cut very close. The syndicate does not touch prices, its chief object being to regulate production.

Billets, &c.—Bessemer Steel Billets are weaker and are now quoted at \$28.50, and Nail Slabs at \$28. Some of the works are busy making Steel Ship Plates. Domestic Bloom and Rail Ends are quoted at \$19 @ \$19.50. Mills generally are pretty well employed and likely to be for some time to come.

Merchant Steel.—There is a fair business at unchanged prices. Best brands Tool Steel, 8½¢; Crucible Spring Steel, 4½¢; Crucible Machinery, 5¢; Open-Hearth Machinery, 2½¢.

Railway Track Supplies.—Spikes are quoted at \$2.15 for 30 days, but sales are reported below the price quoted. Splice Bars \$1.85¢ @ \$1.90, cash, f.o.b. Pittsburgh, and Track Bolts at 2.85¢ with square and 2.95¢ with hexagon Nuts.

Old Material.—The demand continues rather light, but prices are maintained. No. 1 Wrought Scrap, \$21 net ton; Wrought Turnings, \$13 @ \$14; Car Axles, \$25.50 @ \$26.50; Cast Scrap, \$15.50 @ \$16, gross; Cast Borings, \$12 @ \$13; Car-Wheels, \$19.50 @ \$20; short pieces Old Steel Rails, \$18.50 @ \$18.75; long lengths ditto, \$20.50 @ \$20.75.

Detroit.

WILLIAM F. JARVIS & Co., under date of December 10, report as follows: The market remains in about the same condition as a week ago. A few round lots have been placed at full prices, but the majority of orders received were for small amounts and prompt delivery. Southern Gray Forge is at present most in demand. With a fairly active market we quote as follows:

Lake Superior Charcoal, all numbers	\$20.00 @ \$20.50
Lake Superior Coke, all ore	19.75 @ 20.25
Lake Superior Coke, cinder mixed	18.00 @ 18.50
Standard Ohio Black Band	19.75 @ 20.25
Southern No. 1	17.75 @ 18.25
Southern Gray Forge	16.25 @ 16.75
Southern Silvery	17.00 @ 17.50
Jackson County (Ohio) Silvery	18.50 @ 19.00
Old Wheels	20.00 @ 21.00

New York.

Office of *The Iron Age*, 66 and 68 Duane street.
New York, December 12, 1888.

Business in many departments of the Iron and Steel trades has drifted into a very unsatisfactory condition. Importers are doing practically nothing, and in the lines in which home products have exclusive sway the developments of the past few weeks have led to sharp disappointment. Steel Rails, it is true, have recovered somewhat from their lowest position, but the situation is not without its element of danger. But it is particularly in manufactured Steel in which demoralization is greatest. Plates and Structural Shapes, with the exception of Beams, have been sharply cut, and Merchant Steel has dropped considerably in price. With all this raw material, Pig Iron and Old Material have held their own exceedingly well in spite of an unprecedented production. The outlook for Ore points to higher values, and Coke seems certain to rise in the near future close to \$1.50 point at ovens in Connellsville. One feature in the situation is that the low prices alluded to have come almost exclusively from one quarter. Great as the capacity of the group of concerns alluded to is their withdrawal, imminent at any time, from the aggressive attitude taken may easily cause a rebound to more remunerative figures.

Foundry Pig.—The local market is quiet, and as yet the leading company have made no announcement of their intentions beyond the intimation that prices will not be higher. We hear that furnaces in the Chattanooga district have booked considerable orders for delivery in this market and New England, one furnace alone selling about 12,000 tons principally for delivery during the first three and six months, at \$18 and \$17 for No. 1 and No. 2. The principal carrier of Southern Iron has been urged to build two additional steamers, and a good deal was expected from these increased facilities. We understand, however, through a good source, that for the present this is not to be done. The greater part of the stock of off-grade Iron accumulated at one of the furnaces in this vicinity has been disposed of, chiefly to Pipe foundries, at \$13 and upward, at furnace. We continue to quote Standard

to Choice No. 1, \$18 @ \$19.50; No. 2, \$17 @ \$17.50, and Gray Forge nominally \$16 @ \$16.50.

Scotch Pig.—We quote Coltness, \$21, nominally; Shotts, \$20.25 @ \$20.75; Langloan, \$20.25 @ \$20.75, and Dalmeilington, \$19.50 @ \$19.75.

Spiegeleisen.—We quote nominally, in the absence of business, \$27 for 20 % Spiegeleisen, and \$54 for 80 % Ferromanganese.

Plates.—During the week a leading Western mill has taken the contract for the Government vessel at an upset price of 2½¢ a pound, this, including Boiler as well as Ship Plates, subject to the rigid Government inspection and long credit. The same concern has secured the Plates for four vessels to be built by Roach, the quantity involved being about 3000 tons. The market has been weak, with concessions being liberally made, and business being sought even by large mills, with small buyers. We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3½¢ @ 4¢.

Structural Iron.—The market continues weak on everything, except Beams. It is rumored that a contract for 12,000 tons of elevated work for Brooklyn, the business, however, not going to the two mills which have till now taken the bulk of that class of work in that quarter. We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2¢ @ 2.10¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢ on dock for all sizes. Foreign Beams are quoted 2.55¢ @ 2.75¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common; 1.7¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢, and Refined, 1.8¢ @ 2¢.

Merchant Steel.—The market has been completely demoralized by the withdrawal already alluded to of a leading mill from the association. Spring Steel, cut to lengths, has been sold in moderate lots, delivered in this State at 2.25¢, six months flat. The bulk of the Sleigh Shoe contracts for the season were placed before the decline, as well as a great many lots of Tire Steel. Considerable of this business is being readjusted. Steel Shafting has sold at 2¢, delivered in New England, including odd sizes.

Steel Rails.—The situation is not quite clear yet. Eastern mills' sales have been made, aggregating about 8000 tons, the greater part at private terms. Evidence is adduced to show that \$28 is being underbid, and there is good reason to believe that \$27.50 has been done, while the assertion has been made that \$27 would not be rejected. In the West there have been a number of large sales, details of which are withheld. But the market there is still irregular. New quotations of \$26.50 at Pittsburgh have been made, and it is reported on good authority that buyers have been given to understand, in more than one case, by one Western mill that any quotations made in certain territory will be met. Among the contracts known to have been placed are a lot of over 20,000 tons to a Northwestern road, and a lot of 7000 tons to a Kentucky road, and a like amount to a Colorado road. It is certain, however, that for the present at least the low figures quoted some time since, say, \$25 in the West and \$26 in the East, are not being made. There has, therefore, been a clear advance of \$1 @ \$2.50 per ton, according to locality, and a further rise is not improbable.

Old Rails.—No sales of any consequence are reported, the demand and the supply both being light. We quote \$23.25 @ \$23.50 for Tees.

Wire Rods.—The market is dull, with moderate sales of Basic at \$39, and Acid offered at \$38, ex-ship.

Warren, Wood & Co., 115 Broadway, are introducing the Melrose brand made by the Citico Furnace, Chattanooga, to compete with imported Scotch. They submit the following comparative analyses:

	Melrose.	Langloan.	Carnbroe.	Williamson.
Silicon....	1.28	1.23	2.93	2.18
Phosphorus...	0.81	0.73	1.12	0.85
Sulphur....	0.03	0.02	0.03	0.07
Carbon....	3.88	4.13	3.63	3.46

Changes have taken place in the firm of A. R. Whitney & Co., of this city.

Financial.

General business is expanding in steady volume, and in local trade reports are at least fairly good. The total clearing house exchanges of all the principal cities show an increase of 18 % compared with last year. In New York the increase is 16.8 %, and outside of New York 33 %. At nearly all manufacturing points the improvement is decided. All along the northern lakes and at the Northwest the gain is not less noticeable. At New Orleans and Memphis there is a heavy movement in cotton and the sugar crop is being marketed rapidly. The stimulus in railway transportation arises from important arrangements relative to freight tariffs, the attempt at readjustment having made good progress. A Chicago dispatch says the action of the Central Traffic Association in ordering a restoration of east bound freight rates December 17 to the basis of 25 cents on grain and flour and 30 cents on provisions, from Chicago to New York, has stimulated shipments to an extraordinary extent.

The aggregate for the week was 93,391 tons, against 61,361 tons for the previous week. This, with one exception, is the heaviest week's business in the history of the roads. Corn shipments were particularly heavy. In unison with the above and in accordance with previously received instructions, the Eastern agents of all Southwestern railroads on Saturday put into effect a practical advance from previous rates of 20 to 40 %. The advance makes first-class freight \$2.68; second class, \$2.12; third, \$1.78; fourth, \$1.48; fifth, \$1.23; sixth, \$1.19; seventh, \$1.04. But it is estimated that these figures are not strictly adhered to. President Depew, speaking for the trunk lines, is quoted as saying: "We are entirely harmonious, and East and West, matters were never in better condition." Nevertheless, the railroad situation is considered complicated, and there are misgivings respecting the permanency of anything that is done. The reassembling of Congress had little effect.

The Stock Exchange markets became almost buoyant when Missouri Pacific decided to advance rates to a paying basis, regardless of what the other roads might do, and on Friday it was announced that a full restoration of west-bound rates had been made. The result was that at Saturday's closing prices nearly the whole of the decline of the 10 days previous had been recovered. For the first time in years Rock Island went below par, touching 97½. A settlement of the Oregon Navigation difficulties was reached by the Union Pacific and Northern Pacific, and these properties closed strong. An unfavorable bank statement and news that at least \$1,000,000 was engaged for export caused general weakness. Lower prices in London, caused by reports of a proposed advance by the Bank of England established lower values on Monday. On Tuesday the movement was irregularly

downward with New England weakest, but in the final dealings there was a rally.

United States bonds are quoted as follows:

U. S. 4½s, 1891, registered.....	108
U. S. 4½s, 1891, coupon.....	108
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	128½
U. S. currency 6s.....	113

The total amount of bonds purchased to date, under the circular of April 17, is \$99,024,050, of which \$51,396,650 were 4% and \$47,627,400 were 4½%. The cost of these bonds was \$117,450,457, of which \$66,010,877 was paid for the 4% and \$51,439,579 was paid for the 4½%. Maurice L. Muhleman succeeds William Sherer as cashier of the Sub-Treasury in New York City.

The weekly statement of the New York City Associated Banks issued on Saturday showed a loss in surplus reserve of \$2,872,725. The banks now hold \$7,203,825 in excess of legal requirement. The changes in the averages show a decrease in loans of \$2,314,700, a decrease in specie of \$4,449,900, an increase in legal tenders of \$428,300, a decrease in deposits of \$4,595,500, and a decrease in circulation of \$240,900. Money is rather more active, and for time loans there is a fair demand, which is met chiefly by trust companies and out-of-town institutions. Rates on good collaterals are 4% for four months or less and 4½% for longer dates. Commercial paper is offering more freely, and rates are 4½% @ 5% for 60 @ 90 days. The posted rates for bankers' sterling are \$4.85 @ \$4.85½ for 60-day and \$4.89 for sight. The market is strong and occasions some apprehensions that there may be a loss of specie, which would be ill timed with reference to the annual settlements.

The wheat market is unsettled and dull at the close. Corn dropped 1½¢. Cotton is firm at about 9½¢ for spot. In coffee there is a slump, caused by favorable accounts from Brazil. Sugars are steady but dull. The Hawaiian sugar crop promises to be the largest crop ever gathered, reaching fully 120,000 tons, as compared with 110,000 tons for the past season. In provisions there was a break, caused by a raid in Chicago. Dry goods jobbers report a good inquiry for anything that could be shipped before the 17th inst., when advanced freight rates take effect. In the grocery trade orders from the South are becoming more important, but all sales are on a closer margin.

The imports of merchandise at this port during the week were \$8,553,659, of which amount \$1,676,000 represents dry goods. Since January 1 the total is \$436,314,000, against \$440,952,000 for the same time last year. The total of merchandise landed here last month was \$32,877,955, against \$38,300,880 for November of last year. The exports for the month are a disappointment, the total, exclusive of specie, being \$25,446,574, which is one and a half millions below the corresponding total of last year and over \$3,000,000 less than the same return for 1886. Since January 1 the total exports from New York, exclusive of specie, were \$271,009,000, as compared with \$288,976,000 for 11 months in 1887. For two months the trade of the entire country shows an adverse balance of \$55,000,000.

Metal Market.

Copper.—London has remained unaltered during the entire week so far as Chili Bars are concerned, which remain £77. 10/, spot, and £78, futures, good merchantable brands improving 10/ @ £78, and Best Selected giving way to £80. 10. Sales have not exceeded 75 tons. Since the pool sale, alluded to in our last report, our own market has exhibited the same listless feeling and inactivity; what

little transpired has been at 17.25¢ to 17.30¢ for Lake, and 16½¢ for Casting brands. The Anaconda's contract with the syndicate expiring with the current year, it was at first reported that the mine had now already shut down and was to receive \$300,000 monthly for doing nothing till the end of next year, 4¢ per lb profit having been secured it on a fixed estimated output for remaining idle. This was contradicted from Butte City; it was stated that the mine had shut down temporarily, owing to a strike, and resumed work since, the said strike being at an end. There is an impression, however, that some such arrangement has either been concluded or is still in course of negotiation, and that the statement made had merely leaked out prematurely. The fire in the Calumet and Hecla Mine is said to be diminishing, and that it is believed it will soon be under control; at any rate, not much importance as affecting production seems to attach to it at present. Financial matters at Paris, including Copper shares, begin to look very blue, the Panama Company being in desperate straits, with the shares down from 500, where they formerly stood, to 145, and not a franc to be got except through a Government guarantee, which there is considerable hesitation about. For if France, as a maritime power, is to assume the work of the canal, which it would drift into by any guarantee given, it is to be presumed the Monroe doctrine would prevent the United States from remaining a passive looker-on, and such an eventuality the present weak Government of France is seemingly not prepared to run the risk of. If the Panama Canal Company, is on the other hand, allowed to go to pieces French capitalists, large and small, will have to face a dead loss of 1,000,000,000 francs to begin with, and a financial and political crisis is unavoidable, which could hardly fail to affect the Société des Métaux in its financial arrangements, present and prospective. The export of American Copper the first ten months has been 28,773,591 lb, against 10,552,893 in 1887. Spain exported during the first eight months 569,682 tons of Pyrites, against 535,645 last year and 476,163 in 1886, and 18,448 tons of Precipitate, against 18,519 and 17,781.

Tin.—A decline took place in the London market since our last report from £99. 5/, spot, Straits, to £98. 5/, and futures from £99. 15/ to £98. 15/. Sales, 990 tons. Here the market has been irregular, winding up tamely at 21½¢ @ 22¢, spot and December, and 21.65¢ @ 22.15¢, January, while in a jobbing way the price is nominally 22½¢ @ 22½¢ at the close. The import of Tin into the United States the first 10 months has been 27,600,261 lb, against 25,169,673 lb same time last year, while there were re-exported respectively, 118,150 lb and 109,425 lb. **Tin Plates.**—There has only been a moderate demand during the week at a shade lower prices, especially in futures, which are influenced by the decline in Pig Tin. Some orders have been entered in Wales at lower prices, but the bulk of orders are still pending. We quote at the close, large lines, 9 box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; ditto, Coke Finish, \$4.65 @ \$4.70; Terns, \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30; and Wasters, \$4.12½ @ \$4.15. Cokes are 13/ in Liverpool. The imports into the United States during the first ten months have been 577,556,721 lb, against 545,428,369 same time last year, and the re-export 763,626 lb, against 1,038,462.

Lead.—Has been dull and featureless, sales on the spot being restricted to 200 to 300 tons Common Domestic at 3.75¢ @ 3.80¢, for the most part at the outside figures, the closing quotation also being 3.75¢ @ 3.80¢. At St. Louis the market

is flat at 3.50¢ @ 3.55¢, and at Chicago at 3.50¢ @ 3.60¢. The English market is weak in consequence of bullion from the New World and Australia arriving there more copiously; the London quotation is £12. 15/, Soft Spanish, and £13, English Pig. Spanish exportation during the first eight months has been 88,962 tons, against last year 88,048 tons and 75,126 in 1886.

Spelter.—Only a moderate demand has prevailed on the spot, which has been filled without difficulty at 5¢ @ 5½¢ for Common Domestic, while Silesian cannot be quoted any better than 6¢, nominally, the London quotation being £18. 10/. The Spelter Committee on the Metal Exchange has revised the list of brands desirable on contract by eliminating objectionable ones. The export of Calamine from Spain during the first eight months has been 22,325 tons, against 19,917 tons same time last year and 20,335 in 1886.

Antimony.—Has continued quite active, while the available supply is reduced to a minimum. London cables Hallett higher, £44. 10/ @ £45, and here the same may be quoted 10½¢ @ 11¢; Cookson, 12½¢ @ 13¢.

New York Metal Exchange.

The following sales are reported:

THURSDAY, December 6.	
10 tons Tin, February.....	21.75¢
10 tons Tin, February.....	21.65¢
FRIDAY, December 7.

TUESDAY, December 11.	
16 tons Lead, April.....	3.85¢
16 tons Lead, April.....	3.90¢

Coal Market.

The Anthracite Coal trade is very dull, and stocks at shipping ports are accumulating, with the effect of softening prices. Even the hard Lehigh fancy brands are in liberal supply, contrary to the usual conditions. Coal men impatiently await the advent of winter weather. Production at the mines, as reported for the week ending December 8, reflects more decidedly the policy of restriction now in force, with the design of imparting steadiness to the market. The total from the three regions is 708,684 tons, a decrease of 72,000 tons compared with the previous week, and 123,000 less than for the week ended a fortnight ago. For the first time this year the total is less than for the corresponding week in 1887. Since January 1 the aggregate is 36,212,747 tons, against 32,816,717 for the same time last year. It is noticed that the shut-down shows conspicuously in Lehigh Valley. A Philadelphia report says: Individual operators in the Wilkesbarre region have been offering all sizes of Coal in that market at a cut of from 15¢ to 20¢ per ton, shipments Westward via the great lakes having been suspended since the close of navigation. Shipments to tidewater via the canals have also about closed. Navigation on the Lehigh Canal has stopped for the season. The Schuylkill Canal will close on the 15th inst., and the Delaware and Raritan Canal on the 20th, unless closed by ice at an earlier date. Freight from New York to Boston are quoted at \$1.05 @ \$1.25.

Bituminous Coal remains unchanged, and in liberal supply.

The accounts of the shipments of Anthracite Coal over the Reading Railroad for the fiscal year ending November 30 show an aggregate of 7,350,320 tons, against 7,493,801 tons in the fiscal year of 1887.

The Jersey Central, Lehigh Navigation and Reading Railroad companies secured

control of the Lehigh and Hudson River Railroad at the annual election of that company. The new route by the Poughkeepsie bridge will connect the Pennsylvania Coal field more closely with the East.

Several of the big Coal roads propose forming a Coal route through Rochester to Lake Ontario at Charlotte.

The hearing of the E. B. Coxe Lehigh Valley Railroad case by the Interstate Commerce Commission has been postponed until January 25.

Buffalo received by the Erie Canal during the season just closed 298,948,492 lb of Anthracite, against 118,877,035 lb in 1887. The amount of Coal passing through the Sault Ste. Marie Canal this season was 2,135,041 tons, as against 1,352,987 tons last season.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from December 1 to December 6, inclusive, and from January 1 to December 6, inclusive, were as follows:

Iron and Steel.

	Dec. 1. to Dec. 6. Tons.	Jan. 1 to Dec. 6. Tons.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Dec. 12, 1888.

The Block-Tin market has reacted sharply from last week's decline, under the influence of purchases by operators who oversold and found it necessary to cover, in view of the small stocks here. The course of the market has led to a more or less general belief that a revival of speculative demand would bring about a considerable advance. The high rates for money check outside speculation, however, and now that the "short" interest is well covered up prices have shown a tendency to decline again.

Copper speculation has been spiritless, and the syndicate agents are the only buyers who manifest the slightest confidence in the market. Outside "short" selling, as well as buying, is on a very limited scale, and the purchases by consumers are diminishing rather than improving. Standing orders given by the syndicate to

buy prompts at £77. 10 and futures at £78 serve to sustain the market. It is the fact, however, that while the prices of Bars are maintained, the market for manufactured Copper is in poor shape. Sales have been made at £4 under prices fixed by the syndicate, and even at that concession the volume of business is unsatisfactory.

Tin Plate business has been moderate and at somewhat variable prices. Very little change is apparent in the rates for prompt deliveries, but orders have been taken for January and February at a decline from previous prices. The production continues to be on a large scale, and the report has circulation that two more new works have been projected. The exports to the United States last month were 24,000 tons, or about the same as those of October. The total for the past 11 months is about 270,600 tons, against 252,500 tons for the corresponding period last year.

Pig-Iron warrants have declined a trifle under the influence of realizations caused mainly by the high rates current for money. Additional furnaces are blowing out because of difficulties as to fuel, &c., and that fact operates in a measure to offset the unfavorable influences. The demand for consumption and export, however, is not very brisk at the moment. Makers' brands of Scotch are held firmly, as is also Middlesboro' Pig, while Hematites have ruled strong on continued active demand from consumers. The exports of Pig Iron to the United States last month were 14,000 tons, making a total of 138,000 tons since January 1, against 375,000 tons for the corresponding period last year.

The Finished Steel and Iron departments continue active to a degree that is much in contrast with the customary experience at this period of the year. Nearly all works in the various sections have liberal orders in hand and old plant is being brought into use. The large capacity, however, leads to competition that prevents prices from advancing a great deal. Among important contracts placed the past week were 14,000 tons Steel Rails with the Ebbwvale Company and a similar quantity with the Cockerill Company. Prices for Rails are fully 1/3 higher than a week ago, so fully are the mills employed, but Billets and Slabs could doubtless be bought at some concession on the nominal prices. Manufacturers are offering Wire Rods at 5/ decline from the prices they have asked previously this month.

The demand for Old Iron Rails, Scrap Iron, &c., has fallen off somewhat and prices for the same are scarcely as firm as they were a week or ten days ago.

Scotch Pig.—There has been a fair business and prices for all branches are firm. Glasgow freights are a trifle lower.

No. 1 Coitness, f.o.b. Glasgow.....	50/6
No. 1 Summerlee, ".....	50/6
No. 1 Gartsherrie, ".....	48/6
No. 1 Langloan, ".....	50/6
No. 1 Carnbroe, ".....	44/6
No. 1 Shotts, " at Leith.....	49/6
No. 1 Glengarnock, " Ardrossan.....	48/6
No. 1 Dalmellington, ".....	42/6
No. 1 Eglinton, ".....	42/6

Steamer freights, Glasgow to New York, 8/; Liverpool to New York, 10/.

Cleveland Pig.—The market has been fairly active and prices are firmer. No. 1 Middlesboro', G. M. B., 36/6; No. 3 do., 34/.

Bessemer Pig.—There has been a large business and sales are reported at 6d rise. West Coast brands, mixed numbers, 45/, f.o.b. shipping point.

Spiegeleisen.—The output is closely taken up and prices remain firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Business continues brisk and the market strong, with prices somewhat higher. English sections quoted at £4, and light sections £4. 2/6 @ £4. 12/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—There is but little doing in these. We quote £3. 18/9 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A good business reported, but at somewhat irregular prices. Bessemer, 2½ x 2½ inch, £4. 1/3, f.o.b. at N. W. England shipping point.

Steel Slabs.—Demand fairly active and prices steady. Bessemer, £3. 18/9, f.o.b. at N. W. England shipping point.

Old Rails.—Trade rather slow at the moment and prices a shade easier. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 7/6 @ £3. 10, c.i.f. New York.

Scrap Iron.—A moderate business and prices barely steady. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—Small sales making at about former prices. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—A fair trade in Cokes for future delivery at variable prices. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade.....	15/3 @ 15/8
IC Bessemer steel, Coke finish.....	@ 13/6
IC Siemens.....	@ 13/3
IC Coke, B. V. grade.....	13/ @ 13/3
Charcoal Terme, Dean grade.....	12/ @ 12/3

Manufactured Iron.—The market remains firm, and business is still of good volume. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars.	@ 8 2 6
Common.....	@ 5 10 0
Staff. Bl'k Sheet, singles.....	@ 7 10 0
Welsh Bars (f.o.b. Wales).....	5 0 0 @ 5 2 6

Tin.—After advancing on covering of "short" sales the market is dull and rather weak. Straits quoted at £98. 5/ @ £98. 10/, spot, and £98. 15/ @ £99 for three months' futures.

Copper.—Trade slow and prices unchanged, except for Best Selected English. Chili Bars, £77. 10/, spot, and £78 three months' futures. Best Selected, £80.

Lead.—The demand slow and prices rather weaker. Soft Spanish, £12. 15.

Spelter.—Business smaller this week, but prices fairly steady. Silesian, ordinary, £18. 10/.

EAST INDIES

SINGAPORE, December 5, 1888.—**Tin.**—Shipments from the Straits Settlements to the United States during November have amounted to 450 tons, against 50 last year, and to England 1200, against 2250; since January 1 they were respectively 3400, against 4150, and 16,900 against 14,750, making a total during 11 months of 20,300 tons this year, against 18,900 last year, which is an increase of 1400 tons, or about 7 % cent.—*Gillilan, Wood & Co., per cable to their agent, Mr. Charles Nordhaus, 89 Water street, New York.*

MANILA, December 3, 1888.—**Hemp.**—There has been hardly anything done, and the price is nominally \$11.62½ ¢ picul, against \$9.25 same time last year, equaling, cost and freight, ¢ ton £40. 7/6, against £32. 16/6. There cleared for the United States since last cable 7000 bales, against none last year; since January 1 229,000 bales, against 238,000; loading for do., 22,000, against 14,000; cleared for England since January 1 325,000, against 4000; loading for do., 8000, against 4000; cleared for all other ports, 66,000, against 42,000; receipts at all ports since last cable, 8000, against 5000; since January 1, 608,000, against 501,000, and 372,000 in 1886. **Freight,** £7, against \$3.50. **Exchange,** 3/7½, against 3/8.—*Ker & Co., per cable to their agent, Mr. Charles Nordhaus, New York.*

COLOMBO, CEYLON, October 25, 1888.—**Plumbago.**—The market has been quiet during the week at steady rates, the quotations being, in rupees, ¢ ton: Large Lumps, 145 @ 170; Ordinary Lumps, 125 @ 160; Chips, 80 @ 95, and Dust 40 @ 65. Following have been the shipments since October 1: To England, 8806 cwt.; to Hamburg, 851, and to the United States 2380—together, 12,037, against last year 6312; 31,840 in 1886, and 18,152 in 1885. **Coir Yarn.**—Nos. 1 to 4, 7 @ 12 rupees ¢ cwt. **Exchange.**—Six months' sight, 1/5 1-16.—*Volkart Brothers, through John W. Greene, 82 Wall street, New York.*

SPAIN

BILBAO, November 24, 1888.—**Iron Ore.**—Some inquiry has been noticeable, and several transactions have taken place, chiefly in Rubios, at rather irregular and slightly easier figures, the closing quotation for the same being 6/10 @ 7/3, and for good Campanil 8/3 @ 8/6, a few cargoes bringing either above or under these rates. More would have been done but for the scarcity of steamers. As in several Baltic ports navigation has meanwhile closed, greater animation may soon arise from increased tonnage seeking cargo. Total shipments to date sum up 3,264,963 tons, against 3,857,087 last year. **Pig Iron.**—Coastwise some 2056 tons were shipped, and to Ancona, in Italy, 1753.—*Bilbao Maritimo y Comercial.*

BELGIUM.

BRUSSELS, December 1, 1888.—**Iron.**—Our market has been steady; there has been some buying of Pig for account of rolling mills in Luxembourg, supposed to have been at 4 @ 4.2 francs ¢ 100 kg., at the blast furnaces, the former equaling 5.10 francs at the rolling mills. Luxembourg, on the other hand, has not yet recommenced selling Pig Iron at Belgium on a larger scale, except in cases in which stocks had accumulated at the furnaces, there being too good a market for Luxembourg Pig in Germany, where it is paid 4.60 francs at present. The German market is for some time past, however, a most fluctuating one, hence anomalies of the kind will occur. News about the Beam market is of a contradictory nature. It is asserted that a syndicate of makers is on the eve of formation in Northern France to uphold prices in that country, which, if true, would be good for ours who have frequently had to suffer from French competition. Thus not long ago a lot of Beams was sold at 11 francs ¢ 100 kg., free on board, at Antwerp, which would have been the extreme minimum figure in Belgium for Domestic Beams. On the other hand, we are told that the Belgian firm of Halot, Louvain, which quite recently secured the big job of building the La Plata bonded workhouses at Buenos Ayres, has bought 5000 tons Steel Beams of the Rothe Erde German Works superior in quality to ours, the latter making a specialty of the same. The fact is that Steel Beams will bring about a revolution in Belgian industry quite as much as Steel Rails did. In order to confront the crisis our works made large Beams a sort of monopoly, and held their ground; the case alluded to will serve as a hint to them. Still, the superseding of Iron by Steel does not take place in an alarming manner yet; thus we still succeeded in exporting during the first nine months 210,000 tons of Finished Iron, against 80,000 tons Steel, the former showing a slight decrease as compared with last year, and the latter an increase.—*Moniteur des Intérêts Matériels.*

Oliver's oat meal mill, in Chicago, was torn to pieces by a violent explosion on Tuesday morning, and three workmen were killed. Buildings in the vicinity were wrecked. This is the second mill of the kind burned in Chicago recently, and a distillery in that city having been destroyed by dynamite a few days ago, opinions differ respecting the cause of the explosion. Mr. Oliver rejects the meal-dust theory.

The American Institute Fair will close on Saturday evening.

The Charcoal Iron Workers.

Last week the United States Association of Charcoal Iron Workers held its ninth annual meeting in this city, the proceedings being opened with a business session on the 5th inst., after which the members partook of an elaborate dinner on board of the Noordland. Tuesday morning was devoted to a business session, at which the following officers were elected:

President: Irving M. Bean, Milwaukee, Wis.

Vice-Presidents: H. R. Stoughton, Shelby Iron Works, Alabama; Geo. B. Wiestling, Mont Alto, Pa.; J. S. Van Alstyne, Wyandotte, Mich.

Secretary and Treasurer: John Birkinbine, Philadelphia.

Board of Managers: J. D. Potts, Philadelphia; J. C. Fuller, Pine Grove Furnace, Pa.; George M. McCauley, Harrisburg, Pa.; L. Heber Smith, Joanna, Pa.; A. G. Curtin, Jr., Roland, Pa.; R. H. Lee, Lewistown, Pa.; John Birkinbine, Philadelphia; Percy Warner, Warner, Tenn.; Dr. H. M. Pierce, Nashville, Tenn.; Chas. H. Brown, Knoxville, Tenn.; W. H. Rood, Ishpeming, Mich.; J. A. Mathieu, Detroit, Mich.; H. H. Noble, Elk Rapids, Mich.; F. P. Miles, Copake Iron Works, N. Y.; M. Lyman, Waverly, N. Y.; Walter Crafts, Columbia, Ohio; W. N. McGugin, Olive Furnace, Ohio; E. S. Noble, Anniston, Ala.; Willard Warner, Nashville, Tenn.; H. A. Crawford, St. Louis, Mo.; W. H. Lee, St. Louis, Mo.; O. D. Case, Hartford, Conn.; M. B. Richardson, Lime Rock, Conn.; M. Hogland, Rockaway, N. J.; M. R. Hunt, Ashland, Wis.; C. E. Coffin, Murrkirk, Md.; George G. Lobdell, Wilmington, Del.; E. W. Crichton, Oswego, Ore.; Jacob Wissler, Max Meadows, Va.; E. Sjosdedt, Katahdin, Me.

The following Executive Committee was appointed: Joseph D. Potts; J. C. Fuller, George G. Lobdell.

The meeting passed the following resolutions:

Resolved, That the Executive Committee be requested to present to the association a revision of the constitution, and also to consider and report upon any suggestions for reorganization.

Resolved, That a committee of five be appointed, with power to add to their number, to memorialize Congress, urging that such action be taken in regard to our tariff laws or custom duties as will more perfectly encourage and protect the manufacturers in the United States of the various products in which the membership of the association is interested.

In the afternoon, by invitation, the members and their ladies visited Edison's Laboratory, at Llewellyn Park, where an elaborate exhibition of the wonders of the phonograph were given, and the workings of the magnetic separator were inspected.

A toothpick factory is one of the flourishing woodworking establishments of Harbor Springs, Mich. White birch is exclusively used in the manufacture of the toothpicks, and about 7,500,000 of the little splinters are turned out daily. The logs are sawed up into bolts each 28 inches in length, then thoroughly steamed and cut up into veneer. The veneer is cut into long ribbons 3 inches in width, and these ribbons, eight or ten at a time, are run through the toothpick machinery, coming out at the other end, the perfect pieces falling into one basket, the broken pieces and refuse falling into another. The picks are packed into boxes, 1500 in a box, and are then put into cases, and finally into big boxes, ready for shipment to all parts of the world.

The new Chicago and Northwestern Railroad bridge across the Missouri River was formally opened to traffic, 6th inst. The bridge cost \$1,500,000.

Hardware.

With the close of the year there is a falling off in the volume of business and in most lines there is comparatively little doing. It is not the season when manufacturers usually announce changes in price, but in a number of lines there are indications of somewhat lower quotations than have prevailed. Jobbers and manufacturers who are still making active efforts to market their goods are showing a disposition to make concessions to induce purchases, and some of the Western houses are quoting exceptionally low prices. The outlook for a satisfactory trade with the opening of the next season continues good.

Barb Wire.

The New York market is characterized by a limited demand, but prices within the territory covered by the agreement between the Eastern manufacturers are well maintained, quotations being as follows: Galvanized Four-Point 3.6 cents in carload lots; 8-ton lots 3.7 cents, and small lots 3.9 cents.

Cut Nails.

New York sellers agree in reporting a better volume of business thus far this month than they did in November, a favorable sign, considering that we have entered the duller season of the year. Prices remain at \$1.80 @ \$1.90 for carload lots on dock. The meeting at Wheeling yesterday has no special significance to the Eastern trade, because the Western mills have not been sellers in this market to any extent for some time past. It is of interest, however, as showing that the makers of the Ohio Valley, including 14 large mills who can sway the Western trade, have at last grown tired of the demoralized condition of the trade. The Eastern makers hold a meeting here tomorrow, the first for a long time.

We have received the following dispatch from Wheeling: An adjourned meeting of the Cut Nail manufacturers of the Ohio Valley, including 14 mills, was held at the office of the Benwood Company, at Wheeling, yesterday. The pooling scheme was abandoned, the Western firms declining to agree to it. The Western Cut Nail Association was organized, J. N. Vance being elected president and Edward Hazlett secretary. A \$1.90 card was adopted, with the usual discounts. The opinion prevails that the influence of the new association upon the market will not amount to much.

Miscellaneous Prices.

The Fork and Hoe Makers' Union held a meeting in Cleveland on the 5th inst. There was a large attendance and the reports of orders in hand were very satisfactory, showing that nearly all the makers present had sold up to their allotments. The union, as an organization, did not take any action on prices, but most of the members independently agreed to advance prices 5 per cent., making the regular discount 65 per cent., instead of 65 and 5 per cent., as heretofore. These indications point, it will be observed, to a strong and satisfactory condition, and the combination is regarded by the trade as in excellent condition.

The market on Pistols is in a more satisfactory condition than recently prevailed, there having been a recovery from the exceedingly low prices lately ruling. The manufacturers of both Bull Dogs and Double-Action Revolvers are holding the goods firmly at the advanced prices, and it is thought very probable that there will

before long be a further advance. It is intimated that the delay in announcing such advanced prices has been to give parties holding the goods purchased at low figures an opportunity to dispose of them, with a view to avoiding disturbance of the market by the offering of these goods at irregular prices.

An advance was announced by the Cordage manufacturers December 6 on both Manila and Sisal Rope, the quotations for which are as follows, subject to a discount of 1½ per cent. for cash in 10 days:

Manila, ¼ inch and larger.....	12½	cents per lb
Manila, ⅜ inch.....	13¼	"
Manila, ½ and 5-16 inch.....	13¾	"
Manila Tarred Rope.....	12½	"
Manila Hay Rope.....	12½	"
Sisal, ¼ inch and larger.....	10½	"
Sisal, ⅜ inch.....	11¼	"
Sisal, ½ and 5-16 inch.....	11¾	"
Sisal Hay Rope.....	10½	"
Sisal Tarred Rope.....	10½	"
Sisal Medium Lath Yarn.....	9½	"

The market is regarded as very firm, this advance having been caused by increased prices for Hemp, both Manila and Sisal, and also by a shortness of the supply. The market is active, Binder Twine being especially so, in the production of which the manufacturers are running to their fullest capacity.

The following is the price list of the Freeport Hardware Mfg. Co., Freeport, Ill., for their line of Spring Hinges and Door Springs. It is subject to a discount of 40 per cent., f.o.b. cars Freeport, Ill.:

	Per gross pair.
Wiles' No. 1 Spring Hinges.....	\$34
Wiles' No. 2 ".....	30
Devore No. 1 ".....	30
Devore No. 2 ".....	26
Devore No. 3 ".....	22
Rex Spring Hinges (3 x 3 Covered Coil).....	32
Devore No. 1 Door Springs, per gross.....	15

James F. Brook Rubber Company, Trenton, N. J., issue a sheet of quotations on Belting, Hose, Packing, &c.

Wire Goods Company, Worcester, Mass., have issued the following discount sheet applying to their catalogue, December, 1888:

Nail Keg and Store Truck.....	40

Butterfield & Co., Derby Line, Vt., write us that during the past year they have made extensive additions to their plant and are again in the market with a full line of Blacksmiths' Stocks and Dies and Taps. They also issue a new illustrated catalogue in which these goods are shown. They advise us that the price on their Blacksmiths' Goods is from discount 30 and 5 to 30 and 10 per cent., the price on Reece's new Screw Plates being from discount 33½ and 5 per cent. to 40 per cent.

It is to be noticed that the prices of Brass and Copper goods are not as firmly maintained as would be supposed from the condition of the market in the raw material. Difficulty is found in holding these prices up to a normal level, and they are recently giving increased evidences of weakness.

There has been no change in Shot, notwithstanding the condition of the Lead market. Prices are regarded as low, and it is thought probable that an advance will soon be announced.

The present season has been an exceptionally satisfactory one for Skate manufacturers, and some of them are referring to their inability to supply the goods with sufficient promptness to meet the requirements of the trade, some of whom are annoyed at not having their orders executed in time for the opening of the season.

Items.

Buhl, Sons & Co., Detroit, Mich., are issuing a new illustrated catalogue which will take its place among the most complete and satisfactory. It is a noble volume of 1206 pages, which are filled with information relating to a very extensive assortment of Hardware and its related lines. The volume is fully illustrated with excellent representations of the different goods, and presents the goods in a systematic and compact arrangement. The catalogue opens with Metals, Iron, Nails, &c., and ends with Guns, Fishing Tackle and Sporting Goods, all the regular departments of Hardware being represented, with many related lines, including Tinnings' and Blacksmiths' Tools, Household Specialties, Cutlery, &c. More than 5000 illustrations are given in the book. It has an exceptionally complete index, the extent of which may be inferred from the fact that 26 three-column pages are devoted to it. It is also to be observed that only such goods as are carried in stock are catalogued. In the introductory circular to their customers it is announced that their business was established in 1855. In 1865 they began the manufacture of Pig, Bar and Sheet Iron, Nails, &c., at Sharon, Pa., where they employ 1200 men. They state that they use in their mills only the best materials and turn out a product of exceptional quality. No discount sheet is issued by the house, but as values are constantly fluctuating they will quote prices on application. It is their aim to fill all orders on the day received and to give the trade the benefit of the lowest prices ruling on the day of shipment. This catalogue will be an important addition to Hardware literature and will doubtless be appreciated by those who are favored with it, and it cannot fail to be of service to the enterprising house which has issued it in still further enlarging their extensive business.

Freeman Wire Company, St. Louis, Mo., have issued a handsome catalogue which illustrates their goods. It relates to Plain and Barbed Fence Wire, Staples,

&c., and a large variety of Ornamental and Plain Wire and Ironwork, including Bank and Office Railings, Sand, Coal and Ore Screens, Store Fixtures, Flower Pot Stands, Wire Signs, Stable Fixtures, Window Guards, Elevator Enclosures, Crestings and Finials, Iron and Wire Fences, &c. The plant of the company consists of the Wire Mills at East St. Louis, Ill., where they manufacture Iron and Steel Wire, Galvanized, Bright, Tinned, Coppered and Annealed, and all kinds of Plain and Barbed Fence Wire, and of the Wire and Ironworks at 410 North Main street, St. Louis, which are referred to as fitted with complete appliances and machinery for the manufacture of artistic Wire and Ironwork; 106 pages are used in displaying this line of goods, of which, in connection with the cuts, list prices and descriptive matter are given.

The New Haven Wire Goods Company, New Haven, Conn., whose Broiler and Toaster is described on page 917, besides their agencies in Boston, New York and Philadelphia, are represented in the West by Sidney Shepard & Co., Buffalo, N. Y.; the George Worthington Company, Cleveland, Ohio; Standart Bros., Detroit, Mich.; C. Sidney Shepard & Co., Chicago, Ill., and F. A. Lawson & Co., Cincinnati, Ohio.

Montgomery & Co., 105 Fulton street, New York, have lately been appointed agents for the sale of H. H. Barton's Emery Paper, Emery Cloth and Sandpaper in this city. We are advised that the Thrift File Works, of Philadelphia, have also appointed them their agents for New York and the New England States.

The Pittsburgh Tuyere Works, manufacturers of Wrought Copper and Bronze Tuyeres, Coolers and Bosh Plates and Brass and Bronze Castings, Pittsburgh, Pa., have removed their office and works to 83-95 Main street, Allegheny, where they are prepared to fill orders promptly, as heretofore.

It will be observed that among the special announcements on page 50 the Lloyd & Supplee Hardware Company, Philadelphia, Pa., advertise for a salesman with established trade in Western and Southern Pennsylvania. The influential position occupied by this house will doubtless attract attention to this announcement from any Hardware salesmen who are open to accept such an engagement.

James L. Haven Company, Cincinnati, Ohio, have issued their illustrated catalogue No. 15. It comprises illustrations and prices of a large variety of goods, including Shutter, Gate and Spring Hinges, Axle Pulleys, Barn Door Rollers, Grindstone Fixtures, Clamps, Jack Screws, Casters, Bed Fasts, Drills, Tire Benders, Repair Links, Pump Curbs, Meat Cutters, Standard Mills, Agricultural Implements, &c. It is accompanied by a discount sheet of 16 pages in which list prices and discounts are given on this line of goods.

Champion Lawn Rake Company, Canton, Ohio, issue a neat catalogue, in which they describe the different patterns of Lawn Rakes manufactured by them. They include the Champion Steel Lawn Rake, reversible handle, the Champion Reversible Lawn Rake, the Champion Lawn Rake and the Champion Garden Rake.

Fowler & Sons, Buffalo, N. Y., issue a variety of circulars and lists referring to the different departments of their business. They relate to Iron and Steel, their wood-working department, to which a pamphlet of 32 pages is fully devoted; their Trimming, Paint and Varnish department, to which is devoted a pamphlet of 62 pages, covering an assortment of goods in the line indicated, while another relates to the Anderson Bolt Works, Anderson, Ind., of which they are the proprietors. This

gives the standard lists on Common Carriage Bolts, Machine Bolts, Lag Screws, &c., and Square and Hexagon Nuts.

Chadborn & Coldwell Mfg. Company, Newburgh, N. Y., have prepared an exceptionally neat and attractive blotter pad, which is intended to be of use to their customers and also to call attention to their line of Lawn Mowers. The cover of this pad is celluloid, artistically printed in four colors, and under it are half a dozen sheets of blotting paper attached at one end, on each of which is mentioned some point on which they lay emphasis concerning their line of Mowers. The novelty of this device and the attractiveness in which it is gotten up entitle it to special attention.

We desire to call attention to the advertisement of the National Keg and Box Company, Birmingham, Conn., page 50, who advise us that they have extensive mills and facilities for supplying Kegs and Locked Corner Boxes of all kinds to take the place of pasteboard boxes. They also manufacture Hardwood Boxes and Packing Cases.

Chieftain Hay Rake Company, Canton, Ohio, issue a neat pamphlet relating to their Hardware specialties. Post-Hole Diggers are given a prominent place, the Little Giant, Hercules, Scheidler and the New Champion being represented. Portable Tree Protectors, Extension Step-Ladder and the Boys' Tricycle are also shown. The company warn the trade against infringements on their patents for Post-Hole Diggers.

The Avery Elevator Bucket Company, Cleveland, Ohio, announce, December 9, that owing to the extension of their line of manufacture they have decided to change their corporate name to the Avery Stamping Company. They will still continue to make their patent Seamless Steel Elevator Buckets a prominent feature of their business, and, when they are settled in their extensive new works, which, it is expected, will be about December 20, they state they will be prepared to do the most intricate stamping and shaping of metals ever attempted in any country.

A. J. Phillips & Sons, Fenton, Mich., manufacturers of the Bonanza Window Screen, described on page, 918 in addition to their line of Snow Shovels, are also manufacturing the Phillips Adjustable Window Screen Frame, which, they advise us, was satisfactorily tested during the past season by a portion of their trade, and is now offered to the general trade, a large stock being in process of construction. The Frame has wood corner brackets, the sides of which have dove-tail grooves into which slide and engage the dove-tail tongues on the side sticks, and it is pointed out that the dealer or consumer can thus make his own Frame and be sure of securing a fit, as well as a strong and attractive article. The point is specially made that the Frame can be adjusted to any size after it is put together. They are furnished with moldings to cover the edge of the wire cloth and slides for attaching to the window cases. They are made in imitation walnut and in natural red oak.

Trade.

Our Louisville advices, under date December 8, are as follows:

The Hardware trade of Louisville, Ky., is undergoing a steady improvement, both as to value and prices. Those jobbers who had dull business last week feel good over this week's returns. The country is evidently settling down to a fair winter's trade, although the season is quite backward for such goods as enter into cold weather sports. Ammunition continues to go out in large quantities, and Shelf goods are moving satisfactorily. The open winter has the effect of enabling building and improvements, generally, to go on later than usual; this is marked in the sales of Barb

Wire, which, coupled with extremely low prices, enables the country merchant to buy in carload lots, whose wants are usually a few tons at a time. The same conditions govern the trade in Cut Nails, there rarely ever occurring such a large December movement in this staple. The trade hails with joy and yet misgiving the announcement of the promised action of the Nail mills. Wire Nails are still firm, with some large orders offering and looking for a weak-kneed manufacturer. Bar Iron is stiffening from store under strong inquiries for heavy goods; this will probably be followed soon by withdrawals of extreme prices by the mills. One feature that retards trade to a certain extent is that the Tobacco crop of this State and Tennessee has proved to be an enormous one, and well cured, but, because of the great amount grown, prices have dropped so low that it will hardly pay the farmers the expenses of shipping to market. In this way untold thousands of dollars are compelled to lie idle in the curing barns and country warehouses. Lumber coming from Western Kentucky and Tennessee is in such increasing demand, both domestic and foreign, that new saw mills are being set up at all available points on the railroads and streams traversing those sections, and are doing a rushing business. This means prosperity for the manufacturers of such machinery. The hard woods, particularly the white oak, coming from this region, are highly valued both in this country and in Europe. The lands through which the Tennessee Midland is to run have increased in value several times over, being heavily timbered with uncultured virgin forests.

From Dudley Bros. & Lipscomb, Nashville, Tenn., we have the following advice:

Volume of business has been fully as good the past fall as any season heretofore, and notwithstanding the yellow fever and the political excitement we have fully held our own. Crops were extraordinarily fine in growing, but the prospect was considerably marred by continued rains. A large quantity of the corn is still in the fields and much of it has rotted, and cotton picking will not be more than finished in time for planting the new crop; but on the whole enough will probably be saved all right to make business keep up. Prices continue very low, notwithstanding the result of the election. Wire Nails, Shot and other kindred staples are cheaper than ever before. Bar Iron, however, has taken a little turn for the better and is quoted \$1 advance on the ton. Our merchants are stocking up liberally for their Spring trade which usually sets in about the 10th of January.

Trade Topics.

In the existing conditions of business, and with the enterprise which is shown by merchants in different lines, there are indications that a larger variety of goods is being kept by many enterprising houses, and that some of these goods belong to lines other than those which have heretofore been regarded as regularly belonging to their business. It is not infrequently that we hear of furniture dealers handling Stoves, jewelers selling fine Cutlery and grocery houses dealing in Tacks and many kinds of household specialties. In a similar manner Hardware merchants, especially those who have suffered from this encroachment on what they regard as their proper territory, are disposed to enlarge their line of goods. The great Hardware jobbers of the West have thus been adding quite a number of lines which have not heretofore been regarded as belonging to Hardware. They are taking up Lamps, Jewelry and other goods which can be worked in connection with their other regular lines. It is obvious that this can be done with some advantage, giving them an increased variety of goods which they can offer through their travelers to the small trade. In working a town a Cutlery salesman often visits dry goods stores, drug stores, gentlemen's furnishing stores and fine jewelry stores, a fact which illustrates the point made above as to the extent which the lines of separation between the different branches of trade are being obliterated. In the case of the largest jobbing houses this tendency toward expansion of their line is most marked, and is to be accounted for in two ways: In the first place, it is the result of the energy and enterprise possessed by them, which, with their abundant capital, en-

ables them to adapt their business to the constantly changing conditions of trade, and to avail themselves of any opening that may present itself for the extension of their business. And often the fact that their regular Hardware business is being interfered with by the small jobbing houses, which have sprung up all through the Western country, has, doubtless, been influential in inducing this extension of their lines, inasmuch as without such additions to the variety of the goods offered by them it would not be feasible to prevent their business from diminishing in volume, while with these additions their business, notwithstanding new competitions, has probably for the past few years been slightly increasing.

A similar condition of things, though to a less marked degree, prevails in the retail Hardware trade. Instances will occur to our readers in which merchants are showing a disposition to go beyond the lines of demarcation by which Hardware is separated from other classes of trade. It will, however, be conceded that Hard-

The company refer to it as working very satisfactorily, alluding especially to the advantage possessed by it in the fact that there is an economy of time in connection with its use, inasmuch as several invoices can conveniently be paid with one blank.

Ironmongers and their Assistants.

Our English exchanges have recently been discussing the relations existing between merchants and their clerks, and complaints have been made on one side and the other of unreasonable requirements and inconsiderate treatment by the employer and of inattention to business, carelessness and general indifference to their principal's interests on the part of the clerks. The impression gained from reading the letters in this controversy is that there is a too general lack of that understanding which should exist between the merchant and those upon whose energy and fidelity he largely depends for the success of his business, and in this respect the conditions prevailing in England

Memorandum.

Please acknowledge receipt and oblige.

Yours truly,

R. D. Cone Company.

ware merchants have been more conservative in this matter than merchants in almost any other line of business, and have been reluctant to enter upon fields which do not properly belong to them. The extent, however, to which merchants in other lines have encroached upon the Hardware business often drives its merchants in self-protection to handle goods which more properly should be sold by some of their neighbors. This condition of things in the abstract is to be regretted. It would on many accounts be more desirable if merchants would keep closer to their own lines of trade, as this tendency is apt to result in diminished margins of profit, and in many ways to be ultimately disadvantageous to the trade.

Writing on the question as to whether or not it is advantageous for retailers to purchase direct from manufacturers, a Hardware merchant in Ohio says:

I have tried several times to buy from manufacturers, but have invariably found that prices, if not higher, were equal to those offered through jobbers, and had to buy more than I needed to obtain the discount. I now buy all I need of jobbers, except a few articles that they do not carry in stock.

Business Methods.

In view of the interest with which the form adopted by Elsworth & Dudley, Poughkeepsie, N. Y., for making their remittances has been regarded by the trade, we reproduce above in reduced size another form for the same purpose, which has been used for several years by the R. D. Cone Company, Winona, Minn. The entire width of this form is 8½ inches, and its depth about 5 inches. It is tastefully engraved and presents a neat appearance.

seem to contrast unfavorably with those which exist in this country. Referring to this matter, and, in a measure, summing up the controversy, the last issue of the *Ironmonger* remarks editorially as follows:

The correspondence which is currently appearing in our columns on the subject of ironmongers and their assistants serves to remind us anew that perfect harmony has not yet been secured between masters and men. Complaints are made by both sides that the other side is very far from being perfect, and it is obvious that there is a good deal of latent irritation in many quarters. It is a pity that this friction should exist, but it is there, and so long as human nature is what it is, there will often be a certain amount of jealousy and distrust between employers and employees. At the same time it is obviously quite within the bounds of possibility for this disturbing element to be reduced within very narrow bounds—indeed, it is not impossible for it to be wholly eliminated by judicious management. The employer who has a good assistant, and knows it, will generally trust that assistant more fully, and leave more to his discretion than he would were the assistant a mere machine at his work, or otherwise not up to the mark. In the same way an assistant who knows his work and takes an interest in it will have his employer's interests so much at heart that he can scarcely fail to earn and have the respect and consideration of his employer. Trust should, and generally will, beget trust, and mutual confidence should have the effect of furthering mutual interests. Where this amicable state of things does not exist, it is palpable that there is room for all sorts of ill feeling and mistrust. In such cases both masters and men cannot fail to suffer. If the employer cannot or does not trust his assistants, his business must involve him in a vast amount of personal worry, and probably actual losses, while if the assistant cannot trust his employer it is practically impossible for him to have his employer's affairs as much at heart as he ought to have. As our correspondence columns have shown, some of the employers complain that some of the as-

sistants are not sufficiently smart or pushing, and compare them disadvantageously with the dapper and alert young men of the drapery trade. It is possible that there may be a certain amount of truth in this allegation and comparison, but even admitting that that is the case, we are inclined to think that the difference is partly owing to the nature of the ironmongery trade and partly the fault of the employers who have trained the assistants. One employer thus may suffer from the faults of some other employer, but if he does so for any length of time it goes without saying that the fault becomes his own. No employer is compelled to keep an assistant who does not serve him well, and if he likes to put up with indifferent or slovenly service then he alone is to blame. If we assume, for the sake of argument, that all assistants are below par, and unequal to the work required at their hands, then it follows that while we deplore their want of capacity we must still attach a certain amount of blame to the employers as a body. The assistants complain that in many instances they are not allowed to see the *Ironmonger*, and thus are not fully posted up in what is going on in the trade by which they live. In the very nature of things this cannot be right or good policy—indeed, one would have supposed that every ironmonger would be only too pleased to let his assistants read and study the *Ironmonger* regularly and constantly. The more information an assistant possesses the better servant he should be; but if the representative paper of the trade is kept from him, it is perfectly clear that he lacks much that ought to be of direct benefit to himself as well as to his employer. We hope that there are very few instances indeed where this policy is pursued, and we are encouraged to express that hope by the knowledge that in many establishments the employer not only subscribes for himself, but also pays for copies for his assistants. In such establishments the whole of the staff are as well posted up as the travelers who call upon the master, and as well informed as the customer who has gained his information from some of the journals addressed to the general public. It is a sound maxim, indeed, which expresses the sentiment that no man can ever know too much, and it applies to the assistant as well as to the employer. With a little more liberality in this and other matters—especially in respect of cost prices—there ought to be a great improvement in the relations between the two grades of those who jointly constitute the retail branch of the trade. We are not without the hope that the improvement is gradually making itself felt. When it has become fully established we may expect to hear very little more of the complaints which have lately been addressed to us both by masters and assistants.

Arrangement of Stores Abroad.

The arrangement of retail stove and hardware stores is a subject which has received a great deal of attention in these columns for some time past, and from letters which have been received from those who have profited by the suggestions contained in the various articles presented, we feel that our efforts in this direction have not been in vain. The subject is of wide interest both in this country and abroad, and the trade papers on the other side are devoting more or less attention to it. A recent issue of *Ironmongery* contains a number of suggestions as to the proper arrangement of the stock of a hardware store, and we present it herewith as of possible interest to our American readers:

This is a subject which appears to us not to have received the attention it deserves—probably because of the obvious difficulties which its discussion involves. The numberless variations in the size and style which are presented by shop architecture make it a subject of the greatest difficulty. Still, it may be assumed that general principles may be laid down, which, while they must necessarily be varied to meet special circumstances, may be found of some practical value. For the purposes of this paper, we will then assume a shop of the usual type, with a frontage of two windows, and the entrance in the center, containing a counter down one side with drawers under it, and range of ordinary fixtures behind, and, if our readers like, a showroom or warehouse behind or above. It is probable, however, in the majority of

cases, that several smaller warehouses have from time to time been brought into requisition, as the expansion in the volume of stock has required it, and in this case the same principles will hold.

We begin, then, with the shop itself. It will be clear to the merest tyro that some system of arrangement is absolutely essential in order that the law of association may be exercised to enable the ironmonger to lay his hand at once upon any required article; hence every ironmonger will, as far as possible, group goods of a kindred character. He will, for instance, keep all his brass foundry together, and on no account allow it, as some slovens do, to be mixed up with a heterogeneous collection of black goods; and he will also extend the principle and arrange according to their classification the various sub-sections of each class of stock. Thus, assuming that he has a range of fixtures extending behind and running the entire length of his counter, he will find them the most convenient depository for his brass foundry and parcel goods generally, placing the first-mentioned nearest the door, because of their lighter and more attractive appearance, and the last-named at the further end, making a clear line of demarcation between the two. He will then arrange the brass foundry in sub-sections, not mixing up rack pulleys, and curtain rings, and fancy nails, and numerous other goods in inextricable confusion; but having a clearly defined space for everything, sash fasteners, for instance, occupying one division, rack pulleys another, and patent blind furniture another, and curtain rings and picture rings and all other articles being grouped in such a manner that to know where the leading article of a section is placed is to know where all the others are. Now, as to the method of keeping the stock, we are strongly in favor of the steel-bound cardboard boxes, which for convenience, attractiveness and cheapness are to be highly commended. Everybody has seen how untidy the best-kept shelves will in course of time become, as parcels have been frequently opened and their contents gradually abstracted, to say nothing of the considerable time involved in unwrapping and wrapping up, and the not inconsiderable expense of paper and twine. This is all obviated, once for all, if these boxes, which have a most neat and attractive appearance, are used, and they can be procured of any size required, so as to fill conveniently any sized division of the fixtures.

Thus, take, for instance, a dozen rack pulleys; let one be fastened on the outside with thin copper or brass wire, and put the remainder in their tissue paper inside, marking the number, cost and selling price inside the lid, and the article is permanently faced. The customer sees at once, while yet upon the shelves, the article he requires. It is taken from the box, the lid replaced, and the box is back upon the shelf in less time than a parcel can be opened. There is an enormous advantage in this, especially on busy days, or when a long "fiddling" carpenter's order is being filled, as every one who has seen the pile of open parcels littering the counter or floor will admit. Another great advantage offered by this system is that its very neatness inculcates a pride in having the remainder of the stock kept with such care and orderliness as not to destroy the *tout ensemble*. The expense need be no objection, as the entire cost of boxes, for fixtures of, say, 16 x 6 feet, would not exceed £3 or £4, and once provided they will last in good condition for many years. This, then, deals with that portion of the brass foundry and black ironmongery which is exposed for sale on shelves. The spare stock should be kept in their original parcels in the warehouse or other convenient place. The arrangement of tools is a most impor-

tant point. Where at all possible, a window should be specially reserved for these, or a portion of a window distinctly separated from the rest. The window should contain a sample of every tool contained in stock, for it is wonderful with what patience a workman will scan everything in the window until he sees the article he requires; and most ironmongers would find that a thoroughly well-dressed tool window would prove to be one of the most profitable investments. The spare tools may be kept in any convenient place, but, as far as possible, together, and always in paper, to protect them from the ravages of rust and dust. Such small tools as Lancashire tools, however, would, with advantage, be kept in drawers under the counter, while the remainder are stored in good deep shelves further away. And our advice to ironmongers and assistants is always to sell from the window where possible, notwithstanding the disarrangement and trouble this may cause, as by doing this the loss by depreciation of stock is reduced to a minimum.

Cutlery and scissors, excepting where it is absolutely necessary to expose them, as in the window, should be kept under glass cases laid upon the counter or, where these are not available, in drawers. Electro-plated goods should always be placed with due regard to light, and may often be made to give a light and cheerful appearance to an otherwise dark corner of the shop. They should always be kept in air-tight and dust-proof cases, as otherwise, unless the sale be very rapid, they will be the source of endless trouble, and considerably depreciate in value. Copper and planished tin goods should be allowed to remain in their original paper, except those examples required for exhibition, and these last should be always, where possible, sold first, and replaced with others fresh from the paper. Great care is required in the treatment of the finer qualities of japanned goods, as they are peculiarly susceptible to the action of air and gas. The display of these should be limited in point of quantity and duration of exposure, and the bulk of stock should always be kept most carefully in the softest tissue, and be contained in cupboard or drawers. Fenders are perhaps best shown in some of the numerous racks which have been introduced for that purpose, and fire-irons, always well and cleanly oiled, as far as possible should be exhibited in an upright position in a dust-proof case, or, where a case is not available, in properly made bags. For the purpose of effectively showing fenders it is desirable to have a fairly good register stove with a medium quality marble or slate mantelpiece, in some well-lighted position, with a fender and set of fire-irons in position. This renders it possible to exhibit any fender required in such a position that the customer sees at once its suitability in point of taste or style for the purpose required. The general position to be occupied by glass cases must be determined by considerations of shape and dimensions of shop, the question of light, &c. The great points to be attained are—to make an effective display of stock without incurring more depreciation from exposure than is absolutely necessary, and to have the bulk so placed that it is at any moment available. It is entirely useless to continue month after month the exhibition of samples which have been exposed until all their original freshness and gloss have been removed, and the only sensible and business-like plan is to make a point of selling from the exposed stock and of replacing it with new. This system will have the double effect of minimizing the depreciation of stock, and, what is hardly less important, insure a continual change in the character of the stock exposed, and so produce a more effective general result.

The New Haven Broiler and Toaster.

This article is shown in the illustration given below, and is manufactured by the New Haven Wire Goods Company, New Haven, Conn., who call attention to the new principle on which it is constructed. Instead of using a ring or link to connect the two parts they use their patent hinge, thus giving a special strength where other

the South or West will soon be built and will hold 1,500,000 feet of gas. The holder will be supported by columns 110 feet in height, and the receptacle itself will be 105 feet high and nearly 140 feet in diameter. The contract for this large vessel is not yet let, although the excavation is made and the foundation walls are nearly completed, requiring 1,700,000 brick to build it. The gas company, be-

in position securely locks and holds all parts together. The lid is dome-shaped, and readily admits of good sized cups or dishes to rest in the top section. The very best material, we are informed, is employed in the construction of this article, and the manufacturers offer it to the trade in the confident expectation that it will supply a requirement which has existed for a long time past.

The New Haven Broiler and Toaster.

broilers are found to be weak. It will also be seen that the bars of these broilers, instead of running lengthwise, as in other broilers, extend crosswise, and being supported on the back by the heavy handle wires, which run the whole length, are kept from bending and remain in shape. To guard against the cross bars getting out of position or becoming loose a heavy tin ferrule is put between each and the next bar. The point is made that owing to the peculiar construction of the hinge joint these broilers when reversed can be shut perfectly close, or adapted to any thickness, thus making a perfect toaster.

sides providing amply for the city's wants in illuminating gas, propose to furnish water-gas for manufacturing and heating, at a cost of about 50 cents per 1000 feet. Geo. W. Morris, formerly of the firm of Geo. S. Moore & Co., pig iron, is president of the gas company and Mr. Hite Barrett is engineer.

The Picnic Dinner Pail.

The Ohio Tin and Copper Company, of Findlay, Ohio, are introducing to the trade a form of dinner pail or can as it is sometimes called, a general view of which

The Picnic Dinner Pail.

Their strength and durability, as well as the advantages alluded to above, are the points which are emphasized by the company. These broilers are made in six sizes, all of which are 9 inches in length and range in width from 6 to 13½ inches.

The Louisville Gas Company are spending several hundred thousands of dollars in increasing their facilities for making and storing gas. The improvements now going on are being built in the southern part of the city, where the largest gas receiver in

is afforded by the illustration presented herewith. By reference to the cut it will be seen that the pail is made of an upper and lower section and a tray. The top slides upon the bottom section in much the same manner as a drawer operates, the tray resting in the bottom section which forms the receptacle for tea, coffee or other liquids. The manufacturers direct particular attention to the fact that the slides are made of XXXX tin, and therefore is strong and durable. The knife and fork box is removable when desired, and when

extinguished when desired. The alcohol is placed in a metal cup, which is suspended in the frame, as shown in Fig. 1, the tubes shown being open at both ends, and no wick or packing material being required. In using the stove the alcohol is poured into the cup and the vapor lighted, and it is claimed that the combustion produces a draft of air up through the tubes, which causes an intense heat,

Queen Spirit Stove.

This article is illustrated in the cuts herewith given, and is put on the market by Silver & Co., 56 Warren street, New

Fig. 1.—The Queen Spirit Stove.

York, Fig. 1 representing the stove proper, and Fig. 2 the regulator and extinguisher, by means of which the amount of heat given by the stove can be graduated according to circumstances and the stove

Cormack & Co., importers of iron ore, formerly of 231 New street, New York, have transferred their business to Duluth,

Minn., having opened offices at 21 West Seventh avenue. They will give their attention to the domestic ore business.

The Bonanza Adjustable Window Screen.

This screen, manufactured by A. J. Phillips & Sons, Fenton, Mich., is represented in the accompanying illustration.

The Bonanza Adjustable Window Screen.

As will be inferred from the cut, this frame has two movable wings $3\frac{1}{2}$ inches wide, one on each side of the frame, by which means it is adjusted to windows of different widths. The proper movement of these wings is controlled by slides top and bottom, which are covered by the caps the whole length of the frame, the slides being thus entirely concealed, making a plain and unbroken front and back. Both the wings and the frame are beaded on both sides. The screens are made of bass wood, well finished and dipped in oil, thus showing the grain of the wood. The Cortland wire cloth of standard mesh and quality is used. The manufacturers advise us that their object is to produce a well made article at a lower price than they can offer their hard wood line of screens. Three sizes of these screens are made: No. 10, 20 inches high, and No. 11, 24 inches high, both of which adjust from 24 to 30 inches in width, and No. 12, 24 inches high, which adjusts from 30 to 36 inches in width.

A pipe line connecting St. Louis with the Lima, Ohio, and Pennsylvania oil fields, via Chicago, is one of the probabilities of the ensuing 12 months. It is stated that the increasing consumption of fuel oils in St. Louis, through the introduction of improved oil burners for furnaces, had decided the Standard to continue its pipe line from Chicago to St. Louis, and that the pipe will be laid next spring. For an oil pipe line the best wrought-iron pipe is used. It must be capable of resisting a pressure of 3000 pounds, as the oil is forced up long and steep grades. The size used in other pipe lines is 8 inches in inside diameter. It costs about \$1 per linear foot, or over \$5000 per mile, and the cost of laying it is fully \$1000 per mile.

The work of dredging Gedney Channel, in New York Harbor, also Buttermilk Channel and Raritan Bay, has made good progress during the summer. The first mentioned is the most important, as the work includes dredging a channel 1000

feet wide and 30 feet deep at mean low water, extending from the deep water below the Narrows, through the main ship channel to deep water outside. The estimated cost of dredging the channel is \$1,490,000, but the total expense of the improvement, should the building of the contraction works be necessary, will be between \$5,000,000 and \$6,000,000. Up to the beginning of last month nearly 800,000 cubic yards had been removed.

The dredges have secured a channel across the shoals nearly 650 feet wide and of sufficient depth to allow the largest steamships to pass at low water. To complete the improvements at Hell Gate the next Congress will be asked to appropriate \$1,000,000.

Solid Steel Tray Wheelbarrow.

This wheelbarrow is made by the American Steel Scraper Co., Sidney, Ohio. It is represented in the accompanying illustration.

Solid Steel Tray Wheelbarrow.

tration. It has, as will be seen, a metal frame and the tray is made from one plate of steel. The wheel has a wrought iron rim $1\frac{1}{2}$ inches wide, with heavy steel spokes headed and shouldered at each end, which adds greatly to the strength of the wheel, without materially increasing its weight. It is referred to as especially adapted to mining and for use about furnaces and foundries, for mortar, or for handling dirt. The point is made that there is no wood to warp, split or get

water soaked, while the barrow is light to handle, strong, thoroughly braced and durable.

Coast Defenses and Cruisers.

The bill providing for coast fortifications introduced by Mr. Chipman, of Michigan, in the House, authorizes the Secretary of War to cause to be constructed two submerged turreted torpedo forts armed with two 16-inch rifled cannon, two pneumatic torpedo throwers, and six locomotive submerged torpedo guns, and, with two cable lines of torpediums for the protection of New York Harbor, to be placed, one on the shore side in 3 fathoms of water on Sandy Hook side, and one on the opposite side of the channel. Two similar forts are provided at each of the ports of Boston, Charleston and San Francisco. Of those at the latter point one fort shall be situated at Lime Point and one at Fort Point. The forts shall be built for the sum not exceeding \$2,000,000 each, exclusive of armaments. This shall include a sum of \$50,000 as a royalty for the exclusive use of the inventions of William M. McCarty. An appropriation of \$4,000,000 is made.

Mr. Chipman also introduced a bill authorizing the Secretary of the Navy to cause to be constructed one steel armored submerging cruiser of about 8000 tons displacement, provided with three-bladed screws, and of a speed not less than 22 knots per hour. The cruiser shall be armed with two 12-inch high powered rifled guns, four 10-inch rifled guns and a suitable secondary battery, and shall be provided with four torpedo tubes. The cruiser shall cost, exclusive of armament, a sum not to exceed \$4,000,000, the whole sum being appropriated by the bill.

In reply to the statement of the Interstate Commission's report that the operation of the law was generally beneficial to railroads, the *Railroad Gazette* shows the decline in the price of shares since the law went into effect. In New York 46 stocks have declined in value \$221,000,000 and five have risen in value \$4,750,000. The total par value of the stocks mentioned is \$1,500,000,000. The shares showing the

greatest loss are: The Atchison, \$39,000,000; Chicago, Burlington and Quincy, \$26,750,000; St. Paul, \$16,750,000; Missouri Pacific, \$17,250,000; Rock Island, \$12,000,000; Denver, \$5,750,000; Chicago and Northwestern, \$7,750,000; Missouri, Kansas and Texas, \$9,500,000, and Richmond Terminal, \$7,500,000. That these losses have been due entirely to the Interstate bill would be hard to prove, but the *Gazette* argues that this is the case.

CURRENT HARDWARE PRICES.

DECEMBER 12, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

DECEMBER 5, 1888.

The following quotations are for small lots. Wholesale prices, at which large lots only can be bought, are given elsewhere in our weekly market reports.

Digitized by Google

THE IRON AGE

THURSDAY, DECEMBER 20, 1888.

Stifel's Sash-Pulley Grinder.

There is nothing in the homely aspect and size of the axle pulley, or sash pulley, to suggest the important part it has played

its service in lightening the work of hoisting windows, but it has a thousand other uses, and millions of these little castings enter into the construction work of the American people every year. As it pos-

it is thought will accomplish very remarkable results of this character. It is the invention of Mr. Herman C. Stifel, of the N. O. Nelson Mfg. Company, at St. Louis, Mo., and is expected to exert an important

Fig. 1.

GENERAL ELEVATION OF THE STIFEL SASH-PULLEY GRINDING MACHINE, BUILT BY THE N. O. NELSON MFG. COMPANY, ST. LOUIS, MO.

as a luxury in the lives of the people and as a science. Like many another agent in modern civilization, it has a merit out of all proportion to its appearance. It has become most familiar to the masses through

sesses a virtue, therefore, anything which tends to cheapen its cost, so as to widen the field of consumption, has interest for everybody. We present accordingly in this issue engravings of a machine which

influence on this branch of manufacture. Axle pulleys are first cast rough. Their cost up to that point is merely nominal. The work of drilling a hole for the axle, which will be in the exact center, and of

polishing the groove and edges so that it will carry smoothly a small rope or cable involves the main cost of the product. At the present time these pulleys are drilled and polished respectively by machines which have a capacity for turning them out at the rate of from 3000 to 4000 per day. Mr. Stifel's machine, it is claimed, will readily polish 50,000 in the same time, or as many as 12 machines such as are now in use can prepare for it. It may be stated here that the inventor expects in a short time to present to the public a machine complementary to the one he is now constructing, which will drill pulleys as rapidly as this machine will polish them. In short, he will do with two machines, one for drilling and the other for grinding, what is now being done with 24—12 for drilling and 12 for polishing.

The polishing machine in question might seem complicated at first glance, but a brief explanation will make everything clear. The rough pulleys are thrown into the large stationary hopper A, Figs. 1 and 2, whence they progress automatically to completion. There are 12 shutes B (Figs. 1, 2 and 6) leading outward and downward from this hopper; but for the purpose of explanation it is necessary to consider only one of these, as they are all alike and serve the same purpose. The hopper A is surmounted by a large gear-wheel, and from each arm of this gear-wheel a short arm extends downward into the hopper, to a point close to the bottom, so that, when the wheel turns, these arms stir the castings, just as the revolving rake stirs the grain in a mashtub. As the bottom of the hopper A is conical, as shown in sectional view, Fig. 2, the pulleys will by gravity move toward the mouths of the shutes, and the effect of the agitation brought about by the action of the revolving arms is to accelerate their motion and overcome any tendency to stick. In this manner, the shutes will be supplied with pulleys as rapidly as the machine below can dispose of them.

Once in the shute B, the pulley falls to the bottom, and into position where it can be tightly clutched, slowly revolved and held in position while the edges of two emery-wheels revolving rapidly in opposite directions are brought up against it. This clutching process is effected by the spindle C, Figs. 1 and 2, which has a horizontal shifting motion, the same as that used in a clutch coupling. As the wheels of the machine revolve, a cam, D, gives to the spindle C a lateral motion, so that its inner end passes beyond the line of the shute, and allows the pulley casting to drop down by its own weight on to the gate E arranged to receive it. An instant later the cam D has passed beyond, and the spindle C being disengaged, is pulled back into position by a strong spring F. A small center or pin on the end of the spindle fits into the hole in the pulley, while the surrounding surface of the spindle end tightly clutches the face of the pulley and imparts to it a steady motion. It remains in this position until it is polished. Two emery wheels, X X, Fig. 1, are brought up against it on opposite sides, both of them revolving in directions contrary to that in which the pulley is moving. One of the emery wheels has a convex edge, which fits into the groove of the pulley, and polishes it almost instantly. The other emery wheel is considerably thicker than the pulley, and has a square edge, which is brought up against the two sharp rims that border the groove and constitute the largest circumference of the pulley, thus grinding these rims smooth at the same time that the groove is being polished. In order that the sharp rim may not cut creases into this thick emery wheel, the latter receives from a cam a very slow and slight lateral motion back and forth,

thus equalizing the wear. The emery wheels are located at the foot of the vertical arms, as shown in Figs. 1 and 5. These arms are brought together by a heavy spiral spring (S, Fig. 5), and are thrown apart by a cam (H) for a sufficient length of time to admit of dropping the finished pulley and substituting a rough one. As the emery wheels must decrease in diameter through wear, a hand wheel (I, Figs. 1, 2 and 5) is provided by which the attendant at intervals can move the arms inward. The machine is so constructed that each pulley is subjected to exactly the same amount of grinding—that is to

column of pulleys in the shute while the release of the finished one is being effected. When the gate at the bottom of the shute closes again, the ram is withdrawn and the column of pulleys moves down, the lowest being centered, clutched and polished as above described. This operation goes on, over and over again, at the bottom of each of the shutes (B).

Steam Jet Phenomena.

Herr R. Von Helmholtz has sent to *Wiedemann's Annalen* some observations made by himself upon a jet of steam. He

Fig. 2.—Partial Vertical Section.

Fig. 3.—Detail of a Pulley Shute.

SASH-PULLEY GRINDER, BUILT BY THE N. O. NELSON MFG. CO., ST. LOUIS, MO.

say, the polish in each case represents exactly the same amount of emery wheel surface travel, whatever may be the diameter of the emery wheel. This result is accomplished by use of different pulleys as at R. When a pulley has been polished to a proper degree, the arms on which the emery wheel are located are driven apart by the cam (H), as already explained. The spindle which clutches the pulley is thrown outward by its cam, a gate opens, and the pulley is released and allowed to drop into a receptacle set under the shute. At the instant of its release, a ram (K, Fig. 2), situated just above the clutch spindle, is driven forward, and its end enters the center or axle hole of the pulley next in order, thus holding up the entire

remarks that a jet of steam escaping from a hole of 1 or 2 mm. diameter, lighted obliquely and observed upon a black background, is invisible at the lower extremity, and presents toward the top the well-known whitish appearance. This aspect may be modified in many ways. If an electrified point is brought near the steam, the jet immediately becomes azure blue, or, according to the power of the electrical machine, purple, red, yellow, green, &c. These tints are intimately connected with the dimensions of the liquid drops, and hence it follows that the electrical point has the power of provoking condensation of the supersaturated vapor which is found at the lower part of the jet. The same result is obtained by bring-

ing near to the steam jet a platinum wire made brightly incandescent by an electrical current, or silver, iron, copper or brass wires simply made red hot in a flame, or jet steam by the aid of a chimney or by simple blowing, produce a very energetic effect. Finally, traces of certain chemical substances introduced into the steam jet

supersaturated vapors, but their presence cannot be invoked here to explain the preceding facts.

The author is of opinion that they may be attributed to a molecular concussion, the effect of which may be compared to that of mechanical concussion upon superheated or supersaturated liquids. A flame, for example, is the scene of closely approximated and extremely varied movements, and the chemical atoms which are incessantly passing in it from one combination to another are found in every kind of unstable condition. These movements and changeful states of equilibrium leave their traces in the products of combustion at a certain distance from the flame properly so called, and determine the observed phenomena. The luminous effect produced at the extremity of an electrified point and the presence of ozone in its vicinity show that this point is the cause of concussions comparable to those provoked by active combustion, and the analogy between the two phenomena is found again in the fact that they both furnish means for making electricity pass through gas. As to solid incandescent bodies, they can act either through the emission of solid particles from their surfaces or by the chemical concussions which they communicate to the surrounding gases.

Fig. 4.—Enlarged View of Arms Carrying Emery Wheels.

even glass heated below the red, or an organic matter, wood, paper, &c., in a state of slow combustion. The products of any flame whatever, with the exception of the flame of pure alcohol, directed upon the

cause the same modification. Among these are hydrochloric and nitric acid, but concentrated sulphuric acid especially shows the phenomenon. It is known that solid dust particles provoke the condensation of

The test suit brought by John W. S. Earnshaw against Collector Cadwalader, of Philadelphia, to recover alleged excess of duties on imported iron ore, is to be carried to the United States Supreme Court on appeal from a verdict rendered against the plaintiff, and on Tuesday the motion for a new trial was withdrawn. The suit involves the question of allowance for moisture in assessing the duty on imported iron ore.

A scheme is on foot to connect Perth Amboy and Staten Island with a bridge, to be built across the Staten Island Sound, and steps have been taken to put it in more definite shape by applying to the next Legislature for the passage of a bill the general object of which is to authorize the erection of a bridge across the Kill von Kull, to project from a point in Middlesex County at or very near Perth Amboy, to a point opposite in Staten Island, in Westfield, Richmond County. The capital to be expended will be \$1,000,000.

The Kunstädter Steering Screw.

We were given an opportunity last week of examining the Kunstädter screw steering and propelling apparatus, which is at present being completed at the Vulcan Iron Works, at Jersey City, for the new Boston fire-boat, together with the engines and boilers, which latter, we may remark here incidentally, are of a novel type of water-tube design. Having illustrated and described the Kunstädter screw, as applied to the Navy-Yard tug Nina, in our issue of August 6, 1885, it is scarcely necessary for us to go into the matter in detail here. We will simply repeat briefly that Mr. Kunstädter arranges two screws in line with each other, one behind the other, the steering screw, so-called, being on a separate piece of shafting, which is connected to the main shaft by a universal joint, enabling the steering screw, which is mounted aft, to be turned either to starboard or to port up to an angle of 45°, and thus adding its influence to that of the rudder in turning the vessel. The rudder itself may accordingly be made much smaller than is ordinarily the case without in the least detracting from the superior maneuvering capacity of the ship. The universal joint has several features of excellence and some advantages which are not found in the device as ordinarily constructed, special precautions being adopted to prevent working loose of the pins.

In the case of the Boston boat the screws are of the same diameter, but different pitch, and the rudder extends behind the steering screw. In this respect the arrangement differs somewhat from that adopted in the tug Nina, where the steering screw was of considerably smaller diameter than the main propeller, and its separate shaft extended through a sleeve in the rudder, the supplementary screw thus being at the extreme end. It is a noteworthy circumstance that in the case of the Boston boat the propellers, as well as stern frame, are steel castings, having been turned out at Cleveland, and are claimed to be the first of the kind in the country. Facilities had been provided at the Vulcan Works for slowly revolving the screws, thus giving a good opportunity for examination of the working of the apparatus. The fire-boat to which it is to be applied will measure 125 feet along the keel, and the engine will develop 750 horse-power.

Mr. Kunstädter informs us also that the new Hoboken ferry-boat Bergen, which, as is known, is fitted up with triple-expansion engines and a propeller at each end, mounted upon one continuous shaft in place of the customary paddle-wheels, will be fitted up with his screw after a few preliminary trips. Besides adding to the maneuvering capacity of the vessel, the appliance materially augments the speed.

Extraction of Oil from Wood.—Referring to the extraction of oil from wood in Sweden, to which we directed attention some time ago, *La Nature*, in a recent issue, says that it is becoming year by year a more important industry. Those parts of the trees which have hitherto been regarded as useless, such as the stumps and roots, are no longer left in the forest to rot, but are subjected to various methods of treatment, by which not only wood oil, but also turpentine, creosote, acetic acid, charcoal and tar are obtained from them. The oil, as it is now usually extracted, cannot be burnt in ordinary lamps, for it smokes too much. But it may be used in special lamps, which are not dissimilar to the usual photogen lamps. The latter can easily be adapted to wood oil, and when the oil is mixed with a certain quantity of photogen it may be consumed in ordinary lamps. It costs about 3d. per pint; it does not explode, and lasts 25 times longer

than photogen. When intended for lighting it is extracted wholly from pines and firs. Thirty factories in Sweden are said to make its extraction part of their business, and the production is referred to as considerable.

Core Ovens at the Brown & Sharpe Mfg. Company's Works.

Through the courtesy of the Brown & Sharpe Mfg. Company, of Providence, R. I., we are enabled to present on this page engravings representing a general

properly utilized. Cores can be baked well in any part of the oven, and are free from the ashes, smoke and gases of the fire.

The flues and stove are better shown in Fig. 2, and the direction of the draft is indicated by the arrows. The arrangement may be modified according to the position and size of the ovens in which it is used, and it is suitable either for small ovens where only small cores are baked, or for larger ovens where a carriage is used with adjustable shelves, on which cores of any size are placed. The ovens can also be made with the stove at the left of the

Fig. 1.—General View Showing Portion of Interior.

Fig. 2.—Longitudinal Section.

CORE OVEN, BUILT BY THE BROWN & SHARPE MFG. COMPANY, PROVIDENCE, R. I.

view and a section of the core ovens designed by them and made for their own use.

The general arrangement of the ovens is at once apparent from Fig. 1. In several respects it is decidedly superior to the common oven with a fire-pit in one corner. The distinctive feature is a rectangular cast-iron stove or flue or smoke-box, which is connected with the fire-box, and runs inside the oven, back and forth, in several tiers along the sides and across the end, thoroughly distributing the heat, and forming a series of shelves upon which core plates can be placed. There is a damper near the outer end, and the flue is connected with a chimney where there is a good draft. The stove is similar to the fire-box of an ordinary horizontal boiler; a light fire can be carried, and the fuel

door, or arranged for using two stoves, either one or both being employed as desired. The dotted lines in Fig. 2 represent the parts that may be shortened or lengthened as required by the length of the oven. A number of the leading locomotive and machine-tool builders are using the Brown & Sharpe oven, and pronounce it satisfactory.

Judge Cooley says he does not think that any part of the Interstate law will be repealed. On the contrary, some of its provisions may be made more stringent. He called the attention of railroad men at Chicago to the fact that rate cutting, the payment of commissions, &c., were all violations of the Interstate law, that could, upon conviction, be punished by the infliction of a fine of \$5000 for each offense.

A New Automatic Engine.

We present on this page an engraving of a new automatic engine brought out by John Ramming, 304-306 S. Main street, St. Louis, Mo.

The bed is a combination of the box and girder type, possessing strength and rigidity, together with compactness. The pillow block is fitted up with a heavy phosphor-bronze shell, and gun-metal quarter boxes partly filled with babbitt metal, and has convenient adjusting facilities. The length of the connecting rod is calculated on a basis of three times the length of the stroke of the engine, and is fitted up with stub ends and gibs, and keys of such proportion as to admit the use of wrist-pins of a diameter of more than one-fourth the diameter of the cylinder. The crosshead has its wrist-pin in center of bearings. The cylinder has short steam passages and a large exhaust port, and is bolted direct to the end of the

The cylinder is covered with a heavy sheet-brass jacket, and the cylinder head and steam chest have polished nickel-plated covers. The engine is claimed to be economical, and is made in sizes from 30 to 300 horse-power.

The Federation of Labor.

The third annual National Convention of the American Federation of Labor was held in St. Louis, the president being Samuel Gompers, who was formerly a leader among the cigarmakers. This new organization of trade unions, which conducts its operations quietly, but without secrecy, has, within two years, risen to proportions of vast magnitude in the United States. It is now numerically the strongest labor organization in the world. According to a report recently issued from headquarters there are over 3000 local unions in affiliation with it, and its total

Coal Miners' Protective Association, Horse Collar Makers' National Union, Tailors' National Progressive Union, Furniture Workers' National Union, American Flint-Glass Workers' Union, Granite Stonecutters' National Union, Iron Molders' National Union, Amalgamated Association of Iron and Steel Workers, Journeymen Barbers' National Union, Metal Workers' National Union, Brotherhood of Painters and Decorators, Shoe Lasters' National Union, Custom Tailors' National Union, Textile Workers' Progressive Union of North America, International Typographical Union, Umbrella, Pipe and Cane Workers' Union of America, and the Wood Carvers' National Union.

Some of the titles in the foregoing list represent a very large membership. The Brotherhood of Carpenters has 53,000 enrolled members in 445 cities; the Iron Molders' Union has 28,000 members; the Cigarmakers' Union has 28,000; the Amalgamated Association of Iron and Steel

NEW AUTOMATIC ENGINE, BUILT BY JOHN RAMMING, ST. LOUIS, MO.

engine bed. A false head, which acts as a packing chamber for the piston-rod on the outside and for a cylinder centering-piece inside, is forced into a bored opening in the end of the bed. The cylinder is finished on the bottom, and rests on a planed extension-piece which supports the full length of the cylinder. Automatic segmental cast-iron piston packing of improved design is used in the cylinder. There are two main valves and two cut-off valves of simple balanced design worked by two eccentrics with wide wearing surfaces. The governor is especially designed to meet the requirements of this style of valve, and is very sensitive to changes of speed. It can be adjusted to any required speed while the engine is running. This engine, owing to the construction of the valves, is claimed to give full opening for the admission of steam at a valve travel of $\frac{1}{4}$ inch. The engines can be run at high speed.

Special attention is called to the fact that there is not a single spring used of any kind in connection with the governor or valves. All wrist-pins, piston and valve-rods are of steel. The connecting-rod and engine-shaft are hammered iron.

membership runs as high, in round numbers, as 635,000. It is organized on the principle of the independence of the trade and labor unions belonging to it. Each of them retains the right of managing its own affairs without interference, and the Federation merely deals with those general questions in which all of them are interested, and upon which united action is considered desirable. Its assessments are very light; it has but few officers. Their powers are very restricted, and it has not yet suffered from secessions, bickerings, or the ambition of its leaders. The dues of its members are but $\frac{1}{4}$ cent per month, or 3 cents per year, and the wages of its president are but \$100 per month. Upon its roster of unions are to be found such diverse trades as these:

Bakers' National Union, International Boiler Makers' Union, Cabinet Makers' National Union, Beer Brewers' National Union, International Boatmen's Union, National Union of Coopers, German-American Typographia, Brotherhood of Carpenters and Joiners, Cigarmakers' International Union, National Federation of Miners and Mine Laborers, Miners and Mine Laborers' Amalgamated Association,

Workers has over 35,000; the Journey men Bakers' National Union, 19,000; the Federation of Miners, 25,000; the International Typographical Union, 35,000, and so on to the end of the chapter. Many of these organizations have well filled treasuries, and expend large sums annually in the maintenance of their various benefit features. The American Federation is an outgrowth from several old bodies, which were vigorous in their time, but which had objectionable features that have been carefully removed from the present organization. It was as far back as 1866 that the National Labor Union Congress, formed here in imitation of the British Trade Union Congress, was held, but it was split to pieces on the rock of party politics. It was not until 1886 that the American Federation in its present form, which is non-political, was successfully established, and it is since that time it has expanded into the proportions here spoken of.

During a recent trial trip on Delaware Bay the dynamite cruiser Vesuvius, under forced draft, developed a speed of 21.47 knots per hour. The contract calls for a speed of only 20 knots.

The Kansas City Bolt and Nut Works.

The works of the Kansas City Bolt and Nut Company, of Kansas City, Mo., are now running and ready for orders of any kind in their line, having just been completed. This company was incorporated April 6, 1888, and the construction of their plant has been pushed with remarkable vigor to get it into operation so soon. The directors of the company are J. H. Sternbergh and Philip Sternbergh, of Reading, Pa., and J. C. Howes, Hillery Missemmer and Horace A. Keefer, of Kansas City, Mo. J. H. Sternbergh is president, J. C. Howes is vice-president and treasurer, and Hillery Missemmer is general manager and secretary. The capital stock of the company is \$200,000. The works are located four miles east of the business center of Kansas City on the lines of the Missouri and Pacific Railway, the Kansas City and Southern Railway and the Kansas City, Independence and Park Railway. Through the connections of the Missouri Pacific and the Belt Line railways the works are enabled to receive freight and make shipments over all the roads entering Kansas City.

The plant of this company embraces a rolling mill, 90 x 120 feet; spike and nut forging shop, 41 x 100 feet; bolt and washer shop, 40 x 100 feet; machine shop, 40 x 30 feet; burring and tumbling shop, 40 x 70 feet; threading department, 41 x 100 feet, and the necessary engine-house, warehouse and other buildings of a less important character. The rolling mill is fitted with a six-door regenerative gas-heating furnace of the newest type, with a working hearth 7 feet by 18 feet, supplied with gas from two of the Swindell Construction Company's latest improved gas producers. For the present the iron made will be rolled on a 10-inch train. The castings, rolls and other parts of this train were made from new patterns especially for this mill. The capacity of the mill when in good working order will be 20 tons of merchant bar, nut and bolt iron daily. The bolt, nut and spike departments are supplied with machinery and tools of the most improved patterns. The iron in these departments is heated with crude oil on the Aerated Fuel Company's system, the quality of the work thus being greatly improved as compared with the results from the use of coal, while the iron is also entirely free from scale and other defects.

The company will manufacture a great variety of bolts and nuts, washers, rivets, railway spikes, and also splice bars and merchant bar iron. They will make a specialty of the Harvey patent grip track bolt, the patents for which they own. They occupy a very excellent location at Kansas City to secure an important share of the trade of the West in the lines in which they have embarked, and, as the company's officers are men of long experience in this particular branch of manufacture, a bright future seems to be assured. Their success will have great influence in determining the future movements of other manufacturers who are now canvassing the advantages of various Western points with a view to the erection of works nearer their customers.

The Baldwin Locomotive Works, of Philadelphia, are approaching the close of a year of extraordinary prosperity and activity. From January last to the present time they have delivered 654 new locomotives. This is the largest production in any year since the works have been in existence. In 1887 for the entire year the works delivered 653 locomotives; this year, by the time it closes, they will have delivered over 700. The contracts have

included 50 locomotives for the Pennsylvania Railroad Company and 60 for the Philadelphia and Reading Railroad Company. Five locomotives have been shipped to the Dom Pedro Segundo Railway Company, in Brazil, and 30 to the Provincial Railway Company, of Buenos Ayres. Mr. John H. Converse, of the firm of Burnham, Parry, Williams & Co., says that the

Compound Ide Engine.

The Foundry and Machine Department of the Harrisburg Car Mfg. Company, at Harrisburg, Pa., are building for Messrs. John Post, Jr., & Co., of Boston, an Ide compound engine. It is intended, we understand, for the Plymouth Electric Light Company, of Plymouth, Mass. The nature

Fig. 1.—Sectional Plan.

COMPOUND IDE ENGINE, BUILT BY THE FOUNDRY AND MACHINE DEPT OF THE HARRISBURG CAR MFG. CO., HARRISBURG, PA.

large demand for locomotives is mainly attributable to the prosperous activity of railway traffic throughout this country and South America.

The Asylum street bridge of the New York, New Haven and Hartford Railway was tested last week and showed a deflection of only $\frac{1}{4}$ inch of the main girders under a load of 355,980 pounds, returning to position when the load was taken off. The span is 77 feet. The bridge was built by the Berlin Bridge Company, of Berlin, Conn.

of the design will be understood from the elevation and plan which we give.

The simple Ide automatic engine as originally brought out, and subsequently improved, we have illustrated and described in previous issues, and need, therefore, not enter into all the details of construction of the present form. The high-pressure cylinder is provided with the Ide automatic cut-off governor, and steam will be cut off in it at one-third stroke. The low-pressure cylinder will cut off positively at one-third stroke, the proportions being such that each engine will do an equal amount of work. The low-pressure cut-

off, however, is adjustable. The cranks are placed at an angle of 90°, which insures more uniform motion. The connection between the two cylinders is made flexible, so that expansion will not disturb their alignment. The connection between the two engines is also very direct, and makes a receiver of sufficient capacity to admit of an initial pressure in the second cylinder about equal to the final pressure in the first. The exhaust in neither case passes through the valve, but is provided at each end of the valve for exhaust. Steam is taken in the center, so that the heat of the live steam is not so readily conducted to the atmosphere by the exhaust, or, in case of condensing, to the condenser. The connection between the two cylinders is protected by non-conducting material, and covered with a jacket. The latter is allowed to be free at one end, so that there

1887, and brought the total freight tonnage for the season to December 1 up to 6,409,278 tons. This, a Cleveland paper remarks, is doubtless the greatest volume of business which has ever passed through any ship canal in an equal period. It is about the usual tonnage of the Suez Canal for an entire year, showing a monthly traffic twice as great as that of the famous highway opened through the Egyptian sands by Count de Lesseps. The growth of the commerce of the great lakes is wonderful, even in this land of industrial marvels.

The Cameron Iron and Coal Company.

In our issue of last week we made mention of the fact that the new blast furnace of the Cameron Iron and Coal Company, at Emporium, Pa., had been put in blast.

Fig. 2.—End Elevation.

COMPOUND IDE ENGINE, BUILT BY THE FOUNDRY AND MACHINE DEPT.
OF THE HARRISBURG CAR MFG. CO., HARRISBURG, PA.

will be no resistance to expansion and contraction.

The two engines are securely doweled and bolted to a base-plate, with a planed surface. This plate is allowed to project a trifle on both ends of the engine. It can be put upon the foundation, and, with the use of straight-edge, can be brought properly into line. The projections on the end enable examination at any time, to determine whether it has been drawn out of line. The engines may therefore be dismantled, shipped separately and erected without liability of getting them improperly set up. Both cylinders, as shown in Fig. 2, are provided with the Ide safety caps, in which the cylinder condensation water accumulates, and which will give way before any serious strain can come on the cylinder heads. When broken, they can be easily replaced. The cylinders measure 10 and 17 inches in diameter, and have a 14-inch stroke. The engine will run at a speed of 240 revolutions per minute.

The last month of any considerable traffic through the Sault Ste. Marie Canal showed a gain of 105,000 tons over November,

We have since received from Joseph Hunt, general manager of the firm, some additional advices regarding the new furnace. "The furnace just blown in was built by the Cameron Iron and Coal Company, at Emporium, to consume the coal on their property, and, incidentally, to also use such carbonate ores as they may mine, there being, from the developments made, indications of a large amount on the property and contiguous to it in this coal basin. We have located the furnace at Emporium, as it is at the junction of the Western New York and Pennsylvania Railroad and the Pittsburgh and Erie Railroad, thus securing easy access to the Eastern and Western markets, and also Buffalo and the New York State markets. The furnace was erected under my design and supervision, by Riter & Conley, of Pittsburgh. It is 16 feet at the bosh and 75 feet in height, and has three fire-brick stoves, each 18 x 70 feet, of Taws & Hartman's latest design. We have 1000 horse-power of the Heine safety boiler, built by J. P. Witherow, of Pittsburgh, and two blowing engines, with a new and excellent type of steam valves, allowing a large change in cutting off steam. Each engine has a 5-foot stroke,

42-inch diameter steam cylinder and 84-inch blast cylinder. The engines were built by the Scott Foundry Department of the Reading Iron Works, at Reading, Pa. Our hoist is worked by a 12 x 12 double-cylinder engine, built by the Crane Mfg. Company, of Chicago. The cast house is of brick, 150 x 50 feet, and stock house, now building, by Riter & Conley, of Pittsburgh, is of wrought iron, 75 x 192 feet. We expect to use our own coal, and are now erecting 100 coke ovens for that purpose. Our ores will be brought from the Lake Superior region, Wayne County, N. Y., and Centre County, Pa., and will be used in conjunction with our local carbonates in the manufacture of foundry irons. It is the intention of the company to increase the plant as the business justifies, and the anticipation is that finally four furnaces will be built, and I have laid out the plant with that in view. We have been in operation since the 30th ult., and trust to show creditably in the market ere long."

The Heroult Aluminium Process.—

The Heroult process for the production of aluminium, though electrical, differs from that of Messrs. Cowles Brothers in being, in the main, electrolytic. The furnace has a carbon pole at the top and the current passes through it and down through the melted aluminium oxide to an electrode of molten aluminium at the bottom of the furnace. As the above takes place the aluminium oxide is decomposed, the oxygen passing upward and combining with the carbon block, while the molecules of aluminium pass downward and are merged in the bath of molten metal. The furnace is a carbon block hollowed out to a suitable shape and surrounded by an iron frame. There is an opening in the bottom of the furnace for drawing off the reduced aluminium. The distance of the upper carbon electrode from the aluminium is regulated by an attendant and is kept as small as possible. The ore generally used is alumina and the process is a continuous one, but can hardly be considered as any very great advance on previous methods, as on an average 15 horse-power hours are required for the production of 1 pound of the metal. Works have been erected at Neuhausen, Switzerland, for carrying out the process on a commercial scale, the power required being furnished by a turbine of 300 horse-power.

Rust-Proof Wrapping Paper.—A new method for preparing paper for wrapping metallic articles to prevent tarnishing, says an exchange, consists in incorporating with the paper or applying to its surface a fine powder of metallic zinc in such a manner that it will adhere, so that when silver, copper, brass, or iron articles are wrapped in the paper they will be preserved from rusting or tarnishing by reason of the mere affinity of the zinc for sulphureted hydrogen, chlorine or acid gases or vapors, and preventing them from rusting or tarnishing the metallic articles wrapped in such paper. This is done by sifting on the sheet of paper pulp, while it is in the process of manufacture, and before it is pressed and dried, a metallic zinc powder, known in commerce as blue powder, in convenient quantity, about to the extent of one-half the weight of the dried paper. The paper is then run between the press rolls and over the drying cylinders in the ordinary manner. The zinc powder will adhere to the paper and be partly incorporated with it in greater or less quantity, as the sheet of paper pulp is more or less thick or more or less wet. The paper may also be sized with glue or starch and then dusted with the zinc powder, or the zinc powder may be mixed with the size or starch, and then applied to the surface of the paper by well-known methods.

The Victor Radiator.

Among the new forms of radiators for steam and hot water recently put on the market is the Victor radiator, offered to the trade by the Kelly & O'Hara Mfg. Co., 160 Broadway, New York, the radiator being the joint invention of Mr. Patrick J. Kelly and Mr. Thomas W. O'Hara. A general view of the double-loop radiator is shown in Fig. 1, while a sectional view of one of the loops is presented in Fig. 2, the latter illustrating by arrows the course of the steam. The radiator is constructed in sections, each consisting of one or more inverted U shaped tubes and a hollow base, the interior of the latter being divided into compartments, corresponding and connecting with the ends of the tubes. Each loop is cast in one piece, and the loops, we understand, are capable of being so joined together that either steam or hot water may be circulated through them in a di-

rect and continuous current. The steam, as shown, passes up one channel, down the middle, across the bottom, up the right-hand side and finally down again on the outside, and passes into the next section through the opening shown at the lower right-hand corner. In the next section the direction of the current is exactly the reverse, and the steam passes on to the third section from the opposite lower corner, the connections between the loops being at alternate corners. By referring to Fig. 1, it will be seen that the flow and return pipes are connected at diagonally opposite corners of the radiator. The claims made for this apparatus are that it secures a continuous and perfect circulation of the heating agent. Provision is made for collecting and carrying off the water of condensation by channels through the base, by which means it is prevented from flowing or obstructing the course of the steam through the tubes. The radiator illustrated consists of unornamented tubes, 2 inches square, set diamond-wise in direct rows. The sections, or loops, are connected together at the bottom by long bolts extending the entire length of the

Chicago Shippers and Pooling.

Shippers and business men generally in Chicago have conferred with reference to the proposed establishment of railroad pools, and, while there are some differences

no undue advantage over him, and business will seek its natural channels. The Interstate Commerce law could certainly be amended in many particulars where its operation is against the roads, which, on account of the local traffic, are prohibited from competing for through traffic. Whether an amendment sanctioning the formation of pools would cover this case is difficult to say. Under certain conditions it might do so, but the conditions would need to be tightly drawn and unbreakable." To the same effect is the statement of John V. Farwell, head of the house of John V. Farwell & Co., in which Senator Farwell is a partner, viewing the situation philosophically. "Rate cutting between opposing railroads is merely the natural adjustment of rates which have for some reason or other become excessive or disorganized," said he. "The public generally does not suffer much by it, but on the other hand the advantage is so slight it is

Fig. 1.—General View of Radiator.

Fig. 2.—Sectional View of Loop.

THE VICTOR RADIATOR. THE KELLY & O'HARA MFG. CO., BROADWAY, NEW YORK.

rect and continuous current. The steam, as shown, passes up one channel, down the middle, across the bottom, up the right-hand side and finally down again on the outside, and passes into the next section through the opening shown at the lower right-hand corner. In the next section the direction of the current is exactly the reverse, and the steam passes on to the third section from the opposite lower corner, the connections between the loops being at alternate corners. By referring to Fig. 1, it will be seen that the flow and return pipes are connected at diagonally opposite corners of the radiator. The claims made for this apparatus are that it secures a continuous and perfect circulation of the heating agent. Provision is made for collecting and carrying off the water of condensation by channels through the base, by which means it is prevented from flowing or obstructing the course of the steam through the tubes. The radiator illustrated consists of unornamented tubes, 2 inches square, set diamond-wise in direct rows. The sections, or loops, are connected together at the bottom by long bolts extending the entire length of the

of opinion, the general sentiment is believed to be decidedly against their restoration. To meet the exigency caused by persistent rate-cutting certain amendments to the Interstate law are proposed, which Senator Cullom believes will receive the favorable action of Congress. They provide for giving three days' notice by railroads of an intention to lower rates, inflict heavy punishment upon shippers who underbill goods, and also make provision for the more speedy settlement of cases in court arising from a violation of the Interstate law. These amendments, it is said, were suggested by the Chicago Freight Bureau, which has 220 members, of whom one is the local Board of Trade. Among prominent firms expressing an opinion is that of Hibbard, Spencer, Bartlett & Co., wholesale hardware, who take the ground that "railroad wars are the result of competition carried to excess, and, like everything else which is overdone, are injudicious. An agreement between certain roads connecting the same points—say, for example, Chicago and St. Paul—is a benefit to the business community. A shipper then knows his competitor in business has

hardly worth mention. Business is certainly interfered with by this element of uncertainty, and a low rate, allowing a fair profit to railroads and breathing space to business men, would be better than any pools or combinations among railroads." Many other opinions of leading houses coincide.

Lake Copper Shipments.—The various Lake Superior copper mines have shipped refined copper as follows by lake during the season just ended:

	Pounds.
Calumet and Hecla	36,588,086
Atlantic	2,892,135
Allouez	50,000
Central	1,278,388
Tamarack	6,279,442
Osceola	2,321,626
Franklin	2,400,342
Huron	1,575,666
Quincy	4,541,569
Kearsarge	571,011
Copper Falls	975,036
Evergreen Bluff	26,888
Hilton	15,423
Ridge Copper Co.	50,806
Other tributors	7,797
Total	59,574,066

THE WEEK.

A consolidation of Southern timber interests has been formed which is said to control nearly all the timber cut on the South Atlantic Coast. The Southern Pine Company, recently formed, and the consolidated companies of Darien, in Georgia, are both under the presidency of Capt. J. H. Hilton, of New York.

Maine is no longer the "Pine Tree State," the cut of spruce being four times the output of pine, which has nearly disappeared, excepting far north, where Canadian and Western pine comes in competition.

Salt Lake City shipped, during a single week in November, 75 carloads of lead and copper ores, iron, slag and bullion, and the weekly receipts of late vary from \$90,000 to \$155,000 in value.

Four street railway lines in St. Louis have been purchased by Chicago capitalists for \$3,600,000.

Two more private tests of the new process known as electric sugar refining have been made. The crystals made are entirely different from any other. While some in the trade will "not be surprised to find it is all it claims to be," this opinion is not shared by all alike.

The Haytian Consul-General, Mr. Bassett, has been recalled. No reason assigned. Cuthbert Singleton is Consul *pro tem*.

Eleven iron bridges will be substituted for wooden ones on the New York, Providence and Boston Railroad, at a cost of about \$90,000.

President Gompers, of the American Federation of Labor, in his address before the Convention, at Cleveland, denounced Master Workman Powderly, and referred, in an unfriendly spirit, to the attitude of the Knights of Labor toward trades unions.

The police census of Albany makes the population 103,000.

Japan and Mexico have mutually signed a treaty of amity and commerce, through their respective ministers at Washington.

The competition of rival American-built railways in Mexico has induced heavy cutting of rates on European merchandise, to the detriment of export interests in the United States, and especially harmful to American manufacturing interests.

The Chicago Opera House, a supposed fire-proof structure of imposing appearance, caught fire from a calcium light and the interior was burned out, at a cost of \$50,000.

The officials of the Chicago, Burlington and Quincy Railroad Company adhere to their determination to make no vacancies among their new men in order to restore old men who struck.

The origin of cotton fires, which occur so frequently on "tramp" steamers, while they are comparatively rare in the coasting trade, forms the subject of a treatise by the president of a leading marine insurance company in Philadelphia. In consequence of this frequency insurance premiums have nearly doubled within a year in risks on cotton shipped from Atlantic ports to Liverpool, representing a sum equal to about \$1,250,000, which falls mainly on planters at the South. It is remarked that on steamers running coastwise loaded with naval stores and miscellaneous material, more combustible than cotton, only a single fire has occurred within about six years. The inference is that cotton fires on ocean tramps are of incendiary origin and the motive is assumed to be a desire to profit at the underwriter's expense. One remedy suggested is to insert in all charter parties and bills-lading a condition that in case of

fire aboard ship the underwriters shall have absolute control over the cargo.

It is stated that the docks and buildings of the Storage Company, at Girard Point, valued at over \$4,000,000, will be sold under foreclosure, and that the Baltimore and Ohio Railroad Company will bid for the property in sharp competition with the Pennsylvania Railroad Company, which holds many of the bonds.

A mammoth furniture factory is to be established at Little Rock, Ark., by citizens of Grand Rapids, Mich., and efforts are making to attract others from Northern points.

Thomas Longmore, pipe and tube manufacturer, of Walsall, England, who has been in Pittsburgh several days studying the American method of manufacturing pipe, has engaged two practical workmen to go to England, and intends to have improvements introduced in his works similar to those in this country.

The riotous scenes in Birmingham, Ala., last Saturday week are said to have cost merchants in that city \$250,000 as a consequence of the interruption of trade.

The annual report of the Chief of Treasury Special Agents shows a continued and remarkable increase in the amount of dutiable merchandise shipped without appraisement from ports of first arrival to ports of final destination under the Immediate Transportation act of 1890. The aggregate invoice value of merchandise forwarded in this way for each year since the system was established has been as follows:

1881.....	\$14,519,000	1885.....	\$25,860,000
1882.....	21,440,000	1886.....	29,255,000
1883.....	26,283,000	1887.....	37,017,000
1884.....	27,896,000	1887.....	38,929,000

The dutiable value of merchandise handled in this way has increased with even greater rapidity, rising from \$6,604,000 in 1881 to \$21,218,000 in 1888. The original entry of more than two-thirds of the importation has been at New York and the final delivery of more than one-fourth has been to Chicago, with Philadelphia, San Francisco, Cincinnati, St. Louis and Boston following in the order given.

The Boston Exchange is about to erect a ten-story building, to be occupied in part by banking and trust companies. It will have a frontage on State street of 171 feet. Peabody & Stearns are the architects.

The imports of raw sugar at this port have vastly diminished since the formation of the sugar trust. As there are no other buyers of any consequence, holders of sugar are compelled to accept such prices as may be offered in the absence of competition.

The total New York investments in Panama Canal stock are said not to exceed \$500,000. The canal dredgers from New York claim to be amply protected by collateral.

The President elect, General Harrison, signifies, in response to an invitation from the committee, that he will probably be able to participate in the Centennial Celebration of the Inauguration of George Washington as President of the United States, to take place in this city, April 30, 1889.

The American contractors who have entered into engagements with the Government of Chili for extensive railroad building in that country have already made a beginning of that work. More than 600 miles of railroad must be finished within five years, and the most important branches or laterals in a shorter time. The latter penetrate spurs of the mountainous range parallel with the seacoast to directly connect the interior with the several ports

on the seacoast. The agreement permits the importation of 1000 skilled artisans and a much large number of common laborers if the local resources prove inadequate. Large quantities of bridge material must also be imported, besides rolling stock, costing altogether some \$3,000,000 or \$4,000,000. The president of the South American Construction Company, as it is called, is Gen. G. S. Field, formerly at the head of the Union Bridge Company, which built the cantilever bridge at Niagara Falls and the structure across the Hudson River at Poughkeepsie. The vice-president is Col. Newton D. Lord, the resident representative of the company in Chili, and Frederick Leach is the chief engineer of construction. The contract is for the building of bridges, stations, machine shops, and everything complete for operation.

The Missouri Pacific has practically abandoned its shops at Sedalia, Mo., since the road went into the hands of a receiver, and new ones are now to be built at Atchison, Kan. The city votes \$100,000 for the purpose.

The North German *Gazette* contends that the Empire must support the German Trading Company in its conflict with the Arabs in East Africa, on the ground that all foreign traders on that coast will derive advantage from their success.

An American company has obtained from the Mexican Government concessions for the introduction of water, fuel and gas into all the cities and Government buildings throughout the Republic.

Three Canadian Pacific steamers, together carrying 5,250,000 pounds of tea and 760 bales of silk, besides general cargo, have lately arrived at Vancouver after about 14 days' average passage from Yokohama. A single steamer makes the coast connections.

The Charleston Cotton Exchange is of the opinion that with new and improved machinery the manufacture of pine-straw bagging will become one of the most profitable industries in the South.

A convention representing every Southern State passed resolutions, at Montgomery, 13th inst., designed to attract Northern immigration, mechanics and laborers, men of energy and enterprise, to engage in manufacturing and in other ways develop the immense resources of that part of the United States.

It is understood that a large contract for firearms made in this city on account of the Legitimate Government in Hayti is being filled at the rate of 1000 stand by each semi-monthly steamer.

The Polytechnic Institute in Brooklyn has purchased the old Dutch Church, on Joralemon street, for \$325,000, and will probably build an extension.

Since the establishment of a course in electrical engineering at Tuft's College, in Boston, the accessions to the number of students in that department is so large that ample material is at hand for building up a flourishing technical school.

The window-glass factories have increased so rapidly in the West that efforts are making to form a pool to control production.

The entire sum of \$11,500,000 has been subscribed for the contemplated Merchants' Bridge, at St. Louis, and contracts will soon be made.

Among the Departmental Decisions for October and November, announced by J. Johnson, of the Canadian Customs Department, is one that the rate on galvanized wrought-iron tubing over 2 inches in diameter is 30 per cent. ad valorem.

MANUFACTURING.

Iron and Steel.

The Keystone Iron Works, Limited, of Reading, Pa., closed down their entire plant on the 1st inst., on account of a lack of orders. In the meantime repairs are being made, which will take about one month to complete.

The new steel plant of the Phoenix Iron Company, at Phoenixville, Pa., was completed on the 12th inst., and the final test of the engines and roll train was made on the morning of the 18th inst. Engineer John Ferguson, of Pittsburgh, was in charge of the work of erecting and testing the engines. These engines weigh 370,000 pounds, and the roll trains weigh 400,000 pounds. The engines have 2000 pounds pressure, and the plant is expected to turn out steel suitable for armoring cruisers for the Government and for making steel guns of any caliber. The plant was put in operation on Monday, the 17th inst., for the purpose of working down the bearings.

The blast-furnace employees of the Mahoning Valley, Ohio, have received an advance of 10 per cent. in their wages, taking effect on the 1st inst. The advance was voluntary on the part of the operators.

The new Soho Furnace of the Moorehead-McCleane Company, at Pittsburgh, which was put in blast on November 15 last, is turning out about 225 tons of foundry pig iron per day. This is a larger output than was anticipated for it by the owners.

The report that the National Tube Works Company, of McKeesport, Pa., had purchased the plant of the Alikanna Rolling Mill, near Steubenville, Ohio, is officially denied by that company.

The South Chicago rail mill of the North Chicago Rolling Mill Company will be kept in operation through the winter, and will probably not stop for repairs until March or April, to avoid tearing up in cold weather.

The Union Steel Company, of Chicago, have on exhibition in their office a very handsome specimen of the steel from which they manufacture rails. It is in the shape of a piece of a 70-pound rail, of the Rock Island section. It is 14 inches long and beautifully polished, with not a flaw in its surface, and was planed from an ingot which had not been annealed.

The Scranton Steel Company, Scranton, Pa., on Thursday night, December 13, bloomed 401 ingots in one turn of 12 hours, being idle one hour of the time changing rolls.

The Glamorgan Company, of Lynchburg, Va., are now building another cast-iron pipe foundry, with a daily capacity of 20 tons. They will run on 8-inch, 10-inch, 12-inch, 16-inch and 18-inch sizes, and hope to be ready for work early in the new year.

Blanche Furnace, of the Etna Iron Works, at Ironton, Ohio, was lighted up on Saturday, the 8th inst., and on the following Tuesday the cast of six beds of iron was very satisfactorily and successfully made. The furnace is now working very satisfactorily on native and Missouri ores, and Fire Creek and Connellsville coke.

Belmont Furnace, of the Belmont Nail Company, at Wheeling, W. Va., produced 3400 tons of Bessemer pig iron last month.

The Suburban Wheel Mfg. Company, recently organized at Pittsburgh by capitalists of that city, have decided to locate

their plant at Bissell, on the Baltimore and Ohio Railroad, about 20 miles from Pittsburgh. It is expected that work on the new buildings will be commenced in a short time.

The 24-inch department of the plant of the National Tube Works Company, at McKeesport, Pa., which closed down several weeks ago on account of a falling off in the demand for that size of pipe, has again resumed operations.

One of the blast furnaces of the Glendon Iron Company, at Easton, Pa., which has been undergoing repairs for several weeks past, was blown in last week. Two more idle stacks belonging to the same firm are being prepared for blast.

The new pipe mill of the Reading Iron Works, at Reading, Pa., which closed down several weeks ago, has again resumed operations.

Three-quarters of the large iron ship-building plant of the Globe Iron Works, in Cleveland, was destroyed by fire on the 8th inst. The burned portion of the shipyard was 700 feet in length and 50 feet in width, and it contained \$100,000 worth of valuable machinery. Valuable models and drawings, the accumulation of years, were ruined. Four large steel vessels in process of construction were saved from damage. The loss is approximately fixed at \$200,000, and it is probably covered by insurance. The rebuilding of the plant will begin as soon as the insurance is adjusted.

Stack No. 5, of the Allentown Iron Works, at Allentown, Pa., was blown in on Monday, the 10th inst., after being re-lined, and otherwise thoroughly repaired. The stack was blown out for repairs about a month ago. There are now two stacks in blast. The furnace property has been transferred to the Allentown Terminal Company, by whom it was purchased six weeks ago. As soon as the transfer was made George F. Baer, of Reading, was elected president, and Mr. Alfred Broden, superintendent of the Coal and Iron Company's furnaces, was chosen general manager of the Allentown Iron Company.

At a recent meeting of the directors of the Catasauquus Mfg. Company, of Catasauquus, Pa., Mr. James W. Fuller, of that place, was elected to fill the vacancy caused by the death of Mr. Fisher Hazard, of Mauch Chunk, who had been a member for many years.

The statement was made in our last issue that the Chicago Crucible Steel Casting Company had been obliged to tear out their steel melting furnaces because they had found the system on which the furnaces were constructed to be a failure. The designer and builder of these furnaces is J. Zellweger, of 162 La Salle street, Chicago. He controverts the assertion of the company and denies that his system of gas producers is a failure. Their unsatisfactory performance at these works was the result of experiments made against his advice, and through which the furnaces were overheated and burned out. In defense of his furnaces he cites their satisfactory use for various industrial purposes at the Joliet Steel Works, the works of the Ajax Forge Company, the Fowler Steel Car-Wheel Company's works, the Atkinson Car-Spring Works and the factory of the Elgin Watch Company. The last-named company have used these furnaces since 1881. Mr. Zellweger is now putting in his third order for furnaces for the Ajax Forge Company. These facts are mentioned in simple justice to Mr. Zellweger, as his furnaces are known to have been adopted by the steel casting company, and it might be presumed by those not familiar with his gas-producing system that its success had not been demonstrated anywhere.

Machinery.

On Thursday, the 18th inst., a charter was issued to the Altoona Mfg. Company, of Altoona, Pa., with a capital stock of \$100,000. The stockholders are: W. A. Green, John Lloyd, E. T. Kerns, George P. McCullom and G. W. Stratton, of Altoona, and John Reilly, of Philadelphia. The company are authorized to manufacture engines, boilers and cars.

F. D. Buttricks, engineer and machinist, New Haven, Conn., has recently added to his business the making of hardened steel rolls for rolling wire.

The partnership heretofore existing between W. P. Duncan, W. R. Jenkins and J. H. Lingle, trading under the firm name of W. P. Duncan & Co., at Bellefonte, Pa., was recently dissolved by mutual consent, W. P. Duncan withdrawing. The business of the firm will be conducted by W. R. Jenkins and J. H. Lingle, under the firm name of Jenkins & Lingle.

Morse, Williams & Co., Philadelphia, are having erected an electrical apparatus with sufficient power to light their entire manufactory. The lights will be of the incandescent system.

The Betts Machine Company, Wilmington, Del., have recently shipped one of their improved horizontal boring and drilling machines to the Louisville and Nashville Railroad Company, at Decatur, Ala.; one of their 60-inch planers, weight 36,000 pounds, to Wm. Deacon, San Francisco, Cal.; one of their 10 x 16 feet boring and turning mills, 62,000 pounds, to the Bouton Foundry Company, Chicago, Ill., and will ship in a few days two of their heavy frog planers, 60,000 pounds, to the Ramapo Iron Works, Hillburn, N. Y.; one of their 7 x 10 feet boring and turning mills, 34,000 pounds, to Byron Jackson, San Francisco, Cal., and a 48-inch radial drill to Williamsport parties.

The National Pipe Bending Company, of New Haven, Conn., report a large trade for the fall and winter months, over 30 of the National feed water heaters being sold in November. Among the sales were one of 1000 horse-power, two of 500 horse-power, one being for the new electric station in Baltimore, and one to the Cambridge, Mass., Electric Light Station, where over 1000 horse-power of the National heaters are in use. The new Boston Electric Light Station has also just been equipped with the National feed water heater. The coil work for December exceeds that of any month during the year, and they have a large number of orders unfilled.

Contracts were recently awarded to the A. A. Griffing Iron Works, Jersey City, by the Lighthouse Board for furnishing radiators and air valves, and to Amos Aller, of New York City, for automatic traps and swinging check valves. C. H. Delamater & Co., of New York, were also awarded the contract (at \$1850) to furnish a surface condenser for the lighthouse tender Gardenia.

All possible haste is being made in the erection of the new air-brake shops of the Westinghouse Air Brake Company, at Wilmerding, on the Pennsylvania Railroad, about 11 miles from Pittsburgh. The Philadelphia company is laying a new 8-inch gas line to the site, and it is thought that by spring everything will be ready to start. Bad fall weather has delayed work on the building, but already the boiler shop is ready for roofing. The works will be very large, of brick, and the machine shop will be two stories high.

In the course of a few weeks the Butler Mfg. Company, of Butler, Pa., manufacturers of the Ball engines, will have their establishment at that place in full operation. T. M. Shearer is the president and general superintendent; H. S. Gibson, treasurer; O. M. Russell, secretary, and

R. H. Ferguson, general agent. It is the purpose of the stockholders to form a limited company. They have already invested \$22,000 in the plant, and have almost completed one shop 50 x 105 feet, a foundry 40 x 60 feet, and will soon have a blacksmith shop 50 x 100 feet. The Ball engines and boilers were formerly manufactured at Bradford, but Butler's advantages attracted the company, and, although the buildings are not entirely ready, four engines are being made each week.

William Tod & Co., Youngstown, Ohio, have just completed a new brick tool room and stock house, and started two new lathes and a 60-inch Sellers planer. They are also building for their own use a hydraulic press with 10-inch ram, and a very heavy pit lathe for boring and turning large wheels.

The Chase Machine Company, Cleveland, have about completed their new building on Elm street, and they will soon be ready to enter into the manufacture of the Chase fog whistle machine, and do a general jobbing work in their business. The officers of this new enterprise are G. C. Barnes, president and general manager; James L. Chase, vice-president, and J. H. Ball, secretary and treasurer.

Hardware.

J. W. Bookwalter & Co., Springfield, Ohio, announce that they have sold and conveyed to the G. S. Foos Company, of that city, their good-will, stock, patents, patterns and business. The G. S. Foos Company will take immediate possession, and continue the manufacture of the same lines of goods, and will also fill all contracts made with the trade for the coming year by J. W. Bookwalter & Co. There will, therefore, be no change in the business except as to its ownership. The G. S. Foos Company is composed of G. S. Foos, William F. Foos, Robert H. Foos, A. L. Slager and Geo. D. Leedle.

Announcement is made by E. B. Williamson, receiver of the Dodd Mfg. Company, that he will offer for sale at Newark, N. J., the patents of the company for improvements in shutter workers.

The Bromwell Brush and Wire Goods Company, of Cincinnati, Ohio, have been compelled to largely increase their plant, owing to the demand for the specialties they manufacture. Their new additions will be completed in January, when they will be running a full complement of 400 hands. Their capacity for turning out painted wire cloth will thus be largely increased.

Kidd Steel Wire Company, Simonton & Co., sole agents, Pittsburgh, Pa., advise us that they are now manufacturing polished Drill Rods at their factory at Har-marville, Pa. Mr. Kidd, the manager of their factory, has been in the employ of a Pittsburgh rod establishment since his arrival in this country, and previous to that time was employed in one of the large manufactories in England. The rods manufactured by the company are used for twist drills, small taps, reamers, punches, watch parts, dental tools, &c., and are referred to as a superior article. They are drawn to micrometer caliper, and accuracy and uniformity are guaranteed. It is stated that the finest grade of special cast steel imported from Sheffield is used.

The New Haven Wire Goods Company, New Haven, Conn., advise us that they have been in operation since last May, and include among their stockholders Hon. H. B. Bigelow, ex-Governor of the State; Hon. S. E. Merwin, Lieutenant-Governor elect; Frank H. Hooker, of Henry Hooker & Co.; Ely Whitney, Jr., and H. C. Warren. W. C. Perkins, formerly superintendent of the Wire Goods Company,

Worcester, Mass., is superintendent of the company, and Wm. H. Bradley, recently secretary of the Whitney Arms Company, secretary and treasurer. The company have a finely equipped factory with the latest improved machinery, and are prepared at all times to furnish estimates for Wirework of any kind or quantity. They are manufacturing at present a full line of House-Furnishing Kitchen Utensils from Wire, and are preparing additional specialties, which will soon be put on the market.

The Wheeling Hinge Company, of Wheeling, W. Va., recently made a shipment of a carload of bridge irons to Lexington, Ky. This firm make a specialty of this work, and are prepared to furnish, on short notice, any quantity of nuts, bolts, rods and all irons used in the construction of wooden bridges.

The Globe Lock Works, at Norristown, Pa., was completely destroyed by fire on the night of the 10th inst. The company inform us that they have made arrangements to resume manufacturing their goods about the 25th inst., and expect to fill all orders promptly.

Miscellaneous.

Among corporations recently authorized to transact business in the State of Illinois are the following: Indiana Coal and Coke Company, of Chicago; capital, \$150,000; incorporators, D. C. Butts, John Klos and F. A. Holmes. Wyoming Oil and Mining Company, of Chicago; capital, \$1,000,000; incorporators, J. W. Rumsey, T. S. Moffatt and N. M. Harris. Colby Hardware and Electric Company, at Chicago; capital, \$50,000; incorporators, F. K. Biggs, Charles Longbridge and H. L. Forbes. Red Rock Copper Company Chicago; capital, \$300,000; incorporators, Nathan B. Lewis, W. S. Bailey and W. Knox Haynes. Bessemer Spike, Nail and Staple Company, Chicago; capital, \$500,000; incorporators, William T. Egan, W. Eldridge and A. Mitchell. Sheet Steel and Iron Post Company, East St. Louis; capital, \$500,000; to manufacture steel and iron posts; incorporators, Samuel N. Terry, John P. Keiser, Arthur J. Judge and Warwick M. Hough.

During the present week contracts will be let by the Pennsylvania Railroad Company for the building of 1000 gondola and stock cars. It is stated that bids have been received by the company from every car shop in the country for the order. The railroad officials will divide it up among half a dozen different companies, so as to get some of the cars within two or three weeks. All of the cars will be of a carrying capacity of 60,000 pounds each, and will be pressed into service as soon as made. They will be scattered to different points along the Pennsylvania lines west of Pittsburgh. The box cars will cost on an average of \$450 each, and the gondolas about \$285 each.

The Fort Payne Coal and Iron Company have been organized with Hon. D. H. Goodell, Governor-elect of New Hampshire; Hon. Henry B. Pierce, of Boston; Hon. Selden Connor, ex-Governor of Maine; Hon. Joseph W. Spaulding, of Portland, Me.; Hon. F. G. Jillson, of Providence; Horatio Adams, of Boston; W. J. Cameron, president of the First National Bank of Birmingham; John B. Boddie, vice-president of the Board of Trade, Birmingham, Ala.; W. P. Rice, president of the Union Investment Company, Kansas City, Mo., as directors, and with a capital stock of \$5,000,000. The directors organized as follows: Hon. J. W. Spaulding, president; Hon. D. H. Goodell, first vice-president; Hon. Henry B. Peirce, second vice-president; C. L. T. Stedman,

of Boston, secretary; F. H. Tobey, of Kansas City, treasurer and assistant secretary. It is the intention of these gentlemen to begin immediately to develop the property of the company, near Birmingham, Ala. It is not the intention of the company to give their first attention to the manufacture of iron. Coke will be the first product. One hundred ovens will produce about 350 tons of coke per day, and as soon as these have been erected several hundred more will be added.

The Union Ferry Company, of Brooklyn, have contracted with the W. & A. Fletcher Company, of this city, for a steel ferry-boat, which it is intended shall be the finest vessel of this description which has yet been built. The hull will be built at Newburg by T. S. Marvel & Co. The dimensions of the hull are about 209 feet over all, depth of hold 16 feet. The hull, with the exception of the decks, will be built entirely of steel, the plates of $\frac{1}{4}$ inch thickness, with a double strake of $\frac{1}{4}$ -inch plating 42 inches wide. The hull will be divided into five iron water-tight bulkheads, three athwartship and two longitudinal. The engine will be of the jet condensing beam pattern, and the diameter of cylinder 48 inches, with a piston stroke of 10 feet. The boat will be equipped with double-acting fire pumps, and will be lighted with electricity, and the entire cost will be about \$120,000.

Busy days have come again to Roach's shipyard, at Chester. The frame furnaces were lighted several days ago and the sheet furnace was started last week. The blocking used in building the United States cruiser Chicago is being torn down and relaid for the new Mallory and Ocean Line steamships, for which contracts were recently made.

Good Work by Boiler Inspectors.

Below we present a statement showing the work of the inspectors of the Hartford Steam Boiler Inspection and Insurance Company during merely one month. Total number of inspection trips made during the month of August, 1888, 4299; boilers examined, 8026; boilers inspected internally, 8884; subjected to hydrostatic pressure, 565. In all there were reported 7341 defects, which led to the condemnation of 46 boilers. The analysis of defects is given below:

Nature of defects.	Whole number.	Dangerous.
Cases of deposit of sediment.	517	35
Cases of incrustation and scale.	843	49
Cases of internal grooving.	28	13
Cases of internal corrosion.	339	30
Cases of external corrosion.	487	40
Broken and loose braces and stays.	86	15
Settings defective.	151	20
Furnaces out of shape.	243	12
Fractured plates.	145	30
Burned plates.	135	20
Blistered plates.	190	9
Cases of defective riveting.	2,001	329
Defective heads.	66	27
Serious leakage around tube ends.	1,275	161
Serious leakage at seams.	285	56
Defective water gauges.	118	21
Defective blow-offs.	54	6
Cases of deficiency of water.	10	5
Safety valves overloaded.	44	17
Safety valves defective in construction.	42	9
Defective pressure gauges.	263	53
Boilers without pressure gauges.	11	2
Unclassified defects.	49	5
Total.	7,341	963

The good work done by the scientific experts of these companies in averting danger to life and property is ample return for the small premium charge, even if they did not offer substantial indemnity for possible disaster.

The Iron Age

New York, Thursday, December 20, 1888.

DAVID WILLIAMS, - - - PUBLISHER AND PROPRIETOR.

RICHARD R. WILLIAMS, - - - HARDWARE EDITOR.
JOHN S. KING, - - - BUSINESS MANAGER.

President Adams on the Railroad Situation.

Charles Francis Adams, president of the Union Pacific Railroad, has had the courage to characterize in vigorous language the business methods of many railroad managers. In his now famous speech at the meeting of the Commercial Club, in Boston, he said:

That the general railroad situation of the country is at present unsatisfactory is apparent. Stockholders are complaining; directors are bewildered; bankers are frightened. Yet that the Interstate Commerce act is in the main responsible for all these results remains to be proved. In my opinion the difficulty is far more deep-seated and radical. In plain words, it does not lie in any act of legislation, State or National; and it does lie in the covetousness, want of good faith, and low moral tone of those in whose hands the management of the railroad system now is—in a word, in the absence among them of any high standard or commercial honor. These are strong words, and yet, as the result of a personal experience stretching over nearly 20 years, I make bold to say they are not so strong as the occasion would justify. The railroad system of this country, especially of the region west of Chicago, is to-day managed on principles which—unless a change of heart occurs, and that soon—must inevitably lead to financial disaster of the most serious kind. There is among the lines composing that system an utter disregard of those fundamental ideas of truth, fair play and fair dealing which lie at the foundation not only of the Christian faith but of civilization itself. With them there is but one rule—that, many years ago, put by Wordsworth into the mouth of Rob Roy:

"The simple rule, the good old plan,
That he shall take who has the power,
And he shall keep who can."

* * * * *

The construction of all these miles of railroad, for which hardly any immediate demand existed, made a readjustment of traffic necessary. That is, the moment the roads were finished the problem passed out of the hands of the engineer into the hands of the freight agent, by whom traffic of some sort for the new roads had to be provided. The Interstate Commerce act was in operation. It was impossible to pool, and the long haul regulated the short haul. Then followed a depth of railroad morals among freight agents lower than had even previously existed—and that is saying much. The dishonest methods of rate-cutting, the secret systems of rebates, the indirect and hidden payments made to influence the course of traffic resorted to or devised during the last two years I do not hesitate to say are unprecedented in the whole bad record of the past. In this respect I indorse every word of indignant denunciation which Judge Cooley, of the Interstate Commerce Commission, is reported to have recently uttered. Names of members or employees of firms whose business it was desirable to secure, but to whom it was unlawful openly to allow a rebate, have been put upon the pay rolls of companies at salaries equal to the estimated amount of what the rebate would have been; where the influence of a particular person was thought necessary to secure certain shipments, he has been advised that the company wished to consult him, but in order that it might do so more conveniently he must live in a house in a certain quarter—and the rent of that house has been paid by the company;

where it was thought expedient to cut the rate on passenger tickets to a given point without affecting the rates to intermediate points under the Interstate Commerce act tickets to that point have been placed by the hundred in the hands of "scalpers," and they were allowed a commission equal to half the price of the ticket. This commission, the allowance of which the act did not specifically forbid, the "scalper" again shared with the purchasers of the tickets.

Mr. Adams's remarks have called forth a chorus of indignant protests and have caused some personal attacks. Yet the majority of business men, if they are frank, will confess that his denunciation comes pretty close to the truth. The restrictions of the Interstate Commerce act have furnished an additional incentive to underhand practices. The efforts to evade them have put a premium on dishonesty and fraud, and has had a demoralizing influence upon business. It is not our object to inquire now into the question to what extent this state of affairs has reacted upon the morals of the business community itself. Suffice it to say that to a lesser degree his charges apply largely to many branches of trade and manufacturing, especially so far as engagements between men in common pursuits are concerned.

Mr. Adams is inconsistent, however, when, after picturing how the Interstate Commerce law is evaded, he attributes to it an influence prejudicial to the country, to the trade and to the railroads. He is not logical when he dwells on the evils of overbuilding, which was done by the large companies, and, in the next breath, insists that the law in question tends to lead to the aggregation of railroad business in a few large groups. Mr. Adams argues that since it is the long haul which brings the profit, and, since the law against pooling has deprived the smaller lines of the business conceded to it formerly, under the now prohibited arrangements, that, therefore, the smaller lines are being forced into the maws of the few great systems into which the railroads of the country are rapidly crystallizing. Now, it has been generally understood that the "smaller lines" were, under the old pooling system, allowed business in proportion to their capacity for doing mischief, and that, in reality, they got more, usually, than they were entitled to. Persistence in the old policy on the part of the weaker lines would probably be as fatal as Mr. Adams insists that it would be. But, if their managers develop resources hitherto neglected and abandon old methods, all will be benefited.

Speaking of the influence upon trade of the law, Mr. Adams says:

Next came the long and short haul clause. Just as the small, local railroads are crushed out of existence by the anti-pooling clause, so the local points of distribution and second-class business centers throughout the country find themselves, because of the long and short haul clause, unable to compete with the great commercial centers. Traffic, under the provisions of the act, must inevitably seek the railroad having the long haul to the most distant and largest center. The operation of the law in this respect is now beginning to make itself felt upon the smaller distributing points. They are deprived of their markets, for those who formerly bought of them can get the same goods on better terms from the larger and more distant centers. The old local system of distribution is broken up in favor of the centralized system. This fact is now making itself apparent to the manufacturers and jobbers of the smaller cities or towns as against Chicago, St. Louis or Cincinnati; but, as sure as the law of gravitation applies to all places

and works under all circumstances, this same long and short haul clause will next make itself felt against Chicago, St. Louis and Cincinnati, and in favor of New York. In other words, contrary to every design of those who framed the act, its provisions have lent a new impetus to just those forces which it was intended to hold in check. Instead of building up the local road and the small distributing center, it is working the sure destruction of both. An artificial, but most powerful, impetus has thus been given to the process of centralization.

Evidence is somewhat contradictory on this point. It has been stated, on the contrary, that small distributing centers have increased in number and importance during the past two years. It is not unreasonable to suppose that where that tendency has been obliterated by the movement to which Mr. Adams alludes, it may have been the result of the very methods which he denounces so vigorously.

Forgeries in Checks.

Recent instances of forgery in New York have raised some interesting questions as to the responsibility of the parties who have handled the paper. Who must bear the loss—the bank that paid the money or the depositor whose name is forged, or whose name is on the forged check? Can the depositor compel the bank to pay back to him the money advanced? Usually in the case of a forged check or draft, where the signature of the depositor or drawer is a forgery, there can be no question as to the liability of the bank. The bank is bound to know the true signature of its depositors, and no matter how skillful or deceptive the forgery may be, it pays the money at its own risk, and on the judgment of that bank officer whose duty it is to determine the genuine or false character of the paper. The bank, under these circumstances, must suffer the loss and repay the money. There is no difference of opinion about this in the adjudications of the American States or of Europe. And the reason seems to be good why such should be the case. The principle on which the banks are held in these cases is that it would be wrong to make an innocent depositor responsible because the bank made a mistake. The bank is responsible for the acts of its officers and clerks, and not the people who deal with it.

But there is a class of cases where there might perhaps be considerable doubt about the law, and question as to the liability of the bank. That is, where the signature of the depositor is genuine, but the name of the payee or indorser has been forged on the back of the check. Before the check is indorsed by the payee, or even sometimes before it comes into his possession, it is wrongfully appropriated and the payee's name is forged, the check is presented at the bank and paid, and the question is who must suffer—must the bank lose the money, or the depositor? There is hardly the same duty in this case for the bank to know the signature of an indorser who is not a depositor, and it might be argued that it would not be fair or for the best interests of business policy to impose so heavy and serious a responsibility upon the bank. On the other hand, when the bank is directed to pay to a certain person it would seem that it should not be protected if it paid to any other person. It must satisfy itself that the indorsement is correct. At

all events, whichever of these two views is the more logical and sound, the latter is adopted and is settled law in New York. And as a matter of fact and common practice the banks do require that the person making the indorsement be identified or that the check be presented by some depositor in whom the bank has confidence. If the check is indorsed in blank, of course, it makes no difference how many subsequent indorsements are made upon it. They may be all forgeries, yet the bank in that case may make the payments to any holder of the paper in safety. If the check is indorsed specially to the order of some person named, however, then the bank must take the same precautions as to the signature of that person as in the case of the original payee.

This is the rule in New York and in most, if not all, of the other States, but under a statute known as the Bills of Exchange act, passed a few years since in England, the opposite rule prevails in that country. The only signature the bank is bound to recognize is that of the depositor, and it may pay to any holder just the same as if the check was made payable to bearer in express terms. A check becomes in reality, no matter what is stated in it or to whom it is made payable, an order to pay money to the holder on demand. Several European and South American countries have adopted this principle in their codes. The facts of the case referred to in New York as a startling instance of forgery involve questions of considerable interest and importance. The general rules of law relating to forgery apply, of course, to the case, but they may possibly be affected in their application by the fact of the relations between the forger and the makers of the checks. The forger was a trusted employee of the firm of lawyers who drew the checks. They employed him to conduct negotiations of considerable magnitude in connection with real estate transfers, and he had practically full control of this branch of the business. When a mortgage loan was to be made by some client of the firm the firm would draw their check to the order of some fictitious person whose name the forger would give as the intended borrower and owner of the property, and this check was then delivered to the forger to be given to the supposed borrower or mortgagor. The papers being regular, no suspicion of the true state of the case arose.

The name of the fictitious payee was indorsed on the check and it was eventually paid by the bank, after having passed through the account of a person friendly to the forger and whose account was kept in another bank. These forgeries amounted to over \$225,000, and the law firm was obliged to repay this amount to their clients, who had intrusted it to them for investment. The question now arises, can they recover back this amount from their bank, which paid it on the faith of their own checks, the indorsement being the only forgery on the paper. There is, of course, no doubt that the indorsement of a fictitious name is a forgery, quite as much as the forgery of the name of some person really in existence and intended as the payee. But in this case the forger was the trusted clerk of the firm. And it will be said in defense of the bank that under the rules of law

governing the responsibility of employers for the acts of their employees the former should be held responsible for the acts of their clerk whom they selected and trusted and to whom they gave the power and opportunity to perpetrate the forgeries. This rule would not go so far as to relieve a bank from liability in a case where the depositor's signature was forged by his clerk, but it is claimed that here, where the signature was genuine the bank under the circumstances should not be held. The question is an interesting one, as it is likely to occur in the experience of many others. But it would seem from the decisions that the bank cannot avoid liability. Whether the depositor was in reality more in fault than the bank does not affect the question, as the bank had no right to pay money on a forged indorsement.

Direct Ship Propulsion.

Promises of impossible engineering performances to be achieved by modifications of methods tried and discarded in years past, though not so known perhaps to the public at large, have, of late, been made with almost noteworthy frequency. Thus, schemes for the propulsion of ships by jets of live steam, water under high pressure, and by the direct action of explosions of gaseous mixtures, have successively been brought forward, and if their projectors have not derived much satisfaction from them, it has assuredly not been through any lack of rose-colored newspaper accounts.

So far as we are aware, the last attempt to popularize direct steam propulsion was made—unsuccessfully, as may well be imagined—about two years ago, and from appearances would seem to have been wisely abandoned, at least for practical work. For propelling small toy boats the method, to our knowledge, was employed many years ago, and possibly is still in use. Closely allied to it—in fact, the same in principle—is the system of hydraulic propulsion, in which jets of water under high pressure are forced through pipes in the stern of the vessel, causing forward motion through reaction. Just why this system should have survived the other, it is difficult to tell, there being, it is true, a slight gain in efficiency in one respect, though this, it would seem, is counterbalanced by the greater complication of the necessary machinery, in the way of pumps, as compared with simply the boilers required in the other case to supply the steam jets. Evidence of the faith which is still put in it, however, has more recently been given by the building at South Brooklyn, N. Y., of a vessel in which it is proposed to again apply the system. As currently described, the vessel measures over all about 110 feet, and has a 28-foot beam, the draft being about 4 feet. A suitably placed nozzle in the stern post will discharge a comparatively small stream of water, 1½ inches in diameter, at very high pressure—10,000 pounds per square inch, so the report has it—and the speed, it is modestly stated, will be 30 miles per hour. The horse-power to be developed is placed at 1500. The whole thing, of course, is represented as an assured success, completely revolutionary in character. In considering the subject from a more matter-of-fact standpoint we

will take the following formula given by Professor Wood in a discussion of the jet propeller in his work on "Analytical Mechanics" for the mechanical power developed per second:

$$Pu = \frac{W}{g} (\sqrt{u^2 + v^2} - u) u$$

In this W represents the weight of water to be discharged, v the velocity of the jet due to the pressure, and u the velocity of the vessel. Theoretically the velocity of the jet v should equal the speed u of the vessel, which in the present case at 30 miles per hour corresponds to 44 feet per second. Taking the given figures, substituting them in the formula and transposing, we have

$$W = \frac{1500 \times 550}{(\sqrt{44^2 + 44^2} - 44) 44} \times 32 = 33259.4$$

pounds. This represents about 17 tons per second, or over 61,000 tons of water per hour to be forced out through the orifice in the stern of the ship. Figuring out the horse-power on the basis of this weight of water and the enormous pressure, the result will be found to run up entirely beyond realization. The claims made are preposterous, and any figures based on them must, of necessity, be likewise. Considering the weight of water required for the jets for this method of propulsion it may readily be inferred that the quantity of steam necessary to produce the same effect by the direct steam propulsion system, to which we have already referred, would be something enormous, and the requisite amount of coal to generate this steam could scarcely be carried by any vessel. The efficiency of the jets, moreover, is very low, and only the momentum is utilized, all the work in the heat being wasted.

Propulsion by the direct action of petroleum vapor explosions is aimed at in another vessel recently launched at Brooklyn. The machinery is described as consisting of a series of heavy steel cylinders, the ends of which open into the water. In these cylinders explosive mixtures of air and sprayed petroleum are to be fired by electric sparks, continuity of action being obtained by having a number of such explosion chambers in which the discharges will occur in regular rotation. Simplicity, directness and economy are the claims made for the system, though they yet remain to be substantiated. Past experience has, if anything, been discouraging to the development of such projects, and there is no indication now that they will gain any hold upon users of engines for ship propulsion.

We owe it to the *Evening Post* to print the somewhat reluctant and tardy acknowledgment of their error. It is true they did not accord to it the prominence which they gave to their attacks upon *The Iron Age*, but attached it as a rider to a letter written to it by Julius Jonson, of the Jonson Foundry and Machine Company. The comment to that letter reads as follows:

The Iron Age, in its issue of November 29, says: "The *Evening Post* misrepresents us when it states that we claim that the duty is not 1½ cents per pound, but is 45 per cent. ad valorem. Our position was that the business was impossible at 1½ cents per pound duty, and that therefore those who imported the castings must necessarily make the effort to secure the 45 per cent. ad valorem rate." By looking at back numbers of *The Iron Age*, we

find that this contention is correct. We might take serious objection to the remissness of a trade journal which holds out the view that a contract of some importance in a political point of view has been made, when no such contract exists, but it is not worth while to reopen the subject.

Measured by the standard of its apology, the conscience of our contemporary is easily satisfied.* In the struggle between the necessity of telling the truth and of maintaining the attitude of infallibility, the former has been victorious, but it has been apparently a narrow escape. A spirit of lofty criticism is intended as a cover of an ignominious defeat. The effort may succeed with some of its readers, but it will not efface the convictions, unfortunately for the *Evening Post*, which its course has created in the minds of those who are connected with the iron and steel trades.

The Panama Canal Fiasco.

Ferdinand de Lesseps's great Panama Canal scheme is at last in a state of financial collapse. Even the "deluge of puffing" lavished upon it by the French press could not avert the inevitable, and M. de Lesseps himself withdraws, utterly disappointed. The decisive blow came when the Government refused to authorize the postponement of the payment of interest on 500,000,000 francs falling due 14th inst., the Chamber of Deputies declaring that it had no right to legislate on the subject. Neither would it sanction the proposal of the Minister of Finance to form a new company. Thus, according to present indications, 870,000 holders of canal shares, scattered through the length and breadth of France, are doomed to lose their entire investment. Surprise is everywhere expressed that a financial hiatus of such vast magnitude causes so little monetary disturbance. It is estimated that the French people have paid over \$250,000,000 in cash for shares and bonds amounting to \$400,000,000 at par. But the fact must be considered, as stated by the *Economiste Français*, that "there is nothing in this entirely localized failure analogous to the crash of 1882," the failure of the Union German Bank, "extending over a vast number of interests." Apart from this view, however, it may yet become apparent in the pending elections that the people, once aroused to a consciousness of their plight, may become peremptory in their demands for redress—demands which it may be difficult to evade. Thus, a vital question of international importance may be forced into view—namely, "Shall the Government of France assume obligations by which it virtually erects a protectorate on the highway of American commerce between the Atlantic and Pacific Oceans?" The United States Government, France is well aware, could not look with approval upon proceedings of this character. In its pecuniary aspects, as concerns American investors, the downfall of M. de Lesseps is of no serious moment, ex-Secretary Thompson, who undertook to push the enterprise in this country, having met with indifferent success. The American Dredging Company, after excavating 19 miles of canal, still want \$5,000,000 to complete their contract, but they have already handled \$12,000,000 of the promised total. The Lesseps canal fiasco is compara-

ble only to the "Great South Sea Bubble" which long ago passed into history. The Nicaragua Canal advocates will now take fresh courage.

OBITUARY.

PHILETUS W. GATES.

Philetus W. Gates, one of the pioneer iron manufacturers of Chicago, died in that city on the 1st inst. He was born February 25, 1817, at Fenner, Madison County, N. Y. His father was a carpenter by trade, served in the war of 1812 and was pensioned by the Government. At the age of 15 he went to Bristol Center, N. Y., to learn the blacksmith trade. At the end of two years he bought the business and conducted it for one year, but wishing to go West sold the shop and found himself in Buffalo, next in Cleveland, Ohio, Pittsburgh, St. Louis, and finally Chicago. Here he located in a place called Yankee Settlement, 25 miles southwest from Chicago. He worked at farming during the summers and spent the winters at his trade. In 1839 he married Miss Abigail E. Scoville, and in 1840, in connection with his father-in-law, Hiram H. Scoville, took a sub-contract of the Illinois and Michigan Canal. The failure of the State project and the depreciation of the value of the script which they received as pay left them \$700 in debt. In 1842, with \$3 and a horse, which was afterward sold for \$7, he and his father-in-law moved into Chicago. He purchased lumber on credit, erected a shanty near Randolph-street bridge, and began blacksmithing. At the end of a year a foundry and machine-shop were added. Four years later Mr. Gates purchased Mr. Scoville's interest for \$4000, and later took in as a partner A. H. Hoge. Two years after Mr. Hoge sold out to George S. Knight, and the firm became Gates & Knight. The business was successful, and had increased to such an extent that from 200 to 300 men were daily employed. Mr. Gates purchased the interest of Mr. Knight, and, associating himself with Andrew Fraser, G. S. Warner and Thomas Chalmers, the firm became known as P. W. Gates & Co. The business flourished until the financial panic of 1857, when an assignment for \$350,000 was made. Arrangements were made so that the business could be carried on, when the partners became dissatisfied and Mr. Gates assumed complete control. In a little over a year the assignment was set aside, and in 1860 Mr. Gates obtained a charter for the Eagle Works Mfg. Company, under which title the business was conducted until the great fire of 1871. He then retired from active business, and gave his attention to the improving of the property he had acquired. He was a thorough mechanic and the inventor of many improvements in manufacturing, among which may be mentioned the patent die for cutting screws. He was the first manufacturer in Chicago to institute a system of profit-sharing among his employees, and was active in works of benevolence. He left a large estate, and his three sons survive him.

D. A. STEWART.

D. A. Stewart, chairman of the firm of Carnegie Bros. & Co., and identified with many of the extensive manufacturing concerns of Pittsburgh, was found comatose in bed Friday morning and never regained consciousness. All the means known to surgical and medical science were employed to revive him, but he died at 9 o'clock. Mr. Stewart was born in Chambersburg, Pa., and was 57 years of age. He was the son of General Stewart, who was one of the officers of the Pennsylvania Railroad. It was Mr. Stewart's father who gave

Thomas A. Scott, his nephew, his first railroad appointment, and Mr. Scott never forgot it. Mr. Stewart married one of the daughters of the late John Scott, a bank president at Pittsburgh. In 1872 he engaged with his present partners in constructing the Edgar Thomson Steel Works, and at his death was chairman of the firm of Carnegie Bros. & Co., Limited, and one of the managing directors of Carnegie, Phipps & Co., Limited, and president of the Carnegie Natural Gas Company.

WM. R. DAVENPORT.

Wm. R. Davenport died 18th inst., at Erie, Pa. He went from Watkin's Glen, N. Y., to Erie when a boy. He commenced life as a railroad clerk, and next engaged in the manufacture of car-wheels. In 1871 he, with Judge Galbraith and John Fairbairn, established the Erie Car Works, and within a few years carried their operations into Michigan, where they manufactured pig iron and charcoal furnaces, and where they were the pioneers of the business in the Northwest.

Convict Labor in Texas.—I.

BY JOHN BIRKINBINE, PHILADELPHIA.

The State of Texas cares for its 3200 convicts in two penitentiaries, and in several farms covering some 2500 acres; the latter are devoted to raising by convict labor the corn, sugar, vegetables and fruit required for the sustenance of the State wards. The Penitentiary Board also owns some dairy cattle, about 500 mules (used for draft animals), maintains a flock of as many goats, and raises a large number of hogs. In short, with the exception of beef, flour, beans, dried fruits, condiments, &c., the State penitentiary farms furnish provender for the convicts, for the guards, and also for the live stock, and raise the cotton, which is woven by looms in the penitentiaries into the striped goods which constitute the convicts' garb. The two penitentiaries are located in the Eastern portion of the State, the one first established being at Huntsville, Walker County, 125 miles north of the Gulf of Mexico, and 110 miles west of the Louisiana boundary, the newer being at Rusk, Cherokee County, 75 miles northeast of Huntsville, 75 miles east of the Louisiana boundary, 175 miles north of Galveston, and 150 miles south of the Red River, forming the boundary between Texas and Indian Territory.

At the Rusk Penitentiary no females are received, but the Huntsville Penitentiary accommodates both sexes. The women are principally employed on the cotton farms, in manufacturing the sheeting and the cotton goods for summer wear; the cotton and woolen goods for winter wear of the convicts, as well as some kerseys for the market, which are woven on looms; and, in addition, female convicts are utilized in the manufacture and repair of the clothing, bedding, &c., required for the penitentiaries and camps. The industries carried on within the walls of the Huntsville Penitentiary also embrace a cabinet shop, where furniture is manufactured for prison use and for sale, a wagon works, a machine shop, foundry and boiler shop, producing engines and boilers for saw mills and cotton gins. The shoes for convicts are also made at Huntsville. Farms and railroad construction furnish employment for many convicts who are quartered in camps, and are seldom within the walls of the penitentiaries. Formerly Texas employed the contract system, but this was abandoned owing to the abuses which the cupidity of contractors, or the ignorance as to discipline

aided in bringing into the system. The better sentiment of the population rebelled against under-feeding, overwork, severe punishments, including stocks or thumb-screws, and as a consequence the State now controls the labor of all her convicts, and feeds, clothes, watches and cares for them.

It is not the present purpose to discuss the convict labor problem in the various parts of the State, but to treat it only as it relates to the iron industry established at the Rusk Penitentiary, or it may be more proper to say that the possibility of establishing an iron industry was the encouragement which caused the location of the penitentiary at Rusk. The project was, however, not carried out without the troubles which affect initial industries generally; in fact, it was only by abiding faith and persistent urging on the part of the superintendent and penitentiary board that the iron industry escaped abandonment on the eve of successful demonstration. The blast furnace was erected in 1883, and blown in early in 1884, but the campaign was unsatisfactory, chiefly because the contractors who had leased the convicts at a per diem rate were unacquainted with the production or manufacture of iron. This failure brought the enterprise, for which the penitentiary board had such hopes, into disrepute, and a committee of the Legislature recommended closing up the blast furnace. Upon urgent pleading on the part of the superintendent the Legislature made an appropriation for further trial, practically contingent on success, and late in 1885 a second blast was commenced, which terminated in a few months, owing to the stock on hand being exhausted. But the campaign was long enough to demonstrate that pig iron of good quality could be made at a price which permitted of its being marketed at a satisfactory profit. Consequently the appropriation became available, timber lands for a permanent supply of charcoal, as well as ore lands, were purchased, and Mr. R. A. Barrett was made superintendent of industries. Since this time the problem of iron production has been solved, a statement which is borne out by the product of the furnace and foundry. The blast furnace is now and has been producing over 1000 tons of charcoal pig iron per month, which has been sold to car-wheel, stove and other foundries in Texas and other States, and furnished to the foundries connected with the State penitentiaries. One Illinois stove company purchases 500 tons of this pig iron at a time. In fact, the success of the industry has been sufficient to encourage Northern capital to invest in adjacent ore and timber lands, and a charcoal blast furnace 11 x 60 feet is now under contract, and other industries are locating at New Birmingham, 3 miles from the Rusk Penitentiary.

The industrial plant connected with the Rusk Penitentiary consists of a blast furnace 55 feet high and 9 feet 6 inches diameter at bosh. The stack is an iron shell supported on columns. The casting-house and engine-house are of brick. There are two batteries of cylinder boilers, one iron pipe hot oven, a 60-inch by 4 feet Weimer blowing engine, Otis hoist, pumps, &c. Ample stockhouse room is also provided, and the plant is modern in construction. The blast furnace buildings and the pipe foundry, a building 100 x 140 feet, are not within the penitentiary walls, but are inclosed by a stockade which has guardhouses at intervals. Into this inclosure the ore is hauled from the mines 1 mile distant in wagons driven by convicts, the charcoal and limestone is shifted in, and the pig iron, cinder or iron pipe carried out on railway cars, the engine and train crew being convicts. All of the men employed around the blast furnace are convicts except a furnace-keeper on each turn, and the only free employee

connected with the pipe foundry is a negro foreman, whose ability as a manager is helping to solve the race problem in Texas. As the rules of the penitentiary restrict enforced labor to 60 hours per week, and the men employed at the blast furnace work in shifts of 12 hours each, they are credited with 5 cents per hour for overtime, so that a convict who works for seven days on shifts of 12 hours each receives a credit at the end of the week for \$1.20, which he can expend for candles, tobacco, paper, &c., in excess of the weekly allowance to each man, or which can remain until the expiration of his sentence, or it may be sent to his family.

The pipe foundry is equipped for making cast iron water and gas pipes from 4 to 12 inches in diameter, and several important contracts have been filled, the output to date being 2000 tons. A peculiar feature of the pipe foundry is the use of direct metal from the blast furnace. When the furnace is being run on foundry irons the main runner in the casting-house is continued into the foundry, and as much of the cast as is required is led into a 25-ton ladle. From this the metal is poured into distributing ladles, which are carried on the traveling crane to the pipe flasks. When the furnace is making car-wheel iron, or other than a satisfactory grade of foundry iron, pig iron is melted in the cupola. The pipe foundry is equipped with core ovens, drying ovens, proving press, traveling cranes in the foundry and in the yard, and other necessary appliances. All pipe are cast in vertical hinged flasks, those for the smaller sizes accommodating two pipes each. The buildings within the penitentiary walls, which are devoted to industries, comprise machine shop, pattern shop, foundry, smithery and wood-working shop, all operated with convicts, and under convict foremen, except the pattern and machine departments, which have the supervision of a skilled mechanic employed by the State. Some of the work turned out from the shops is worthy of mention. Over 800 tons of castings were made for the State Capitol building at Austin, among which were fluted columns 33 inches in diameter and 22 feet long, with capitals, the thickness of the metal in the shell being $\frac{1}{4}$ inch. All of the dome castings, some of them 4 feet 6 inches by 11 feet, and $\frac{1}{4}$ inch thick, cast on curves; the oriole windows, cornices, &c., were included in the contract, for which the State received the same price at which other foundries would do the work. The machine shop and smithery did considerable work on these castings, and have produced large numbers of tram cars for cane and wagons for sugar for use on plantations, besides fitting up the pipe foundry. All the wagons, carts, furniture, &c., required to carry on the work connected with the penitentiary are constructed by convicts within the walls.

The results accomplished cannot be other than satisfactory to Major Goree, who, as superintendent, has championed the iron industry in connection with the penitentiary, and the work already done is creditable, for, almost without exception, the convicts have learned whatever they knew of any of the trades since their confinement. Men have gone from the Rusk Penitentiary (and each year will add to the number) with a determination to start life anew, backed by a trade acquired under the State discipline. Men who entered here mainly because, having no settled aim in life, they drifted into channels which led them into difficulty, may re-enter the active world, free from the prison pallor due to the system of solitary confinement, and equipped with a knowledge of tools and how to use them. The conclusions which force themselves upon the writer, after three visits to the vicinity of the Rusk Penitentiary, cover-

ing a period of three years, when opportunities were given to critically examine the system employed in utilizing convict labor in Texas, are of such nature as to commend it to favorable consideration. The questions which naturally arise are:

1. Is the employment of convict labor prejudicial to free labor?

2. Does the State become a damaging competitor with private enterprise?

3. Is the system of punishment reformatory, and severe enough to encourage the reduction of the number or rather the proportion of criminals?

Before taking up these important queries it is proper that some data as to the disposition of convicts and their employment be given. The sentences imposed by Texas courts are as a rule severe, and of the 860 convicts who are connected with the Rusk Penitentiary 10 per cent. are sentenced for life, or what is equivalent to it, a term of 99 years; 15 per cent. have been given terms of 50 years or over; 15 per cent. have to serve imprisonments of between 15 and 50 years. It is proper to state that a majority of those sentenced to long terms are sent to Rusk Penitentiary, and that owing to a system of commutation for good conduct a convict sentenced for 10 years may complete his term in 7½ years, or one who is sentenced for 20 years may reduce his time to less than 13 years. Murder, horse theft and rape are the crimes which receive the heaviest sentences, but other crimes have meted out to them punishments which, when compared by length of terms of imprisonment with those given in other States, are severe, and in many cases so unjust as to cause the Legislative committee which investigated the prisons to recommend the establishment of a pardon board, or the exercise of executive clemency. The earlier history of Texas and the extent of its territory, much of which is still border lands, is undoubtedly responsible for some of the extreme measures, and the former existence of slavery has left its impress in the harsh punishment of negroes. Another reason for many severe or apparently unjust sentences is that the law of Texas permits the jury not only to determine the guilt of the prisoner but to fix the penalty, the province of the judges being to see that a fair trial is held, that the law is expounded, and to pronounce the sentences imposed by the jury. Under such a system ignorance, prejudice and prevailing public sentiment will in any community influence the decision of juries, and the committee above referred to recommended "that a pardoning board, or committee, be inaugurated for the purpose of visiting the penitentiaries, examining into doubtful cases, looking into the prison records of the same, and into the conduct of life of the long-term convicts, and to make report thereon to the Governor for his action in extending executive clemency on the recommendation of such pardoning board or committee."

The convicts are divided into three classes—viz., those whose sentences do not exceed 15 years, those whose sentences are between 15 and 50 years and those whose sentences exceed 50 years, the last two being easily recognized by red or black balls stenciled on the striped suits in addition to the name and number. As a rule, the long-term men are employed within the walls and make the best mechanics, as their only hope of commutation or pardon—beyond the time earned—lies in making themselves notable by their conduct or work. In preparing the patterns for the State Capitol contract over one-half of the force engaged in the pattern shop had been sentenced to the penitentiary for murder. Another division is the "trusties" and the "rank men." The "trusties" are accorded special privileges, due in part to their conduct, and in part to the length of sentence and other circumstan-

ces which would have a tendency to discourage attempts to escape. Only occasionally is a long-term convict made a "trusty," a majority of them being men who have nearly completed their imprisonment, or whose home ties would prevent assuming risks of recapture in the State. The "trusties" are employed as clerks, draftsmen, messengers or turnkeys; they compose the crews of the trains running on the tracks about the blast furnace, and to the main line of railroad—one mile—or on the branch road to the clearing where charcoal is made, and often are sent 15 miles away with their trains with no guard. The "trusties" also act as stablemen, herd goats, work in the garden or peach orchard, &c. When the writer first visited the Rusk Penitentiary in 1885, he was met at the railroad, 17 miles distant, by a "trusty" who was sent with a carriage to convey him to Rusk. It is seldom that a "trusty" becomes a fugitive.

The second class, or "rank men," embrace all convicts who are not "trusties," some who are considered safe and not desperate are used as teamsters or work in the fields, where a guard may have as many as twelve to watch. The balance are either worked within the penitentiary wall or within the furnace stockade. At the coaling camp, 16 miles from the furnace, where the charcoal is made, there are 225 men, of whom 40 are "trusties," who are utilized on the night watch, looking after the meilers, or detailed as leaf haulers and to other positions where guarding would be impracticable. All the charcoal used at the blast furnace is made in meilers in the woods, there being no kilns connected with the furnace plant.

In mining ore, chopping wood, making charcoal and general work on farms or outside of walls and stockade the rule is to allot one armed guard to six "rank men." In addition, where there are a number of convicts together, a mounted guard, equipped with a breech-loading shotgun and a revolver, is provided. He also has several deer hounds and a catch dog to capture any who attempt to escape. The presence of armed guards is an unpleasant, but evidently necessary, feature, but is evidently better than the ball and chain. The only use of the latter is as a punishment, but when a number of convicts are taken to any distance they are chained together and accompanied by guards. In the camp wooden prison buildings, with bunks, are provided, but the convicts are not chained in the bunks, as was the former practice. At the blast furnace most of the day force are long or life term men, but at night they are chiefly men whose terms expire within two years. As the inclosure within the stockade, as well as the penitentiary proper, is brilliantly illuminated by electric lights, the force of guards at the blast furnace is no greater at night than during the day. The iron ore, which is abundant in the vicinity of the Rusk Penitentiary, is a brown hematite, formed either as a bog ore or as the result of the oxidation of a carbonate. It lies in practically continuous horizontal beds, averaging probably 30 inches in thickness, over large areas, covered by a thin ferruginous rock and sand. The ore is, therefore, easily won, and the spectacle of over 100 convicts, in striped suits and hats, shoveling away the sand, prying up the ore or loading it on wagons is interesting. A squad of guards surround the workings and a guard accompanies a train of six teams hauling ore to the furnace.

Schools of Forestry are earnestly advocated by Prof. E. L. James, of the University of Pennsylvania. "At least 20 per cent. of the whole agricultural region of any country," says Professor James, "should remain in forest for the good of

the other 80 per cent. Few people are aware of the peculiar relations the forests bear to our national prosperity. How many know that the value of the forest products of the United States amounts to more than \$700,000,000 annually? But the increment of wealth which that yield represents is not the most important consequence of the growth of forests, and the argument that they should be preserved and fostered and protected for fear that a scarcity of timber will follow is not the only one to be presented in behalf of their sustenance. A more important one is that they determine to a great extent climatic and hygienic conditions. Whether the presence of forests increases the rainfall in a given area is a disputed question, but that they bring about a much better distribution of moisture through the year is not doubted."

The Western Cut Nail Manufacturers' Association.

In our issue of last week we made brief mention of the fact that the Western cut nail manufacturers had formed another organization, to be known as the Western Cut Nail Association. For some weeks past the manufacturers have been endeavoring to form a pool, or devise other means to remedy the present demoralized condition of the cut nail market. Several meetings were held at which the pooling scheme was thoroughly discussed, but it was discovered that there were numerous obstacles in the way of success, the principal one being the refusal of one or two large concerns in the West to be governed by the pooling plan in any way. On Tuesday, the 11th inst., a large meeting of the manufacturers was held at the office of the Benwood Iron Works, at Wheeling, W. Va. The following named firms were represented:

Benwood Iron Works, Wheeling.
Riverside Iron Works, Wheeling.
Belmont Nail Company, Wheeling.
Wheeling Iron and Nail Company, Wheeling.
La Belle Iron Works, Wheeling.
Junction Iron Company, Wheeling.
Bellaire Nail Works, Bellaire, Ohio.
Laughlin Nail Company, Wheeling.
Jefferson Iron Works, Steubenville, Ohio.
Kelly Nail and Iron Company, Ironton, Ohio.
Belfont Iron Works Company, Ironton, Ohio.
Wellston Steel and Nail Mill Company, Wellston, Ohio.
Middleport Steel and Nail Works, Middleport, Ohio.

In addition to those concerns represented letters were received from several other firms promising their co-operation. After a long discussion on the question of forming a nail pool it was decided to abandon that scheme, and in its place the Western Cut Nail Manufacturers' Association were formed. Mr. J. N. Vance, of the Riverside Iron Works, Wheeling, was elected president, and Edward Hazlett was chosen supervisor. The headquarters of the association will be in Wheeling, at which point Mr. Hazlett will have an office for the management of affairs pertaining to the association. The card rate was fixed at \$1.90, with 10 cents per keg off for carload orders, and the usual discount of 2 per cent. for cash. It is not the intention of the association to restrict the output or control the sales of members. On the contrary, it will be the aim of the association to operate on an equitable basis, and to make it possible for them to run more steadily than heretofore. All contracts for nails for future delivery will be held as other contracts are, and enforced strictly, and a determined effort is to be made to place the nail trade on a more business like basis.

Indiana Natural Gas District.—I.

The natural gas district of Indiana lies northeast of Indianapolis, that city being less than ten miles from the gas-bearing territory. The extent of this district is, roughly, about 60 miles in length and 40 miles in width, comprising the largest single gas district thus far discovered in this country. The territory embraced in these limits has been very thoroughly developed since the existence of natural gas was discovered there about two years past, and the supply has been demonstrated to be large and of satisfactory flow, insuring its continuance for many years. The wells which have been sunk average a little over 900 feet in depth, and thus far there has been no perceptible diminution of pressure at any of them caused by the sinking of other wells in their vicinity. Salt water is forced up with the gas in the wells in part of the district, but not in sufficient quantity to interfere with the use of the gas, being easily disposed of. Its presence in those localities has, however, caused some manufacturers to prefer other points in the district in which dry gas is found. This is apparently an advantage to the district, as it has led to the establishment of several manufacturing centers, instead of the concentration of activity at but one or two points. The Indiana natural gas is of high calorific power, and besides it possesses a decided odor, causing any leak in the pipes to be immediately detected and easily located. The whole of this district is well populated, and it lies in a part of the State supplied with a perfect network of railroads, thus affording ready-made transportation facilities, and an abundance of labor, both of which are highly appreciated by the manufacturers who are removing thither to enjoy the supreme benefit of cheap fuel. The country has further been endowed by nature with a rich soil, so that its agricultural resources are adequate to the support of a teeming population, which is an advantage by no means to be overlooked.

Four towns in this district have sprung into prominence, and are competing with one another for manufacturing supremacy. They are Kokomo, Marion, Anderson and Muncie. Each is a county seat, and each offers inducements to outside manufacturers for the location of works in its immediate vicinity. Each is likewise a railroad center, none of them being dependent on but one line. The interested visitor will find them apparently equally enterprising, all of them having systems of water works, and being lit with electric lights as well as artificial and natural gas. The population of each place has likewise doubled within the past two years, the number of inhabitants now ranging from 8000 to 12,000. They are all supplied with good newspapers, and other evidences of thrift and enterprise abound on every hand. Real-estate speculation has, of course, been rife, but sensational booming has been discouraged, the residents of each locality wisely preferring a steady growth on a solid basis to a rapid advance in values and the inevitable harmful reaction which would follow. This is evidenced by the scarcity of dwelling houses at present experienced throughout the district, the utmost endeavors of the builders being unable to keep up with the demand. Among the industries which have been transplanted to this new field of activity the manufacture of glass is most prominent, but iron and steel workers are fully alive to its advantages, and several important establishments have already been built up in these lines, while others are making preparations to follow. As far as possible the industries of the district have been diversified to avoid the calam-

itous effects upon the community of depression in trade or of strikes or labor troubles in any one branch. Passing from the general features of the district to the special points of interest in the leading towns, the industrial establishments first considered will be those of

KOKOMO.

The Rockford Bit Company have located their works some distance from the built-up portion of the town, and not only enjoy a pleasant site but have ample room for enlarging. The works of this company were formerly at Rockford, Ill., and at Ashtabula, Ohio. These two plants were consolidated this year and their machinery was removed to Kokomo, where it was first started up in September. The buildings are substantially constructed of brick, the factory occupying a large building and the office and shipping department occupying a second. The forge room, 80 x 86 feet, is situated in one end of the main building. It is one story high, is well lighted, and contains four helve hammers and special machinery for shaping and pointing bits. The fitting up and machine room takes up the remainder of the first floor, its dimensions being 100 x 86 feet. It is equipped with lathes, drills, emery wheels, and a number of special machines for shaping bits. Many of the machines in use have been built by the company. This part of the building is two stories high, the second story being devoted to the polishers and finishers. Power is supplied by a Mansfield Machine Company's engine, built at Mansfield, Ohio. Natural gas is used for raising steam, for heating steel in the forge room, for heating the works and offices and for light. In comparison with coal the use of gas in the forge room is highly appreciated by the workmen, who lose no time waiting for the fire to burn up, and also lose no steel through overheating. In point of economy there is no comparison, as the gas is furnished to the company free for all time. From 50 to 60 hands are now employed, most of whom are skilled mechanics, and they turn out about 2000 bits daily. American steel is used, which is made of special quality to meet the exacting requirements of this class of tools. A great variety of wood-boring tools is manufactured, special attention being given to bits for car-builders and railroad mechanics. The standard tools made embrace molding cutters, carving cutters, dovetailing cutters, &c., hollow augers, furniture-makers' bits, sash and door makers' supplies, &c., but orders are also taken for special and irregular sizes and shapes, which cannot be purchased from the usual stock carried by dealers. The company issue a catalogue illustrating and describing a large number of the tools they manufacture. Their Perfection and Juvenile Perfection bits are put up in sets in finely finished wooden boxes. A considerable portion of the catalogue is devoted to cuts of patterns of solid steel-edge molding cutters, the manufacture of which has recently been added to the company's line.

The Rock Island Knife and Shear Company's works are in the same locality. They were removed to Kokomo from Rock Island, Ill., and have very recently been put in operation. Their first pair of shears was turned out on the 3d inst. The factory is built of brick, 75 x 24 feet, two stories high, with a one-story wing, 30 x 20 feet. Natural gas is here used for every purpose requiring fuel except welding. Steel-laid shears and tinnern's shears and snips are at present the sole product. A drop forge is used for welding the steel edges to the blades. Three different kinds of shears are made—namely, full nickel, japanned bows and polished blades, and japanned bows and nickel-plated blades. Sixty sizes and styles are turned out altogether. The plant of the company

comprises a drop forge, tapping and drilling machines, emery belts for polishing, buffing wheels, grindstones, japanning oven and a nickel-plating machine. The company maintain a Western office at Rock Island, Ill., and an agency at Kansas City, Mo., to handle all business arising west of the Mississippi. D. F. McLarty is president; W. B. Ferguson is vice-president; W. M. Prentice is secretary, and J. F. Robinson is treasurer.

The glass interests of Kokomo comprise the Kokomo Window Glass Company, who operate ten pots, and whose works were transplanted from Ithaca, N. Y.; the Howard Glass Works, making a specialty of fruit jars, operating ten pots, and who came from Steubenville, Ohio; the Opalescent Glass Works, C. Edward Henry, proprietor, removed from New Rochelle, N. Y., and manufacturing colored glass for decorative purposes, electric insulators, &c., and, last, the Diamond Plate Glass Company, a new corporation, whose works are now in course of erection, and whose buildings alone cover 8½ acres. This company have a capital of \$600,000, and expect to employ 500 workmen. They intend to begin manufacturing operations in April, their machinery being now in course of installation. The members of the company are local and Ohio capitalists. Monroe Seiberling, of Kokomo, is general manager. M. P. Elliott, superintendent, was last connected with the plate glass works at Crystal City, Mo., and has had experience in the management of plate glass works abroad. The Ohio capitalists embrace A. L. Conger, O. C. Barber and George Perkins, of Akron.

The miscellaneous manufacturing establishments embrace the Kokomo Wood Pulp Company, making paper stock; the Kokomo Straw Board Company and the Newman Paper Company, making paper boards; a canning factory, for fruit and vegetables, working 400 hands in the season; the Enterprise Heading Company, making barrel heads and staves; Lynch Brothers' boiler works, removed from Titusville, Pa., and Ford & Co.'s job foundry, also from Titusville. These establishments have all been located in Kokomo since the discovery of natural gas, mainly through the efforts of the Board of Trade, which is an association of the citizens organized for the purpose of advancing local interests. The Board of Trade control a number of gas wells, from which they furnish free gas to the manufacturers. They are in communication with a number of other manufacturers in various sections of the country, with a view to removing their works, and have excellent prospects of success with a large part of them. The railroads passing through Kokomo are the Chicago, St. Louis and Pittsburgh, the Lake Erie and Western and the Toledo, St. Louis and Kansas City.

MARION.

At this place 20 manufacturing establishments are now in operation and three are in course of erection, whose choice of the locality is due to the supply of natural gas. The first factory under the new dispensation started to lay its foundations in July, 1887. There are three window-glass works, one glass-bottle factory, one fruit-jar factory, one wood-pulp works, one for making straw wrapping paper, one school crayons, a skewer works, turning out 1,500,000 skewers daily; a branch factory of the wagon works of the Studebaker Mfg. Company, of South Bend, a clock factory, hame works, shovel handle factory, soap works, excelsior factory, chair and wooden hoop factory, sleigh-bell factory, stove works, malleable iron works, &c. The population of this place was but 4200 only two years since, and it is now estimated at over 10,000.

The Marion Stove Company have a very complete foundry for the manufacture of hollow-ware and stoves. The establishment was formerly located at Sidney, Ohio, and operated under the name of Sidney Mfg. Company. The owners are F. J. Gould, F. P. Fruchey and R. O. Bingham. Their works at Marion were put in operation in March. The buildings are of brick. The molding floor is 100 x 60 feet, located in a one-story wing, and has a cupola of 48 inches outside diameter. The rattling and cleaning room adjoining is 60 x 40 feet, and contains five rattlers or tumbling barrels, to which five more are soon to be added. The engine room, which is by the side of the rattling room, is 30 feet by 24 feet, and is furnished with a Russell engine built at Massillon, Ohio. The finishing is done in a two-story building, 80 x 30 feet, containing drilling, grinding and polishing machinery. Part of this building is also used for storage. A plant for nickel plating will be added to the finishing department early in the coming year. The principal stoves made by this company are the Sidney Oak and the Retort. The latter is a stove specially adapted for burning soft coal. The hollow-ware line is very complete, covering all kinds of stove hollow-ware, sugar kettles, ham boilers, furnace kettles, hollow mauls, &c. They also manufacture cellar grates, ventilator grates, bob sleds, sled soles, porch supports, sled runners, bridge castings and cast washers.

The Barton Bell Company, of Marion, Ind., manufacture all classes of small Bells, their line embracing Sleigh Bells, Call Bells, Car Bells, House Bells, Gongs for electric purposes, &c. The factory was originally located at East Hampton, Conn., having been established there by the Barton family in 1793. It was removed to Marion and put in operation in its new location this year. As the company's leading customers were in the West and the raw materials of their manufacture were principally obtained in the West also, it was concluded, in the interest of economy, that it would be desirable to remove the factory to that part of the country, and the natural gas field of Indiana, in which Marion is located, offered the strongest inducements. A brick building was erected especially adapted to the purposes of the company. In form it is L-shaped, the arm containing the brass foundry being one story in height, 65 x 40 feet, and the main portion of the structure consisting of two stories, 110 feet in length by 40 feet in width. A few small buildings are connected with the works, and used for the storage of materials, &c. Natural gas is used wherever heat is required, and a 30-horsepower engine furnishes the power. From 35 to 40 hands are now employed, and all the processes in the manufacture of bells, from the casting to finishing and mounting, are carried on in this one establishment. In casting sleigh bells in these works the "jingler" is placed in a core of sand, which is afterward properly inclosed with others in a flask into which the melted metal is poured. When the rough castings are taken out of the flask the sand in the core is easily reduced to small fragments which run out through the holes in the bell, leaving the jingler ready to perform its function of making sleighing music. The original method of making sleigh bells was to cast them in two pieces and braze or solder them together. The present method was invented by the grandfather of A. W. Barton, present secretary of the company and manager of the works. The company publish two catalogues or price lists, one being devoted to their general line and the other to gongs and bells for electric and other purposes. They have brought out a number of novelties this season in saddle and shaft

chimes, with a view to meeting the demand for fine musical effects and artistic ornamentation.

Sweet & Clark, formerly of Troy, N. Y., are putting up a large malleable iron works. The buildings are being constructed of brick. The foundry is 254 feet long by 74 feet wide, the annealing room is 188 feet long by 64 feet wide, and a building for the manufacture of curry combs is 200 feet long by 70 wide, two stories high. Eight annealing furnaces will be erected at first, room being left for additional ones when needed. The specialty of the works will be the manufacture of curry combs, but the firm will be prepared to contract for all classes of malleable casting work.

Dougherty & Feely, manufacturers of boilers and stationary engines, at Chester, Pa., have completed negotiations for the removal of their works to Marion. They will erect a building 300 feet long by 85 feet wide, and expect to employ 250 men when their works are in full operation.

Negotiations are pending with other manufacturers to induce them to locate at Marion. Free building sites and free gas are offered. Marion has recently been selected as a very suitable location for the erection by the National Government of a soldiers' home, and a large appropriation is available for that purpose. It will thus be seen that there is good reason for the belief of the citizens that their town is destined to be the seat of a very large population. The railroad facilities are excellent, the lines running through the town consisting of the Chicago, St. Louis and Pittsburgh, the Toledo, St. Louis and Kansas City, and the Cincinnati, Wabash and Michigan. A belt railroad has been constructed by private enterprise, which passes through the principal manufacturing locality, and affords direct connections with all the roads.

The Coke Trade.

For the first time in several months the supply of coke at the present time is greater than the demand. This is accounted for by the fact that the recent heavy demand for coke has had the effect of lighting up the idle ovens in the Connellsville region, thus greatly increasing the supply until it has overcome the demand, and a slight reaction in the market has taken place. A number of blast furnaces are reported to be overstocked, and there seems to be no question but that the new year will not witness the activity in the coke market that existed a month or so ago. In view of this, it is doubtful if the proposed advance of 25 cents per ton, which was to go into effect on January 1 next, will take place. The protest recently entered against this proposed advance by the Western Coke Consumers' Association, mention of which has already been made, has also had considerable influence with the operators, and it is probable that there will be no change in prices for some time yet. The production for the month of November aggregate 532,400 tons, as against 523,700 tons for the month of October. The total shipments for November also exceeded all previous records, averaging 1118 cars per day. The record of the past six months is set forth in the following table:

1888.	Pittsburgh.	West.	East.	Total.
June.....	4,900	9,460	4,800	19,160
July.....	4,000	10,700	5,860	20,560
August.....	5,350	12,450	6,650	24,450
September.....	5,270	13,916	6,140	25,326
October.....	5,900	17,900	5,925	29,725
November.....	6,325	17,085	6,060	30,070

The estimated production for the week ending December 8 was 126,895 tons, or about 7050 cars, which is the largest pro-

duction of any week this year, and perhaps the largest in the history of the region. The shipments during the same week aggregated 6950 cars, consigned as follows: To Pittsburgh and rivers, 1500 cars; to points West of Pittsburgh, 4000; to points East of Connellsville, 1450. At 18 tons per car, 6950 cars moved represent 125,100 tons, 1800 tons, or 100 cars, less than the aggregate product of the region.

HARDWARE ENGINEERING

BY OBERLIN SMITH.

In these days, when almost every structure, from a human brain up to (or down to) a suspension bridge, is regarded as a machine, the profession of mechanical engineering has become a very dignified and important one, both when practiced by those who rear and train human brains as well as by those who design and build suspension bridges. As a logical conclusion from these premises we infer that any intermediate structure which may be regarded as wholly or partially a machine requires the application of special knowledge in particular, and common sense in general.

Taking a view of the large class of familiar articles usually known as "hardware," we find that many of them may be properly regarded as machines, while to all of them may be applied many of the general principles which machinery designers must carry into effect. If such a designer desires a fit of the blues and an utter sinking of all heart that is in him down through the soles of his shoes, he has only to look over a collection of modern hardware, as shown in the shops of any of our large ironmongers. It is true in such a collection there are very many useful and convenient articles which our modern civilization could not possibly do without. Some of them are well designed for strength as well as beauty; but, sad to say, a considerable majority lack not only the proper proportions to get the greatest strength from the least metal (which fact of itself often makes them hideous) but almost all of them have not sufficient metal to make them more than temporary toys.

This is, of course, in many cases the result of sharp competition between manufacturers, especially in the case of staple articles which the different producers make nearly alike and which are not patent-protected monopolies made by only one concern. There is, however, no reason or common sense in bringing the weight of an article down to such a minimum that it becomes almost, if not quite, worthless. The remedy for this state of things may, in some golden future day, lie in a Governmental interference which shall prevent villainously weak and imperfect articles being sold in the shape of hardware, just as much as it ought to, and sometimes does, prevent poisonous, injurious and adulterated articles of food from being imposed upon a too credulous public. Meanwhile the remedy must lie with the individual manufacturer who values his reputation too highly to spoil his goods for the sake of the slight saving effected by robbing them of a few ounces of iron. The increased sales which would eventually come from embodying proper strength and correct mechanical principles in the design of this class of goods would far more than compensate any manufacturer who should thus choose to apply common sense to his business for his extra pig iron bills.

To begin such a reform, the proper measure to be employed by a manufacturer who does enough business to warrant such a proceeding is to employ an educated engineer, preferably one who has

been accustomed to planning machinery and who also has a reputation for artistic talent, to design each article just as he would the members of a machine. Such designing would consider the amount and direction of all probable future stresses, and would not ignore the ordinary principles governing the dimensions of shafts and pitmans and levers and beams. Just as Dame Nature shapes the trunk and branches of a tree with the beauty that comes of itself when maximum strength accompanies minimum material, so would be fashioned the main outlines of our ideal pieces of hardware. Just as she afterward adds the leaves and flowers, subsidiary to the main design of the tree, so would all mere ornament, such as diaper-work, conventional foliage, &c., be designed last; with the feeling that it was upon and with, but not of, the generic form dictated for each piece of metal by natural law.

Not only is reform needed in the strength and beautiful proportions of much of our hardware, but much more common sense is wanted in adapting it to all its functions, instead of only a part of them. The writer has been led to the foregoing reflections by the disappointing experiences due to moving into a new house, with its usual consequent of several months' attempted conquest over the "totally depraved inanimate things" in the shape of hinges, knobs, catches, window fasteners, sash weights, wall-hooks, and the thousand and one other things that are hung on to, and jammed in to, and screwed fast to, the woodwork of modern houses, even when the hardware has been paid for as of superior, or at any rate average, quality. During such contests as these the heart in its bitterness crieth out: Why should hinges be made just thin enough to bend a little with the weight of the door that is hung on them so that it aggravatedly rubs against the opposite jamb? Why should the screw holes in them allow only for so slim a screw that it draws out if the wood happens to be white pine, and just at the time, too, when a small boy wants to have a ride on top of the door? Why should the screws fastening door knobs to their spindles constantly work out of place, so that their sharp edges gash the confiding fingers that grasp them? Why are sash-weights sold with such sharp corners, and ornamented with ragged edges and fringe-like fins, so that they jam in their boxes, instead of being made with nicely rounded corners? Why are the most ingenious sash fasteners, although provided with levers and cams and wedges, and other anti-rattling devices, made so that, if the upper sash is slightly down from its upper position, or the lower one slightly up, the two members of the fasteners fail to engage, although the faithful housemaid thinks she has fastened the window and confidently goes to her peaceful dreams into which do not enter thoughts of the gruesome burglar whom she has so sorely tempted to "go a burgling?" Why do highly ornamented shutter-hooks crumble up and fall down like pieces of dry toast when a sash is left open and a 7-mile-an-hour breeze strikes the inside shutters? Why do wall hooks descend from their proper sphere in life and lie crushed and mangled upon the floor, should an overcoat be hung upon them in whose pocket has been left a shot pouch or a few extra hard apples? Why are the screws by which such hooks are fastened so slim and small that they ignominiously retire from the position they have taken in the wood, even in cases where the hooks themselves have had enough of the ordinary principles of the projecting beam applied to their design so that they do not break in twain?

I have, in the new house spoken of, been especially aggravated by the behavior of what, save for a slight structural

weakness, would have been one of the best inventions, in a small way, of modern times. This was an outside-shutter hinge with an attachment for operating the shutters from inside the room and holding them in any position desired, all by means of a beautifully nickel-plated crank projecting from each side of the inside casing. It was the best of such devices that could be found in the market, and was in general designed upon correct principles. Its action while in proper health and spirits was simply perfect, and all who have seen it have declared it to be one of the most convenient things among all the conveniences of the modern household. These machines (they properly belong under this head as a strictly engineering design) in spite of their many good qualities have been a source of some unhappiness to their user, simply because their maker, although he had a good thing, which was so far above ordinary cheap hinges that he need not attempt to compete with them, made them so light that they would break entirely off and the shutters fall to the ground if they happened to be left open with a high wind blowing. Was this to save from 2 to 3 cents' worth of iron per window? It seems hardly probable. Presumably the reason, as indicated at the beginning of this article, lay in the want of a carefully studied design. This should consist not only in calculating the strength necessary to resist the maximum stresses to be incurred, but in a practical trial of the embodied design afterward, and by tests which would secure a sufficiently high safety factor to avoid breakage in ordinary use, with its train of annoyances and a possible loss of reputation to the maker. In this particular case I had such an affection for the maker (though personally unknown to me) that I did him the favor to write him a good scolding, accompanied with some practical hints for improvement. These, I believe, he has laid to heart, let us hope with a probable result of an increase in the sum of human happiness among all those who do not like to put their heads and arms into a cold winter's night or take out a musquito frame and let in a lot of June bugs every time a pair of shutters have to be adjusted.

The above criticisms have not been written with unkindly feeling toward the men who are constantly providing us with conveniences to make more happy in little things our daily lot, but only with a view of calling their attention to some of the defects which their customers must suffer from, and with the hope that they will be spurred onward to renewed zeal in improving their wares. Very much good work has been done in this way in recent years in some of the articles now sold. In all our stores we see marvels of cheapness and efficiency. Among these are many of the carpenters' tools now in use. In fact, tools of all kinds seem to have been developed into better designs than has household hardware. Among the latter, however, are many beautiful articles, especially in the line of bronzework and iron in imitation of bronze. In many kinds of wirework almost absolute perfection has been reached. For instance, what could be more cheap and convenient and well adapted to its purpose than the screw eyes and hooks which can now be found in innumerable sizes and proportions? This same favorable criticism will apply to much of the hardware and to culinary utensils that are cut, stamped and drawn from brass, tin plate and other sheet metals. In the department of stoves and in steam and gas fitting there is much excellent work. In gas fixtures proper, however, although there may be much that is artistic, there is often some very poor engineering as regards the attainment of strength and durability. To look upon the dark side of the picture again, we

have only to enter the domains of the plumber. If there is in existence anything less worthy of the noble name of "machine" than some of the so-called water-closets and the mass of "contraptions" often placed on, in and about the tanks supplying them, this writer would like to know it. And then, the shapes—but let us draw the veil.

If this were a treatise on "The general cussedness of familiar things," instead of a sober article on hardware, I might mention jewelry. Did anybody ever know a breastpin whose pin would maintain its alleged elasticity? or a cuff-button strong enough to stay adapted to its environment?

Another breed of first cousins to the hardware family are the metallic toys which are now so numerous. Some of them are cheap and good; others cheap and nasty. So bad are some of the so-called "mechanical toys" that their makers run a grave risk in putting on them any name by which their origin might become known to the Society for the Prevention of Cruelty to Children; and yet they might, with, in most cases, scarce a fraction of extra cost, be made comparatively strong and durable. A good designer would often contrive such simplification of parts and such cheaper processes of construction as would more than compensate for a little extra metal, while at the same time he would secure stiffer and stronger members and more durable wearing surfaces. He would also avoid the few stupidly weak spots (caused by too small screws, rivets, &c.) which we often find in otherwise strong toys.

I saw a play once in which all the characters were ephemerals who, with but little lease of time, were born, and grew and died. In dealing with some of our modern cast-iron hardware this myth of my youthful recollection is forcibly brought to mind. Let us hope that, with advancing civilization, the makers thereof will learn to instill into their wares the power of more vigorous life and length of days, and not leave themselves open to suspicion of being like the shoemaker who passed his knife around the stitches after he made a strong seam, so that more new shoes would be wanted quicker. Perhaps the only present remedy available is for a long suffering public to "cry aloud and spare not"—not only in regard to corruption in politics or bad stitching in a \$10 pair of shoes, but also when they get a bad penny's worth of cast iron where they should have had a good penny-and-a-half's worth.

The process which is being worked experimentally at Springfield, Ohio, by Mr. Bookwalter, is the Robert process first developed at Stennay, France, and since, it is said, adopted at Angleur, Belgium. As we understand it, the principal patent of the process is that the metal in a small converter is blown on the surface, the tuyeres being so placed that the cinder formed is projected against the side of the converter, to which it adheres. Fresh surfaces of metal are thus constantly presented to the refining action, the process, indeed, being apparently a compromise between the refinery and the converter.

Bids were opened at the Ordnance Bureau, in Washington, on Saturday, for 27 cast-iron bodies for 12-inch mortars, for finishing and assembling the same and for 27 sets of steel forgings for trunnion hoops and breech mechanism for the same. The bids were as follows: R. Wetherill & Co., of Chester, Pa., for finishing, \$8500, or for manufacture complete, \$20,500; South Boston Iron Works, for bodies, \$2750; for finishing, \$4250; West Point Foundry Company made exactly the same bid; Builders' Iron Foundry, Providence, R. I.,

for bodies, \$1475; Radial Drill Company, of Cincinnati, for bodies, \$2850; Bethlehem Iron Company, of Bethlehem, Pa., for steel mortar forgings, \$5496 per set; Midvale Steel Company, of Philadelphia, for steel mortar forgings, \$2770 per set.

Washington News.

(From Our Regular Correspondent.)

WASHINGTON, D. C., December 18, 1888.

The tariff discussion in the Senate is not progressing as rapidly as Senator Allison, in charge, has wished, but he still insists that he will be able to bring the measure to a vote within two or three weeks after the holidays, if not sooner. The policy on the appropriation bills seems to be a re-enactment of the existing provisions for the expenses of the Government where practicable. The new year estimates and the existing appropriations are being carefully examined and compared, and where not absolutely necessary to add new items the bills for the next year are being kept within the bounds of the present. This course will save debate and will greatly shorten the time required for the parliamentary routine of getting these measures through the two Houses of Congress.

An arrangement of this character will give the Committee on Finance reasonable time for the disposition of the Tariff bill.

The tariff reform tendencies of certain Republican Senators do not please the sub-committee in charge. They say that they do not like spread eagle speeches one way and voting the other. The speeches, they say, influence public sentiment into the belief that the Republicans are divided on the general principles involved, which the voting does not sustain. The discussion in the Senate is now in Committee of the Whole. When the passage of the bill is reached the Republicans will be united on the committee's bill and the committee's amendments.

The Senate Finance Committee are still giving hearings, although the bill and amendments have been practically accepted in caucus. The value of the hearings just now is to strengthen the committee on certain points, which were not fully understood as to detail before the bill was reported. The Senate bill is not expected to receive even a vote in the House, as the Committee on Ways and Means have announced their opposition to it and their adherence to their own measure. It is apparent that the Democrats do not give up the tariff contest, nor do they intend to. It is evident that the next struggle will be the most stubborn one ever experienced in the tariff history, with the outcome in grave doubt. The educational campaign has commenced, and with industrial States like New Jersey voting as she did, it is fair to assume that there will still be two sides to tariff reform in the political struggles of the future.

PROPOSED NEW PORTUGUESE TARIFF.

The Department of State has received a translation of an official paper issued by the Portuguese Premier, which says: "The treaty of commerce and navigation celebrated with France terminating in 1892, it becomes necessary to gather the elements for the organization of a new project for a general custom house tariff that may hereafter serve as a basis for such negotiations as may be established with foreign nations. His Majesty the King sees fit to direct the Superior Council of the Custom House to make the necessary examination and studies to organize the said project of tariff. For this purpose the same council will apply to all corporations and authorities who may possibly be able to throw light on the subject."

TRADE REPORT.

Philadelphia.

Office of The Iron Age, 220 South Fourth St.,
PHILADELPHIA, Pa., December 18, 1888.

Pig Iron.—The outlook is still somewhat uncertain, but, in the meanwhile, prices seem to be held with a fair degree of steadiness—indeed, the strength of the market is remarkable, considering the enormous furnace output and the comparative indifference of buyers. It would not be quite correct to say that the market is as firm as ever; neither would it be correct to say that it is very much weaker, and yet, as regards some particular Irons, both statements would be correct. After careful investigation, it appears that nearly all leading brands are well sold ahead, and that only in very exceptional cases would concessions be made on further transactions. If the pressure from other quarters becomes very severe, competition will be met, but, in the present condition of order books, there is no immediate necessity for such a course, hence all the leading makes of Iron may be called steady to firm, at prices ruling for several weeks past. As regards other brands, however, there is undoubtedly both irregularity and weakness. In this group may be included almost every brand that is not regularly on the market. They may be from entirely new furnaces or from furnaces that are only on this market occasionally, or from local furnaces that are operated spasmodically. Irons of this character may be of good quality, but they have no regular standing, and are, therefore, hard to sell, even when offered at low prices, but it is this class of Iron that will probably make the market during the next six months. Notwithstanding the disadvantages, as mentioned, their ultimate disposition is, after all, only a question of price. A consumer might not be willing to experiment for the sake of 50¢ per ton, a dollar would make him consider the matter, and another half dollar would probably decide him to give it a trial anyway. The question is just this: Is there enough outside Iron to lead to results of this character? It is too soon to give a definite answer to that question, but the position, to say the least, is very sensitive, and not altogether conducive to confidence. A few large purchases would be a great relief to the market, but buyers of this class are not prepared to take hold at the figures generally quoted, and there is some danger of parties from a distance unloading before those near at hand make up their minds what course to adopt. As a matter of fact, one of the leading Alabama companies made a sale of 7000 tons yesterday through Justice Cox, Jr., & Co.—price not definitely known, but believed to be not far from \$15, ex-ship Philadelphia, for quality similar to our Gray Forge. A fairly liberal movement among buyers during the coming week would enable sellers to maintain their position, but postponements for two or three weeks longer would subject the market to a severe strain. Quotations for standard brands range from \$18 to \$19, at tide, for No. 1 Foundry; \$17 to \$17.50 for No. 2, and \$16 to \$16.50 for Gray Forge. A few choice brands command a trifle more, and by the same rule concessions can be had on certain new brands, &c.

Foreign Iron.—Bessemer is still too high for this market, about \$20 being asked without attracting buyers' attention. Spiegel is offered at \$27 for 20%, with bids at from \$26.50 to \$26.75.

Blooms.—In fair demand at unchanged prices, say—Steel Nail Slabs, \$28.50 @ \$29, at mill; Billets, from \$32 to \$36, according to analysis; Charcoal Blooms,

\$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 per "bloom" ton of 2464 lb.

Muck Bars.—Business is dull, with sellers at \$29, at mill, or \$29.50, Philadelphia. Bids for good sized lots are not obtainable within half a dollar of these prices, so that sales have been of a limited character.

Bar Iron.—The market is so irregular that it is almost impossible to report it satisfactorily. Some mills are still quoting 1.85¢ to 1.9¢, firm, but as they are full of orders for the next five or six weeks, they feel themselves in a position to hold out for their prices. Others want work to begin the New Year with, and quote 1.8¢, taking probably a little less when a desirable order is offered to them. There are still others a short distance from the city who quote about 1.75¢, f.o.b. cars, so that prices vary according to circumstances, although about 1.8¢ seems to be a fair average city quotation. It is difficult to say what the outcome will be. Prices ought to be higher than they are, and under a moderately good demand probably would stiffen a trifle, but to put them as they were five or six weeks ago would require some heavy buying. Prospects are said to be very encouraging, and we believe they are, but it is actual business that makes prices, and until that comes talk will avail but little. Skelp Iron is easier to buy, and sales of Grooved reported at 1.85¢, 1.87½¢ and 1.9¢, according to deliveries. Buyers are talking 1.8¢ @ 1.85¢, with chances somewhat in their favor.

Plate and Tank Iron.—There is no material change from last week. Leading mills are tolerably well supplied with orders for the balance of the year, and in some cases well into January, but there is a general feeling that the demand is not what it ought to be to secure uniformity in prices. There is a great deal of work in sight, however, and the chances after the turn of the year are fairly good both for full employment and better prices, but in the meantime business may be taken at low figures by those who are anxious to fill up at once. It is said that nearly 10,000 tons of Iron will be wanted by the pipe makers during the next four or five weeks. A few orders of that class would help the market wonderfully. Prices in the meantime are about 2¢ @ 2.1¢ for Ordinary Plates and Tank plates, 2.1¢ @ 2.2¢ for Universal Plates; Shell, 2.4¢ @ 2.5¢; Flange, 3.5¢; Fire-Box, 4¢; Steel Plates, Tank and Ship Plate, 2.25¢ @ 2.3¢; Shell, 2.7¢; Flange, 3¢ @ 3¼¢; Fire-Box, 3½¢ @ 4½¢.

Structural Iron.—Business has not improved to any extent, although the outlook seems to be more encouraging, and manufacturers are inclined to expect some large orders in the near future. Meanwhile while some mills are running full others are doing very little, and are in consequence a little weak on prices, which are still nominally as follows: 2¢ @ 2.10¢ for Bridge Plate; 2¢ @ 2.10¢ for Angles; 2.6¢ @ 2.7¢ for Tees, and 3.8¢ for Beams and Channels, Iron or Steel.

Steel Rails.—The market is quiet, but firm at last week's prices. There are a few inquiries for fair-sized lots, but the general outlook does not indicate any material change from the conditions prevailing for some time past. Quotations are ordinarily \$28 at mill, but it is not unlikely that a little shading would be done on the right kind of orders. The demand for Steel in other forms is very large, and helps the mills greatly in the absence of Rail orders.

Sheet Iron.—There has been a very good demand for small lots in anticipation of the mills shutting down during the holiday season. Prices are very weak,

however, and on good sized orders special quotations are given. Small lots about as follows:

Best Refined, Nos. 26, 27 and 28....3¼¢ @ 3½¢
Best Refined, Nos. 18 to 25....3¢ @ 3¼¢
Common, ½¢ less than the above.
Best Bloom Sheets, Nos. 26 to 28....4¼¢ @ 4½¢
Best Bloom Sheets, Nos. 22 to 25....4¢ @ 4¼¢
Best Bloom Sheets, Nos. 18 to 21....3¾¢ @ 3½¢
Blue Annealed.....2.8¢ @ 3¢
Best Bloom, Galvanized, discount.....62½¢
Common, discount.....67½¢

Merchant Steel.—There is not much demand, and prices are unchanged, as follows: Tool Steel, 8½¢; Machinery, 2.6¢; Crucible Spring, 4½¢; Crucible Machinery, 5¢; Best Sheet Steel, 10¢; Ordinary Sheet, 8¢.

Old Rails.—There is not much demand at present, but owing to light stocks prices are steady and unchanged. There are buyers at \$23.50 for spot lots, with sellers for shipment at \$24. Store lots held for still higher figures.

Scrap Iron.—In fair demand but at somewhat lower figures. Asking prices about as follows: \$21 for cargo lots; \$21.50 @ \$22 for carload lots, delivered, or for choice \$22.50; No. 2 do., \$14 @ \$15; Turnings, \$13 @ \$14; Old Steel Rails, \$20 @ \$21; Cast Scrap, \$15 @ \$16; do. Borings, \$9 @ \$10; Old Fish Plates, \$25 @ \$26; Old Car-Wheels, \$17 @ \$18, Philadelphia, or its equivalent.

Wrought Iron Pipe.—Business is rather quiet for this year's deliveries, but prices for such are steady and unchanged. The outlook for next year's business is thought to be very encouraging, although it may not come in to any extent until after the holidays. Meanwhile discounts on small lots are quoted as follows: Black Butt-Welded, 52½¢; Galvanized do., 42½¢; Black Lap-Welded, 62½¢; Galvanized do., 52½¢; Boiler Tubes, 60¢.

Nails.—The market shows no improvement, and prices are so ruinously low that efforts are again being made to bring about a restriction of output. Meanwhile prices are nominally \$1.90 @ \$2 from store, but carload lots of outside brands are quoted at extremely low rates without securing much business, although they demoralize the market.

Cleveland.

CLEVELAND, December 17, 1888.

Iron Ore.—Negotiations between the mine owners and furnacemen, regarding Ore for next year's delivery, are now going forward so rapidly that vessels have already been chartered to carry Ore from Escanaba to Cleveland during the entire shipping season. The rate is to be \$1.25 per ton, or 15¢ below the lake freight from Escanaba at the opening of navigation this year. The representatives in this city of the great mining districts anticipate a slight advance in Ore quotations next season, reasoning that the triumph of the protection policy has put new life into the Iron industry and that the moderate prices paid for Ore this year were in conformity with the inactive and discouraging condition of the Pig-Iron market during a greater portion of the year. Business for the past week has been confined quite exclusively to the sale of several 5000-ton lots of Ore now on the docks. It is now believed that by the close of the year considerably less than 100,000 tons of the Ore on the docks will remain unsold. Ore is being rushed down to the furnaces at a rapid rate, 28,000 tons having been forwarded last week. The railroad companies seem to have plenty of cars and the docks will soon be cleared. It is now considered an assured fact that an active buying movement will set in immediately after the holidays.

Pig Iron.—Dealers look upon the market as remarkably active for this season of

the year, with the holidays less than ten days ahead and a new year scarcely two weeks away. The demand for Mill Iron is persistent and a scarcity is already reported. Prices for Neutral Mill Iron vary from \$16.50 to \$17, and for Red Short from \$17.25 to \$17.75, cash. Bessemer and Foundry Irons are also selling well and the whole market is so much firmer than is usually the case in December that manufacturers are allowing the expectations for next year to have free play. A heavy month's trade is expected in January.

Nails.—Steel Nails are again quoted at \$2, after two months of fluctuating prices. Iron Nails are worth \$1.90, with only scattering sales reported.

Old Rails.—It seems next to impossible to buy Old Americans for less than \$25, at which figure scattering transactions are reported.

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts.,
CHATTANOOGA, December 17, 1888.

Pig Iron.—The present demand is such as to keep the yards clear of all desirable grades, and at prices that show no falling off. Sometimes sales are made for round lots at some concession; then again sales are being made at figures above the average ruling prices, the difference being sometimes in quality and reputation of the article; and then again the time that is given makes some little difference in prices, but upon the whole the average is up to \$14.25 for No. 1, at furnace bank. The demand for Pipe Iron keeps up remarkably well, and several round lots have been disposed of during the week. The fall and winter are generally considered off seasons with the Southern foundries, but, notwithstanding this, the demand from this section has been steadily on the increase, and the present month shows larger shipments to these parties than any previous period of the same length. Some efforts have been made quite recently by Northern capitalists to establish storage yards at the different furnaces, receiving such surplus iron that may be made over and above sales, and issuing warehouse receipts thereon, but, so far as heard from, have met with no practical results, as none of the furnaces have had any surplus to store in this manner.

Louisville.

LOUISVILLE, KY., December 17, 1888.

Pig Iron.—Since our last report the market has been dull, with but few sales of any note. It is hardly expected that there will be any marked improvement in the market during the balance of this year, as buyers seem to be holding off until after the first to make purchases. Furnaces are unwilling to make any concessions in prices, and we think the final result will be that buyers will have to make their purchases at furnaces' prices. Prices are lower this December than they have been for many years, and we think the market will take an upward tendency after the first of the year. There has been some little old material offered, but very few sales have been made lately. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$16.25 @ \$16.75
Southern Coke, No. 2 Foundry, new classification.....	15.75 @ 16.25
Southern Coke, No. 3 Foundry, new classification.....	15.25 @ 15.75
Gray Forge.....	14.75 @ 15.25
White and Mottled, different grades.....	13.75 @ 14.25
Silver Gray, different grades.....	15.25 @ 16.25
Southern Charcoal, No. 1 Foundry.....	17.50 @ 18.00
No. 1 Mill.....	15.75 @ 16.75
Southern Car-Wheel, standard brands.....	22.50 @ 23.50
Southern Car-Wheel, other brands.....	18.75 @ 20.75
Hanging Rock Coke, No. 1 Foundry.....	16.75 @ 17.25

Hanging Rock Charcoal, No. 1 Foundry.....	20.50 @ 22.75
Hanging Rock, Cold Blast.....	21.75 @ 24.75
Hanging Rock, Warm Blast.....	18.75 @ 19.75

Detroit.

WILLIAM F. JARVIS & Co., under date of December 17, report as follows: There is considerable demand for Car Wheel Irons, and on this class prices are held very firm. There are some large deals on Gray Forge that will probably be closed in a few days, and although the deliveries are to run through the larger part of 1889, yet buyers are able to obtain concessions from present prices. Other grades of Southern Irons are offered at a little under figures at which they have recently been selling, but this cutting is confined to a few furnaces that are not in financial condition to hold, and want to place their output for several months ahead. Choice brands of Mahoning Valley Coke continue to be called for, and buyers are willing to pay the prices asked. Jackson County Silvers are also in good demand, several large orders at full quotations having been booked. With prices firm, except on some brands of Southern, and a good demand, we quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.00 @ 18.50
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 1.....	17.75 @ 18.25
Southern Gray Forge.....	15.75 @ 16.25
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.50 @ 21.00

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave.,
PITTSBURGH, December 18, 1888.

Pig Iron.—Continues dull and the market is weaker; demand continues light, as consumers are buying only for immediate wants. However, while the market is weak at present, there is reason to believe that it will steady up again in the near future. Even now there are buyers for future delivery at a slight concession on present prices, but no sellers; while some furnacemen are making concessions in order to effect sales for immediate delivery, because they must have money, they are refusing to contract ahead, from which it is evident that there is a general belief of a more active and stronger market in the near future. That there will be an increasing consumption early in the new year there is not much doubt, with but little prospect of production being pushed much higher than it is now, as capacity is at present pretty fully employed. Prices have gone off within the past few weeks 25¢ @ 50¢ per ton on Mill Irons and \$1 on Bessemer. The decline in the latter was not unexpected, as it was higher relatively than Mill Iron. We quote prices as follows:

Neutral Gray Forge.....	\$15.75 @ \$16.00, cash.
All Ore Mill.....	16.50 @ 16.75, "
White and Mottled.....	15.00 @ 15.50, "
No. 1 Foundry.....	17.50 @ 18.00, "
No. 2 Foundry.....	16.75 @ 17.00, "
No. 1 Charcoal Foundry.....	23.50 @ 24.00, "
No. 2 Charcoal Foundry.....	21.50 @ 22.00, "
Cold Blast Charcoal.....	25.00 @ 27.00, "
Bessemer Iron.....	17.00 @

Sales of Bessemer were reported at \$17, cash, but so far as we can learn there have been no actual sales below that price. We are advised of well-known brands of Neutral Mill at \$15.75 @ \$16, cash, and other lots not so desirable at \$15.50, cash.

Muck Bar.—There is less inquiry and the market is weaker. We quote at \$28.75 @ \$29.50, cash. The latter is an extreme price, and can only be obtained for something very desirable for immediate delivery, both of which considerations are often very important with buyers.

Spiegel.—We can report a sale of Ferromanganese, 80 %, at \$56, cash, and Spiegel is quoted at \$27 @ \$28, cash, for 20 %.

Manufactured Iron.—There is less new business, as is to be expected at the close of the year, and the mills continue to be pretty well employed in working up old contracts. Bars are quoted at 1.75¢ @ 1.80¢; Plates, 2.20¢ @ 2.25¢; No. 24 Sheet, 2.85¢ @ 2.90¢, all 60 days, 2 % off for cash. Skelp Iron is weaker and lower; Grooved, it is reported, has sold down as low as 1.75¢ @ 1.80¢, and Sheared at 1.95¢ @ 2¢. The falling off in the trade for Pipe has, as a matter of course, very materially curtailed the demand for Skelp Iron; this, however, is usual at the close of the year.

Nails.—There is but little inquiry for Nails here, which is owing to the fact that Pittsburgh makers are refusing to sell below card rates, on a basis of \$1.90 for 12d to 40d, 60 days, 2 % off for cash, whereas buyers claim to do better elsewhere. There are only two firms here at the present time paying attention to the Nail trade, Chess, Cook & Co. and Jones & Laughlins, and they are doing very little, owing to the cause noted. The Wheeling manufacturers have fixed prices at \$1.90, 60 days, 2 % off for cash, with the regular abatement of 10¢ per keg on carload lots and upward, which, with the discount for cash, brings the net price down to about \$1.77, which is still considerably below the price demanded by the Pittsburgh manufacturers.

Wrought-Iron Pipe.—The demand continues light, as it always is at this season of the year, and prices remain weak and irregular, so that it is difficult to give reliable quotations. It is, to use a common phrase, a go-as-you-please market, each firm being free to make its own rates, and those anxious for business are cutting very close, especially on desirable orders. We quote nominally as follows: Discounts on Black Brtt-Welded Pipe, 52½ @ 55 %; on Galvanized do., 45 @ 47½ %; on Black Lap-Welded, 62½ @ 65 %; on Galvanized do., 52½ @ 55 %; Boiler Tubes, 60 @ 62½ % off; 2-inch Tubing, 11½¢ @ 13¢ per foot, net; 5½-inch Casing, 38¢ @ 40¢.

Old Rails.—There have been very few sales reported during the past couple of weeks, but prices are still maintained: \$25 @ \$25.25, cash, for American Tees. Demand is light, as consumers—the end of the year being so near at hand—are buying only as their immediate wants necessitate. Old Steel Rails may be quoted at \$20.50 @ \$21 for long lengths and \$18.50 @ \$19 for short pieces.

Steel Rails.—Are still quoted at \$28, cash, on cars in Pittsburgh. The 17,000-ton contract secured by a Chicago mill, in regard to which so much has appeared in print during the past few days, it is claimed, was first secured by a Pittsburgh firm who were competing with Chicago for it and subsequently turned it over to the Chicago firm.

Billets, &c.—In regard to Bessemer Steel Billets, the market remains quiet and unchanged. Sales at \$28.50, cash. Nail Slabs quoted at \$28; Domestic Bloom and Rail Ends, \$19 @ \$19.50.

Railway Track Supplies.—Spikes are still quoted at \$2.15, 30 days; Splice Bars, \$1.85 @ \$1.90; Track Bolts, \$2.85, with Square, and \$2.95 with Hexagon Nuts.

Merchant Steel.—No change in prices. Best brands Tool Steel, 8½¢; Crucible Spring, 4½¢; do. Machinery, 5¢; Open-Hearth Machinery, 2½¢.

Old Material.—The demand continues light; prices unchanged. Sales No. 1 Wrought Scrap, \$21 net ton; Car Axles, \$25 @ \$26; Wrought Turnings, \$18 @ \$14;

Cast Scrap, \$15.25 @ \$15.50, gross; Cast Borings, \$12 @ \$13; Old Car-Wheels, nominal, \$20.

After January 1 the style of W. D. Wood & Co., Limited, will be changed to W. Dewees Wood Company, with general business offices at the works, McKeesport, and a branch office at 111 Water street, Pittsburgh. Communications to be addressed to McKeesport.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. |
CINCINNATI, December 17, 1888.

Pig Iron.—There has been a further contraction in the volume of business in Pig Iron during the past week in our local market and an easier feeling has prevailed, some transactions having been negotiated for prompt delivery on a lower level than for several weeks, but prices for long future delivery have suffered little change. But while the majority of sales made recently have been small, there has not been an entire dearth of large transactions. The local representative of a large Southern company has succeeded in placing considerable Iron East, mainly in Philadelphia, and local firms have also sold some round amounts of Southern and Northern Iron in Louisville during the past few days, one lot of "Pipe Iron" amounting to 3000 tons. Sales of Mottled Coke and Gray Forge Iron have been made for prompt delivery at \$14 and \$14.50 $\frac{1}{2}$ ton, cash, respectively. No. 1 Southern Coke Foundry Iron has been sold at \$16, showing a relaxation of 25¢ $\frac{1}{2}$ ton, and in general the trades consummated during the week have been more at the inside than at outside quotations. The disposition previously noted to hold off until the turn of the year has continued, and this fact has resulted in the easier tone noted, advantage of which has been taken by a few enterprising buyers. The demand for Car-Wheel Iron, especially for Woodstock, Shelby and Clifton, has continued active, and agents have much difficulty to make satisfactory disposition of the orders already booked. One feature of special prominence at present is the large movement of freight of all kinds, but largely of grain, from West to East. All the local roads have their full equipment in active employment, and are utilizing passenger crews to move freight. For this reason the adequate number of cars cannot be obtained to ship Iron. The following quotations are the approximate prices current here for cash, f.o.b. cars:

Foundry.	
Southern Coke, No. 1 (new classification).....	\$16.25 @ \$16.75
Southern Coke, No. 2 (new classification).....	15.50 @ 16.00
Southern Coke, No. 3 (new classification).....	15.00 @ 15.25
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	18.00 @ 18.50
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.50 @ 18.00
Forge.	
Strong Neutral Coke.....	15.00 @ 15.25
Mottled Neutral Coke.....	14.00 @ 14.25
Gray Forge.....	14.50 @ 14.75
Car-Wheel and Malleable Irons.	
Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—The local nearby mills have booked liberal orders for next year's delivery, placed by carriage builders, machine shops, &c., but the sales for present delivery are small. A firm tone prevails at previous prices and no change for the immediate future is foreshadowed. Common Bar Iron, 1.90¢; Charcoal Bar Iron, 2.90¢ @ 3¢; Sheet

Iron, Boiled, Nos. 10 to 27, 2.50¢ @ 3.25¢; Sheet Iron, Charcoal, Nos. 15 to 25, $\frac{3}{4}$ ¢ @ $\frac{4}{4}$ ¢ $\frac{1}{2}$ lb.

Old Material.—There has been a fair inquiry for both Old Rails and Wheels recently, with moderate sales of Rails at \$23 @ \$23.50 and of Old Wheels at \$19 @ \$19.50 $\frac{1}{2}$ ton, cash.

Nails.—There has been a moderate jobbing demand and a steady market. Jobbing prices are based upon 12d @ 40d, which sell at \$1.95 $\frac{1}{2}$ keg, with 10¢ rebate in carload lots, at mills. Steel Nails sell at \$1.95 and Steel Wire Nails at \$2.65 $\frac{1}{2}$ keg.

A new firm for the sale of Pig Iron and general commission has been created here during the week. The style of the firm is Van Vorhees & Smith, representing the firms of George W. Stetson & Co., of Boston and New York, and Edmund D. Smith & Co., of Philadelphia. Rooms have been secured in the Johnson Building. Mr. Blandy, recently connected with Rogers, Brown & Co., is the local representative of the branch office. The business controlled is considerable.

New York.

Office of *The Iron Age*, 66 and 68 Duane street. |
NEW YORK, December 19, 1888.

Foundry Pig.—Although the Thomas Iron Company have not yet formally opened their books, they have entered orders during the week for 1889 delivery from regular customers to the total of about 12,500 tons, the price to be fixed later on. This brings the total of their engagements, as we are informed by B. G. Clarke, to about 40,000 tons, a part of which is Iron the delivery of which cannot be completed this year. We hear well-authenticated reports of some cutting by Southern furnaces, growing out of the necessity to meet financial obligations, and learn of offers of No. 2 Northern Iron, for Forge purposes, at a cut of 25¢, to induce anticipating of orders. We quote: Standard to Choice Foundry, No. 1, \$18 @ \$19.50; No. 2, \$17 @ \$17.50, and Gray Forge, nominally, \$16 @ \$16.50.

Scotch Pig.—We quote Coltness, \$21, nominally; Shotts, \$20.25 @ \$20.75; Langloan, \$20.25 @ \$20.75, and Dalmellington, \$19.50 @ \$19.75.

Spiegeleisen.—We quote nominally, in the absence of business, \$27 for 20 % Spiegeleisen, and \$54 for 80 % Ferromanganese.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, $\frac{3}{4}$ ¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2¢ @ 2.10¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢ on dock for all sizes. Foreign Beams are quoted 2.55¢ @ 2.75¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common; 1.7¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢, and Refined, 1.8¢ @ 2¢.

Steel Rails.—Sales east of the Allegheny Mountains have been confined to small lots aggregating between 6000 and 8000 tons at private terms. There is little business in sight in the immediate territory of the Eastern mills, but inquiries are at hand from the South, which may be taken by them if the Western mills continue to hold at the prices which they quote. Considerable stir was created by the report in the newspapers that a Chicago mill had taken an order for 17,000 tons for the Union Pacific at a price equivalent to \$27.50 at Chicago. This is

the order secured first by a Pittsburgh mill at \$30, plus bridge toll, delivered at Omaha. For a consideration, this mill transferred the work to the Chicago concern, partly because the former found it somewhat difficult to arrange for the delivery required. The opinion is expressed, too, that the transfer implied the withdrawal from competition on some business now pending. Negotiations are under way for some important orders, with the probability that they will be closed before the new year. Buyers have been holding off, in distrust of the stability of the higher prices being asked by the mills. The report of the Board of Control shows the sales for 1888 delivery to have been, up to December 1st, 1,251,177 gross tons, and the actual deliveries 1,116,788 tons. The sales for 1889 delivery reported up to December 1st aggregated 270,671 tons. Transactions closed since then will swell the total to at least 400,000 tons, not counting the business done by the Allegheny Bessemer Steel Company, who are not in the association, and not counting, of course, Light Rails, which are not included in the allotments.

Merchant Steel.—Purchases are being made only from hand to mouth. The market continues demoralized. As an instance, we may cite the case of Tire Steel, of a size which would have brought 0.4¢ extra under the old scale, selling, delivered, at 2.1¢, flat—a cut of about $\frac{1}{4}$ ¢.

Wire Rods.—There is some inquiry and a moderate amount of business, \$39.50 being asked for early steamer shipment for Basic Rods and \$39 for shipment, at the option of the seller, by steamer. In Germany the rank and file of Rod makers ask prices too high to allow of business here, but there are occasional sellers under the market, whose offerings are sufficient to supply the limited requirements of this country, their quotations being about 104/, shipping port.

Old Rails.—We are not reported any business, which is due to the absence of any local supply at prices which buyers are willing to pay. There is more inquiry for round blocks by several Eastern mills. For future shipment—say the early months of next year—Foreign Double Heads have been offered at \$23.75 here.

Cotton Ties.—Importation orders have ceased and business is confined to supplying the smaller trade from stocks at Southern Atlantic Gulf ports. For such business 95¢ @ \$1 is named, at New Orleans, per bundle.

Rail Fastenings.—Among the recent sales of Spikes is a lot of 5000 kegs to a Western road. Steel Angles have been weakening.

Financial.

During the week there has been a temporary increase of demand for merchandise, in anticipation of the advance in railroad freights, which took effect on Monday. The presence of Western and Southern jobbers in the dry goods market was particularly noticed. For a similar reason the east-bound shipments from Chicago were very heavy, the total being 77.-125 tons, against 59,623 tons for the previous week and 48,598 tons for the corresponding week last year. An encouraging feature is afforded by the preliminary statement of exports for November, which, for the first time in six months, compares favorably with the corresponding month last year. An examination of the several items shows that while the aggregate has doubled since July the increase is almost wholly due to the movement in cotton. Breadstuffs and provisions are going out on a much reduced scale. The adjustment of railroad difficulties is still in progress,

but Judge Cooley, chairman of the Interstate Commerce Commission, who has been investigating the rate-cutting wars on Northwestern roads, is not sanguine of a permanent settlement until the law has been somewhat amended. He says no bill to repeal the law will succeed in Congress. President Charles Francis Adams, of the Union Pacific, says that it is the absence of good faith among railroad officials which has brought about such rate cutting, but the primary cause is a craze for railroad construction. Transcontinental rates will be advanced 20 % January 1, and a new tariff will soon be issued. Twenty-four suits, aggregating \$120,000, against the Rock Island Railroad, alleging extortionate rates, have been begun at Davenport, Iowa.

The Stock Exchange markets have been active and generally strong. On Thursday, excepting the coal stocks and Union Pacific, the tone was weak, partly on account of lower prices in London. On Friday stocks were very dull and closed on a fractional decline. The reports of rates being restored in the West were offset by heavy engagements of gold for export and the collapse of the Panama Canal scheme in Paris. On Saturday the favorable bank statement caused a noticeable improvement. Prices in Europe were a fraction lower, owing, it was said, to the failure of the Panama Canal loan. More strength was developed on Monday, the coalers leading. There was more buying by prominent operators on the improved railroad situation East and West, with an important advance in London. On Tuesday the market was moderately active and lower. Efforts to realize were aided by reports that east-bound rates were not mentioned.

United States bonds were strong and in good demand. Quotations as follows:

U. S. 4s, 1891, registered.....	108½
U. S. 4s, 1891, coupon.....	108½
U. S. 4s, 1907, registered.....	127½
U. S. 4s, 1907, coupon.....	128½
U. S. currency 6s.....	119

The general markets are quiet. Cotton is in light demand and ½¢ lower. Wheat and flour are alike dull, millers declining to purchase, and wheat exports are entirely suspended. Corn is quiet and weak. Refined oil is a shade stronger and cottonseed oil decidedly so. The gradual upward tendency in hemp, owing to the scarcity, has resulted in a further advance of ½¢ for both Manila and Sisal. Cash lard a turn dearer. Salt is unchanged. Raw sugars are easier. Wool is quiet but strong. Ocean tonnage is scarce, rates well sustained. Provisions are on a stronger basis. Raw silks have advanced 2½ to 3 francs in France and 40 to 50 Mexican dollars in Japan.

The considerable increase in surplus reserve shown by the weekly bank statement, amounting to \$2,468,400, was an agreeable surprise, it appearing that the large Treasury disbursements, including payments on account of pensions as well as bonds purchased and interest falling due, more than offset the heavy exports of gold. The surplus now held is \$9,672,225, against \$7,928,400 at the corresponding time last year and \$4,008,200 in the third week of December, 1886. In loans there was a contraction of \$3,101,300. According to the Custom House report the exports of specie from this port during the week amounted to \$5,693,505, making a total since January 1 of \$44,087,000, as compared with \$17,586,000 for the same time last year, and nearly \$47,000,000 in 1886. The imports of specie for the week were \$87,000, and since January 1 \$7,097,000. It is surmised that shipments to London may continue, but no apprehensions of undue stringency from this source are felt. The common impression is that, with the large current exports of cotton and so large a proportion of the corn crop yet to

come forward, together with an improved railroad situation, the new year will enter with a better tone in financial circles. Rates for money on call advanced to an average of about 3%. Time loans on good collateral were made at 4 % for two or four months, and at 4 @ 5 % for four to six months. Commercial paper was in good demand, the supply being moderate. Rates were for 60 to 90 days' indorsed bills receivable 5 @ 5½ %, for first-class four-months' commission-house names 5½ @ 6 %. The total amount of bonds purchased to date under the circular of April 17 is \$100,686,200, of which \$51,396,650 were 4 per cents, and \$49,289,550 were 4½ per cents. The cost of these bonds was \$119,247,668, of which \$66,010,877 was paid for the 4 per cents and \$53,236,791 for the 4½ per cents.

Sterling is firm, with posted rates at \$4.85½ @ \$4.90. The Bank of England rate is 5 %, and with possible money complications in France, connected with the Panama Canal failure, easier rates are not expected. Germany, to meet demands in the Argentine Republic, draws on New York.

The clearings of 39 cities for the week ended December 15 show an increase of 6.6 %. Outside of New York the increase is 3.3 %. New York increased 6.9 %, Boston 2.2 %, Chicago 3.9 %, St. Louis 8.9 %, San Francisco 6.1 %, Cincinnati 5.9 %, Pittsburgh 4.8 %, Minneapolis 13.7 %, Omaha 19.3 %, Topeka 16.2 %, Kansas City 32.2 %, New Orleans 22.4 %, Louisville 25.8 %, Memphis 36.9 %, Denver 44.3 %, Columbus 25.3 % and Galveston 46.3 %. Philadelphia decreased 0.4 %, St. Paul 2.9 %, Duluth 49 % and Wichita 34.8 %.

The total exports of breadstuffs for November show a decrease over the same month last year of \$1,794,000. The decrease is chiefly in wheat and wheat flour. For the five months ending November 30 the decrease in total exports of breadstuffs is \$12,000,000 over the exports for the same period last year, and for the 11 months ending November 30 the value was \$100,622,453, against \$148,019,669 during the corresponding months of 1887, a decrease of over \$47,000,000. The total exports of beef and hog products for November show a decrease of about \$500,000; of dairy products, of about \$300,000. Exports of cotton show an increase of about \$1,300,000. The total value of our exports of mineral oils during the 11 months which ended November 30 was \$42,549,492, against \$41,246,286 during the corresponding period of last year.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from December 7 to December 13, inclusive, and from January 1 to December 13, inclusive, were as follows:

Iron and Steel.

	Dec. 7. to Dec. 13. Tons.	Jan. 1 to Dec. 13. Tons.
Pig Iron: Crocker Bros.....	760	15,384
G. W. Stetson & Co.....	300	14,750

Metal Market.

Copper.—The London market seems to sink, for the time being, into as listless a mood as our own, sales there for the week having been restricted to 275 tons all told, and prices unaltered: Chili Bars, spot, £97. 10/; ditto., futures, £78; good merchantable brands, £77. 10/ @ £78, but Best Selected declining from £80. 10/ to £80. Here very little transpired, one December contract selling at 17.40¢, and one January ditto. at 17.15¢. At the close December may be quoted 17¢ @ 17.15¢, and January, 17¢ @ 17.10¢. The financial disturbance in Paris growing out of the suspension of the Panama Canal Company temporarily depressed Rio Tinto shares in that city, but they recovered 11 francs yesterday. In Boston there was also a decline in Copper shares of from 2 to 8 points, but there seems to be little apprehension that the French syndicate will for the present be in any shape affected by the financial events in the French capital. It may take a week or two before the Panama Canal Company's immediate fate will be decided. The import of American Copper into Liverpool and Swansea the first 11 months has been 22,562 tons Fine, against 14,087 same time last year. The export of Pyrites from Spain during the first nine months has been 629,600 tons, against 594,779 tons last year and 515,094 in 1886; of Precipitate respectively, 21,239, 19,499 and 20,672 tons. New Copper mining companies are being organized in a good many quarters, from Portugal to New Zealand; after a while they may begin to tell on production unless the syndicate buys them up one after the other.

Tin.—Has again declined slightly in the London market, spot Straits from £98. 5/ to £97. 5/, and futures from £98. 15/ to £98. during the week. Sales 550 tons. In our own market there has been a persistent dead calm at 21½¢, nominally, for 10-ton lots, and 22¢ in a jobbing way. As per cable dated December 18 from Gilfillan, Wood & Co., Singapore, to Mr. Charles Nordhaus, New York, the Straits shipped this way December 1 to 15 150 tons, against 100 tons last year, and to England 1200, against 1200. Since January 1 to this country 3550, against 4250 in 1887, and to England 18,100, against 15,950. **Tin Plates.**—The demand for spot goods is only moderate at unchanged prices. Some orders for forward delivery have been booked during the week, but makers refuse to make sufficient concessions to bring in the bulk of the business offering, which is still held in abeyance awaiting a change in the market. Liverpool is quoted 3d. higher in the meantime, Coke being cabled 13/3. We quote, large lines, 3 box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; ditto, Coke Finish, \$4.65 @ \$4.70; Terns, \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30; and Wasters, \$4.12½ @ \$4.15.

Lead.—Although hardly anything beyond a mere jobbing trade has been done in Common Domestic, the market winds up stronger at 3¼¢ here and 3.55¢ in St. Louis. As long as the 15,000 tons of Corwith stock overhang the market, the bulk thereof here, business in Lead will be of a skirring nature merely, and besides this is about the dulllest time of the year, so that for the moment Lead attracts but little attention. Some 800 tons are to be offered at auction to-day. Spanish exportation of Pig Lead the first nine months has been 97,917 tons, against last year 99,168 and in 1886 82,591 tons. In London Soft Spanish improved from £12. 7/6 to £12. 10/, and English Pig is cabled £12. 15/.

Spelter.—Has remained inactive here at 5¢ @ 5½¢, Common Domestic, ordinary brands, and Silesian at 5¼¢, both nom-

inally, while in London the quotation for the latter remains £18. 5/. The International Syndicate in Europe is advocated to be renewed for 3½ years, to date from July 1 next, with an allowed increase of 5 % in production. This is what the German and Belgium smelting works recommend already. Spanish Calamine exportation during the first nine months has been 23,105 tons, against 20,698 in 1887 and 21,140 in 1886.

Antimony.—Has been moderately active at 12¼¢ @ 13¢ Cookson, and 10¼¢ @ 11¢ Hallet, the latter being £45 in London.

New York Metal Exchange.

The following sales are reported:

THURSDAY, December 13.	
25,000 lbs. Lake Copper, December.....	17 40¢
FRIDAY, December 14.	
32 tons Lead, December.....	3.70¢
25,000 lb Lake Copper, January.....	17.15¢
80 tons Copper, January.....	3.70¢
96 tons Lead, January.....	3.75¢

Coal Market.

We learn that the Reading, Lehigh Valley and New Jersey Central will close their collieries from December 22 to January 2. This does not affect individual collieries.

The wholesale Anthracite Coal market is dull and weak, from the effects of accumulated surplus. The increase at tide-water shipping points during November was 210,000 tons. The stock on the 30th ult. was 569,238 tons, and since then production has fallen off 100,000 tons, the total for the week ending 15th inst. having been 680,859 tons, which, however, is a decrease of only 28,000 compared with the previous week. Compared with the corresponding week last year the decrease is nearly 100,000. From January 1 to November 30 the production was 35,441,795 tons, against 31,572,939 tons in 1887, an increase of 3,868,855 tons. The year 1888 is the banner year in the history of this industry, both as to the volume of trade and general condition. There is no complaint that business is done at a loss. The Reading is the only company that reports a decrease of tonnage. The facilities for production next year will be increased to nearly 45,000,000 tons. Among other improvements the Lehigh Valley Coal Company is surveying a railroad which will open a rich valley north of Mount Carmel, Llewellyn and Nagle. They have built a new breaker and will reopen the abandoned Black Diamond mine. Sales of Lehigh are reported as low as \$3.50 @ \$3.90 ¢ ton, f.o.b., for Broken and Egg, and there are reports of cutting in other directions.

Bituminous Coal prices are dull and weak, as a consequence of free production, but the pool basis of \$3.25, f.o.b., is still quoted. The Seaboard Association held a meeting to secure the co-operation of the Beach Creek Railroad, which this year has produced over 1,500,000 tons, but no final action was reached. The Clearfield and Cumberland last week reported 145,000 tons. Philadelphia papers report that R. B. Wigton & Co., Bituminous Coal shippers, are about to sue the Pennsylvania Railroad Company for damages for alleged discrimination in freight rates.

Heavy floods at Carbondale, Shenandoah, and Pittston are reported, causing much damage. At Mt. Carmel work at the collieries will not be resumed until next year.

A cargo of Alabama coal is being shipped from Pensacola to Cuba, to which point the parties concerned have shipped 100,000 tons per annum from Pennsylvania. Efforts are making to build up a large trade from the Alabama mines to the seaboard.

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Dec. 19, 1888.

Operations in Copper have been comparatively small and without other feature than that the "syndicate" agents freely met the demand at unchanged prices. Consumers have no greater faith than heretofore in the stability of prices, and consequently purchase supplies only as required to tide over immediate wants. The rumor has been circulating that the syndicate contemplate a reduction in prices for the new year, as a means of inducing consumers to purchase with greater freedom. The foundation for the report is, however, of a doubtful character. Furnace material is difficult to sell, and mainly for the reason that outside of the "syndicate" the outlet for Bars is very limited. In this connection it may be stated, as a matter of more than passing interest, that the accumulation of Bars in the hands of the "syndicate" is due in a measure to the fact that they necessarily have to purchase, in the form of good merchant Copper, nearly all the Matte sold to smelters in the crude form.

Apropos of the recent sales of Lake Superior Ingot to American consumers, it is reported on semi-official authority that the quantity was 10,000 tons and the price £87. 6/, less 2½ %, leaving, it is calculated, a net profit of £8 ¢ ton, to the syndicate. A report has had circulation on the market here to the effect that the "syndicate" has closed with the Anaconda Company for its entire production the first half of 1889 at market value.

Block Tin has ruled lower again under the weight of renewed reports of probable heavier shipments from the Straits, together with lack of outside speculative interest in the market. The demand has improved somewhat the past few days, however, with the result of toning the market somewhat.

There has been no radical change in the Pig Iron market. Operators in "warrants" are inclined to defer operations until the makers' returns are published, and home consumptive demand is only fair. The purchases of Scotch brands for Italian account are quite large, but American buyers purchase sparingly. The demand for Middlesboro' Pig has slackened, and stocks are now increasing at that point, without, however, unfavorable bearing upon prices.

The Steel trade continues active, particularly in the railway and shipbuilding supplies departments. Prices are still firm in those branches while somewhat irregular in others. Among transactions reported the past week is an order for 21,000 tons Steel Rails and 1200 tons Sleepers, secured by Bolckow, Vaughan & Co.

Hawks & Crawshaw, Gateshead, have discontinued making Steel. The Cyfarthfa works have started up 16 puddling furnaces and three mills for the manufacture of Bars.

Tin Plate makers report more numerous inquiries the past week, and in many instances buyers and sellers have met on prices, with the result of a good business being put through. There is a better tone to the market, and sellers have refused to duplicate orders at the lowest prices ac-

cepted recently. The old Lodge Iron Works have been purchased for £2500, and will be converted into a Tin Plate works.

Scotch Pig.—There has been a fair business at generally steady prices.

Steamer freights, Glasgow to New York, 3/, Liverpool to New York, 10/.	

Cleveland Pig.—Demand has continued slow, and the market is rather weaker. No. 1 Middlesboro', G. M. B., 36/6; No. 3 do., 33/9.

Bessemer Pig.—The transactions have been large, but at irregular prices. West Coast brands, mixed numbers, 44/6 @ 45/, f.o.b. shipping point.

Spiegeleisen.—Inquiries are not so numerous, but prices held firmly. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—There continues to be a good business, and prices are held firmly. Standard English sections quoted at £4, and light sections £4. 2/6 @ £4. 12/6, f.o.b. at N. W. England shipping point.

Steel Blooms.—Demand very moderate and prices nominal. We quote £3. 18/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—A fair business reported, at firm prices. Bessemer, 2½ x 2½ inch, £4. 1/3, f.o.b. at N. W. England shipping point.

Steel Slabs.—The market steady with demand fair. Bessemer, £3. 18/6, f.o.b. at N. W. England shipping point.

Old Rails.—Holders firm at previous prices, but the demand slow. Tees quoted at £3. 5/ @ £3. 7/6, and Double Heads, £3. 8/ @ £3. 10, c.i.f. New York.

Scrap Iron.—A moderate business doing at old prices. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—The demand moderate, and prices unchanged. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—No material change in prices. Bessemer fair. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3	@ 15/6
IC Bessemer steel, Coke finish	13/6	@ 13/6
IC Siemens	13/9	@ 13/9
IC Coke, B. V. grade	13/	@ 13/3
Charcoal Terne, Dean grade	12/	@ 12/3

Manufactured Iron.—The market continues strong and is fairly active. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d.	£ s. d.
Common	@ 8	2 6
Staff. Bl'k Sheet, singles	@ 5	12 6
Welsh Bars (f.o.b. Wales)	5 0 0	@ 5 2 6

Tin.—Trading larger this week, but the market unsettled. Straits quoted at £97. 5/, spot, and £98 @ £98. 5/ for three months' futures.

Lead.—The market very quiet and rather weak. Soft Spanish, £12. 10.

Spelter.—A fairly active business without material change in prices. Silesian, ordinary, £18. 5/.

Copper.—Speculative dealings in Chili Bars have been larger at unchanged prices. Best Selected sold at £5 decline from late

nominal price. Chili Bars, £77. 10/, spot, and £78, three months' futures. Best Selected, £75.

Tin Mining at Perak.

A correspondent of an Eastern journal, describing a visit to the Malay State of Perak, reminds us that it is only about ten years since the British Government found it necessary to interfere forcibly in the affairs of Perak, and practically to place its affairs under the control of the Resident, Sir Hugh Low. A steamer now runs daily from Penang to Larut, whence the thriving town of Taeping is reached by a short railway. From this place the capital, Kwala Kansar, is reached by coach. Taeping is thoroughly a Chinese town of the modern kind, and the Chinaman appears perfectly happy there.

The tin mines are just outside the town and cover an area of several square miles and are worked wholly by Cantonese. They are a series of hollows having the appearance of quarries; enormous numbers of coolies, working like so many ants, convey the sand or rubble to the washers' troughs, which are placed at a sufficient height to allow of the water running freely down an incline. One man takes up the minute portions of tin, having the appearance of points of black lead, and which sink at once to the bottom of the trough; others pick up stones from the gravelly mixture; others again push up the heavier portion of the mud from which the tinstone is not yet completely separated, so that it may pass through the water again and nothing be lost. The ore is then washed once more in special washing-houses and is thrown with charcoal into a simple furnace, like a barrel standing on end, and made chiefly of clay; the molten lead oozes down through the charcoal and escapes through a hole in the bottom into a pit hollowed out of the ground, the tin being left. The tin molds are simply holes pressed into the sandy floor by circular wooden rollers, each consisting of half a section, with broad, wooden lips, which leave indentations similar in shape to the blocks of tin shipped abroad. The tin is left here for several days to cool, when it is hauled out with a long iron rod and dashed with water.

It is curious that the only tin mine in Perak supplied with adequate machinery and worked by Europeans fails to give a profit, while the Chinese with their primitive methods can turn the most unpromising mine to advantage. Kwala Kansar consists simply of one business street of Chinamen, the Malays living about in the jungle doing little. New roads are being laid out in every direction under the superintendence of the Resident, and the great trunk road is being continued inland, so as to reach the tin mines of Kinta, the produce of which now reaches the coast by water.

E. P. Allis & Co., of Milwaukee, Wis., have put in operation their long contemplated scheme of furnishing dining facilities to their employees. They have fitted up a large room in their office building for a dining hall, in which any employee can obtain his midday refreshment for a nominal sum. No compulsion is exercised, but each person is free to avail himself of the opportunity if he desires. No change has been made in the length of the noon-ing in consequence of the new arrangement, so that the employees have a longer time for rest and social intercourse than they would have if they were obliged to go some distance from the works to get their dinners. Those who were formerly in the habit of carrying their lunch and eating it cold can now get hot dinners, and will be

able to work better, both to their own advantage and to that of the firm. Representatives of the various departments find the new arrangement a great convenience, as the dinner table becomes a favorite place for the discussion of various business matters, and the interchange of ideas and opinions. The more agreeable the surroundings are at lunch time, and the more appetizing the luncheon itself, the better will the workmen feel, and possibly the better engines they will turn out for E. P. Allis & Co.

W. S. Kessler & Co., well known to the iron trade of Chicago and vicinity as manufacturers' agents for the sale of iron and steel, bolts, nuts and railway supplies, have made arrangements to enter an entirely different line of business. They have established the Albion Malleable Iron Works, at Albion, Mich., their office being at the works. They will use the building vacated by the Gale Mfg. Company, who have erected larger works for the manufacture of plows. The building is 100 feet front by 400 feet deep, constructed of brick, and is three stories high in front. Messrs. Kessler & Co. are now putting in an air furnace of the most improved type with the necessary annealing ovens. They expect to be ready for business by the 1st of February, and will then be prepared to take orders for any kind of malleable castings, their specialty being castings for agricultural implements. They will employ from 75 100 hands and will make from 10 to 15 tons of castings daily.

The Louisville Southern Railroad was completed last summer under the management of Col. Bennet H. Young, forming with the Cincinnati Southern a competing line to the Louisville and Nashville system for Southern trade. Since the construction of the road a great many surmises and reports have been afloat as to what combination would absorb the new outlet. All rumors were set at rest on the 14th inst., when it was announced officially that the Louisville, New Albany and Chicago road had leased the Southern for a term of 30 years, making a through trunk line from Chicago to all points South and Southwest reached by the Cincinnati Southern road. The L. W. A. & C. guarantees the interest on the Southern's bonds, besides agreeing to divide net profits with stockholders over and above expenses. The former road has heretofore entered Louisville over the Pennsylvania Company's bridge across the Ohio River, but will probably soon come over the Kentucky and Indiana bridge, which was built and is operated in connection with the Southern road.

The sales agency for the pig iron of the Woodward Iron Company for Chicago and the Northwest has been taken by Rogers, Brown & Co., 98 Dearborn street, Chicago. The Woodward Company are now operating two furnaces and making 200 tons daily. Rogers, Brown & Co. also represent the Nashville two furnaces and the large new coke furnace, at Gadsden, making the Etowah brand. They will sell the product of the new Trussville Furnace, just being completed, near Birmingham, by Pennsylvania iron men.

The American Institute Fair was visited by 200,000 persons.

The imports of merchandise at this port during the week were valued at \$7,854,000, of which \$2,089,000 represent dry goods. Since January 1 the total is \$444,169,000, against \$449,000,000 for the same time last year.

Hardware.

Merchants and manufacturers are more occupied in closing up the year's business than in taking care of current orders, the demand in general being quite limited. But few changes in prices are announced, and new goods, revision of lists, and other matters relating to next season's trade are withheld until the opening of the year.

Barb Wire.

The New York market presents no new features, prices remaining as before, for Four-Point Galvanized, carload lots, 3.6 cents; 3-ton lots, 3.7 cents, and smaller lots 3.9 cents, with deliveries within the territory covered by the agreement of the manufacturers. The demand is small.

Cut Nails.

The New York market is quiet, at \$1.80 @ \$1.90 for carload lots, on dock, and \$1.90 @ \$2 for small lots, from store. Nothing of general interest was done at the meeting of the Eastern Nail makers, in this city last week.

Miscellaneous Prices.

The annual meeting of the Norway Iron Carriage and Tire Bolt Association was held on the 11th inst. No change in prices was made. The following are the officers of the association: R. P. Cowles, New Haven, Conn., president; C. E. Collins, Cleveland, Ohio, vice-president; F. L. Cowles, secretary and commissioner, and William C. Lanman, Norwich, Conn., treasurer.

Advices from Chicago are to the effect that rumors are current of dissensions among Wire Nail manufacturers, and it is thought by some that lower prices may be made.

At a recent meeting held by the Common Carriage Bolt Association the former discounts and rebates were re-affirmed. It is not intimated that any change in prices will be made for the present.

Since our last report there have been several advances in the Cordage market, as a result of which prices are on both Manila and Sisal Rope 1 cent per pound higher. On the 11th inst. Manila Rope was advanced $\frac{1}{2}$ cent, and was followed by Sisal on the 13th with the same advance, and on the 17th both Manila and Sisal were also advanced another $\frac{1}{2}$ cent per pound. The present prices for large lots are as follows, subject to a discount of $1\frac{1}{2}$ per cent. for cash in 10 days:

Manila, $\frac{1}{2}$ inch and larger.....	cents per lb	13 $\frac{1}{2}$
Manila, $\frac{3}{4}$ inch.....	"	14 $\frac{1}{2}$
Manila, $\frac{1}{2}$ and 5-16 inch.....	"	14 $\frac{1}{2}$
Manila Tarred Rope.....	"	13 $\frac{1}{2}$
Manila Hay Rope.....	"	13 $\frac{1}{2}$
Sisal, $\frac{1}{2}$ inch and larger.....	"	11 $\frac{1}{2}$
Sisal, $\frac{3}{4}$ inch.....	"	12 $\frac{1}{2}$
Sisal, $\frac{1}{2}$ and 5-16 inch.....	"	12 $\frac{1}{2}$
Sisal Hay Rope.....	"	11 $\frac{1}{2}$
Sisal Tarred Rope.....	"	11 $\frac{1}{2}$
Sisal Medium Lath Yarn.....	"	10 $\frac{1}{2}$

The market is still firm and strong, and it is thought that prices may go still higher, as there is a marked scarcity of Hemp, preventing several of the factories from running. In these circumstances manufacturers are not desirous of securing orders.

The Syracuse Hardware Company, Syracuse, N. Y., manufacture the Barry Hanger, of which a very full description, with all requisite illustrations, is given in their circular relating to it. This Hanger is listed at \$6, subject to a discount of 40 and 10 per cent.

A. W. Bishop, Berea, Ohio, issues a neat catalogue devoted to Animal Pokes, in which descriptions are given of the I X L, O K, Pioneer and America. His Buckeye Sash Lock is also represented, and Wyman

Brother & Co.'s Oak Stave Bushel Baskets. This latter house have recently built and equipped an extensive factory for the manufacture of these baskets, which will be brought generally to the attention of the jobbing trade. In regard to Animal Pokes, Mr. Bishop advises us that there is an increasing demand, and refers to the advantages possessed by him from his location in a well-timbered country. The following are his prices, f.o.b. Berea, Ohio:

I X L Poke.....	\$6.50
O K.....	5.50
Pioneer.....	3.75
American.....	3.00

The Braddock Wire Company, Rankin, Pa., intimate that on or about January 1 they will issue a circular giving special prices on genuine Glidden Barb Wire in carload lots, f.o.b. Chicago.

The following are the prices of the Nickel-Plated Steel Nut Cracks and Picks for which the Alford & Berkele Company, 77 Chambers street, New York, are special agents, the list prices given being subject to a discount of 40 per cent.:

In metal plush-lined cases: Half dozen Nut Picks.....	\$0.75
In metal plush-lined cases: Half dozen Nut Picks and one Nut Crack.....	1.50
In leatherette case: One dozen Nut Picks.....	1.50
In leatherette case: One dozen Nut Picks and two Nut Cracks.....	3.00
In plush case: Half dozen Nut Picks and one Nut Crack.....	3.00
Nut Cracks in paper boxes, per dozen....	9.00

Items.

White Mountain Freezer Company, Nashua, N. H., for whom W. H. Quinn & Co., 99 Chambers st., New York, are agents, announce that they have improved in several respects their White Mountain Freezer for 1889, and, among the more important improvements, they mention a complete covering of the gearing, for the purpose of preventing anything from getting between the gears when the Freezer is in use. The company have recently issued a circular calling attention to a new Freezer they are putting on the market, called the Arctic, which they refer to as an exceptionally desirable low priced Freezer. The company have also branch offices at 113 Broad street, Boston, Mass., and 14 West German street, Baltimore, Md.

Union Metallic Cartridge Company, Bridgeport, Conn., announce that they have decided to load their Paper Shells, for doing which they use the most approved machinery and methods, and call special attention to the quality of the material, the powder used being referred to as made expressly for the purpose and giving the best results. They issue a circular giving a price list of the standard loads, describing 38 combinations, which will meet general requirements.

Taunton Tack Company, Taunton, Mass., for whom J. P. Dabney, 239 and 241 Lake street, Chicago, Ill., is agent, have recently added to their enlarged assortment of goods in that city a full line of Wire Carpet Tacks, for which they report a large demand.

E. C. Meacham Arms Company, St. Louis, Mo., have issued their price current No. 394, which bears date December 8. It is not as large as some of their issues, but represents a line of Arms in which Breech-Loading Shotguns have a prominent place. It has also a key to the quotations, which are made in cipher.

Pope Mfg. Company, Boston, Mass., are issuing the Columbia Calendar for 1889. This is intended for desk use and is in the form of a pad of 365 leaves, one for each day of the year. The pad rests upon a portable stand, and when placed upon the desk can easily be used, or used for making memoranda, for which blank space is provided. Each page contains quotations

relating to bicycling and type-writing, the Calendar thus calling attention to the Cycles made by the company and also to the new Becker Type-writer, which they are putting on the market. The extracts are very readable, and serve their purpose well. The Calendar will be appreciated by those who receive it.

Fulton Iron and Engine Works, Detroit, Mich., have issued a new edition of their catalogue, which relates to the Detroit Tools, including Combined Anvils and Vises, Tire Upsetters, Tire Benders, Iron Sheaves, Hand Punches, Fire-Pots, Ventilators, &c. The pamphlet is very neatly printed and gives excellent illustrations of the different Tools. It shows, also, those that have been added since the issue of their former catalogue.

The growth, enterprise and advantages of Montana are exhibited in a handsome pamphlet entitled "The Resources, Business and Business Men of Montana," in which a number of illustrations are given and sketches of prominent business concerns. Among the houses in Helena the A. M. Holter Hardware Company is alluded to as the leading establishment of its kind in Montana, and a sketch is given of its history, with a reference to the extent of its business. Among the articles for which it is agent the following are mentioned: Knowles' Steam pumps, Atlas Engines and Boilers, Leffel Water-Wheels, Leschen's Wire Rope, Buffalo Forges and Blowers, Weston's Chain Blocks, Lightning Screw Plates, Canton Steel Works, Jarecki's Pipe-Threading Tools, New York Belting and Packing Company, Sanderson's English Steel, Star Portable Forges, Morrison's Packing, American Flax Packing, Howe Scales, Hoe Saws, Mixer's Saw Gummings, Morley's Lumbering Tools, Atkins' Silver-Steel Saws, McMullen's Woven-Wire Fencing, Champlain Horse Nails, Burden's Horse Shoes, Giant and Judson Powder, Gold and Silver Medal Caps and Mica Roofing. The business of the company during the present year has been very satisfactory. The large proportion of their trade is with the mining companies, who are, they advise us, almost without exception prosperous. The prosperity of the city is also indicated in a sheet recently published by their enterprising Board of Trade.

Pullman Sash Balance Company, Rochester, N. Y., issue a circular in regard to the construction and use of their Sash Balance, which plainly indicates its special features and utility. It will be observed that this Sash Balance is represented in the advertisement of the company on page 72. The circular also gives the price list, which mentions the different sizes of Sash, with prices for Side and Top Balances.

In his announcement, on page 62, F. V. Wooster, 66 Beverly street, Boston, Mass., illustrates his Axe Wedge, and calls attention to the fact that several styles of these goods have been recently put on the market, which he refers to as infringing his patent.

Grand Rapids Refrigerator Company, Grand Rapids, Mich., issue a new catalogue of their Refrigerators and Creameries for the season of 1889. The catalogue, which is elegantly printed, is well arranged, and gives tasty illustrations of the different styles of hardwood Refrigerators put on the market by the company, and also a number of testimonials, some of which are from prominent and widely-known Hardware houses. The opening circular to the trade calls attention to the advantage in the manufacture of hardwood Refrigerators possessed by the company from their location, and also to the completeness of their factory. The point is also emphasized that they sell to only one dealer in a town, thus giving their

agents the advantage of the special features possessed by their goods. They also issue an exceptionally neat leaflet, intended to be used by jobbers who handle their goods. The capacity of the factory, we are advised, is 100 Refrigerators a day, and it has been running steadily during the past summer and fall.

W. D. Wood & Co., Pittsburgh, Pa., announce that on and after January 1, 1889, the style of their firm will be changed to W. Dewees Wood Company with general business offices and works at McKeesport, Pa., and a branch office at 111 Water street, Pittsburgh.

L. A. Weyburn Company, Rockford, Ill., issue circulars relating to the Ideal Swivel Clevis, Mole's Tire Shrinker, Mole's Adjustable Clamp, the Ideal Farm Gate Hinge and specialties, including Plow Shares, Cultivator Shovels, the Ideal Equalizer, &c.

Trade.

From Louisville, Ky., we have the following advices under date December 15:

The general business of Louisville, Ky., for the past week has been very satisfactory. The crowded freight depots show the enormous volume and varied kinds of merchandise and manufacture shipped from this city.

The Hardware trade during the past week has experienced nothing startling, but a good, steady business was maintained; with considerable increase and better feeling prevailing. The order books show an improvement over last week's good trade, with the further aid of advanced prices on some articles. Barbed and plain Wire are still weak, with few sales from mills, but a good trade from store, which will probably be cut short now by cold weather. The jobbers are looking for the promised advance by the mills. Wire Nails are in good demand, and the dealers whose stocks are running low are feeling around for a break among the manufacturers.

Cut Nails have at last responded to the enormous demand, and made one step up. The action of the mills is approved of by the trade, though they were led to believe the advance would be greater. This conservative movement is best suited to the present time of low prices, and can be further pushed up if the trade demands it, which is looked for some time next month.

Exports.

PER BARK SUBRA, DECEMBER 4, 1888, FOR CAPE TOWN, SOUTH AFRICA.

By H. W. Peabody & Co.—9466 pounds Sisal Rope, 30 dozen Handles, 8 cases Edge Tools, 12 cases Axle Grease.

By Coombs, Crosby & Eddy.—1 pkg. Clothes Pins, 1 case Tinware, 30 dozen Axle Grease.

PER SHIP STEINORA, DECEMBER 7, 1888, FOR BRISBANE, AUSTRALIA.

By Meriden Britannia Co.—4 boxes Plated-ware.

By F. B. Wheeler & Co.—5 dozen Axes, 1 dozen Mattocks, 4½ dozen Saws, 1½ dozen Meat Choppers, 260 dozen Handles, 94 pounds Castings, 1 case Hardware.

By Coombs, Crosby & Eddy.—9 gross Hardware, 20 dozen Tools, 3 dozen Handles, 19 dozen Hardware, 18 gross Tools, 6 dozen Handles, 4 dozen Hardware, 6 dozen Tools, 25 Stoves.

By H. W. Peabody & Co.—68 cases Sewing Machines, 185 packages Hardware, 4,500 pounds Nails, 18 cases Saws, 458 dozen Handles, 39 packages Lampware, 10,000 Cartridges, 68 packages Stoves, 75 packages Carriage-Ware, 23 packages Agricultural Implements, 6 cases Railway Supplies, 47 packages Windmills, 14 cases Axes, 7 packages Hardware, 18 packages Pumps, 6 crates Railway Supplies, 168 packages Hardware, 14 cases Axes, 111 cases Agricultural Implements, 36 dozen Handles, 48 sets Axes, 18 packages Farm Machinery, 92 packages Carriage-Ware, 72 crates Stoves, 3 cases Pumps, 20 crates Blacking, 15 packages Drills, 12 cases Carriages, 15 gross Blacking, 12 cases Tools, 6 cases Edge Tools, 1 case Springs, 3 cases Farm Machinery, 9 packages Carriages and Parts, 9 cases Hardware, 6700 pounds Bolts, 9 Axes, 9 packages Carriage-Ware, 3 packages Lampware, 10 cases Tools, 150 dozen Handles, 3 cases Hardware, 44,800 pounds Barb Wire, 1 case Saws, 10 gross Blacking, 379 dozen Handles, 1 gross Grease, 9 packages Lampware, 13 packages Hardware, 470 dozen Handles, 2 cases Firearms, 1 case Wood-Working Machinery, 56 cases Lawn Mowers, 3 packages Hardware, 2 packages Lampware, 1 package Hardware, 7

cases Hardware, 38 packages Wood-Working Machinery, 5 packages Carriage-Ware.

TO TOWNSVILLE.

18 dozen Handles, 20 packages Hardware, 1 case Firearms, 44,800 pounds Barb Wire, 5 gross Blacking, 534 dozen Handles, 5 gross Shade Rollers, 560 pounds Grease, 9 packages Agricultural Implements, 600 feet Hose, 70 packages Stoves, 67 packages Lampware, 4 rolls Wire Cloth, 2 cases Firearms, 91 packages Tools, 65 packages Hardware, 3 packages Pumps.

PER BARK ESSEX, DECEMBER 7, 1888, FOR BRISBANE, AUSTRALIA.

By Richmond Cedar Works.—950 pounds Wooden-Ware.

By Arkell & Douglass.—½ dozen Windmills and Parts.

By D. C. Pratt.—244 dozen School Slates.

By Collins Company.—122 dozen Tools, 123 dozen Tools.

By Reed & Barton.—1 cask Plated-Ware.

By L. Gershel & Bro.—29½ dozen Plated-Ware.

By Winchester Repeating Arms Co.—20,000 Metallic Cartridges.

By Healy & Earl.—1 crate Forges.

By Manhattan Brass Company.—5 cases Lampware.

By H. W. Peabody & Co.—22,400 pounds Barb Wire.

By Tower Mfg. Co.—6 dozen Hardware, 5 cases Chalk, 60 cases Slates.

By Lazarus & Rosenfeld.—3 dozen Lamps, 1 gross Fly Traps, 50 dozen Washboards, 50 boxes Clothes Pins, 31 dozen Forks, 2 cases Guns, 140 dozen Handles.

By R. W. Cameron & Co.—1 box Machinery, 14 dozen Picks, 11 dozen Handled Axes, 12 Stoves, 4 cases Axes, 4 cases Carriage Material, 8 cases Axes, 3 cases Carriage Springs.

By V. Basanta.—20 dozen Handles, 80 dozen Hatchets, 15 dozen Saws, 18 dozen Thermometers, 4 gross Blacking, 1 gross Whips, 12½ gross Chimneys, 2½ gross Toy Goods, 10 Velocipedes, 2 dozen Money Drawers, 6 dozen Traps, 6 dozen Braces, 17 dozen Lamp Goods, 4 sets Harness, 5 dozen Clippers, 1 dozen Clocks, ½ dozen Pistols, 6 dozen Snaths, 7 dozen Braces, 18 dozen Strops, 60 dozen Lamp Goods, 100 gross Lamp Wicks, 44 dozen Lamp Goods, 15 gross Lamp Wicks, 3650 pounds Carriage Bolts, 1000 Broom Handles.

By R. W. Forbes & Son.—105 dozen Axes, 12 dozen Hammers, 9 dozen Forks, 476 dozen Handles, 13 racks Churns, 20 dozen Snaths, 15 gross Shade Rollers, 1 case Lampware, 45 dozen Axes, 13 crates Stoves, 15 cases Hardware, 6 dozen Axle Grease, 1 case Traps, 2 gross Shade Rollers, 1 case Razor Strops, 1 crate Sad Irons, 11 dozen Axes, 1 dozen Snaths, 2 cases Cages, 31 cases Hardware, 26 dozen Axes, 10 bundles Washboards, 54 dozen Handles, 2 cases Lampware, 1 case Toys, 67 dozen Hatchets, 6 cases Hardware, 38 cases Hardware, 246 dozen Tool Handles, 24 crates Stoves, 2 packages Lampware, 2 cases Bent Screws, 1 case Stencils, 40 dozen Axes, 28 packages Carriage-Ware, 6 dozen Forks, 30 sets Axes, 10 dozen Axes, 1000 Handles, 96 pounds Sash Cord, 2 cases Scales, 1 case Traps, 1 cask Pumps, 1 case Egg Beaters, 4 cases Lanterns, 630 pounds Tire Bolts, 4 packages Kitchen-Ware, 6 dozen Curry Combs, 6 cases Scales, 7 boxes Lawn Mowers, 1 case Toys, 1000 Handles, 1 case Store Trucks, 20 packages Wooden-Ware, 955 pounds Carriage Bolts, 8 dozen Hammers, 1 dozen Ladders, 20 dozen Axes, 2 gross Shade Rollers, 3 cases Oil Stones, 20 gross Blacking, 1 box Cultivators, 12 crates Stoves, 13 dozen Axes, ½ dozen Meat Choppers, 10 packages Hardware, 1 case Hay Knives, 1 rack Churns, 1 dozen Corn Shellers, 4 packages Lampware, 11 cases Hardware, 25 dozen Axes, 14 cases Saws, 11 cases Hardware, 6 gross Shade Rollers, 21 crates Stoves, 2 dozen Wringers, 5 dozen Snaths, 1 dozen Hay Knives, 19 dozen Saws, 28 packages Carriage-Ware, 20 packages Carriage-Ware, 18 packages Carriage-Ware, 2500 pounds Iron Castings, 4 dozen Hatchets, 6 gross Shade Rollers, 2 racks Churns, 27 crates Stoves, 9 packages Hardware, 28 cases Axe Handles, 6 cases Scales, 16 dozen Axes, 30 dozen Axle Grease, 5 dozen Forks, 1 gross Shade Rollers, 52 dozen Axes, 1 case Plated-Ware, 725 Tire Bolts, 4 dozen Curry Combs, 1 case Firearms, 4 cases Hardware, 14 cases Hardware, 13 packages Hardware, 78 packages Carriage Woodwork, 156 dozen Axle Clips, 8 packages Plows and Parts, 2 cases Axes, 9 cases Shade Rollers, 4 packages Wagons, 14 packages Wagons, 300 pairs Roller Skates.

PER SHIP CREEDMORE, DECEMBER 8, 1888, FOR MELBOURNE, AUSTRALIA.

By Waterbury Clock Co.—16 cases Clocks, 7 cases Clocks.

By American Trading Co.—50 boxes Clocks.

By Leaycraft & Co.—28,800 pieces Roofing Slate.

By Lazarus & Rosenfeld.—6 dozen Skates, 2 gross Pencils, 36 cases Skates.

By Singer Mfg. Co.—2094 cases Sewing Machines.

By Healy & Earl.—102 dozen Axes.

By Welsh & Lea.—2 casks Pumps, 9 cases Wringers, 5 boxes Nails, 2 cases Hardware, 1 barrel Hardware.

By Arkell & Douglass.—35 kegs Nails, 25 kegs Nails, 15 sets Hubs, 28 dozen Forgings.

By Woodhouse & Stertz.—13 dozen Axes, 1 case Saws, 1 case Hardware.

By Arnold, Cheney & Co.—10 cases Perambulators, 1 case Spokes.

By A. Field & Co.—50 sets Axes, 39 sets Springs, 30 sets Axes.

By McLean Bros. & Rigg.—25 dozen Planes, 36 dozen Cow Bells, 1 Miter Box, 4 dozen Drawing Knives.

By W. H. Crossman & Bro.—82 dozen Handles, 10 dozen Wash Boards, 2 cases Tools, 10,000 Fuses, 1200 dozen Handles, 1 case Hardware, 2 reams Sand Paper, 6 packages Hardware, 6 cases Hardware, 2591 lbs. Grease.

By R. W. Forbes & Son.—5 packages Hardware, 14,000 Bolts, 26 packages Hardware, 2 packages Hardware, 36 dozen Chisel Handles, 30 packages Lampware, 11 cases Wringers, 30 gross Pencils, 11 dozen Saws, 3 cases Kitchenware, 2 cases Hardware, 24 dozen Handles, 20 dozen Brooms, 2 cases Kitchenware, 1 dozen Swings, 11 dozen Locks, 19 packages Hardware, 4 cases Firearms, 18 crates Stoves, 28 dozen Axes and Hatchets, 2 cases Scales, 3 cases Kitchenware, 11 cases Wringers, 16 cases Kitchenware, 1 case Cages, 500 pairs Skates, 34 dozen Perambulators, 20 gross Glass Cutters, 4 dozen Velocipedes, 200 cases Slates, 100 gross Pencils, 1 case Toys, 2 cases Toys, 10,000 Cartridges, 15 packages Hardware, 2 gross Shade Rollers.

By McLean Bros. & Rigg.—6 gross Glue, 1 dozen Axes, 2500 Broom Handles.

By Crane & McMahon.—20 crates Whiffletrees, 7 crates Whiffletrees, 71 packages Carriage Material, 6 cases Carriage Material.

By Mailer & Quereau.—27,000 pieces Roofing Slate, 5 packages Machinery, 1200 dozen Handles, 400 dozen Handles, 70 dozen Handles, 2 cases Pins, 20 dozen Handles, 6000 pounds Nails, 1 case Brushes, 1 case Saws, 8 cases Velocipedes.

By W. H. Crossman & Bro.—10 dozen Wringers, 3 dozen Revolvers, 12 dozen Curry Combs, 1 cask Pumps, 2 dozen Velocipedes, 10 dozen Forks, 70 dozen Whip Stocks, 8 dozen Wrenches, 264 dozen Handles, 1 dozen Churns, 24 dozen Traps, 10 dozen Horse Brushes, ½ dozen Scales, 3 dozen Meat Choppers, 45 dozen Spading Forks, 2 dozen Hoes, 78 dozen Axes, 3 dozen Bush Hooks, 18 dozen Hatchets, 9 cases Hardware, 4 cases Tools, ½ dozen Chucks, 1½ dozen Saws, 54 dozen Hammers, 55 dozen Traps, 1 case Hardware, 30 dozen Cow Bells, 3 packages Tools, 1 package Hardware, 4 cases Lamp Goods, 30 pounds Tacks, 5 cases Slates, 28 dozen Mouse Traps, 3 cases Hardware.

By R. W. Forbes & Son.—50 dozen Washboards, 1 case Saddlery, 1 case Clocks, 8 packages Hardware, 1 case Pumps, 4 packages Hardware, 1 gross Grease, 1 cask Lampware, 1 case Hardware, 2½ dozen Perambulators, 1 case Plows and Parts, 560 dozen Axes.

Business Methods.

From a New Jersey Hardwareman we have received a letter criticising the forms for making remittances which we have recently published. It is, however, to be borne in mind in reading our correspondent's suggestions that the extent and character of the business transacted has much to do with the desirability of any given method, as one which is suited to certain circumstances would be quite unsatisfactory in others. But we take pleasure in laying before our readers the substance of our correspondent's letter:

Our idea of these things and our way of doing are as follows: First, all the creditor cares about is to have his money and have it promptly paid. Second, all that the debtor should care about is to have a simple acknowledgement or receipt. Nearly every concern with whom we deal sends us a monthly statement. About the 15th or 20th of each month we take these statements, check them by our books, make corrections and deduct allowances. Then we write on bottom of statement, in pencil, three words, "Please return receipted," enclose with statement check for net amount and mail to the creditor, and that's all there is to it. This is simple, economical and to the point, and

so far as these essentials are concerned we'll bet an election hat that none of your readers can produce anything to beat it.

Tendencies in Trade.

We have given in previous issues a number of letters most of which were written by merchants in different parts of the country, in which our correspondents discuss the question as to the position of the Jobber in the distribution of Hardware, and the advantages and disadvantages attending direct dealings between the retailers and the manufacturers. Most of these letters have indicated an appreciation of the important place occupied by the jobbing houses, and the efficient manner in which they serve the convenience of the trade, especially those whose purchases are not of sufficient volume to justify ordering direct from the manufacturers. The enterprise of the jobbing houses, and the fact that merchants can often purchase from them at prices at least as low as those obtainable from the manufacturer have also been duly recognized. On the question as to whether the jobbing business is on the increase there has not been entire agreement, the changes in its character, its decadence in its former strongholds and its development in new fields, making the determining of its precise status a somewhat complicated matter. The disposition shown by many manufacturers to seek their customers mainly among the wholesale trade has also an important bearing on the question; but, on the other hand, it is well known that there are many manufacturers whose policy is to market their goods principally among the retail trade.

Most of the letters which we have published on this question have been from merchants, but that the situation may be seen as regarded from the manufacturers' point of view, we give the following extracts from letters from manufacturers, in which this matter is touched upon in some of its phases. The extracts are given without other indication as to the identity of our correspondents than the State in which they are located:

Connecticut.—We think there is a tendency (and quite strong, too) on the part of Hardware merchants in many lines of goods to buy direct from the manufacturer rather than from the jobber, especially in those lines which are sold very close to cost.

Rhode Island.—In the case of our business there is not an increased tendency on the part of retail merchants to buy direct from us rather than from the jobbers. There are a good many kinds of our goods made and most of the retailers are obliged to sell some of each; therefore they go to a jobber for them, because if they do not want to buy more than one-half or one-quarter dozen they can get them right from the jobber with other goods at a less cost than if they purchased that quantity direct from the factory at a separate shipment. To illustrate this: I was in Boston the other day, and while in a wholesale house there talking to one of the firm a retail Hardware merchant came in and left an order, which contained an order for our line of goods, and in that order, which was only for one dozen all told, he specified three different makes. He gets them from the jobber in one shipment with other goods, whereas if he had gone to the manufacturers he would have had three small shipments.

Illinois.—In regard to the direct trade with retail dealers we avoid it as much as possible. We think that the increased price received over what we charge the jobbing trade is more than consumed by the bother in collecting from a great many country dealers, the extra expense of shipments, cartage, bookkeeping, &c., so that we prefer selling all our goods through the jobbing trade, unless sometimes we get orders from localities where

we have no job agent. This exception is rapidly, however, being overcome by the establishment of agencies in nearly every large city in the United States.

Connecticut.—I am pleased with the results of my Chicago agency, sales increasing every month and also sales to jobbers, while direct sales to retailers decrease very perceptibly. This is the case with Western trade. In Eastern sales to retailers I see no change from year to year.

Indiana.—The line of — is a limited one and they are not bought by the retail trade in large enough quantities to make it pay them to purchase direct of the manufacturers; consequently our trade is wholly with the jobbers. We, however, notice that in other larger lines manufacturers are establishing warehouses in certain Western cities, and we have an idea that their object in doing so is to get nearer the retail trade and to be better able to supply them.

Illinois.—We think undoubtedly the tendency of the Hardware merchant is to purchase direct from the manufacturers. We have observed this ever since we have been in business. The tendency seems to increase rather than decrease. The same may be said of manufacturers as well as merchants. The tendency is for manufacturers to trade with manufacturers, and to ignore the merchants. This seems to be the law of trade, and while we, as merchants, have endeavored to circumvent both the merchants and manufacturers, the fact remains that we have not been able to do it. To protect ourselves we have been forced to become manufacturers, and every year we find ourselves increasing the manufacturing department, striving in this way to hold our trade. We do not find that manufacturers buy less of us on this account, but we think they are more inclined to buy of us, as they feel sure that we are headquarters on any goods we offer. The trade in Chicago is being more largely done to-day by the direct representatives of Eastern factories than ever before, and it looks as though the jobbers, if they wish to continue in business, would have to do as the New York jobbers have done, become manufacturers. The Chicago jobbers have the enterprise, the intelligence and the means to do this, and when they find it necessary this is undoubtedly what they will do, for they are here to stay and supply the market.

New Jersey.—We notice a decided growth in the tendency of small dealers to buy direct from first hands, or, at least, a desire to do so. We think this increased tendency to buy direct is owing to the fact (at least as far as our line of goods is concerned) that the jobber does not carry the amount of stock that he formerly did; in these days the manufacturer has almost the whole load to carry, the jobber simply buying to fill orders, being, in fact, a sales agent only. On the other hand, the fierce competition among manufacturers and the fear of being "left" is compelling them to go to the small trade. This solicitation, together with the knowledge that the jobber carries little or no stock on hand to supply a quick order, gives the small dealer one of the few happy moments of his life—buying a few dollar's worth of goods of the manufacturer without the intervention of the jobber. Although we have always considered manufacturing and distributing to consumers as being two distinct branches, it now looks as though the question of competition would eventually bring the manufacturer and the small dealers into closer relations.

Pennsylvania.—We have so far chiefly disposed of our goods through the jobbing trade, considering it for our purpose more convenient and less expensive than soliciting orders direct from the retailers. Hence, our experience as regards the tendency of the latter to purchase direct from the manufacturers is very limited. If we were manufacturing as large a line of goods as some manufacturers do we should probably attempt to sell direct to the retail trade, and have no doubt that we

could make it to their interest to have them encourage us in doing so; but, with the comparatively few articles we make, we could not not expect to do much trade direct or receive encouragement from the retail trade to solicit orders for them.

Indiana.—We think we see a tendency each year for the larger dealers to purchase their leading goods direct from the manufacturer, and there is hardly a city of any size in the West but that purchases a large portion of its goods direct. On the other hand, there is a large number of dealers in the interior who do a smaller business and buy from the jobbers, and probably as many goods are sold by the jobbers, if not more, than heretofore, on account of the large number of these small dealers that are in business, while the larger dealers in the larger towns or cities have largely increased their trade and capital. We do a large trade with the dealers, and find it a very satisfactory part of our business.

Boston, Mass.—We do not think there is an increased tendency upon the part of retail hardware merchants to purchase direct from manufacturers, because they have always been inclined to do that as much as possible. We do not think it good policy on the part of the manufacturers to encourage this trade, and a great many of them look at it in this light. They find that they are obliged to carry more stock than when they sold simply to the jobbing trade, and the retail merchant is very quick to obtain the extreme prices, thus forcing the manufacturer, in reality, to do a jobbing business at manufacturers' prices. We think that while the hardware merchant is still trying to buy direct the manufacturers are protecting the jobbers to a larger extent than formerly. You will realize that this is our personal experience, and as we are both young men it would not have much weight in comparison with older heads.

Kentucky.—We have noticed a growing tendency on the part of the Hardware merchants to purchase direct of the manufacturers, which we attribute largely to the numerous small manufacturers who are constantly springing up, and who seek this class of trade, as well as consumers themselves, as an outlet for their product. Mills of established reputation endeavor to confine their sales to the jobbing trade.

Ohio.—The jobber, in my case as in many others, is almost a necessity. I will have no agency in Chicago or elsewhere hereafter, but will transact the whole of the business from this city.

Michigan.—The writer was for about 13 years engaged in the Hardware business and begs to say that while some dealers desire to buy of the manufacturer, it is principally confined to the large or first houses. We do not think that the time will ever come when there is no more use for the jobbing Hardware houses.

New York.—In our experience it would appear that the tendency of Hardware merchants to buy direct from the manufacturers is on the increase every year. In fact, a retailer is often considered behind the times or lacking in enterprise if he goes to the jobber for his wares. We refer, of course, to the best city retail trade; the country merchant generally buys less than a manufacturer would care to make a shipment of. The reason for this tendency, in our opinion, is that the jobber looks more for a low price in buying than he does for a good, or even sometimes a fair, article. The city dealer must have good goods to make and retain customers, and he cannot always purchase the quality he wants except of certain manufacturers, who may be unable to deal with a jobber for handling their better goods. There are many reasons why it would be preferable to deal with the wholesale trade and allow them to look after the rest. It saves much labor of detail and the collection of accounts is generally more satisfactory, not to mention the advantage of the concentration of

efforts on one house and on one large order, instead of a great many houses who require only a few goods each. It is well understood by manufacturers of well-made goods that it is only occasionally that a jobber will recognize it to be of importance to have in stock a line of goods that will please his trade in a lasting way. It is generally a question either of forcing the maker of the good article down in price to that of some one else who turns out perhaps wretchedly inferior goods or else of buying w. i. goods at a few cents less, thus necessitating the sale of the other quality at the retail stores. This also tends to degenerate the standard that many manufacturers wish to maintain, as they are apt to become discouraged upon observing how readily worthless goods sell, and how little appreciation is shown of really meritorious goods; and it is quite often that one who starts out with the determination to make only good goods to sell at as low a figure as possible is forced to take a lower price than he can afford, or curtail in quality. If the jobbers would open their eyes to this state of things there would be a much better and more healthy condition of business as the outcome, and the margins would be greater at a higher price paid the manufacturer if the same rate for a profit were added.

Massachusetts.—We are increasing our trade very largely in the West, principally among the jobbers. We ship the larger retail trade to some extent, although it is necessary for them to anticipate their wants somewhat on account of the "go-as-you-please" style of the railroad companies in relation to the freight transportation.

Connecticut.—Our experience among the Hardware merchants is this: That the large jobbing-houses are growing less and the trade (small jobbers and retailers) are purchasing more direct from the manufacturers.

New York.—Our sales are largely to the jobbers, from the fact that comparatively few retailers carry our goods in stock. Our observation is, however, that it is sort of "bred in the bone" to go to the manufacturers direct where possible, and it seems to be easier to do so to-day than ever before. We have been surprised to note the selfishness on part of some jobbers who do not seem willing that a manufacturer's agent should have any commission, because they "wanted the world," and then, again, the same spirit crops out of retailers, who want one-sixth dozen at same price as by gross, and who, after deducting freight and 2 per cent., write out a check on some four-cornered bank for a mere pittance. This is a queer age.

New Jersey.—There is always more or less tendency on the part of country Hardware merchants to seek quotations from manufacturers, thinking in this way to save part, at least, of the jobber's profit. We have not been struck with an increase of this tendency of late, but now that you draw our attention to it, we think it has been more marked than formerly.

Massachusetts.—We do not think there is an increased tendency on the part of the retail Hardware merchants to purchase direct from the manufacturers, but rather from the jobbers.

Connecticut.—We notice an increased tendency on the part of Hardware dealers to order direct from the manufacturers, and to order in small quantities to supply immediate wants, thereby obliging the manufacturers to carry the stock.

New York.—Our product being patented specialties, and being of the opinion that the vast territory included in our country cannot be thoroughly covered through any other agency than the jobbing trade, we seldom make sales to retailers.

Massachusetts.—We observe an increased tendency on the part of Hardwaremen to purchase direct rather than from the jobbers. If this is continued, we think it will be to the advantage of both the Hardwareman and the manufacturers, as it will result in better prices for both.

New York.—We have observed an increased tendency on the part of Hardware merchants to buy direct from manufacturers, as we sell only at present about one-eighth of our goods to jobbers, the rest being sold direct.

Ohio.—As the jobbers buy our goods in carload lots, the saving in freight, as between that quantity and the lesser quantity that the retailer would buy, is very large; and, in addition to this, there is a large difference in our price as between the jobber and the retailer.

Indiana.—We have very little trade with the retail Hardware merchants throughout the country. Our trade is mostly with the manufacturers and Hardware jobbing houses. We have never catered to the retail trade, and prefer to distribute our goods as above indicated.

Connecticut.—We have always noticed a tendency toward direct dealings, and of course the reason is obvious. Every one who sells goods at all wishes to be considered as a jobber, and wants jobbers' prices and terms. We know of no cure for the malady, and do not know if we can add anything to what has already been said regarding it.

Pennsylvania.—We have for some time past noticed a decided tendency on the part of the small and medium trade to deal direct with the manufacturers, they preferring to do so and pay freight rather than buy from the local jobbers.

Maine.—The tendency on the part of the retailers is to buy as much as possible direct from the manufacturers, as our experience is that the jobbers want a slice each way, or, in other words, the largest slice.

Rhode Island.—We find a very decided tendency on the part of Hardware merchants to buy direct of the manufacturer, and while we, as large manufacturers, have no wish to ignore the large jobbers, and would prefer to do business through them, we feel that it is not always safe to leave our interests in their hands, for smaller manufacturers will go directly to the Hardware merchants and obtain their orders by personal solicitation and quoting even prices with the jobber, or sometimes a trifle less. Our trade with the large jobbers has materially decreased of late years, and increased with the Hardware merchants, particularly those who are large distributors of goods. We think that the line between the Hardware jobbers and merchants is not so distinct as it formerly was, for many of the merchants do more or less of a jobbing business, according to their location. In view of the above we have been forced within the last few years to establish a warehouse in Chicago where we carry a full line of our goods, and from which stock we can quickly supply the immediate wants of our customers. Since we commenced business in 1838 we have noticed a movement in the location of the Hardware jobbing trade that is interesting and suggestive. When we began business the jobbing trade was mostly located in New York and Boston, but it moved to Albany, thence to Buffalo and Cincinnati, thence to Chicago and St. Louis, and now indications are that Kansas City, Minneapolis and St. Paul will ere long be jobbing centers of considerable importance. As the movement of the jobbing trade has been westward many of the Eastern houses have retired from business or become manufacturers' agents. It is worthy of note that during this time Philadelphia has always retained a certain amount of jobbing trade, while Baltimore has remained a city of Hardware commission merchants.

Ohio.—We have no dealings with retail dealers except in our own town. Our experience is that the jobbers do a larger proportion of the business in our goods than they did 10 years ago.

Pennsylvania.—Our sales to the retail trade are less than they were two years ago, while our sales to the jobbing trade are increasing.

Massachusetts.—We have had a great many inquiries from retailers for prices,

and if we did not quote them the price to jobbers they have apparently been provoked and would not give us an order. We have just answered an inquiry from a retail house in San Francisco, and have quoted him price by dozen and also referred him to the jobbers as being the better way to get the goods, and we presume it will be the last he will do about our goods, because we have not given him the price we give the jobber. We have many instances of this sort. Of course we have no objection to selling to the retail trade, provided they are willing to pay the retailers' price, although as a general thing we would rather sell to the jobber. We do our best in making price to divide fair profit between jobber and retailer, and it looks to us as though the retailer should be willing to get his goods of the jobber, paying him a fair margin.

Pennsylvania.—Our trade is very large with the dealers within a radius of 100 or 200 miles, but we find that we receive very few orders from a greater distance, except those from jobbers. We are disposed to think that the jobber is a necessity and cannot be done away with only at a great disadvantage to dealers, who can secure an assortment of goods that would require several different manufacturers to fill at about the same prices that manufacturers sell at to the small trade, thereby making a considerable saving in freight and getting the goods quicker.

Connecticut.—We deal with jobbers and large retailers, and our experience with the retail trade is not as good as that of some other manufacturers. But as far as our information extends, the majority of the retail trade are buying of the jobbers, especially in the West, as they can get at short notice a bill of goods at one house instead of ordering from several manufacturers, and thus save freight. Large retailers are generally ordering from the manufacturers.

Rhode Island.—With regard to increase of retail trade with manufacturer: We think in the East it is very marked in our line of goods, as also the direct trade of consumers with manufacturers.

Connecticut.—Our ——— and other specialties are handled by some of the leading jobbers West, and trade in the above named article is spreading. We find a gradually increasing demand from the retailer, but scarcely know the cause.

The lowest bid on a lot of 5000 tons of steel rails for the German State railroads recently was 116 marks. This is equivalent to \$28.37, so that the German prices are considerably above those in our country.

During the week ending December 15 the Lackawanna Coal and Iron Company, of Scranton, Pa., produced 3499 tons, 13 cwt. of rails, including light rails.

J. & H. Taylor, of 16 St. John street, Montreal, call our attention to an error in the paragraph published on page 900 of *The Iron Age* of December 18, relating to the proposed bridge over the St. Lawrence River, at Coteau. The bridge is to be built by the Canada Atlantic Railway Company, for its traffic between Ottawa and Boston, via the Central Vermont and its connections.

Up to the present time there have been made 9200 tons of open-hearth steel in a single furnace at the Homestead Steel Works of Carnegie, Phipps & Co., Limited, Pittsburgh, and it is expected that a tonnage of not less than 15,000 tons will be got out of this one furnace. There have been no repairs of any kind to it beyond one cleaning of the checker work. The furnace was built with low silica brick made by Isaac Reese, at Manorville, Armstrong County, Pa.

The Lamson Patent Revolving Show Case.

This case, which is illustrated in the accompanying cut, is put on the market by Danforth & Pike, 114 Washington street, Boston, Mass. It is octagonal in shape and referred to as strongly made

inches. It is obvious that the plates can conveniently be placed between the bars and in this position can easily be rinsed, or if desired to use the construction as a plate warmer it can be put in the oven or over the range or register, when the warm air circulating freely between the plates will warm them evenly. This article is

The Lamson Patent Revolving Show Case.

and handsomely finished. The panels are of plate glass and are held in place by deep grooves in the posts, no putty or cement being used. The tops and bottoms are so constructed as to prevent them from warping, swelling or contracting. The shelves, it will be observed, revolve independently of each other on a steel standard in the center, and are adjustable in any desired position. They are made from light gray iron highly japanned, and in the best cases are covered with plush. As will be seen from the cut, one-fourth of each shelf is wanting. This enables one to remove an article without reaching under a shelf, as by simply revolving the shelf until the aperture in the shelf above is over the article wanted it can readily be reached and taken out. These cases are made in three sizes with 14, 18 or 24 inch shelves, and also in different kinds of wood as well as with iron top and bottom. All the cases are so constructed that the parts are interchangeable. The efficiency of the display secured, and the large variety of goods accommodated, are points on which special emphasis is laid.

Folding Dish Drainer and Plate Warmer.

This article is manufactured by Woods, Sherwood & Co., Lowell, Mass., and is represented in the illustration given below. It will be seen that it consists of two movable wire sides, which are so attached to the supports underneath that they can be separated, as shown in the cut, so as to permit the placing of dishes or plates between them, or, if desired, can be folded together, so as to permit the article being put away in a small space. The sides are about 16 inches long and their height 8

well made and finished. Its simplicity and utility are referred to as commending it to the trade.

The investigation by the New York Senate committee relative to alleged extortionate elevator charges, from which the grain traffic on the canals is said to suffer severely, seems to show that the McEvoy bill is practically a dead letter.

Folding Dish Drainer and Plate Warmer.

The law is evaded by charging for storage for every ten days or fraction thereof. Thus the elevator men get exactly the same rates as before. This schedule of rates was adopted by an agreement of the Elevator Association. There are 40 concerns in it, 27 of which are active. The earnings of the 27 are pooled, and one-third of the amount is set aside to be divided according to their respective shares in the association among the active houses.

The rest is divided in the same way among all the members, "dead houses" included.

Wages Calculator.

The Willis Mfg. Company, of No. 157 Broadway, New York, have introduced to the trade a device for readily computing the wages of workmen, a view of which is shown in the accompanying cut. It consists of a series of paper dials, on which are printed the amounts for different numbers of hours at different rates, so connected by internal mechanism that when an auxiliary dial of hours is turned to any

Wages Calculator.

required number the amount of that number by the different rates per hour will appear in the several openings over the dials first referred to. This will at once be understood by reference to the cut. The engraving shows the mechanism operated by means of a handle with a peculiar crank connection. The device is also manufactured operated by a center button. The sample before us has on one side rates 14 $\frac{1}{4}$, 15, 16 $\frac{1}{4}$, 17, 17 $\frac{1}{2}$, 19, 20, 22, 22 $\frac{1}{2}$, 23, 23 $\frac{1}{2}$, 24 $\frac{1}{2}$, 25, 25 $\frac{1}{2}$ and 27 cents per hour. The opposite side of the device is provided with a corresponding

number of rates, rendering the calculator susceptible of use in an establishment with the widest range of wage prices. The advantage to the bookkeeper or time-clerk in having something of this kind for use in figuring, something which frequently has to be done with no time for revision and proof, will be manifest without lengthy explanation. In addition to calculations of wages the same mechanism may be adapted to various other uses.

CURRENT HARDWARE PRICES.

DECEMBER 19, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.

CURRENT METAL PRICES.

DECEMBER 19, 1888.

The following quotations are for small lots. Wholesale prices, at which large lots only can be bought, are given elsewhere in our weekly market reports.

IRON AND STEEL.

Bar Iron from Store.

Common Iron:	
1 to 2 in. round and square.	1 1/2 to 2 1/2 @ 2.00¢
1 to 6 in. x 1/2 to 1 in.	1 1/2 to 2 1/2 @ 2.00¢
Refined Iron:	
1 to 2 in. round and square.	2 1/2 to 3 1/2 @ 2.10¢
1 to 4 in. x 1/2 to 1 1/2 in.	2 1/2 to 3 1/2 @ 2.10¢
4 1/2 to 6 in. x 1/2 to 1 in.	2 1/2 to 3 1/2 @ 2.10¢
1 to 6 in. x 1/2 and 5-16	2 1/2 to 3 1/2 @ 2.20¢
Rods—1/2 and 11-16 round and sq.	2 1/2 to 3 1/2 @ 2.20¢
Bands—1 to 6 x 3-16 to No. 12	2 1/2 to 3 1/2 @ 2.4¢
"Burden Best" Iron, base price.	3 00 @ 2.4¢
Burden's "H. B. & S." Iron, base price.	3 00 @ 2.4¢
Ulster	2 80 @ 2.4¢
Norway Rods	4 00 @ 5.00¢

Merchant Steel from Store.

Open-Hearth and Bessemer Machinery.	
Toe Calk, Tire and Sleigh Shoe, base price in small lots.	2 1/2 @ 3¢
Best Cast Steel, base price in small lots.	5 1/2 @ 5¢
Best Cast Steel Machinery, base price in small lots.	5 1/2 @ 5¢

For Classification and Extras adopted by the Merchant Steel Association of the United States, June 1, 1888, see *The Iron Age*, June 21, 1888.

Sheet Iron from Store.

Common American.	R. G. Cleaned.
10 to 16.	2 7/8 @ 2.80¢
17 to 20.	2 8/8 @ 3 0/8
21 to 24.	2 9/8 @ 3 1/8
25 and 36.	2 10/8 @ 3 3/8
27 and 30.	2 11/8 @ 3 5/8
28.	2 12/8 @ 4 0/8
B. B.	2d qual.
Galv'd, 14 to 20.	4 50 @ 4 38
Galv'd, 1 to 24.	4 87 1/2 @ 4 75
Galv'd, 25 to 26.	5 25 @ 5 12
Galv'd, 27.	5 62 1/2 @ 5 48
Galv'd, 28.	6 00 @ 5 85
Patent Planchet.	7 10 @ 6 94
Russia.	9 1/2 @ 10¢
American Cold Rolled B. B.	5 1/2 @ 7¢

English Steel from Store.

Best Cast	15¢
Extra Cast	16 1/2¢
Swaged, Cast	16¢
Best Double Shear	15¢
Blister, 1st quality	12 1/2¢
German Steel, Best	10¢
2d quality	9¢
3d quality	8¢
Sheet Cast Steel, 1st quality	15¢
2d quality	14¢
3d quality	13 1/2¢

METALS.

Tin.

Banca, Pigs.	24¢
Straits, Pigs.	24¢
English, Pigs.	23 1/2¢
Straits in Bars	25¢

Tin Plates.

Charcoal Plates—Bright.	Per box.
Melny Grade.	
1C, 10 x 14.	\$6.75 @ \$6.00
1C, 12 x 12.	6.00 @ 6.25
1C, 14 x 20.	5.75 @ 6.00
1C, 20 x 28.	12.00 @ 12.50

THE IRON AGE

THURSDAY, DECEMBER 27, 1888.

The Armington & Sims Compound Engine.

We show on this page one of a series of five compound condensing engines of 100 horse-power each, built by the Armington & Sims Engine Company, of Providence, R. I., for the machine shops of the Ordnance Department of the Washington Navy Yard. We regret having been unable to obtain sectional views and details of the engine, but trust that our readers will be enabled to get a fair idea from the engraving of the general design. The engines were referred to in an article on the works of the Armington & Sims Com-

journals. The wheels undergo a test at Fullerton. From present appearances it will take a year until the work is finished. It is difficult and heavy work to perform. In all about 4000 wheels will be exchanged.

Shipbuilding on the Delaware.—The iron shipbuilders along the Delaware River are crowded with orders for large ocean steamships. One of the largest shipbuilders said the contracts on hand would take two years to complete. The Pacific Mail Steamship Company are in the market for two iron steamships of about 5000 tons each, to cost \$2,000,000, for the San Fran-

and Miners' Line is building a new steam ship at Wilmington, Del., and Boulton, Bliss & Dallett have two iron ones at Cramps's yard and a wooden vessel at Bierly, Hillman & Co.'s yard, for the Venezuela trade. A contract for the construction of a revenue steamer for service in the Charleston, S. C., district, was, on Monday, awarded to Pusey, Jones & Co., at their bid of \$72,600.

Since the recent explosion of a petroleum vessel in Calais Harbor experiments have been made to determine what proportion of petroleum vapors mixed with a given amount of air will form explosive

COMPOUND ENGINE FOR THE GOVERNMENT ORDNANCE SHOPS AT WASHINGTON, BUILT BY THE ARMINGTON & SONS ENGINE COMPANY, PROVIDENCE, R. I.

pany, published in our issue of November 29, but we will repeat here that they are arranged for rope driving, as shown, each engine having two sheaves. Being double, with the cranks opposite, they are perfectly balanced, and can therefore be safely run at the high speed, 275 revolutions per minute, for which they were designed. The cylinders measure $10\frac{1}{2}$ and $16\frac{1}{2}$ inches in diameter, and have a common stroke of 12 inches. They will run with a boiler pressure of 220 pounds, and appear to be particularly well adapted for electric lighting where a high speed, close regulation and compactness are required.

The Lehigh Valley Railroad have 1000 box cars, of which they are changing the wheels at Packerton, East Penn. Junction, Bethlehem and Phillipsburg. Those which are now in use are not strong enough. They are being taken out and replaced with wheels having stronger

cisco and Central American trade. The Ward Steamship Line, to Cuban ports, contracted with the Delaware River Shipbuilding Works, on Monday last, for two iron steamships 310 feet long, to register 3000 tons each. Contracts have also been made for two iron steamships for the Ocean Steamship Line, to ply between New York, Philadelphia and Savannah. Charles Mallory contracted with the Delaware River Shipbuilding Company for a 3000-ton coasting steamer to cost \$350,000, for the Galveston line. The Morgan Steamship Line, plying between New York and New Orleans, the Pacific Improvement Company, of California, running to the North Pacific ports, and the Oregon Railway Company are also in the market for two new steamers each. Col. Edgarton Hogg, of the Oregon Pacific Railroad Company, also needs two iron steamships for the trade between San Francisco and Yaquina Bay, Oregon. The Merchants

compounds. In mixing ordinary illuminating gas with air it is found that one part of gas to eight of air gives the most violent explosion, and with the vapor of the volatile portion of petroleum nearly the same observation is made. With one part petroleum vapor to five of air no explosion takes place. With six parts of air there is a feeble explosion, and with from seven to nine parts a very violent one. With 12 parts of air the detonation is still violent, but with 16 parts it becomes feeble, and with one part vapor to twenty of air there is ordinarily no explosion.

Mr. Rudolph Hering, C. E., is authority for the statement that the load which one horse can draw on an asphalt pavement will require two horses on the best Belgian block, three horses on ordinary Belgian block, five and one-fifth horses on good cobble-stone and seven and four-fifths horses on bad cobble-stone.

The Reid Petroleum Burner for Steam Raising.

In view of the growing interest attached to the burning of petroleum under boilers for steam raising, and not less of the conflicting testimony as to the merits of the various burners which have been brought out for the purpose, we are specially pleased to be in position to give in this issue engravings of a burner, and of the setting used in connection with it, which seems to have given general satisfaction. The burner was invented by Mr. Joseph Reid, and is made by the Reid Burner Company, of Cleveland, Ohio.

From Fig. 1 on this page a good idea can be formed of the construction and function of the apparatus. It is of the injector type, steam being used as the spraying agent, and its novelty is found more particularly in the mechanism by which the admission of oil and steam into the combustion chamber is regulated. This regulation is effected by having a reciprocating nozzle, which controls the steam supply, so connected that when it is operated either to increase or diminish the flow of steam, the oil cock also will be opened or closed. The reciprocating nozzle in our engraving is designated by the letters C C, and is furnished with a steam part, B. The nozzle has the usual conical or funnel-shaped mouth, which fits over the end of the interior nozzle, D D. It will be readily understood that when the nozzle C is reciprocated the opening between its mouth and that of the nozzle D will vary, and thus regulate the volume of issuing steam. The rear end of the nozzle C is threaded and furnished with suitable packing and a gland to insure steam tightness, while the fixed nozzle D is provided with an internally threaded flanged collar set in a circumferential groove, as shown. This collar has a wrench socket and is adapted to engage the thread of the nozzle C, and when turned, moves the latter back and forth as desired. The oil-pipe A enters the side of the nozzle D, and extends parallel with it on the interior. It is provided also with a rack, regulated by the lever H. Rigidly fixed to the reciprocating nozzle C is a lug, which has an axial screw threaded pin working the connecting rod R. The latter carries an index hand, and its left-hand end is attached to the oil-cock lever H, an anti-friction roller being arranged to work in a slot in this lever. It will thus be seen that the oil-cock and steam regulator are so connected as to be compelled to work in unison. The graduated strip S passes around the oil-pipe A, and its opposite end is slotted so as to permit free motion of the pin of the connecting rod R. The scale rod S has a guide, as shown, through which the rod R passes. After the parts have been put together and tested, the rod S is suitably graduated to indicate the quantity of oil passing into the burner for a given time. The burners are made in four sizes: No. 1, for large boilers and other very heavy work; No. 2, for boilers of from 5 to 60 horse-power and lighter work; No. 3, for burning brick, tile, furnaces, small boilers, &c., and No. 4, for burning lime. They are simple in construction, easily operated, and low in cost. During the six months that they have been on the market they have given highly satisfactory results wherever used.

In Figs. 2, 3 and 4 we show the form of boiler setting which is recommended for use in connection with them. It will be noticed that the grate-bars and firing and ash-pit doors have been removed. A wall is built up from the floor to a level with the bearing bar, about 4 inches thick and 32 inches distant from the front wall. From this an incline is made to meet the top of the old bridge wall, the space be-

tween the walls being filled with broken stone or clinkers. The angle of incline between these walls should be as near 45° as possible. Should it occur that the distance between the walls is too great to permit of this, it should be accomplished by making the angle of 45° from the front wall, thence going back in a straight line to the top of the old bridge wall. This wall and incline should be faced with the best fire-brick and well cemented. The fire chamber should be narrowed the whole depth and length, and the bed made from the hollow bridge wall back, with ashes or clinkers, leaving a space of 16 inches

back end of the lower and the front end of the upper section. Fire-brick standing on end is used in these. The whole should be thoroughly cemented. The ash-pit should then be filled with ashes to a level with the lower section. The air passing through all these air flues becomes greatly heated, that in the rear flues reaching from 800° to 900° F., and that in the front from 400° to 500° F. at the point of delivery. The firing place and ash-door openings should then be closed entirely. Dampers may be placed in the air flues to assist in regulating the supply. The figures may be changed as circum-

Fig. 1.—Half Section of Burner.

Fig. 2.—Section Along C D of Fig. 3.

THE REID PETROLEUM BURNER FOR STEAM RAISING.

between it and the bottom of the boiler. An 8-inch wall should be erected in the rear of and against the old bridge wall to within 23 inches of the bottom of the boiler; upon this a hollow bridge wall, with space of 5 inches.

This is covered with brick laid edge-wise, 4 inches apart. The distance between the upper sides of these bricks and the bottom of the boiler will be about 8 inches. Two 6-inch air flues are then constructed, beginning at the back wall and extending to and connecting with the hollow bridge wall (see Fig. 4). They are run parallel to the side walls, and at a distance of from 15 to 18 inches from them. They may be made of fire-brick or tile. Two supporting walls should be built for these flues. Two air flues should also be built in the ash-pit, as shown in Fig. 3, 7-inch openings being left at the

stances require. In using ashes care should be taken to have them as free from coal dust as possible. The cost of such a setting will be low, and one burner, it is stated, will be sufficient for any boiler of 100 horse-power or less.

When a burner is set under a boiler it should be connected with both the steam and oil line by a swinging joint, so that the direction of the flame can be easily changed upward or downward, or to either side, as may be required to secure a uniform heat. The front end of the burner should be about 6 inches inside of the fire opening, and after being connected up, this opening around the burner should be bricked up tight so as to prevent the cold air from entering the furnace. In starting the burner care should be taken to have the oil shut off entirely, so that there is no flow of oil whatever from the burner.

The dampers being open steam should be turned on slowly, in order to blow any water or other substances out of the nozzle. A lighted torch then being put in the furnace, the oil is turned on slowly until the fire is started. The amount of oil can be regulated at will by the valves on the burner. In shutting off, the oil should be turned off first.

We understand that in all cases where the Reid burner has been employed eminently satisfactory results have been obtained. The Union Steel Company and the North Chicago Rolling Mill Company, of Chicago, Ill., highly praise it. Accord-

oil flame from the Reid burner, we are told, has developed no difficulty of this kind. Altogether the favorable experience with the system has induced the North Chicago Rolling Mill Company to make arrangements for its introduction into both their North Chicago and Bay View mills—testimony which it is well worth considering.

Though we have shown the burner here in connection with a setting for steam raising, we would repeat that the device is turned out in modified forms for the different other uses to which the system may be applied, such as for lime

merated for oil over coal by the manufacturers who have used both will evidently cause them to continue the former, even after the consideration of economy shall have been eliminated, because of the greater uniformity of heat produced, the better control of the heat secured and the lessened repairs to boilers.

The insurance companies have abated their opposition to the use of oil for fuel, and thus a serious obstruction to its introduction has been removed. Inasmuch as the greatest danger in using it has arisen from the storage of large quantities in tanks near the works, this matter has re-

Fig. 3.—Vertical Section of Boiler Setting with Reid Burner.

Fig. 4.—General Plan.

THE REID PETROLEUM BURNER FOR STEAM RAISING.

ing to Mr. E. C. Potter, of the latter company, their boiler house at South Chicago formerly contained 12 boilers, from which, when using coal, they could not get steam sufficient for their requirements. Two boilers were, therefore, added. Now, with the use of oil, these boilers are run in two batteries, one of eight and one of six boilers. The main battery of eight boilers has, under the new arrangement, been found to yield almost all the steam required, only a moderate demand for assistance being made on the other six. With the whole number going the supply is much in excess of the demand. The boilers are 16-foot flue boilers made up in the old way of a comparatively large number of small sheets exposing numerous seams to the fire. While using coal the boilers were almost constantly undergoing repairs, owing to leaking seams; but the

and brick kilns, furnaces, &c. The question of the relative cheapness of oil and coal naturally comes up for consideration in this connection. While nothing positive can be claimed for the future, it seems certain that for a long time to come the supply of oil will be large enough to meet the demand without any considerable rise in price, especially when it is considered that the field for the use of oil fuel is restricted somewhat by questions of transportation, the development of natural gas territory and the location of manufacturers in close proximity to coal deposits. The use of oil will grow in the vicinity of towns and cities, where the formation of great volumes of smoke and soot is highly objectionable, and in districts somewhat remote from coal deposits, making the cost of coal comparatively high. The advantages enu-

ceived careful attention, and the plan of burying the tanks under ground has been adopted, and is being generally followed. In some cases pumps are used to force the oil to the furnaces, but water pressure is now being applied wherever available, to secure a continuous flow of oil without the use of pumping machinery. We may add that the Reid system has been adopted by the Union Steel Company and the North Chicago Rolling Mill Company, of Chicago, the Joliet Steel Company, of Joliet, Ill., the United States Rolling Stock Company, of Hegewisch, Ill., the J. I. Case Plow Works, of Racine, Wis., the Wisconsin Malleable Iron Company, of Milwaukee, and a large number of other manufacturers, including brick and lime burners, and others requiring intense and uniform heat in conducting their operations.

The Ideal Engine.

The Ideal engine, of which we present engravings in this issue, is an improved form of the well-known high-speed automatic engine built by A. L. Ide & Son, of Springfield, Ill., and was designed to meet special requirements in electric lighting and other uses where high rotative speed, small space, perfect regulation and a reliable, durable and economical power are required.

The construction, principle and operation are the same as in the Ide engine, the only difference being that the Ideal has a double frame with two sides, like a right and left hand Ide engine combined in one frame, rendering it doubly rigid, with two main-shaft bearings and double cranks, which support the driving-wheels without the use of outer bearings for the shaft. This construction of frame is a strong and rigid form, and renders self-lubrication of all the working parts of the engine possible and practical. The governor is simplified by dispensing with several parts which experience has proved unnecessary, and still retaining all the excellent qualities and unequalled performance of the original Ide governor. The valve gear is simplified by connecting the eccentric directly with the valve stem, dispensing entirely with slides and rocker-arms, with their several joints. All parts are steel, phosphor bronze and charcoal iron, fitted to templets and gauges, and are interchangeable. Every engine is thoroughly tested by running in the works, and the valves and governors are adjusted and set to operate perfectly under varying loads and steam pressures.

Fig. 1 illustrates the general design, while the longitudinal section, Fig. 2, and

fourths of the oil ordinarily used, besides giving more perfect lubrication. It will be seen from Fig. 2 that the oil is thrown upon the guides, and, being wiped from the top guide by the slide, passes through a tube in the top slide, entering a funnel in the connecting-rod, and after passing through the bearing drips to bottom of crosshead. The piston rod also receives

gine disks are in rotation the centrifugal force causes the oil to be thrown into pockets provided in the hood over the disks, illustrated on the preceding page. From these pockets the oil flows through the pipes into a receptacle or pocket cast upon the main bearings. From this point it flows into the groove and channel connecting with the crank-pin, which is hol-

Fig. 2.—Longitudinal Section, Showing Lubricating Arrangement.

THE IDEAL ENGINE, BUILT BY A. L. IDE & SON, SPRINGFIELD, ILL.

the cross section, Fig. 4, explain the method of automatic lubrication which has been adopted.

Continuous streams of oil flow through all bearings, which enables the engine to run months, if required, without stopping for adjustment, and dispenses with the constant attention and care which must be bestowed when oil cups are used. As the oil is used over and over continuously, and not thrown over the engine-room floor, it produces a saving of over three-

fourths of the oil ordinarily used, besides giving more perfect lubrication.

The crank-pin is large and made of hard tool steel, ground to gauge and forced in with hydraulic press under a pressure of 20 to 40 tons, according to the size of engine. The method of oiling the main bearings and crank is best shown in Fig. 4. It will be seen that an oil chamber is provided under the two crank-disks, which is supplied with enough oil to insure the

low. The centrifugal force carries it into the crank-pin, from which it escapes through two holes into the bearing. Thus it will be seen that the main bearings receive constant lubrication, while the lubrication of the crank-pin is insured by the supply of oil from each side. This method of lubrication is constant and perfect, and provides for the most important bearings about the engine. Sufficient oil is placed in the basin under the crank disks, so it will flow in streams through both pipes

to main shaft bearings and in drops to the eccentric, but valves are provided on the pipes, so that the supply can be regulated as desired, and the oil-chamber or basin can be supplied with fresh oil while the engine is running. The oil from this chamber can be drawn off by a cock in end of frame communicating with the pocket and used over again. Besides the saving in oil these devices keep a clean and presentable engine and engine-room.

The governor, shown in Fig. 3 in position in the fly-wheel, is simple in construction. All its parts are in sight, and are readily accessible for cleaning. It is secured to the side of the fly-wheel, and connects through the eccentric on the main shaft direct to the valve without the use of gearing, pulleys, shafts or belts. It is attached to the valve direct, and gives an open port at the beginning of each stroke, and varies the point of cut-off as the resistance requires from the beginning to three-fourths of each stroke. It acts instantly, and cuts off the steam at a

cents, and 12-inch, 31 cents, and the Bethlehem Iron Company, 8-inch, 24 cents; 10-inch, 26½ cents, and 12-inch 27½ cents. There is an appropriation of \$1,455,000 for this purpose.

The British Belted Cruiser Australia.

The London *Engineer* illustrates in a recent issue the latest addition to the British navy, the belted cruiser Australia, a sister ship to the Galatea. Both vessels, built and engined by Messrs. R. Napier & Sons, Glasgow, belong to the class of swift and powerfully armed belted cruisers specially designed for the protection of commerce. Their principal dimensions are: Length between perpendiculars, 300 feet; breadth, extreme, 56 feet; depth, molded, 37 feet; with a displacement of 5000 tons at 19 feet draft when in the normal fighting condition, but this may be increased to 6000 tons when an extra supply of coal is

ward and aft respectively; ten 6-inch guns similarly mounted on the broadside; eight 6-pounder and eight 8-pounder quick firing guns, also six torpedo tubes. The engines, which were designed by Mr. A. C. Kirk, the senior partner of Messrs. Napier's firm, were originally specified by the Admiralty to be of the ordinary compound type for 7500 horse-power; but from their previous experience Messrs. Napier were able to show that by substituting triple-expansion engines they could guarantee an increase of 1000 horse-power, and almost a knot more speed, thereby enormously increasing the value of the ship as a fighting machine, without adding to the total weight of machinery and coal, or occupying more space. This suggestion was eventually adopted by the Admiralty and also carried out in the other ships of the class.

Two sets of engines are of the three-crank horizontal type, working twin screws, and are placed one before the other in separate water-tight compart-

Fig. 3.—Enlarged View of Governor.

Fig. 4.—Section through Center of Main Shaft and Crank Pin, Showing Lubricating Devices.

THE IDEAL ENGINE, BUILT BY A. L. IDE, & SON, SPRINGFIELD, ILL.

point that will just do the work and maintain the fixed speed of the engine. The variation of speed from no load to the full power of the engine is claimed to be less than 1 per cent. The dash-pot attached to the eccentric controls the movement of the weight, preventing any sudden movement or jumping of the weight when a great change of load occurs suddenly. The speed of the engine may be changed to suit requirements by shifting the weight.

Safety caps are fitted to the cylinder, as in the older design of Ide engine, to prevent breakage of the cylinder heads due to accumulation of water of condensation. The valve-chest, however, is mounted at the side of the cylinder instead of at the bottom. The safety caps when broken can be easily and quickly replaced.

Bids were opened 20th inst. in the office of Chief of Ordnance of the Army, in Washington, for supplying complete sets of rough-finished, oil-tempered and annealed steel forgings, of American manufacture, for 8-inch, 10-inch and 12-inch guns. The bids were as follows: The Midvale Steel Company, Philadelphia, for the 8-inch, 29 cents a pound; 10-inch, 30

shipped. The belt which protects the water line for two-thirds of the length consists of steel-faced compound armor 10 inches thick, strongly supported by steel and teakwood backing, and terminates at each end in an athwartship iron bulkhead 16 inches thick to stop end-on shot. Level with the top of the armor belt is a protective steel deck 2 inches thick on the flat and 3 inches on the angle where it slopes down below the water-line, and this deck also extends to the stem and stern respectively. All the machinery of vital importance, including the steering gear, air compressors, electric dynamos, &c., is placed under the protective deck, while above it, for the length of the engine and boiler-rooms, the sides are defended by coal, and an armor-plated conning tower on the upper deck is fitted with steering gear, telegraphs, &c., for working the ship when in action. While every precaution is thus taken to keep out shot and shell, the buoyancy in case of penetration is insured by the minute subdivision of the under-water portion of the hull, which contains upward of 130 separate water-tight cells and compartments. The armament consists of two long range 22-ton breech-loading guns and central pivot mountings on the upper deck, for-

ments, the cylinders being 36 inches + 51 inches + 77 inches x 44 inches, and steam is supplied by four double-ended boilers of the return-tube type, which are placed forward of the engines in two independent stokeholds divided by water-tight bulkheads. The results of the official trials were highly satisfactory. In the case of the Galatea the collective horse-power on the four hours' forced-draft trial was 9204, being more than 700 horse-power in excess of the contract; the highest power developed during any single half-hour was 9665 horses, and the mean of the last three hours gave 9415, equal to 1915 indicated horse-power above what was originally proposed by the Admiralty. This result was attained on a consumption of 1.97 pounds of coal per indicated horse-power per hour with an air pressure in the stokeholds of only 1½ inches.

Reform in Bills of Lading.—The Boston Executive Business Association, at a meeting lately held, adopted the following resolutions: "Resolved, That in the opinion of this association it is the duty of common carriers to issue bills of lading for the goods received for transportation, and to deliver the goods and quantity receipted for or pay for the deficiency with-

out subjecting the receiver to the expense of litigation. *Resolved*, That we believe and insist that all merchandise should be delivered to the receiver on payment of the freight specified in the bill of lading. *Resolved*, That we heartily approve of the action of the Classification Committee of the New England railways in eliminating from their classification and tariff 'owner's risk,' and we strenuously urge the adoption of the same by all common carriers."

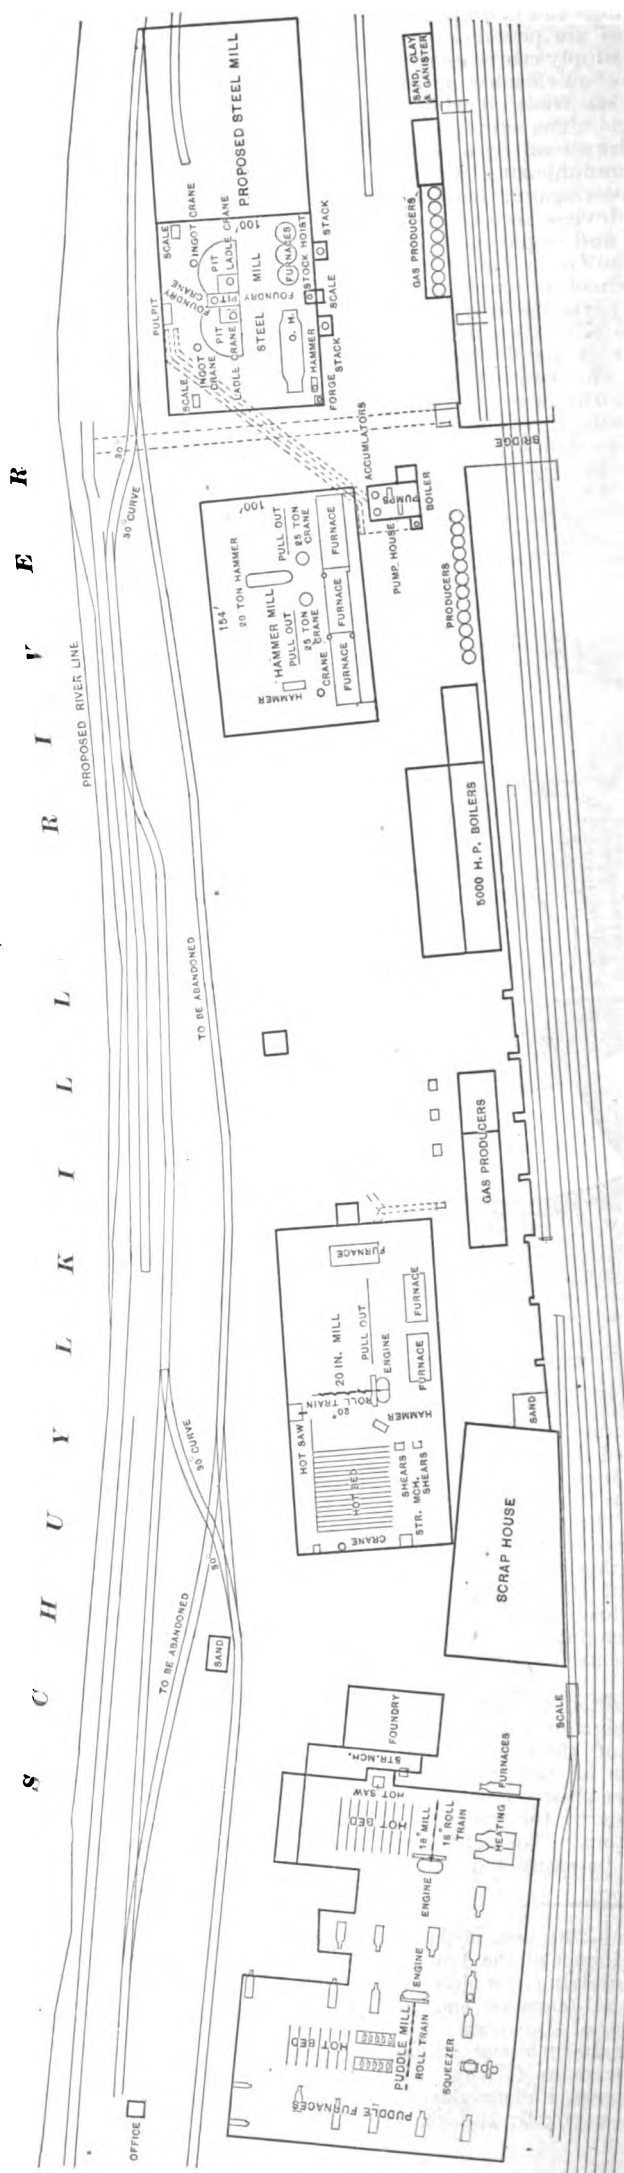

The Pencoyd Iron Works.

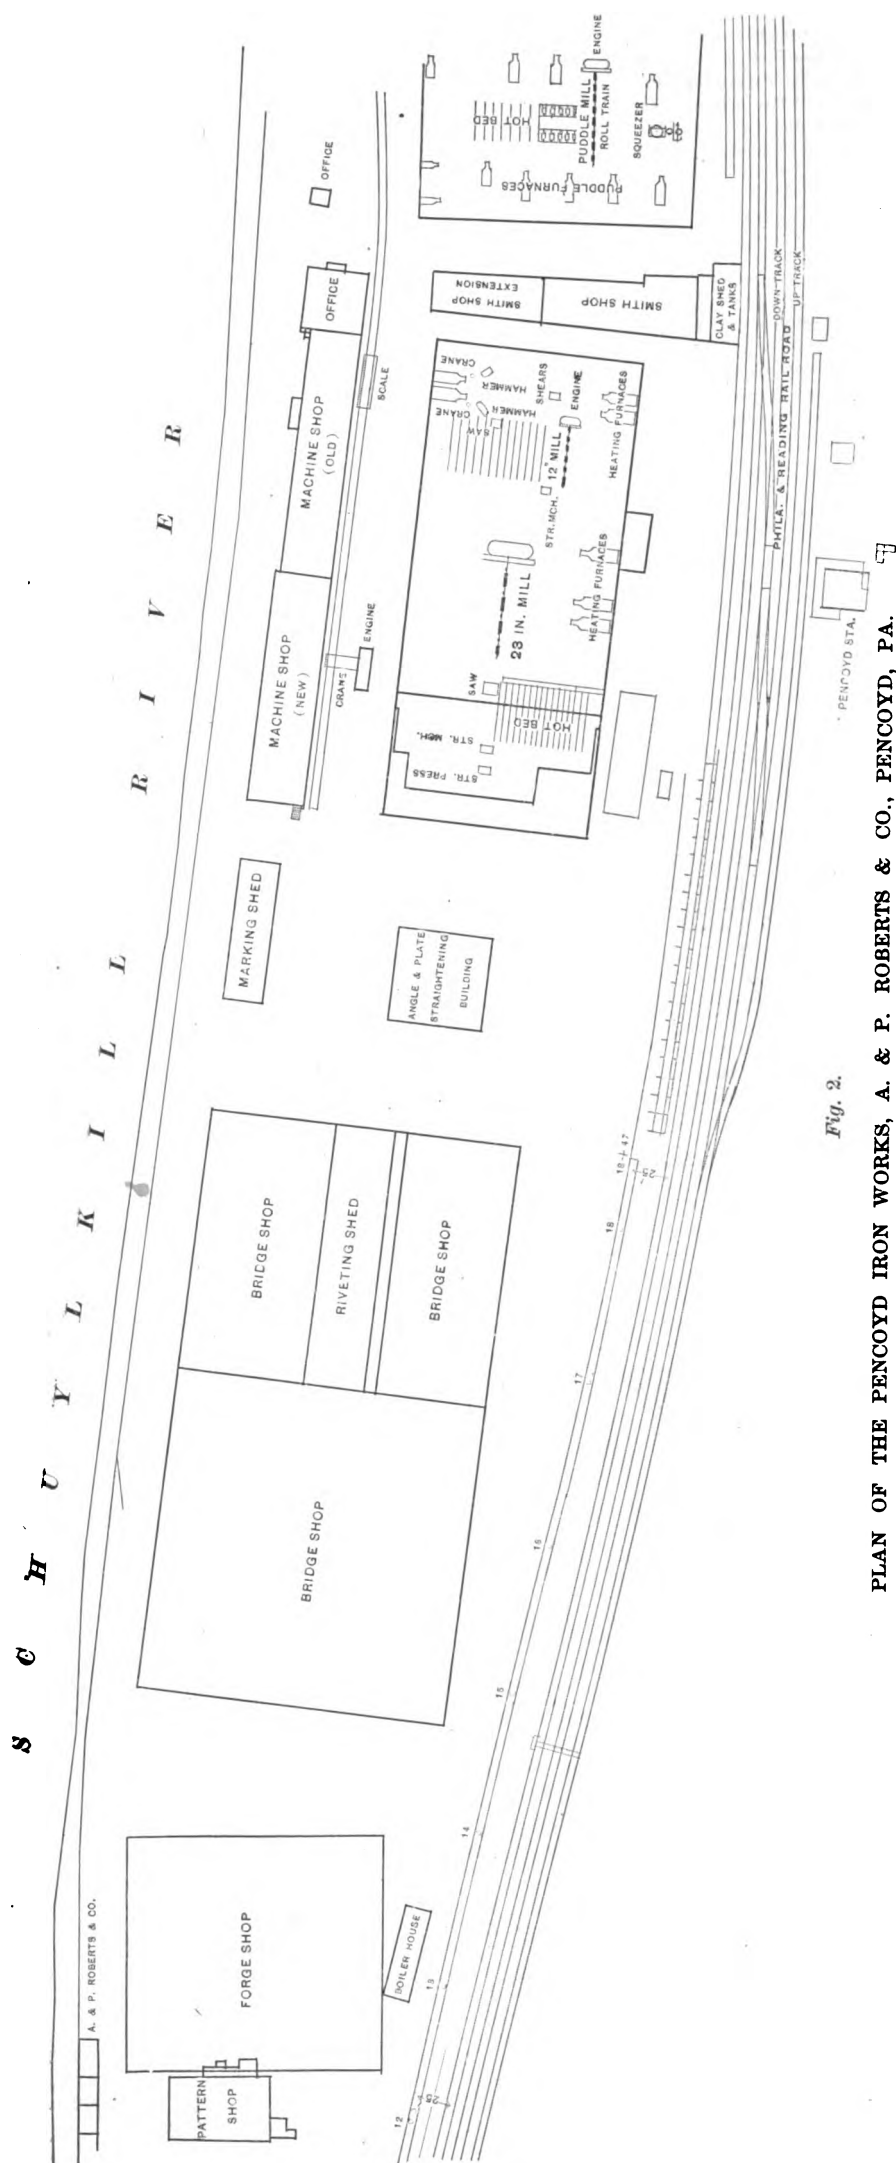

During a recent visit to the Pencoyd Iron Works of A. & P. Roberts & Co., situated on the Philadelphia and Reading Railroad, at Pencoyd, on the Schuylkill River, in Montgomery County, Pa., we had occasion to observe the important improvements now going on at that establishment, and obtained some data concerning the extensive plant for future enlargement, now being developed. The Pencoyd Works themselves were built in 1854, and the old puddle mill itself has since that time run almost without an interruption, and has never called, in all that time, for any extensive repairs or alterations. The present establishment is the outgrowth of that earlier enterprise, the firm having entered into the manufacture of structural iron and beams as the result of taking the order for the erection of the Main Building at the Centennial Exhibition in 1876. The Pencoyd plant covers about 25 acres, the works being built *en échelon* on a strip of land lying between the Philadelphia and Reading Railroad and the Schuylkill River, the former being considerably above the general level of the works, while the latter is below it about 15 feet. Retaining walls are being built along the railroad and a wall is also projected along the river front. The works are thus on a strip about 2900 feet long, and averaging about 350 feet in width. In order to show the location of the buildings in detail the plan was divided into two parts in our accompanying engravings, a part of the puddling mill in Fig. 1 being reproduced in Fig. 2.

Beginning, then, on the right of Fig. 1, we enter first the steel works. In the year 1886 the Pencoyd Works decided to add a steel plant to their establishment, putting up a 20-ton Richmond & Potts open hearth steel furnace, the gas being supplied by eight circular producers located immediately below the railroad track. Later, a new 12-ton furnace, with circular hearth 8½ feet in diameter, with water-cooled doors and flues, circular regenerators and removable roof for regenerators and furnace, was put in. The furnace is of special design, with an improved reversing gear, which in many respects departs radically from the usually accepted type of this class. The old furnace has been torn down, and a second furnace, of the same type as the new one, is generally put in its place. Bottom casting is being applied.

Between the two furnaces will be a large pit for making heavy castings from both furnaces, if necessary, while in front of each furnace is a semi-circular pit. When completed, the shop will have two ladle cranes, two ingot cranes, and one crane in connection with the foundry pit. Parts of one of the new cranes, built by the I. P. Morris Company, are now on the ground. The older ladle crane and the two ingot cranes are by the Morgan Engineering Company.

Immediately adjoining the open-hearth melting department a new building, 154 x 100 feet, has gone up, which contains a 20-ton hammer. It is of wrought iron exclusively, with the exception of the guides. To make the foundation for the large hammer the excavations were carried down to the solid rock, which was covered with 2 feet of Portland cement concrete,

PLAN OF THE PENCOYD IRON WORKS, A. & P. ROBERTS & CO., PENCOYD, PA.

and then the foundations were carried up of cut stone, a free space of 5 inches being left between the foundations of each leg of the hammer and the foundation of the anvil, the entire depth of the foundation being about 25 feet, and being anchored by 12 3-inch bolts. A manhole gives access to the latter. The anvil has a total height of 11 feet 8 inches, and has a total weight of 421,155 pounds, distributed as follows:

	Pounds.
Two blocks of 49,600 pounds.....	99,200
" " 52,600 "	105,200
" " 54,200 "	108,400
One " 54,300 "	54,300
One steel block.....	18,600
One anvil-die.....	8,100
Six wrought-iron bands.....	2,160
Four " bolts.....	3,080
Lead between anvil and timber.....	5,700
Zinc between blocks—1st course.....	8,313
" " " 2d "	5,122
" " " 3d "	2,012
" " " 4th "	1,018
Total.....	421,155

The base of the anvil is 11 feet 10 inches by 15 feet 2 inches. The hammer, which was built by the Maerkische Maschinenbau Anstalt, has a diameter of 1100 mm. and a stroke of 2510 mm., the total height being 10.118 m., the falling weight being 40,000 pounds. The hammer is served by two 20-ton cranes with a hydraulic pressure of 700 pounds. They are able to handle 20 tons each, the diameter of the hydraulic cylinder, which is attached to the mast, being 25 inches, with 11 foot 8 inch stroke. The trolley ram is 6½ inches in diameter, with 12½ foot stroke, while one ram 8 inches in diameter, and 2½ foot stroke, through rack and pinion, revolves the crane. The mast is one of the heaviest wrought-iron forgings made in this country, being 18 feet long. The hammer shop contains three re-heating furnaces, one with a hearth 13 x 7 feet 9 inches for two 10-ton ingots, a second, 20 x 6½ feet, for two 8-ton ingots, and the third, 20 feet 9 inches by 5 feet 8 inches, for twelve 1-ton ingots. They are served by hydraulic cranes built at Pencoyd, and a hydraulic arrangement is also to be put in for withdrawing the ingots. In the same hammer shop are to be two 8-ton axle hammers and one 5-ton hammer is also contemplated for forging. A new producer plant has been built for the hammer forge and other furnaces.

At the time of our visit a new boiler-house was being built, 123 x 50 feet and 40 feet high, the contracted space making it necessary to build it in two stories immediately in front of the retaining wall of the railroad track, which thus affords excellent facilities for handling the coal cheaply. Into this house 5000 horse-power of Babcock & Wilcox boilers are being put, and a number of economizers are also to be added. The stack being built in connection with it is to be carried up 30 feet with stone and 125 feet with ironwork, the total height being 155 feet and the diameter 10 feet in the clear.

Following the hammer shop is a 20-inch blooming mill, with three heating furnaces and a small temporary hammer for cutting up the billets. On this mill are also rolled angles, for which a straightening machine is provided, channels up to 5 inches, beams up to 6 inches and 6-inch rounds. The mill is driven by a 32 x 48 vertical engine.

Then follows, in the puddle mill, an 18-inch mill, rolling plates from 8 inches down to 2½ inches, rounds from 6 inches down to 1½ inches, angles from 4 x 3 inches to 3 x 3 inches and tees from 5 x 2½ inches to 3 x 2½ inches. The puddle mill contains 16 double and 1 single puddling furnace, with the puddle train, squeezer, hot-bed, &c. The works are equipped also with three axle hammers, one 3000 pounds, one 5000 and one 6000 pounds. In the finishing mills are a 12-

inch mill and a 23-inch beam mill, with their complement of heating furnaces, shears, hot-beds, saws, straightening machines, &c. The 23-inch mill makes up to 15-inch beams and channels. Running parallel to the finishing mills are two machine shops, well equipped with modern tools. Further on the bridge shop is reached, the old shop having been 200 x 375 feet. This year the large new shop has been added, shown in our engraving as the adjoining large square. This is an exceedingly handsome structure of great span, the roof trusses being designed to take a load of 10 tons at any one point. In the bridge shop, at the time of our visit, two pneumatic riveters of the Allen type were being used, while a heavy stationary hydraulic riveter was temporarily placed in a special building.

Power Dumping Apparatus.

We illustrate a power dumping apparatus designed by Mr. W. R. Jenkins, of the firm of Jenkins & Single, of Bellefonte, Pa., for the Scotia ore mines of Messrs. Carnegie Bros. & Co. The object was to overcome the objections to the "dump" or "tipple" in ordinary use. Since its erection about one year ago it has been in constant use, and is in every way satisfactory.

The cradle dump as usually built is designed so that when a loaded car is on it the center of gravity is above the center of the tippie, so that it will turn of its own accord and dump the contents of the car. The result is that the load is discharged in an almost unbroken mass. This is in many cases very objectionable, as for instance when discharging the contents into a pair of rolls to be crushed, or as in the case for which the arrangement shown was designed, the dumping of the contents into a washer in order to separate iron ore from the clay, &c.; or the dumping of coal with the least breakage of the lumps. In any of these cases it is desirable that the "material" be discharged gradually, and that it be under control of the operator, who can, so to speak, feed the contents of the car into the receptacle as fast as he desires. In the case of the cradle operated by gravity it may be well to explain that after the car is turned upside down and emptied the center of gravity is again above the center of the tippie, and it is brought back into position automatically by gravity. At least that is the intention, but in practice it is a matter of hard work to assist in turning either in one direction or the other. The application of power to a dump of this kind, so far as we are aware, is novel, and the result eminently satisfactory.

The tippie used is what is commonly known as the cradle dump, one end of which next to the circular rail is hooped with plate-iron, about 10 inches wide. To this is attached a chain, the other end being fastened to the drum A in the operating mechanism, which in this instance was placed overhead, and is driven by a belt on the pulley B. On the same shaft with the pulley B is a small paper friction pulley C. An intermediate shaft D has on one end a large iron friction pulley E, and also on the same shaft is a small spur pinion gearing into a spur wheel on the drum shaft. The end of the shaft D is carried by a pillow block, G, which is capable of being moved back and forth, to permit of the friction pulley E being thrown into and out of contact with the pulley C, and also against the stationary brake-block H. This movable pillow-block is operated by means of a lever, as shown. In operation, when a loaded car is run into the tippie, the friction pulleys are brought into contact and the drum set in motion, winding up the chain and slowly turning the cradle until the car is

upside down. If necessary at any time, the frictions can be released and the pulley brought back against the brake-block and the car held stationary in any position. In this manner the operation of dumping can be prolonged to any length of time desired. On releasing the friction device,

shaft. The material is dumped into steel crushing rolls, 4 feet diameter, falling from them into the washers.

The Union Pipe Mill Company, of Pittsburgh, with a capital stock of \$25,000,

Fig. 1.—Elevation.

Fig. 2.—Plan of Overhead Pulley Arrangement.

POWER DUMPING APPARATUS, MADE BY JENKINS & SINGLE,
BELLEFONTE, PA.

the cradle is brought back into its original position by means of the counterweight O. The gearing was in this case speeded to make one-half a revolution of the tippie in about 15 seconds. The cars had a capacity of about 30 cubic feet, and were filled at the mines by a steam excavator, two tipples being used, having a combined capacity of 120 cars per hour. Both tipples are operated by the same driving

was chartered last week. The stockholders are James J. Brown, B. Brown, R. J. Brown, Joseph Brown and Hugh McElroy.

The breakwater at Cleveland harbor will be extended 600 feet, at a cost of \$70,000. The ironwork will be done by Andrew La Cour, of Cleveland, and the construction by Jas. B. Donnelly, of Oswego.

THE WEEK.

Although the exports of petroleum from the United States are decreasing in quantity by reason of Russian competition they are not declining in value. The report of the Bureau of Statistics shows that during the eleven months ended November 30, 1888, 506,153,493 gallons of petroleum were exported, at the value of \$42,549,492. In the corresponding period of 1887 the petroleum exports amounted to 530,571,678 gallons, of the value of \$41,246,286. Thus, compared with the petroleum traffic of 1887, 24,418,185 gallons less in 1888 brought \$1,303,226 more.

The lower end of New York City, more particularly Wall street, Broadway, and the region contiguous, is undergoing a complete architectural change. The metamorphosis is so radical that within the last ten years the district referred to has almost passed recognition. The latest movement is the purchase by the Union Trust Company of the buildings at 78, 80 and 82 Broadway, near Wall street, for \$1,200,000, with the design of erecting on the site a splendid structure for their own use and for general office purposes. It is also reported that the five buildings on the southwest corner of Wall and Broad streets, opposite the Drexel Building, are to be torn down this spring and an office building erected at a cost of upward of \$1,000,000.

By advancing several million dollars of her own money Miss Mary Garrett, daughter of the ex-president of the Baltimore and Ohio Railroad, has recovered that property from the control of the bankers who had advanced \$500,000 in furtherance of the plans of Samuel Spencer, who is now succeeded by Chas. F. Mayer, of Baltimore, and it is stated that the policy of the road will now be an aggressive one, that an independent route to New York will be established, and the Staten Island terminal work pushed with vigor.

Leading Pittsburgh manufacturers, among whom are B. F. Jones, J. W. Chalfant, M. K. Moorhead, Jas. Loughlin, Jr. and W. C. Quincy, are forming a dock company to build docks on Lake Erie at Cleveland and Ashtabula, to facilitate the handling of ore. In the same line of enterprise are three large docks to be built at West Superior, one of which will be the largest coal docks on the chain of lakes. Another is for the Ohio Coal Company, and a third for the Eastern Minnesota Railway Company.

Canadian financial institutions have over \$23,000,000 loaned in the New York market, much of which represents the proceeds of a loan placed by Canada upon the London market last July. The refusal of the Government to make a \$1,000,000 loan direct to the city of Toronto causes much complaint.

Plans for the improvement of the East River from Grand street to Thirty-fourth street, for the better accommodation of the Sound steamboats, have been presented to the Sinking Fund Commissioners from the Dock Board and approved. A margin street 175 wide and a new bulkhead line are proposed. The entire estimated cost \$10,000,000.

The growing importance of New York City, which Congressman Cox says will have 8,000,000 inhabitants 50 years hence, including the suburbs, is assigned as a reason for liberal appropriations for the improvement of its harbor. "At this magnificent port," said Mr. Cox, "with its two entrances—East River into Long Island Sound and thence to the sea, and through New York Harbor via Sandy Hook to the ocean, New York imports two-thirds of the merchan-

dise of our country, receives two-thirds of the import duties for our Government, sends out one-half of the domestic products of the country and gives hospitality to one-half of the foreign tonnage trade with the United States. Three-fourths of the passengers who come from and go to foreign countries, including three-fifths of all immigrants, find their grand depot at New York harbor. While it is admitted that New York has so large a preponderance of our commerce, with its exports and imports, the appropriation for the care of its harbor is grotesquely inadequate. This bill, which appropriates \$12,000,000, gives \$100,000 for New York harbor, \$20,000 for Gowanus Bay, \$150,000 for the Harlem improvement and \$175,000 for the East River and Hell Gate, hardly \$500,000."

The Merchants' Bridge and Merchants' Bridge Terminal Company have received bids from the King Bridge Company, of Cleveland, the Union, of New York, and the American. Under the best bid, which, it is said, was accepted, the bridge complete will cost \$1,200,000 and the terminals an additional \$300,000. The bridge will consist of three spans, averaging 522 feet, and two approaches, each about 425 feet long, the entire length being a little short of a half mile.

Bids for an armed coast defense vessel of 4000 tons, to be of materials wholly American, will be opened by the Navy Department February 1.

The remedy prescribed for rate-cutting in railroad transportation is to put men who are both honest and capable in control of our great corporations.

Prominent real-estate experts and dealers in New York City have employed engineers, who are engaged in determining the cost of a stupendous scheme for an arcade, or tunnel, designed to provide a thoroughfare on the West Side to remedy the long-block nuisance. The distance between the principal avenues averages about 900 feet, and it is proposed to divide the blocks by opening an arcade for foot passengers only over a railroad tunnel, or, as an alternative, to open a thoroughfare for light vehicles, open to the sky, except in business sections, where galleries could be introduced along the several stores facing the street, under a glass roof. The expenditure would be mainly in the excavation for the tunnel and construction of buildings appropriate to each neighborhood. In the residence portions the arcade or thoroughfare would need be but a story high, admitting of the occupation of all of the space above the tunnel but the first story for dwellings. In the retail sections the arcade might be 50 feet wide, or less, and would be lined with rows of neatly constructed buildings on either side, facing the arcade, and available for all kinds of retail stores, offices, &c. One plan is to interest the present owners of property in a large corporation as shareholders, or to carry out the scheme under the power of eminent domain.

Owners of property on the east side protest against the monopoly of the piers on the East River by rich corporations. The piers are being covered with sheds, forcing ships which have landed and receive cargoes there to find wharfage in Jersey City or Brooklyn.

Foreign vessels, according to the report of the Commissioners of Navigation, continue to crowd us out of the foreign trade, even in our own ports. British vessels pay the largest portion of the foreign tax. Norwegian and German sailing vessels and German and French steamships pay a good deal of the rest. The tax paid by vessels of the United States is less than a quarter of that paid by the British vessels, and the business done in our ports by the vessels

of each nationality is in about the same proportion. The figures giving the amount of tonnage tax collected from foreign vessels shows to what an alarming extent they are encroaching upon a trade that should be more largely ours.

Mr. Robertson, of New Brunswick, of Joggins raft notoriety, is endeavoring to form a syndicate to promote the new mode of transporting logs to market so that the waste timber may be utilized. There is about to be built on the Washington Territory coast a raft consisting of about 8,000,000 feet, whose destination is Valparaiso. Another will be sent to San Francisco for a mill on Socoleta Bay, which will be stocked entirely by rafts towed from Washington and Oregon Territories.

The Philadelphia police authorities charge that at least 150 fires in that city during the year were the work of professional "fire-bugs" whose headquarters are in New York City. The firm have agencies in all the principal cities, that their guise is generally that of a glazier, and that they are ready to start a fire to order, furnishing supplies of clothing when desired, on stipulated conditions, also the needed chemicals.

On two recent occasions, once at the lower end of Broadway, and again at the corner of Maiden Lane and Nassau street, the electrical subway has blown up with great force, destroying the pipes and iron castings. Electrician Wheeler, of the Board of Electrical Control, says that almost any underground system will work, viewed simply as an electrical channel. The problem is to get one that will protect the wires against illuminating and sewer gas. Co-operation of competent electrical experts in laying subways is the only security against constantly recurring explosions.

Engineer Gustav Lindenthal, the projector of the proposed high bridge over the Detroit River, has in contemplation a structure which would rank among the largest on the continent, with towers not less than 300 feet above the water, and the superstructure at least as high as that of the Brooklyn Bridge. The towers supporting the superstructure will be of steel, and will stand on stone piers which will be founded on rock nearly 100 feet deep. These foundations will be put down by the pneumatic method, the same that was used for the St. Louis and the Brooklyn bridges. The location of the piers will determine the cost of the bridge. The bridge company, Mr. Lindenthal says, consist of men of financial resources who can carry out what they undertake.

The German Export Society has decided to build the Floating Exhibition Palace of Germany, having raised 5,000,000 marks for the purpose. The plan is to sail from port to port showing the superiority of German wares. "International exhibitions," says the prospectus, "do not occur often enough, and must be supplemented in this way." The vessel is to be called the Kaiser Wilhelm, and will be the work of German shipyards, and upon a scale more magnificent than that of any craft afloat. According to plans the ship will be 172 m. long, 20 wide and 14 high. It will have four engines propelling as many screws. The material will be principally German steel. The cost of a two years' tour is estimated at 3,150,000 marks. The income from the rented space—1000 to 1200 marks for each booth—and from sales will be, it is thought, at least 7,260,000 marks, leaving a balance of 4,110,800, or over 2,000,000 marks annually—a pretty sum on the pages of the ledger. Emperor William has promised his aid to the enterprise, and it is hoped that the vessel will sail from Hamburg on her first voyage in the spring of 1890.

MANUFACTURING

Iron and Steel.

Under date of the 19th inst. the Laughlin Nail Company, of Wheeling, W. Va., write us as follows: "During the greater part of November, and all of this month to date, we have been shipping at the rate of from 8 to 12 carloads of nails per day. Since the advance made on the 11th inst. we have had numerous inquiries, and have taken a good many orders at the new price. We are looking for still higher prices within another 30 days, and think that the outlook for spring business is very encouraging."

Under a decree of the United States Court the Commissioners in Chancery, in the case of the Fidelity Trust Insurance and Safe Deposit Company, of Philadelphia, against the Shenandoah Iron Company, in Page County, Va., have advertised to sell, on January 8, the works and personal property, 33,000 acres of mineral lands, 3 mansions and 77 tenant houses. The debt against the company is over \$800,000.

The rolling mill of the Straight Fibre Iron Company, at Stewart avenue and Fortieth street, Chicago, was burned on the evening of the 18th inst. The flames first appeared on the roof over one of the puddling furnaces, just after the night turn had gone to work. The mill hose was immediately put into service and the fire would have been extinguished easily, but a coupling broke, causing delay and giving the flames the mastery. The city engines did not arrive in time to save the structure, which was wholly built of wood, but they prevented the fire from communicating to the buildings of the Chicago Forge and Bolt Company, standing in dangerous proximity. The greater part of the machinery and equipment of the plant has not been seriously damaged, and as soon as the insurance is satisfactorily adjusted the works will be rebuilt. As the loss is well covered by insurance the company will not suffer financially from that cause directly, but the stoppage of the works comes most inopportunistly, as the company had received orders which would have kept them employed up to their full capacity for months. A rough estimate places the damage to the property at \$50,000.

Martel Furnace, of the Martel Furnace Company, at St. Ignace, Mich., has been blown out for the purpose of repairs. A new hearth will also be added. The furnace will remain idle until spring on account of the difficulty experienced in shipping iron during the winter months.

Raney & Berger, of New Castle, Pa., proprietors of the Raney & Berger blast furnace at that place, have made a contract with J. P. Witherow, of Pittsburgh, for the erection of a new stack, 23 feet bosh and 80 feet in height, and a tower hoist of wrought iron attached, to be used as a spare stack. It is not the intention of the firm to operate more than one stack at the same time.

The Lewis Foundry and Machine Company, Limited, of Pittsburgh, are engaged in the erection of a 12-inch merchant train, together with the engine and rolls, for the Horseshoe Machine Company, of Anniston, Ala.

The work of relining Grace Furnace, of the Brier Hill Iron and Coal Company, at Youngstown, Ohio, which was commenced on the first day of the present month, is expected to be completed and the furnace ready for blast on January 1 next.

We are informed, on good authority, that the Bessemer converting department of the new plant of the Allegheny Bessemer

Steel Company at Duquesne, Pa., will commence operating shortly after the 1st of January next. In this way a stock of blooms will be secured ready for use for rolling into rails as soon as that department commences operations, which will probably be in March next.

On the morning of the 14th inst. a fire broke out in the Soho Iron Mills, of the Moorhead-McCleane Company, at Pittsburgh. The main building escaped injury, but the foundry and machine-shop were considerably damaged. The loss was not large, and was fully covered by insurance.

On Wednesday, the 19th inst., there was rolled in the armor-plate mill of the Homestead Steel Works of Carnegie, Phipps & Co., Limited, at Homestead, Pa., a shaft 20 x 20 inches in diameter and weighing 26,500 pounds. This one is even more remarkable than the other large shafts rolled in this mill a few days ago, since it required 2 x 4 inches more reduction from the same sized ingot—an octagon 40 inches in diameter.

The Bessemer steel department of the Bellaire Nail Works, at Bellaire, Ohio, turned out 6560 tons of finished steel during the month of November. The blast furnace of this company during the same month turned out 3914 tons of Bessemer pig iron.

Rosena Furnace, at New Castle, Pa., operated under lease by Oliver Bros. & Phillips, of Pittsburgh, for the week ending Saturday, December 8, turned out 1122 tons of iron. This is the largest output of the furnace in the time given since it was erected.

From the Steelton, (Pa.) Reporter of the 22d inst., we take the following information regarding operations at the plant of the Pennsylvania Steel Company, located at that place: "No. 2 Bessemer made a heavy run all week, averaging 900 tons of ingots every 24 hours. No. 1 open-hearth has both furnaces in operation on special steel. 1 large punion and several gear-wheels were cast during the week. No. 1 blooming mill made a medium run. No. 2 had one turn on nail plate and the other on rail steel for the merchant mill. The hammers were on special steels, partly for cruisers. The universal mill was on heavy slabs for structural purposes. The rail mill made a light run and was on 85s, sec. 67, all week. The merchant mill was rolling rails and billets on the 20-inch train and small sizes and shapes on the 13-inch train. The frog, switch and signal department is very busy, running night and day, with plenty of orders. The foundry cast a number of gas retorts for shipment. A number of molds are in preparation for bells and other heavy work which will be cast next week. The machine shop is busy on new work and the boiler shops, blacksmiths and pattern makers are similarly employed.

Notices have been posted at the Edgar Thomson Steel Works of Carnegie Brothers & Co., Limited, at Braddock, Pa., that the wages for December will be paid on the basis of rails at \$28.50 per ton.

Swede Furnace, at Swedeland, Pa., operated by R. Heckscher & Sons, under the superintendence of Albert Walters, has beaten its own record, making 515 tons of pig iron last week.

The American Wire Nail Company, of Coryington, Ky., who are building a new rod mill at Anderson, Ind., have contracted with Alex. Loughlin & Co., engineers and contractors, Cleveland, Ohio, for two natural gas heating furnaces of the same size and capacity as those now in use at the rod mill of the Joliet Steel Company, at Joliet, Ill. These furnaces re-

cently turned out 777 tons of finished No. 5 rods in one week, which, it is claimed, beats the record for two furnaces with working hearth 7 feet by 18 feet.

Machinery.

The Kilby Mfg. Company, Cleveland, are running night and day upon heavy work for paper mills and cable roads. One digester for paper stock is made of lead bronze, 7 feet in diameter, 22 feet long, and weighs 30,000 pounds. It is cast in five sections. The cable road work goes to the Pacific coast, and one order will make 65 carloads.

The American Brake Company (Westinghouse Air Brake Company, lessee), of St. Louis, have undertaken the improvement of their works on a large scale, and at an estimated cost of about \$25,000, accounting for both additional machinery and new buildings. The new steam plant and machinery ordered by the company embrace the following: 125 horse-power Babcock & Wilcox boiler, with the Verona automatic stoker; two new Westinghouse engines, one of 65 horse-power for the machine shop, and the other, of 35 horse-power, for the blacksmith shop; large steam hammers, including a 1500 pound Bement & Miles hammer; a drill press that will perform the remarkable feat of running two 4-inch twist drills at the same time through iron or steel; six-spindle drill press; 2-inch bolt cutter; new furnaces, &c.

Hardware.

Wiley & Russell Mfg. Company, Greenfield, Mass., have recently completed a fire-proof building to be used as a depository for stock. Makers of taps and dies find it necessary to carry a great variety of these tools in stock, and thousands of small bins, neatly arranged in a room 40 x 50 feet, contain the various sizes, shades of sizes, shapes and number of threads kept on hand by this company.

The McCosh Iron and Steel Company, of Burlington, Iowa, are erecting a wire-drawing plant. It will consist of 50 blocks, and will manufacture wire for their barb wire and wire nail machines. A 250 horse-power engine, built by the Murray Iron Works, of the same city, will furnish power.

The American Steel Screw Company, with a capital stock of \$1,000,000, was incorporated at Lima, Ohio, on the 18th inst. The company is composed of New York, Chicago, Cincinnati, and a few home capitalists. The company has purchased ground and will commence the construction of buildings at once. Employment will be given to 1000 men.

The factory of the Putnam Wire Nail Company, Greencastle, Ind., was destroyed by fire on the 15th. The loss was about \$11,000, the insurance being \$6300. The company have not yet decided whether to rebuild or not.

Whitfield & Jacobs, Pontiac, Mich., report large orders for their Buckell safety levis, which is being taken hold of by the jobbers.

M. Bare, Hamilton, Ohio, has sold the entire equipment, including machinery, patterns, dies, &c., of his hoe manufactory to the Chattanooga Tool Company, Chattanooga, Tenn., who have moved the machinery to their city, where they will manufacture the full line of hoes and rakes formerly made at Hamilton. They have also, they advise us, brought the skilled labor that operated Mr. Bare's factory to their works at Chattanooga, thereby securing greatly increased facilities for making their old line of handled hoes, drain cleaners and neck yokes, as well as the complete line of rakes and eye hoes made by Mr. Bare.

The wire-nail factory of the Hartman Steel Company, Limited, at Beaver Falls, Pa., which has been idle for some weeks, resumed operations on double turn on the morning of the 18th inst. The wire mill department of this firm, which has been idle for two months, has partially resumed operations, and preparations are being made to operate it to its full capacity after the first of the year.

C. H. Amidon, late Amidon & Bastedo, has removed his works from their former location, on Main street, Buffalo, to 1451 Niagara street, occupying the entire upper half (second story) of the Josiah Rose Iron Works plant. The present factory covers an area of 250 x 65 feet, which will be occupied in the manufacture of bit braces.

The incorporation of the American Steel Screw Company, with works at Lima, Ohio, is announced. It is intimated that the enterprise will be carried on on a large scale.

Joseph Churchyard's Sons, Buffalo, N. Y., have completed an addition to their factory. This addition was rendered necessary by the requirements of their refrigerator business, and they have now a brick building 56 x 112 feet, four stories, adjoining their main building. They have also put in a large-power elevator with a capacity of 80,000 pounds and have their entire plant equipped with automatic sprinklers as a safeguard against fire. They have, however, been extremely fortunate in this regard, as they have been located in their present quarters for 36 years and have never had a fire in the establishment.

Acme Shear Company, Bridgeport, Conn., have completed changes and additions to their factory, thus obtaining about double their former available floor space. They have purchased from the estate of E. C. Maltby & Son, Sheldon, Conn., the entire plant of machinery, tools, dies, patterns, &c., used by them in the manufacture of steel spoons and forks, and will continue the manufacture of this line at Bridgeport. They expect to be in shape to turn out some work by January 1, at latest, and to put the goods on the market in improved quality and finish.

The Lambert & Bishop Wire Fence Company, of Joliet, Ill., have added to their plant a new brick building, 160 x 50 feet, for storage purposes. They have also put in a new Corliss engine and a number of new barb-wire machines.

Under date of the 8th inst. the Lima Lock Mfg. Company, recently organized at Lima, Ohio, for the manufacture of door locks, knobs, and general builders' hardware, write us as follows: "This company will commence operations here on January 2, 1889, having several large buildings which will be arranged temporarily for our use. Some of the leading capitalists of this city are interested, as well as a few in New York. We start up with a large number of orders on hand. We have secured the patents, patterns and trade of an Eastern concern and will do a large business from the start, having ample capital at our command."

Miscellaneous.

The Aluminum Brass and Bronze Company, recently formed for the manufacture of aluminum and silicon sheets, rods and wire, under the exclusive rights in the United States of the Cowles patents, are erecting buildings covering 2 acres area at Bridgeport, Conn., which are expected to be ready in April next. The officers of the company are: F. J. Kingsbury, president; William Powe, treasurer; F. J. Kingsbury, Jr., secretary; Dr. Leonard Waldo, electrical engineer; Charles S.

Morse, mechanical superintendent; Mr. Kingsbury is also president of the Scoville Mfg. Company, Waterbury, and Mr. Powe was formerly connected with Ansonia Brass and Copper Company.

Gordon M. Richardson's wholesale tinware establishment, at 237 Lake street, Chicago, was damaged by fire on the 18th inst. The fire originated in the rear of the third floor from the effects of an overheated stove in the japanning room. The supports of the elevator machinery at the top of the building were weakened by the flames and it fell through to the second floor, causing much damage. The fire was extinguished before the building was completely destroyed. Mr. Richardson's loss will not exceed \$5000, which is fully covered by insurance.

Last week the Pittsburgh, Cincinnati and St. Louis Railroad Company let a contract for the building of 2000 freight cars, divided as follows: 1000 box cars to the Ohio Falls Car Company, at Jeffersonville, Ind., 500 stock cars to the Missouri Car Company, St. Louis, and 500 gondolas to the Peninsular Car Company, of Detroit.

The following corporations have recently been organized under the laws of Illinois: Chicago Car-Brake Company, capital \$200,000, to manufacture attachments; incorporators, J. N. Young, G. B. Quigg and Edward Lewis. Brownlev Brake Shoe Company, Chicago, capital \$200,000, to manufacture brake-shoe bushings and kindred appliances; incorporators, J. K. Allen, M. S. L. Rickey and L. P. Conover.

Coal and Modern Civilization.—Prof. J. S. Newberry, in a lecture on "Coal, the Dominant factor in Modern Civilization," recited the formation and history of coal, and then proceeded to show that, though ancient civilizations had progressed without its use, the period since the extensive use of coal has given the present age so great an impetus in industrial affairs that men would be reduced to the condition of the Dark Ages if they were suddenly deprived of its use. "It is estimated," he said, "that with the average engines now in use about 1,500,000 foot pounds are practically evolved from the combustion of a pound of coal and are available in the performance of any work done. In other words, the combustion of a ton of coal yields a power equivalent to that of six men and a well-grown boy throughout the year. In round numbers the annual production of coal in this country is now 100,000,000 tons; in Great Britain 160,000,000. This vast quantity of condensed force will be seen to be equivalent to 1,000,000,000 men working for a year. When we realize that all this is an element utterly wanting in the lives of the ancients, and that it has been almost entirely added to pre-existent agencies within the last hundred years, we must concede that it has been a most important factor in our material progress, and not without potent, we may almost say controlling, influence on the occupations, habits, manners, morals, and politics of those nations which have fallen heir to the most abundant supplies of this precious material."

The pontoon bridge over the Missouri River at Nebraska City is probably the longest in the world. Its length across the navigable channel is 1074 feet, while the back channel is traversed by a causeway 1050 feet long, supported on cribs. The charter for this bridge has been held for 12 years, because of the difficulty of obtaining financial support for a project which appeared so impracticable. It is stated that the entire bridge was built in 28 days, at a cost not exceeding \$18,000, by Col. S. N. Stewart, of Philadelphia, assisted by Gen. Lyman Banks, of Iowa. The draw

is V-shaped, with the apex down stream. It is operated by the current and controlled by one man. The clear span is 528 feet. The bridge was completed in August and is doing good service. It will be removed during the ice season.

The Population of the United States.

The total vote cast at the last Presidential election was 11,340,518, an increase of 2,136,090 over 1880. Assuming that the vote cast in 1888 bore the same relation to the total population as the vote of 1880 bore to the total population in the census year, it would appear that there has been a growth of 10,396,503 in eight years, and that a count of heads at the present time would show a population of 59,767,843 in the United States. It appears that the population in each State in 1880, and the apparent population in 1888, are as follows:

	Population in 1880.	Apparent pop. in 1888.
Alabama.....	1,282,505	1,541,583
Arkansas.....	802,525	1,089,952
California.....	864,694	1,299,428
Colorado.....	194,327	320,008
Connecticut.....	622,700	708,298
Delaware.....	146,608	145,956
Florida.....	269,493	346,392
Georgia.....	1,542,180	1,414,353
Illinois.....	3,077,871	3,662,916
Indiana.....	1,978,301	2,255,185
Iowa.....	1,624,615	2,020,650
Kansas.....	996,006	1,618,073
Kentucky.....	1,648,690	2,137,542
Louisiana.....	939,946	1,106,448
Maine.....	648,936	577,129
Maryland.....	934,943	1,144,368
Massachusetts.....	1,783,085	2,167,716
Michigan.....	1,636,937	2,186,186
Minnesota.....	780,773	1,280,217
Mississippi.....	1,131,597	1,112,584
Missouri.....	2,168,380	2,803,075
Nebraska.....	452,402	555,522
Nevada.....	62,266	41,609
New Hampshire.....	346,991	386,852
New Jersey.....	1,131,116	1,366,334
New York.....	5,032,871	6,079,732
North Carolina.....	1,399,750	1,675,225
Ohio.....	3,196,062	3,712,556
Oregon.....	174,768	259,799
Pennsylvania.....	4,282,891	4,785,189
Rhode Island.....	276,531	383,219
South Carolina.....	995,577	461,477
Tennessee.....	1,542,359	1,912,717
Texas.....	1,591,749	2,088,928
Vermont.....	332,286	379,671
Virginia.....	1,512,565	2,159,060
West Virginia.....	618,457	857,633
Wisconsin.....	1,315,497	1,729,461
Totals.....	49,371,340	59,767,843

Illinois has increased 585,045; Kansas, 611,977; Michigan, 549,249; Minnesota, 499,444; Missouri, 634,695; New York, 996,861; Ohio, 514,794; Pennsylvania, 502,298; Texas, 497,197, and Virginia, 646,495 souls. South Carolina shows an apparent decline of 534,100 inhabitants.

Southern Pig Iron Freight.—The Southern Railway and Steamship Association has issued a rate-sheet for January, making the rate to Chicago and Detroit from Birmingham, \$4.15; from Chattanooga, \$3.90, and from Sheffield, \$3.90; to Cincinnati, \$2.90, \$2.40 and \$2.65, respectively; to Cleveland, \$4.15, \$3.65 and \$3.90; to St. Louis, \$3.40, \$3.15 and \$2.95; to Kansas City, \$5.64, \$5.64 and \$5.19; to Louisville, \$2.65, \$2.40 and \$2.40, and to Pittsburgh, \$4.80, \$4.30 and \$4.55, respectively.

The Goulds, Austin and Caldwell Company have been incorporated at Chicago, with a capital of \$100,000. The incorporators are Frederick C. Austin, Robert W. Caldwell and Seabury S. Gould. The company will conduct a manufacturing business auxiliary to the business of the well-known firm of Goulds & Austin, of Chicago. As all the details of the new undertaking have not been completed further particulars are withheld until that is accomplished.

The Iron Age

New York, Thursday, December 27, 1888.

The Short-Haul Clause.

Judging from surface indications we may expect an effort to be made toward altering the Interstate Commerce law. The New York *Tribune* recently said: "There are signs that a radical change in the law will soon be demanded—not mere modifications of detail, but vital and far-reaching changes—which amount in the aggregate to a new and different system." One of the clauses of the present law to which grave objections are raised by our railway managers is the section forbidding a greater charge for a shorter than for a longer haul. It is to this that the railroads west of Chicago attribute much of the falling off of net earnings shown in their reports. But is this clause a direct cause of such losses? Rather let us say it is the effect of circumstances affecting the revenues of the company at once instead of slowly, as before.

To illustrate our meaning let us take the several roads between Chicago and Omaha, the rate between these places on a certain line of staple manufacture being assumed to be 50 cents. Let us also suppose that on railroad A there is a local factory making this article as well as at Chicago. Under the old plan, if railroad B cut this rate one-half between the termini, railroad A would do the same, but leaving the local manufactory to pay 50 cents as before. While this continued the total revenues of railroad A would not be as much reduced as though the cut rate of 25 cents applied at once to the local station. Having assumed that the article was a staple, and one upon which the margin of profit was very close, the through rate of 25 cents from Chicago to Omaha would in a very short time make itself felt in the sales of the local factory still paying one-quarter of a cent per pound more than the Chicago competitor. The manufacturer would begin a series of appeals to the general freight agent of his road. He would justly argue that his factory was competing in Omaha with the Chicago factory just as certainly as though the two plants stood side by side. There was, he might continue, one great difference between them and that was that railroad A got the carriage of all his goods, supplies in and product out, while the shipments of the Chicago factory would be divided among the several roads. Hence, the best policy was to encourage and strengthen the local factory, of whose traffic the railroad was sure. These arguments could not but meet with the approval of the clear-headed railroad manager, and so in time the local rate would be reduced from 50 cents per hundred to the through cut rate of 25 cents. By the operation of the short-haul clause this reduction would be made at once, while under the old system the reduction would indeed come in time, but only under pres-

sure of argument and appeal. So we say that this short-haul prohibition is not in itself a cause of reduction in local revenue, but merely compels the prompt adjustment of rates which are competitive between factory and factory.

This adjustment of rates between one particular manufactory and another is one of the difficult problems of tariff making, but also one of the most important. It is complicated by competition between water and rail carriers, but, though subject to exceptions such as the need of earning fair returns, in the long run the one factory must be put upon even terms in the market as against the other if the carrier desires to see his traffic retained. The pinching of local industries in order to sustain a rate war on through traffic, aside from its injustice, is one of the most foolish practices from a business point of view in which a railroad can indulge. It is, in truth, killing the goose which lays the golden egg. As a matter of fact, these principles are recognized by leading men, who, nevertheless, inconsistently condemn the short-haul prohibition, though it puts their principles in concrete form. Subject to exceptions, as all broad theories of trade or political economy must be, the prohibition of high local as compared with low through rates is certainly correct.

Late Developments in Brazil.

Since our last editorial on Brazilian affairs in August everything has gone on smoothly. Dom Pedro II. continues in fair health in his retreat in the country at Petropolis. A good deal of his former visiting of public departments and of institutions is now discharged by his daughter, the ex-regent, Princess Isabel, and her husband. The Government and Ministry have pledged themselves to turning over a new leaf since the slavery question is out of the way. The reactionary policy of the last ten years is reversed, and the country inaugurates the new era with heavy expenditures on immigration and public works, which must be met by additions to the large foreign debt of the nation. Brazil is about to enter upon a period of expansion, dear to engineers and contractors, and usually very dear, indeed, to the nation that pays. The new policy has been greatly favored in its advocacy by the advance of exchange to 27½ pence per milreis (the first time since 1876)—that is, to about 1 per cent. above gold, par, the paper money thus achieving the rare result of being worth in the market more than the gold it pretends to promise to pay. There is even a prospect of a further appreciation of treasury bills, inasmuch as the incoming tide of British gold which has produced the phenomenon has not yet reached its maximum, and may continue to the close of the year. The passage of the new Banks of Issue bill is also of the greatest importance. Under its provisions the banks of issue are authorized to circulate their own bills upon a reserve of one-third gold, the remainder being guaranteed by deposits of 4½ per cent. national stock, to be created for the guarantee of the issues of the banks authorized by the measure. To a considerable extent the appreciation of paper money has, of course, also been brought about

by the restoration of confidence in the future of Brazil, since the decree of emancipation of May 13 has been followed by no disorder and by less disorganization of labor on the coffee estates than had been anticipated. The large crop of 8,000,000 bags of coffee has been secured, the freedmen working, it is true, a little sluggishly, and picking negligently, many of them, yet the work has been performed, and the coffee has been gradually advancing in value, so that to-day it brings 17 cents in New York, against the highest point reached in June, 1887, which was 22½ cents, the Brazil crop then being short. In other words, Brazil has this year been singularly fortunate in this item of coffee. Meanwhile sugar also brings nearly 1 cent more per pound in New York than it did last year, and, though late, the Brazilian crop is ample.

In spite of the willingness of the former slaves to perform plantation work in the provinces of São Paulo and Bahia, both these provinces have taken immediate steps through their respective Legislatures to procure immigrants from Europe by the hundreds of thousands, and since August last Italian laborers are pouring into Brazil. They get free passage for themselves and families per steamer direct; upon arrival agricultural implements are given them free and a week's provisions; besides in money \$12 to \$30 each single colonist, and families \$30 to \$60, of our money. These advances they have to refund gradually out of their earnings. Those who prefer to go into farming for their own account, may rent tracts of provincial land in lots of 15 or 30 hectares, the hectare equaling 2½ acres, or may buy such lands on easy terms. These inducements, in pamphlet shape, have been translated into Italian and other languages; emigrant agents are actively at work throughout Southern Europe, in Portugal, Spain, and especially in Italy, and the result is a swelling current of immigration into Brazil such as never has been seen. As the climate of São Paulo is healthy, and very nearly temperate, the great coffee region of that province attracts the new-comers particularly. The planters thus fully gain their point; whether the former slaves in the future work with a will or not, they will have no lack of white labor as good or even more reliable, and the high price of coffee enables them to pay liberal wages. Both São Paulo and Bahia have discarded the Chinese from the very commencement, thereby avoiding a serious mistake.

The credit of Brazil is now better established in Europe than ever. In April last the firm of Rothschild & Sons in London negotiated for the Government a loan of £6,000,000; subsequently the Government sold to a British syndicate the Leopoldine Railway for the sum of £7,000,000, and since then railway, provincial and municipal loans have been placed to a smaller amount or are still in course of negotiation.

On July 1 8573 km. of railway were in running order in Brazil, 1310 being built and 3597 authorized to be added, which will, when finished, constitute a total of 13,480 km. Of this total 4624 will be Government lines, 2797 with the interest guaranteed by the Government, 245 provincial, 2805 with interest guaranteed by provinces, 2917 private without interest guarantee and 92 tramways. Now great international schemes are being taken in

hand, in which to some extent American and Canadian capitalists will also be interested. One is the South American trans-continental scheme of extending the Bahia Central Railroad from Bahia to Arica on the Pacific, via San Francisco, in the province of Minas, Goyaz, Cuyaba and Oruro (Bolivia). The distance is calculated at 5700 km., and Bolivian trade is also to pass over it.

At the same time a syndicate of Canadian and American capitalists is reported to be undertaking a vast scheme for the development of the natural resources of the interior of Brazil. The syndicate includes Mayor Abbott of Montreal, who is a director of the Canadian Pacific, and Mr. Duncan McIntyre, an ex-director of the same company. No contracts for the carrying out of the scheme have been made, the Brazilian authorities agreeing to pay all preliminary expenses if the plans should prove unsatisfactory. Concessions to the syndicate will include mining rights for 99 years on the Rio Tocantins and tributaries and the privilege of purchasing all the land required at 1 cent per acre. The ball is thus fairly put in motion. All we can say is that with the growing well-to-do condition of Brazilian planters, in spite of the loss of their slaves, and the confidence which Brazil inspires on all hands, the great South American empire seems to be on the eve of a most promising future, which will be all the better for American trade.

Additions to Productive Capacity.

In many lines of manufacture the United States would appear to be overstocked. The capacity of existing establishments is far beyond the demand for the class of goods which they produce. The iron and steel trades abound in instances of this kind, which need not be particularized, as they are so familiar to all. In these branches prices are so low that proprietors of works have ceased to make calculations of possible profits, but are racking their brains to devise new methods of economizing so as to be able to reduce the cost of their goods to the selling level. Combinations, pools, agreements to restrict production and other artificial means of controlling the market and enhancing values have been tried, abandoned and tried again without success, until manufacturers are discouraged. Some of them are withdrawing permanently from the struggle, disgusted with the necessity which confronts them of paying for the privilege of manufacturing what the public requires. Yet there is not an established industry in this country in which additions to productive capacity are not being made at the present time, even including within the scope of this assertion the branches of trade which are obviously unremunerative.

This seems to be an inexorable law of the establishment of manufacturing industries. The United States now possesses ample capital seeking investment, experienced business men in almost every branch of manufacture thus far developed and a vast army of skilled workers to man any new venture or to meet the demand for an increased force in an enlarged factory. If a new section of the country is found to offer advantages for the seat of an industry the location is soon tested by some restless,

enterprising spirit with sufficient means to make the venture or with the requisite address to interest others possessing the means. The growth in population of sparsely settled districts making new trade centers, the discovery of natural resources previously unsuspected, the increase in transportation facilities and lowering of freight rates by the construction of new lines of railroad, all have their effect on the growth and dissemination of manufacturing industries, particularly when a country is peopled by a race eager to better its condition and ready at any time to change its location for a new one offering such an opportunity. To such a movement, involving a steady increase in productive capacity, even a financial panic is scarcely a check.

The greatest increase in manufacturing establishments naturally occurs when prices are high and profits large, either through an extraordinary demand or a scarcity in the supply brought about by combinations or other artificial influences. A strong argument against combinations is that they may in time intensify the evil of excessive competition and low prices, which they are created to alleviate, by inviting further investments of capital in the business as soon as it is made profitable. Yet, if this is the only argument to be advanced against combinations it lacks conclusiveness, because the unprofitableness of an industry by no means prevents others from engaging in the same line, firmly believing that they will be able to produce at less cost than the unfortunates already in the business or in some other way will secure an advantage over them. Outside influences are also having a decided effect on our present manufacturing development. There are speculative builders of manufacturing enterprises, who locate works at presumably good points, equip them with improved machinery, and launch them if possible when a wave of prosperity appears to be looming up in the distance. Land and town-lot speculations play their part also, quite a number of works recently put in operation or now in course of erection owing their origin to schemes of this character rather than to what might be termed legitimate trade influences.

Those who are waiting for a return of prosperity to come after our industries cease to grow, and who hope by keeping down prices to deter others from engaging in manufacturing enterprises or enlarging their works, apparently have a weary wait before them. They might as well stand on the banks of a river until the water runs by so that they can cross dry-shod. If they hope to continue in business themselves they must energetically determine to better their machinery, introduce more economical methods, remove nearer to sources of supplies of raw materials or nearer to their natural markets, or adapt their plant to the production of some specialty which is not overdone—if they can find it.

The *Rè Umberto*, recently launched for the Italian Government, is the largest war vessel in the world, her displacement being 13,298 tons. She is 400 feet long by 76 feet 9 inches broad, and draws 29 feet of water. The armor on her barbettes is 19 inches thick, and she is fitted with a 3 inch steel protective deck as well. Her main armament will be four 104-ton guns and twelve of 4½ tons, while her engines are expected to give a speed of 18 knots.

Convict Labor in Texas.—II.

BY JOHN BIRKINBINE, PHILADELPHIA.

Having described existing conditions, the queries suggested may be taken up.

1. Is the employment of convict labor prejudicial to free labor?

All men in the Texas penitentiaries, before their incarceration, belong to one or the other of two classes: they were either workers or loafers. If they were workmen they competed with other workmen; if they were loafers they lived off of others who worked. If the State forces the convicts to work it does not add to the actual number of workers, except in so far as it makes use of one who did nothing for himself or was of no use, but, rather, a detriment to others. Is not free labor rather benefited than otherwise by having a less proportion of taxes required for prison expenses, and by having ex-convicts returned to the community educated to do something helpful?

2. Does not the State become a damaging competitor with private enterprise?

There seems little reason to expect such a result if the present policy—that of making the penitentiaries self-supporting—is followed; if the State is willing to lose money on its manufacture, then the use of convict labor may be an injury to private enterprise. Reports show that the cost of feeding, clothing, guarding and caring for the State convicts, not including any interest on money invested in buildings or lands, is about 50 cents per capita per day, but there are a large number who are not actual producers; the office, the hospital, the kitchen, the laundry, the repairs of shoes and clothing, the cleaning of cells, buildings, &c., all take from the number actually engaged in productive labor, bringing the cost per capita to probably 60 cents per day. But, as this compensation is based on 365 days per annum, and as the men work but six days per week, the actual cost of convict labor per working day does not fall much below 70 cents per day per man. The fact of the blast-furnace working continuously does not seriously influence this, as the number of men employed on Sunday is small, and each man receives 60 cents for his extra time. Other conditions also add to the actual cost of convict labor. In case of inclement weather no outside work, such as mining ore, chopping wood or farmwork, is permitted, a light rain throughout which free labor would work being considered as sufficient cause for bringing the convicts under shelter. As a rule, the convicts work because the State demands it, or because it is a relief to the monotony of prison life, the incentive which a free laborer has to earn a living for himself and loved ones is missing, and, although there are many instances where convicts put enthusiasm into their work, it cannot be expected to be the rule. Again, the management must be careful to avoid overtaxing convicts, for the public sentiment, which was offended by the now extinct contract system, would champion, without investigation, the cause of any convicts whose friends should find them to be as they supposed, overworked. But the policy pursued by the Penitentiary Board has been to favor the establishment of industries in Texas, and not to sell its products below the market. In fact, one strong argument favoring the location of the penitentiary at Rusk was to develop the State resources and to encourage industries. That this result will follow is evident, for private enterprise is now erecting a blast furnace within 3 miles of the Rusk Penitentiary, and about this other industries are expected to center. If the State was a damaging competitor, capital would hardly come right beside the State fur-

nace, but seek a location elsewhere. The establishment of the iron industry at the penitentiary has been the instigating cause for the selection of New Birmingham as a site for industries, and the penitentiary officials have given every assistance possible to the enterprise. The contract for the State capitol castings was awarded to the penitentiary as much from State pride as on account of the price paid, for its bid closely approached the proposals of outside parties.

The appropriations made at the last Legislature were for improvements, and not for prison sustenance. The total amount appropriated was about \$10 per convict per annum, so that even had it been used for maintenance it shows that the burden is lifted from the taxpayers by the convicts. But the Texas penitentiaries are practically self-sustaining, and if the management is continued so as to secure this there appears to be no reason why the State should be a damaging competitor with any industry properly established and managed.

3. Is the system of punishment reformatory and sufficiently severe to encourage the reduction of the number, or, rather, the proportion, of criminals?

Immediately upon entering the penitentiary a convict, after bathing, assumes the distinct clothing furnished by the State, and realizes that he is no more a free man. His time belongs to the State; he is constantly under surveillance; he has no choice as to the disposition of his time, but must rigidly adhere to the rules established for prison discipline, and he must recognize that there is no relief except such as he earns by meritorious conduct. He must rise at the time assigned, arrange his cell, march in line to breakfast, eat the plain but substantial fare provided, march out under guard to his work, receiving his mid-day meal either at work or in the dining hall; then resume work and march to supper, after which he is searched and locked in his cell. Then, unless deprived of the privilege by reason of insubordination or misbehavior, he may read books obtained from the prison library or write until the time for bed, but what he reads or what he writes is subject to inspection by the officials. In fact, whatever he does impresses him with the knowledge that he has forfeited his right to freedom.

He might possibly receive more severe mental punishment by solitary confinement, but this would only last as long as the mind was active, and he might devote his time to taming mice or other harmless diversions. He would receive greater physical punishment by the stocks or thumb-screws, but would either the mental blank or the physical torture reform him? Is not his punishment just as severe as far as it affects him by depriving him of any choice as to what he shall do, wear or eat, except within narrow limits, and compelling him to exert himself, so that he will not be a burden to the community whose peace he has offended? Is not active work better discipline and more christianlike than a brief daily aimless walk for the exercise necessary to keep a man from dry rot? Is not the attention which he must bestow on his work better use for his brain and for the community than the useless mental wanderings of solitary confinement? The discipline is rigid, and infractions of the rules are promptly punished—first by depriving the convict of privileges, next by confinement, except during working hours, to darkened cells; finally, the whip is used, but only on written orders from the superintendent. On the other hand, good behavior earns the privilege of extra cell furniture, the use of the library and other privileges which may seem of small importance to outsiders, but are of great moment to the convicts. The only question which is suggested is whether the

freedom of association, which outside work permits, is demoralizing; but the disposition of the force of convicts and the constant surveillance to which they are subject reduce this risk, and a man may run just as much chance of profiting by the good influences which he receives from one brother convict as in the bad which he may absorb from another. The confidence reposed in "trusties" would seem to indicate that the discipline is sufficiently severe for punishment, and yet humanitarian enough, to aid in reformation. The proportion of criminals to the population must be determined by statistics which are not at hand. In a State where the population grows as rapidly as that of Texas, and which draws into it so much of the element which confounds license with liberty, it is probable that the number of convicts is on the increase, and there are undoubtedly those who, after being released, return to the penitentiary. But, without claiming expert knowledge upon prison reform, the conclusions arrived at commend the system employed at the Rusk Penitentiary, which appears to be for the good of the State and the convict.

It is, however, difficult to become accustomed to the presence of armed guards and to the knowledge that the lash is among the possible punishments. Of punishments the prison rules provide that "the severer modes of punishment, and especially whipping, shall only be resorted to after milder means have failed to bring the offender to terms. A sergeant desiring an order to whip a convict must make an application in writing to the inspector stating fully the offense, and that other means had been tried and failed to produce the desired effect.

"In whipping, a leather strap, about 2½ inches wide and 2 feet long, fastened in a wooden handle, shall be used, and care must be taken not to break the skin. Every officer inflicting this or any other punishment will be held to a strict account that it is not abused.

"A guard inflicting punishment, even by order of the sergeant, shall be promptly discharged.

"No convict shall be made in any manner to punish another convict."

Whether the system employed in treating convicts in the State penitentiaries in Texas is the best must be left to the decision of others who have made prison reform a study. But the condition, appearance, health and general bearing of the convicts in the Rusk Penitentiary give evidence of fair treatment, good food and rigid discipline, and is in marked contrast with the condition of affairs in New York State prisons as set forth in the *Tribune* of December 5, from which the following extract is made:

ALBANY, December 4.—The State prisons are in a wretched condition. There are 1000 idle convicts in Sing Sing, 600 at Dannemora and 1000 at Auburn, making a total of 2600 convicts who are daily locked up in their cells in the State prisons because there is no work for them to do. This misfortune to the State is caused by the law passed in July by the Legislature forbidding the sale of any goods made by the convicts, and restricting the profitable labor of the convicts to the manufacture of articles needed by the prisons or by charitable institutions. Experience has shown that the charitable institutions already manufacture for themselves with their own inmates, 17,608 in number, 60 per cent. of the clothing and other articles they need. Experience has also shown that 150 convicts out of the total of 3008 can manufacture all the goods that are yearly needed by the prisons and charitable institutions. All the wardens reported that the convicts were suffering in health owing to their enforced idleness, and expressed fears that before spring there would be much sickness in the prisons. The prisons were also, they reported, running behind badly in a financial way. In another year, if the present miserable system is continued, the taxpayers of the State will be compelled to make good a deficiency of \$400,000. That will be the cost to the State of supporting the convicts in idleness.

Analysis of Chrome Steel.

Two graduates of the Stevens Institute of Hoboken, N. J., B. Franklin Hart, Jr., and Julius Calisch, prepared a thesis on chrome steel, its manufacture and uses. They review the literature of the subject, allude to the manufacture of chrome steel at Brooklyn, recall the tests of the alloy in connection with its use on the St. Louis bridge and go into details of the methods of analyses employed by them. It is in the direction of analyses that original work appears to have been done. We quote below the results of their determinations, with all the decimals which are dear to the young chemist:

	"No. 1" steel. Per cent.	"No. 1" steel. Per cent.	"No. 3" steel. Per cent.	"No. 3" steel. Per cent.
Carbon.....	1.1071	1.1453	0.7283	0.7417
Phosphorus.....	0.0354	0.0410	0.0186	0.0158
Chromium.....	0.7563	0.6827	0.5127	0.5368
Silicon.....	0.1292	0.1339	0.1754	0.1614
Sulphur.....	0.0065	0.0058	0.0063	0.0088
Manganese.....	0.0219	0.0231	0.0163	0.0108

	No. 1 "magnet" steel. Per cent.	No. 2 "magnet" steel. Per cent.	No. 1 "rock drill" steel. Per cent.	No. 3 "rock drill" steel. Per cent.
Carbon.....	0.9371	0.9653	0.8508	0.8480
Phosphorus.....	0.0522	0.0439	0.0218	0.0190
Chromium.....	0.4940	0.5974	0.5455	0.4083
Tungsten.....	0.6186	0.7614
Silicon.....	0.0550	0.0613	0.1246	0.1359
Sulphur.....	0.0043	0.0050	0.0057	0.0060
Manganese.....	0.0167	0.0167	0.0112	0.0094

All the samples analyzed were the product of the Chrome Steel Works, at Brooklyn, No. 1 steel being used for turning, planing and other tools used for purposes requiring a steady cut. No. 3 steel is made for all kinds of fine edge tools, chipping chisels and machine-shop tools of every description. Magnet steel, as the name indicates, is used for permanent magnets, and rock drill steel for mining, quarry and stone-cutters' use.

Board of Railway Control.—Substantial progress has been made during the last week in the formidable task of bringing all the leading trunk-line railway corporations into harmonious action with reference to freight and passenger traffic. As if supplementary to recent action which promises well for the establishment of permanent and equitable rates on merchandise bound East or West, the officials of Western roads now announce that an agreement affecting their properties has been reached, after protracted conferences. Western and Southwestern rates, it is promised, will be restored after January 1. Conferences of the Western Freight Association were followed by meetings of railway managers in this city, at which the subject was fully considered, with the result of giving sanction to the agreement entered into by nearly all the roads west of Chicago, each of the presidents pledging himself personally to see that equitable rates are made and enforced. Several large banking houses representing foreign holders of railroad securities were parties to the proceedings, all alike seeming desirous of reconciling their interests and conforming in the most liberal sense to the requirements of the Interstate law. The practical result is the formation of a Board of Control, with all concerned mutually pledged to maintain rates on a sound business basis. At any meeting of stockholders it will be possible to oust from his position any reckless official, for the protection of investors.

The Indiana Natural Gas District.

II.

ANDERSON.

Some very important manufacturing establishments have already been located at this point and others are expected soon to follow. They comprise a bolt works, straw-board works, edge-tool works, glass works, butter-tub factory, foundry and machine works and a number of wood-working concerns which are now in operation, and a wire-nail factory in course of erection.

The Anderson Bolt Works were the first comers, removing to this point from Fowlerville, N. Y., near Buffalo, and were put in operation last spring. Their main building is 250 feet by 50 feet, the engine and boiler house is 30 feet by 24 feet, and the iron stock house is 60 by 20 feet. They are built of wood, with an iron roof. The Walworth fire sprinkler has been applied throughout the works for protection against fire, with discharge vents 10 feet apart. The plant is well arranged for the receipt and shipment of material and finished product. A narrow-gauge railroad runs from the shipping and receiving room the entire length of the works, this room opening on a railroad siding. The equipment of the plant consists of a large number of machines for the manufacture of carriage and machine bolts, bridge and roof bolts, wood or log screws, skein screws, bolt ends, square nuts, hexagon nuts and washers. The capacity daily is about 75,000 bolts of all kinds. The arrangement of the works received the careful attention of the manager, L. S. Taylor, formerly connected with the Unionville works of the Upson Nut Company, and who afterward built the Aetna Nut Company's Works, at Southington, Conn. The iron manipulated at these works is purchased from the rolling mills and comes principally from Youngstown, Ohio. The entire establishment is run with natural gas for steam raising, heating iron, light, &c., less than 1 pound pressure furnishing an adequate supply. The engine and boiler were built at Buffalo by G. W. Tift & Son. The engine is of 80 horse-power. The engineer in this establishment is a skilled machinist, and to employ his many leisure moments he has a lathe in the engine-room on which he makes all the dies used in the works. A novel arrangement has been introduced for the purpose of preventing the unnecessary waste of oil at the nut and bolt machines. Two barrels are sunk under the level of the floor at one end of the factory, one containing the oil and other ingredients of the lubricant, and the other intended as a receiving and settling tub, having an overflow into the first barrel. A pump forces the oil up into overhead pipes running to the machines, and pipes under the machines catch the waste oil and return it to the settling tub.

Manning & Farmer have just put in operation the Anderson Knife and Bar Works. This is a wholly new enterprise, established for the purpose of manufacturing knives for woodworking machines, book binders, paper trimming, leather splitting, fodder knives, shear blades, paper-makers' fly bars, &c. The factory consists of a frame building 208 x 35 feet, two stories high in the center and one story high at each end, with an engine room in a one-story annex on the side. The ground floor is divided into a forge-room, machine shop, grinding-room and office. The forge-room contains a small direct-acting steam hammer, a train of rolls, two heating furnaces and a smith's fire. One of the heating furnaces is intended to serve the rolls and hammer and the other is used for tempering. Steel bars are bought from steel manufacturers and are rolled into the special shapes and

thicknesses desired. The train of rolls is two-high, the upper roll being adjusted by independent screws in the housings, so that one side can be elevated slightly higher than the other when rolling bevels, guides in front of the rolls keeping the steel in proper position when being rolled. Plain rolls are used on some work and rolls with beveled grooves on special patterns. The hammer is used for forging odd shapes. The engine running the rolls and hammer is not connected with any other machinery. The machine shop is equipped with drills, planers and lathes. The grinding-room is unusually roomy, and well lighted. It contains five large stones and one small stone, each connected by a belt with a main shaft, fitted with the Cuyahoga Pulley and Shafting Company's friction clutches, by which each stone can be started and stopped independently of the others, yet avoiding the use of loose pulleys and the excessive wear of the belting. The second story, over the machine shop, is devoted to patterns. The proprietors of these works were formerly residents of Dayton, Ohio. S. E. Farmer was for many years the practical man and superintendent of A. A. Simonds' works, at Dayton, and has had a wide experience in the manufacture of the special products which the new works will make.

The buildings of the American Wire Nail Company, of Covington, Ky., are in course of erection, a large part of the framework being in place, and the foundation piers for the remainder stretching over a vast expanse, indicating the immense proportions of this plant. It will comprise a rod mill, wire-drawing works and wire-nail factory. The site chosen for the works appears to have been selected with admirable judgment, both for proper elevation and for railroad facilities.

Four railroads connect Anderson with the outside world—namely, the Chicago, St. Louis and Pittsburgh, the Cincinnati, Wabash and Michigan, the Midland (a new line running to Terre Haute), and the Cleveland, Columbus, Cincinnati and Indianapolis.

MUNCIE.

This is also becoming a manufacturing center of some importance. It contains an iron-bridge works, a wood-bending works and four glass factories; nail works and a glass works are in course of erection, and negotiations are progressing for other enterprises. Of the glass factories in operation two make window glass, one makes bottles and one fruit jars, the window-glass works being of large capacity.

The Indiana Bridge Company removed to Muncie from Indianapolis a short time previous to the development of the natural gas field, having been influenced in their choice of locality by other considerations. They have used natural gas throughout their works, however, from the time they were completed. They own 4 acres, affording them ample room for extending their operations. Their main building is 200 x 45 feet, and the smith-shop is 100 x 40 feet. Their yard, used for erecting purposes, is 250 x 125 feet. The main building has a traveling crane running its entire length, and covering every part of the shop, for the transfer of heavy material. In addition a narrow-gauge railroad track extends through the center of the building, across the erecting yard and through the smith shop, having turn-tables at suitable points. The company have a steam riveter, make their own rivets, and have a full equipment of other machinery suitable to the manufacture of iron bridges. They forge their own eye-bars, except when other makes are specified. A large gas-heating furnace will shortly be erected for heavy work. The company make a specialty of patent leg bridges,

and also control a patent method used in long span bridges, by which one post is used where other companies generally find it necessary to use two. The patent leg bridge is suitable for spans up to 70 feet, and is intended principally for highways and for other purposes calling for a cheap, yet durable, bridge. They avoid the use of stone abutments, being supported on posts at both ends, which are thoroughly braced and backed with heavy lumber for earth filling. This is quite a feature in many localities in the West which are without suitable stone. The company purchase their bridge material at Pittsburgh and points further East, as it is found most convenient. They are well supplied with winter work, having sixteen bridges to construct. C. M. Kimbrough is president and general manager; John R. Marsh is secretary and treasurer. In addition to these gentlemen the board of directors consists of George T. McCulloch, T. F. Rose and A. L. Johnson.

J. H. Smith & Co. operate a wood-bending works, which has been established at Muncie for three years. They manufacture shafts, poles, rims, singletrees, &c., but do not make hubs and spokes. They have just completed an extension to their factory 70 x 43 feet. The entire building is now 220 feet long, the old portion being 60 feet wide. It is two stories high, and is built of brick. Lumber is taken in the rough and sawed to size, then finished to the desired shape or pattern. The Almy end pressure is used in bending rims, and Smith's improved shaft and pole bending machinery is used for shaping shafts and poles, the wood being thoroughly steamed before bending. The works employ about 125 hands and turn out a large product, which will be increased as soon as the addition to the works is fitted with machinery. The method pursued here in drying lumber is somewhat novel. A rough house was built of rejected pieces, piled up after the fashion of a log house, and having ample ventilation through interstices and openings purposely made. A few natural gas burners beneath the piled lumber inside furnish the heat. The temperature is not allowed to rise above 80°, the supply of gas being temporarily cut off when a higher heat is reached. The peculiar action of the gas is such that in six days the lumber in the kiln is ready to be used for any purpose, or can be exposed to the weather without damage; is not brash and does not "check" or split open, as does lumber dried with steam or hot air. Natural gas is used for raising steam, it having been found cheaper and more desirable to burn the offal of the wood working machines in special furnaces to get rid of it than to use it for fuel. The firm issue a catalogue of 16 pages, giving illustrations of their goods and a complete price list.

The Muncie Nail Company have their works nearly completed, and expect to put them in operation early in the coming year. The company formerly operated works at Greencastle, Ind., under the name of Greencastle Iron and Nail Company, and have removed to Muncie to secure the advantage of free natural gas. Efforts were made to find natural gas at Greencastle, but they terminated in complete disappointment, although wells were sunk to a depth of 2000 feet. The works at Muncie are constructed partly of the material of the Greencastle works, but the machinery is practically new and of the best construction. They have 16 puddling furnaces, a muck train, a plate train and 50 nail machines for making cut nails. Room has been provided in the factory for 25 additional machines, so that the company can increase their cut-nail plant or put in wire-nail machines, if it may prove desirable in time to do either. Both iron and steel nails will be made, the company having a trade in both. They will purchase

steel slabs for the present, being disinclined to erect a steel plant at this time. The works include a foundry for the manufacture of iron and brass castings, both for their own use and for outside parties. There is also a machine shop for roll turning and repairs. The company have their own keg factory. The buildings are frame, covered with steel sheets. J. F. Darnall is president of the company and G. H. Brown is secretary and treasurer.

The railroad connections of Muncie comprise the Cleveland, Columbus, Cincinnati and Indianapolis, the Lake Erie and Western and the Fort Wayne, Cincinnati and Louisville lines.

MISCELLANEOUS NOTES.

In addition to the four principal points above considered, some of the smaller towns in the district enjoy a bright prospect of industrial growth. They have the same opportunity to obtain natural gas by merely sinking wells, and while they are availing themselves of the supply of cheap fuel for domestic purposes, they do not lose sight of greater benefits. Hartford City is one of them, and there are perhaps others with equally good prospects of shortly becoming the seat of a fair degree of industrial enterprise.

A number of cities and towns on the border of the gas district, up to 25 miles distant, have been connected with the gas wells by pipe lines, or are making such connections as rapidly as possible. Indianapolis, Richmond, Frankfort, Lafayette, Peru, Logansport and others will thus be able to realize some of the advantages of gaseous fuel, although it will necessarily cost them more than if they were located in the immediate vicinity of the wells.

In conclusion, an important point in connection with the Indiana natural gas district cannot be overlooked. Its geographical position is highly advantageous. It is located almost in the center of a circle having in its periphery such important cities and distributing points as Chicago, St. Louis, Louisville, Cincinnati, Cleveland and Detroit, with the great iron and steel producing districts of Ohio and Western Pennsylvania within quite easy reach. It is traversed by the great highways of commerce between these cities, and not by mere branches or feeders.

Wear and Stretch of Cables.

Mr. G. Leverich, in his paper on the Brooklyn Bridge cable railway, presented a short time ago to the American Society of Civil Engineers, presents some interesting facts on cable wear and stretching. He points out, among other things, that by the constant bending of the cable around the sheaves and drums, where there must be a slight movement of the strands and wires over each other, and particularly at the splices where the ends of the strands lap; the inner projecting surfaces in contact are abraded and wires from time to time broken. The outer surfaces of the exterior wires are also worn away, somewhat by the action of the grip sheaves, but more by contact with the grooves in the sheaves and by the slip in the grooves of the drums. An experimental grip with revolving solid metal jaws was tried on one car on the bridge for a few trips early in 1884. Shortly afterward wires were found nearly or quite pinched off, being imbedded, where they crossed, as if sunken under a heavy hammer, and in one instance 200 broken wires in 100 feet of cable length were reported. In a hauling cable, however, the wires are constantly breaking; so long as the ends do not project and strip, the only injury which results is the decrease in cable strength, and this is slight if the breakages are evenly distributed and not

close together. As may be expected, the wear requiring attention and repair is confined to the splice and its immediate vicinity. This repair is usually accomplished by inserting a new piece of cable. Sometimes, however, a short piece of badly worn strand has been replaced by a new one. No cable has been broken on the bridge and only once has a strand hauled loose and unwound.

During the period a hauling cable is used it permanently stretches, at first rapidly and afterward at a lesser rate and quite uniformly. Since March, 1883, a daily record has been kept of the position of the Brooklyn tension car. From this and earlier data, the stretch of these cables is readily deduced, and is here given.

Stretch of Cables.

Cable.	Length of Cable Hauled.	STRETCH.			
		For Total Length Hauled.	For Last 25,000 Miles Hauled.	Per Mile Of Total Length Hauled.	Of Last 25,000 Miles Hauled.

"	107,274	287.	0.032

When taut, and the tension car is at its highest position, the cable is about 11,400 feet long; whence the first cable during its entire use stretched 2.35 per cent., and the second cable, up to May, 1888, stretched 2.52 per cent. During each 8 hours of the first 40, after the second cable was put in, it stretched 16½ feet, 3½ feet, 6½ feet, 2½ feet, and 1½ feet, respectively, or altogether 30½ feet; some of this doubtless was slack, not all taken out when the splicing was done. The stretch of a cable is due partly to the tension to which it is subjected, but doubtless much more to the action of the grips. The latter were applied 1074 times for the 329 trains run April 29, 1884; 2150 times for the 515 trains run April 27, 1886, and 2688 times for the 487 trains run May 1, 1888. Taking 106 feet as the mean length of cable which passes between the grip sheaves, from the time the grip is closed until the train moves at full speed, on the days mentioned, the total length of cable thus subjected to pressure was 114,918 feet, 230,050 feet, and 287,616 feet; and if the compressed spaces were uniformly distributed, the whole cable passed between the grip sheaves, 10, 20, and 25 times, respectively. As the cable stretches, the hempen core becomes harder, more compact, and, of course, smaller; from this as well as wear, the cable also is reduced in size; the first, when taken out, being but 1½ inches, and the one in use now is about 1⅞ inches in diameter. Besides stretching permanently, the cable under changes of load and variations in temperature, extends or contracts within elastic limits, sometimes to a noticeable extent; data, however, are lacking to determine with precision how much is this movement separate from the other.

An officer of the Philadelphia Natural Gas Company, at Pittsburgh, is credited with the following statement: "Experiments prove that with the present method of boiler heating it requires 2½ cubic feet of gas to evaporate 1 pound of water. The use of a proper burner will enable 1 pound of water to be evaporated by 1.38 cubic feet of gas. When we consider

all the boilers in the two cities that daily evaporate hundreds of gallons of water we can see that the excess of gas used amounts to millions and millions of feet weekly. The same principle applies to the making of salt and the puddling of iron. To puddle a ton of the latter the mills now use 28,000 cubic feet of natural gas. The same work may be done with 14,000 feet. Of course the mill owners make no effort to save, as they get the gas by contract, but when the meters are ordered to be placed in every establishment everybody will see the necessity of adopting economizing methods."

Logansport and Peru (Ind.) Industries.

The Logansport Mfg. Company, of Logansport, Ind., are manufacturers of hubs, spokes, rims, shafts, wagon-poles and other wagon woodwork. Their works are located in the heart of the Indiana hardwood district, which has a reputation for its timber among the wagon and carriage manufacturers of a large part of the country, but more especially in the West. The company have their own sawmill, and thus possess an advantage over many similar establishments in controlling the stock for their factory.

They employ about 85 hands, in addition to the force engaged in the woods. The factory contains machines for bending shafts and poles, bending rims for wheels, turning spokes, turning and mortising hubs, &c. The stock for the bending machines is steamed, then placed in the machines, bent in the desired shape, clamped so that it cannot straighten, and put aside with the clamps on until it dries. The spoke-turning machines have a traveling bit, which moves along horizontally and turns the spoke into the shape of a steel pattern placed above, which governs the motions of the bit most accurately and ingeniously, even finishing the hub-end of the spoke square. The hubs pass through three machines. The first bores the axle-hole, the second turns the hub in its proper shape, with great rapidity, and the third mortises the holes for the spokes. This mortising machine is partly automatic in its operations. The workman first guides its motions in boring holes in the proper place for each mortise; then sets the chisel machinery in operation, and the machinery finishes one hole after another without further attention until the last hole is completed, feeding the hub accurately and very rapidly for the operation of the chisels. The chisels are two in number, and they first descend close together into the hole previously bored in the hub. They are gradually spread, by a cam motion, to the full width of the mortise. The company publish a catalogue of 44 pages illustrating the various kinds of goods which they manufacture and giving complete price lists. A. J. Robinson is president and John E. Redmond is secretary.

S. E. Howe, of Logansport, Ind., manufactures plow-handles, plow-beams and rounds, cultivator handles and wagon woodwork, in connection with his hardwood lumber business. His factory is a commodious and substantial brick building, and he employs 50 hands.

The King Drill Company, of Logansport, Ind., have recently engaged in the manufacture of windmills. They turned out 100 in the last season, and expect to do a much larger business in the future. While their trade has been mainly local, they have sold some mills as far West as Iowa. The mill they manufacture is known as the Improved Aldrich. The patentee, W. H. Aldrich, who superintends its construction, has had 20 years experience in building and erecting mills. The Aldrich pump is a double-acting anti-freezing force pump, with a three-way cock, to be used with a windmill or to be oper-

ated as a hand force pump, which is also manufactured by the company. Their principal business has hitherto been the manufacture of grain drills, but this branch of trade is now unremunerative on account of excessive competition among the numerous manufacturers. They have a machine shop and foundry, and do general repair work in addition to the manufacture of specialties mentioned.

The Indiana Mfg. Company, of Peru, Ind., will put a new refrigerator on the market this season under the name of North Star. It will be constructed on a different principle from other refrigerators, and will be intended strictly for domestic use, and not for creameries or other establishments requiring very large refrigerators. The works of this company are very extensive, are located in a good hardwood lumber section of Indiana, and are operated largely on sewing-machine frames for manufacturers of sewing machines in various parts of the country. Natural gas has been piped into Peru from the Xenia gas wells, 16 miles distant, and is now being used largely for domestic and manufacturing purposes. The Indiana Mfg. Company, however, use the offal from their wood-working machines for raising steam. In their refrigerator department they manufacture about 1000 per month during the season. They will be sold exclusively through Bennett & Shirk, 112 and 114 Lake street, Chicago.

Tariff Revision in Sweden.

The Scandinavian peninsula has just concluded a season of tariff agitation. The protective party having come into power in the Swedish Diet, a number of important changes have been made in the customs schedules. In most instances the revision has amounted to a large increase of previously existing rates. The revised list is characterized as the "new system." The changed policy of the kingdom began by the imposition of an almost prohibitory duty on breadstuffs at the beginning of the year, followed by an entire tariff revision, which went into operation on July 1, 1888. The following list will show the old and new rates on the products of metallurgical industries. The rates are in kroners, 1 kroner equals \$0.268, and öre, 100 öre equal 1 crown.

Iron and Metals.

Pig iron and scrap iron and steel, 80 öre per 100 kg. (before free).
Blooms of iron and steel, 2 crowns per 100 kg (before free).
Beams and other forms of iron of lower weight per m. than 20 kg., 2.50 crowns per 100 kg. (before free).
Bar iron, 2.50 crowns per 100 kg. (before free).
Sheet iron, not polished, 3 mm. thick and more, 3 crowns; less thickness, 4 crowns; polished, varnished and nicked, 6 crowns (before free).
Anchors, drags, &c., 4 crowns per 100 kg. (before free).
Chains with 6.25 mm. diameter of the links, 7 crowns per 100 kg.; 25 mm. or more, 8.50 crowns per kg. (before free).
Nails, large, 4 öre per kg. (before 3 öre).
Screws, for wood, 75 mm. long and more, 20 öre; less than 75 mm. 30 öre (before 15 öre).
Castings: Beams, columns, fences, &c., 2 öre per kg. (before 1 öre); stoves, cooking vessels, 4 öre per kg. (before 2 öre); tables, chairs, smoothing-irons, &c., 10 öre per kg. (before 8 öre); copying presses, mincing machines, &c., 20 öre per kg. (before 15 öre); finer castings, 40 öre per kg. (before 25 öre).
Iron and steel wires, thick, 4 öre; fine 8 öre per kg. (before free).

Railway material: Axles, springs, wheels, wheel bands, 5 öre per kg.; not specified, 10 per cent. of the value.
Copper and other wire, 10 öre per kg. (before free).
Metal wire (before free), duty as on other wire.
Printing types, letter stamps, 25 öre per kg. (before free).
Guns and rifles, 1 crown 50 öre per kg. (before 50 öre).
Fire engines, syringes, 10 per cent. ad valorem (before 5 per cent.).

Natural Gas for Louisville.

Louisville is now assured of a supply of natural gas for heating purposes, which is to be piped from Meade County, a distance of 30 miles. The contract for 8-inch pipe has been let to Morris, Tasker & Co., who are to begin delivery next week. Ackerly, Sammel & Perrin, contractors for laying the line, are now at work clearing away timber, making excavations and telephone connections, &c. They promise to have the line complete inside of 90 days, probably in 50 days.

The Kentucky Rock Gas Company are the promoters of this enterprise, and have borne all the expense, without outside capital, this being essentially a home undertaking. The following well-known business men are directors and incorporators: J. H. Lindenberger, John B. Castleman, Wm. J. Davis, R. T. Durret, John H. Ward, W. J. McConathy, M. S. Barker, N. Fenzer, James Carter, the first three being president, vice-president and manager respectively. Major Davis has worked hard for the success of this enterprise, and to his energy belongs its success. This company proper own about 15 wells, with a daily flow of 11,000,000 cubic feet, but some of these are small producers. They control 13 other wells giving 7,000,000 cubic feet more, in all about 18,000,000 feet per day. Some of these wells give dry, pure gas, while others throw out large quantities of salt water, but the gas can easily be separated, as is done in some Pennsylvania districts, and if the natural pressure, which is about 120 pounds to the square inch, should not be sufficient, force pumps will be used.

The quality of the Meade County gas is said to be purer, and can be used with little or no purifying for illuminating purposes. One point of interest to the future consumers is the probable cost to them. The company propose in no case to charge more than 20 cents per 1000 feet, that being their maximum, but to range from that down to 10 cents if necessary. This will insure the gas being used generally for fuel, doing away with the clouds of smoke that continually hang over the city; a nuisance that has been yearly increasing in proportion to the growth of manufacturing.

Prof. Richard Proctor, State Geologist, who has done a great deal in opening new fields of enterprise in the State, has been studying the Meade County gas fields, and recently had associated with him Professor Orton, State Geologist of Ohio, a high authority on matters of gas and oil. Professor Orton's report, just published, proves conclusively that the supply in this region is likely to be as lasting as in any other part of the country, his theory being that all natural gas is stored in certain localities in reservoirs of various capacities, and not produced by any course of nature now in force.

These 28 wells are scattered over a territory of many miles in extent, showing that the field is large, and many of the largest pouring out over 1,000,000 cubic feet per day each, and have been running without diminution for nearly a year; and one, the Moreman well, bored 26 years ago, in the search for oil, has been flowing un-

ceasingly since that time, and for the last 18 years has been used in the manufacture of salt from the brine running from the same well. The salt water issuing from some of these wells will undoubtedly be utilized at no distant day, as it is strong and pure, and in quantity.

Treasury Decisions.

DUTY ON WALL-PAPER ROLLERS.

The appellants claiming 35 per cent. instead of 45 per cent. ad valorem, the Treasury Department has decided in favor of 45 per cent. on the ground that the articles consist of wood rollers, on the surface of which is wrought in brass a design or pattern, and being manufactured in part of metal they were returned for duty at the rate assessed under the provisions of schedule C (T. I., 216), for "manufactures, articles or wares not specially enumerated or provided for * * * composed wholly or in part of * * * metal."

DRAWBACK ON WOVEN-WIRE MATTRESS-FABRIC.

The Secretary in a letter to the Collector of Customs says: "On the exportation of so-called mattress-fabric, manufactured by the Hartford Woven-Wire Mattress Company wholly from wire made of imported steel rods, a drawback will be allowed equal in amount to the drawback payable under the existing regulations on the quantity of such wire contained in the exported fabric," and gives directions as follows: "The exporter will be required to supplement each entry with a certificate, under oath or affirmation of the proprietor or superintendent and foreman of the factory where the wire was drawn, stating the particulars of the importation, with the invoice mark, and weight of the imported rods used, the weight of the wire produced therefrom, and its size by the wire-gauge. Each entry must also be supplemented with a separate statement of the weight of the exported fabric, verified by the oath or affirmation of the person by whom it was weighed. The usual oath of the proprietor and foreman on the entry will be so modified as to include a statement showing that the fabric specified in the entry was made wholly from the wire described in the certificate of the proprietor or superintendent and foreman of the wire factory. The Department concurs with you in the opinion that no drawback can be allowed on the completed wire mattresses manufactured by said firm in part from domestic wood, and their application for the establishment of a rate of drawback on the wire-fabric entering into such mattresses is, therefore, hereby denied."

DRAWBACK ON HUNGARIAN STEEL NAILS.

The Secretary of the Treasury writes to the collector at Boston. "On the exportation of the Hungarian nails manufactured by E. Phillips & Sons, of South Hanover, Mass., wholly from imported boiler-steel shearings or steel-plate scraps, a drawback will be allowed at the same rate as that prescribed by the Department's instructions of September 8, 1887 (Synopsis 8424), for steel nails manufactured from imported steel slabs by the Fall River Iron Works Company, of Fall River, Mass.—viz., equal in amount to the duty paid on the imported material used in the manufacture, less the legal retention of 10 per cent., the quantity of the material so used being determined by adding to the net weight of the exported nails 7½ per cent. of such net weight."

The sum of \$10,000,000 has been raised for the Roman Catholic University at Washington, and work on the buildings has commenced.

TRADE REPORT.

Chicago.

Office of *The Iron Age*, 95 and 97 Washington street, CHICAGO, December 24, 1888.

Pig Iron.—Car-Wheel manufacturers are in the market for Charcoal Pig Iron, and one of them has already contracted for his supply for next year. In view of the large quantity involved in this transaction it is understood that the buyer secured a concession of about \$1 per ton from current quotations. Other Car-Wheel manufacturers are sounding the market, but seem inclined to defer their purchases, in the belief that prices will be lower. Manufacturers do not coincide in this view of the situation, as there are large contracts for Charcoal Pig Iron still on their books to be filled, and it will require but a few good orders like the one just placed to stiffen the vertebrae of sellers disposed to make concessions. Regular quotations of Lake Superior Charcoal Pig Iron are \$20 for Nos. 1 and 2, and \$20.50 for the higher numbers. Alabama Car-Wheel remains firm at \$26.25. In Soft Coke Irons but little business is reported. Jackson County Softeners are quoted at \$18.60 for No. 1, but buyers refuse to pay this price, substituting cheaper Irons. American Scotch (Blackband), No. 1, is held at \$19.50 @ \$20.50, but these are nominal quotations, as most of the furnaces are sold ahead and are out of the market at present. Hocking Valley and other Ohio Soft Irons are quoted at \$17.50 @ \$18. A considerable quantity of Lake Superior Coke Iron has been sold, but the demand is for small lots only, buyers being indisposed to anticipate their needs. The prices named for this Iron are \$17.50 @ \$18 for No. 1, \$16.50 @ \$17 for No. 2, and \$15.50 @ \$16 for No. 3. The nominal quotation for Coke Bessemer is \$17.50, but a very large sale has recently been made on private terms by one Steel company to another. In Southern Iron but little business is reported, and while some companies maintain a firm front others are quite willing to shade prices to secure orders. Current quotations on this class of Iron are now about as follows: No. 1 Coke Foundry, \$17.25; No. 2 Foundry and No. 1 Soft, \$16.25; No. 3 Foundry and No. 2 Soft, \$15.75; Gray Forge, \$15.50; Mottled \$14.75. All the above quotations are on a cash basis, f.o.b. Chicago.

Bar Iron.—Large orders have been rare during the week, but quotations are being maintained with remarkable unanimity at 1.72½¢ @ 1.75¢, half extras, f.o.b. Chicago, for mill lots of Common Iron. Store prices are unchanged at 1.90¢ @ 2¢, according to quantity and quality.

Structural Iron.—Business is quiet, as is usual at this season. Orders being scarce and mills more anxious for work, prices are weaker, particularly for Angles and Plates. Jones & Laughlins deny the truth of the report that the Chamber of Commerce contract was taken at less than the combination price for Beams, but some of their competitors are so chagrined at being beaten that it would not be surprising if prices were cut on the next large Beam order on the market. Nominal quotations on mill lots are as follows, f.o.b. Chicago: Angles, 2.15¢; Universal Plates, 2.20¢ @ 2.25¢; Tees, 2.55¢ @ 2.60¢; Beams and Channels, 3.40¢. Store prices are as follows: Angles, 2.35¢ @ 2.50¢; Tees, 2.60¢ @ 2.70¢; Beams, 3.80¢.

Plates, Tubes, &c.—Some desirable mill orders for Plates were placed during the week, and prices were slightly cut, showing that the mills are not so full of

orders as they have been. The demand for small lots has been fair. Store prices are as follows: Heavy Iron Sheets, Nos. 10 to 14, 2.60¢ @ 2.70¢; Steel Sheets, 3¢ @ 3.50¢; Tank Iron, 2.55¢ @ 2.65¢; Tank Steel, 2.75¢; Shell Iron, 3¢; Shell Steel, 3.12½¢; Flange Iron, 4¢; Flange Steel, 3.50¢; Fire-Box Steel, 4.75¢ @ 5.75¢; Boiler Rivets, 4¢ @ 4.25¢; Ulster Iron, 3.75¢. Boiler Tubes, 60 % and 62½ % off.

Sheet Iron.—The demand for Black Sheets is hardly so great as it has been, but, with the exception of Stove Pipe and Tinniers' Irons, it is still very strong. Galvanized Iron is fully as active as previously reported, telegraphic orders being quite numerous, showing the urgency for supplies among consumers. Small lots of Black Sheets are firmly held at 3.10¢ for No. 24; 3.20¢ for Nos. 25 and 26, and 3.30¢ for No. 27, while Galvanized is unchanged at 60 % and 5 % off for Juniata and 60 % and 10 % off for Charcoal. Mill lots of Black Sheets are now selling at 3¢ and 3.02½¢, f.o.b. Chicago for No. 27.

Merchant Steel.—In Tool and other high-grade Steels very little is doing at present, as the end of the year is approaching, and most consumers are letting their stocks run down before inventory. Bessemer Bars are variously quoted, some manufacturers offering them at 1.80¢ @ 1.90¢ on the Iron classification, while others ask 2.10¢ @ 2.15¢, Steel classification. The extras are being adhered to more strictly than the extras on Bar Iron. Store prices for the principal grades of Steel are as follows: Bessemer Bars, 2.30¢; Tool Steel, 8.50¢ @ 9.50¢; Specials, 13¢ @ 25¢; Crucible Spring, 3.75¢; Open-Hearth Spring, 2.50¢; Open-Hearth Machinery, 2.40¢ @ 2.75¢; Crucible Sheet Steel, 7¢ @ 10¢.

Steel Rails.—Matters have been harmonized between the Pittsburgh and Chicago mills, prices are being maintained on a basis of \$28 and \$30 at mill, respectively, and the parties interested are looking for an advance before a decline. The 17,000-ton contract for the Union Pacific Railroad, which was taken by Carnegie Bros. & Co., has been transferred to the North Chicago Rolling Mill Company, who will fill it at the price at which it was first placed, but who will take no more orders at the same rate, which is the lowest thus far made by any Western mill. The transfer of this contract has helped to put the trade in better shape. Orders for about 25,000 tons were placed by Western railroads during the past week, a considerable portion of which went to Pittsburgh by consent, including one order for immediate delivery and another order for delivery in the last half of next year.

Old Rails and Wheels.—Last week decided dullness in Old Rails followed the activity of the previous week, when several thousand tons of Iron Rails were sold in separate lots at prices ranging from \$22.50 to \$23, Chicago, and others were sold at \$23 in the interior of the State. The supply is getting more abundant in some parts of the country, particularly in the South, and bids are being solicited on a considerable quantity now available. The nominal quotation at Chicago is \$23, in the absence of sales, but a firm offer of \$22.50, and probably of \$22, would be accepted by some holders. Old Steel Rails command from \$15 to \$20, according to length and selection, freedom from Frogs, &c. Quite a demand exists for second-hand Rails of light sections from 12 to 40 lb, for relaying for light traffic in lumber regions, coal mines, &c. The demand for Old Car-Wheels is improving; 1000 tons are reported to have been sold recently at \$19.25, while an offer of \$19.35 for another 1000 tons was refused.

Scrap.—This material has moved in line with Old Rails, an active week having been succeeded by a very quiet one. Some sales of No. 1 Wrought have been made, but in other lines the movement has been limited. Mixed Foundry Scrap is worth \$15. Quotations for carefully selected Scrap are as follows per ton of 2000 lb: No. 1 Railroad Wrought Scrap, \$21.25 @ \$21.50; No. 1 Wrought, from city dealers, \$21; Track Scrap, \$20.25 @ \$20.50; No. 1 Mill, \$15 @ \$16; No. 2 Mill, \$10.50 @ \$11; Horseshoes, \$20; Axles, \$26.50 @ \$27; Pipes and Tank, \$13; Cast Machinery, \$14 @ \$15; Stove Plate, \$11.50; Borings, \$10 @ \$10.50; Turnings, \$11 @ \$11.50; Axle Turnings, \$13; Mixed Steel, \$12 @ \$13; Coil, Leaf and Tire Steel, \$16.

General Hardware.—The activity in Shelf Hardware continues, and the business transacted in this month is now fully as large as that of any December in ordinary years. The demand for goods is still of a general character, showing the healthy condition of the retail trade. Toys have naturally been in very heavy request, but Skates and Sleds have moved more slowly than usual at this season, because of the remarkable mildness of the weather, very little ice or snow having made its appearance in this locality up to the present. Steel Goods have been advanced to 65 % and 5 % to the general trade, but no other change has occurred worthy of note. In Heavy Hardware a better trade is reported, but business is still unusually dull with most jobbers. Good winter weather is earnestly desired by them.

Nails.—The course of the Wire Nail trade is strangely at variance with that of the Cut Nail trade. While prices of Cut Nails are now firmly held, and a marked upward tendency is perceptible, at least on the part of manufacturers, a decided break has occurred in Wire Nails, and factory prices are all at sea. The demoralization of the Wire Nail trade has taken place most inopportunistically, as the large stocks held by jobbers have about been exhausted, and it would appear that the conditions were favorable for the maintenance of prices. If jobbers had been compelled to pay the regular rate for new stocks they would no longer have been able to sell at manufacturers' prices, and business in this line would have been established on a substantial basis. This is what the Wire Nail manufacturers have been waiting for, and it is very strange that they should destroy their hopes of remunerative business just when the fulfillment of their plans was in sight. Large sales of Wire Nails have been made at cut prices, and a restoration of rates, if again attempted, will merely result in another season of weary waiting for the exhaustion of stocks in second hands. A theory is current that the break in prices was made by the combination for the purpose of forcing into line the few manufacturers who have refused to join and who have quietly been selling Wire Nails at rates a little under those fixed by the association, thus securing a fair amount of business while the other manufacturers were doing little or nothing. The manufacturers of Cut Nails are beginning to receive renewed inquiries, and are making some sales at the advance recently established. A possible advance to be made in January, which is now freely predicted, is having its effect upon those who have not arranged for all the Nails they will need. Notwithstanding the assertions made to the contrary when the manufacturers were booking heavy orders in the early part of the month, it now transpires that many of the Cut Nails then sold will be delivered in the future, as the principal makers are announcing that their capacity is covered well into March. An attempt was made by the local jobbers to advance the price of Steel Nails in small lots to \$2.10, but while

some of them are endeavoring to maintain that rate others are selling at \$2, and on combination orders even this price has been shaded. The regular price of carload lots on track is \$1.95. Small lots of Wire Nails are still being sold at \$2.60, but a good movement is occurring in mixed carloads at \$2.55. Jobbers are having a very good demand for both kinds of Nails, and are selling carload lots very freely.

Barb Wire.—The condition of this branch of trade shows no improvement either in demand or prices, but an early resumption of activity is looked for. The merchants must soon stock up for spring trade if they expect to do any business, and it will be remarkable if prices do not then advance, as so many buyers will be in the market at once. A few heavy dealers are taking time by the forelock and arranging for their season's supply, but manufacturers generally are not anxious to sell for future delivery. Small lots of Painted are quoted at 2.90¢, and Galvanized at 8.60¢, with the usual difference on carload lots.

Pig Lead.—A quiet week is reported, sales amounting to only about 400 tons, at 3.55¢. At the close 3.50¢ was bid, but no anxiety to sell is shown on the part of refiners. Consumers claim to have supplies which will carry them well into the coming year.

Pickands, Brown & Co., 115 Dearborn street, Chicago, have been appointed sole agents for the Northwest for the Hinkle Furnace of the Ashland Iron and Steel Company, at Ashland, Wis., manufacturing Lake Superior Charcoal Pig Iron.

The North Chicago Rolling Mill Company are now manufacturing Iron Car-Truck Channels at Milwaukee, Wis. They make 10½ and 12-inch Channels and have received a number of orders for them from car builders. The Springfield Iron Company, of Springfield, Ill., have also decided to resume the manufacture of Iron Car-Truck Channels, in view of the demand for them which is springing up.

Philadelphia.

Office of *The Iron Age*, 220 South Fourth St., PHILADELPHIA, Pa., December 24, 1888.

Pig Iron.—It is almost impossible to form any definite opinion of the market at present. Reports are so contradictory that one hardly knows what to believe. There is a probability, however, that a good deal of business has been done in a quiet way, and as the details are harder than usual to get at, the presumption is that some concessions have been made, although leading sellers claim that they have made "no change in prices." There are others, however, who would be very glad to take business at inside quotations, but as yet without meeting much of a demand. Hence there is reason to believe that if the larger buyers have placed orders as stated, there must have been some inducements held out to secure their business. Or it may have been done in that very indefinite way called "price at time of delivery," which, as a matter of fact, looks as though buyers were not satisfied with prices quoted to-day. Be that as it may, there is really nothing in the position to warrant expectations of important changes in either direction. Consumption is so large, and reports from the South and West are all so favorable, that there is a fair probability that even the present large output may be taken without affecting prices. An advance is in the meantime out of the question, although even that might come, toward spring, providing that accumulations during the next three or four months are

not too large. On the other side, it is claimed that cost is again increasing, and that there is no money in the business at to-day's prices, while not a few are losing on every ton of Iron they sell. For the present, therefore, the outlook is exceedingly doubtful, as there is not enough evidence on either side to enable impartial observers to form any decided opinion either way. There is plenty of business and plenty of Iron; the question is, Will they continue in as fair proportion as they have been during the past six months? Will there be business enough to absorb the increased output of Iron? The next 30 days will doubtless supply an answer to this question. Meanwhile there are liberal offerings at \$18 @ \$19, at tide, for No. 1 Foundry, \$17 @ \$17.50 for No. 2 and \$16 @ \$16.50 for Gray Forge. Some sellers say they find very little business at inside rates, while others claim that they are abundantly supplied with orders for January and February on same terms as ruling during the past three months, and are quite indifferent about increasing their lines unless at full quoted rates.

Monday Evening.—There has been decidedly more inquiry to-day, and bids at 50¢ reduction for round lots February and March deliveries have been declined. Sellers express a willingness to shade 25¢ for deliveries to commence at once, but would rather carry the Iron themselves than allow the reduction asked for. On the whole, it seems as though buyers and sellers were getting closer together, and a great deal of business is likely to be arranged for during the next four or five days. Sellers show more confidence than they have done for some time past, as they think there are indications of large consumption soon as the mills start up on the new year's business.

Speigeleisen.—A sale of 1000 tons, 20 %, is reported at \$26.75, ex-ship, New York, duty paid.

Blooms.—A very unsettled market is reported in Steel Blooms, with somewhat heavy transactions at prices lower than have been mentioned for some time. Prices about as follows: Nail Slabs, \$28.50 @ \$29, at mill; Billets, \$31 @ \$35, with sales of 1000 tons for Boiler Plates at about \$36, delivered at consumers' mills; Charcoal Blooms, \$52 @ \$54; Run-out Anthracite, \$42 @ \$44; Scrap Blooms, \$32.50 @ \$34 @ "bloom" ton of 2464 lb.

Manufactured Iron.—A great many inquiries have been made within the past few days, some of which have already resulted in business, while others are likely to do so before the close of the week. The outlook has materially improved, and prospects for full employment at the mills are now considered pretty well assured. These inquiries represent all classes of consumers, and include specifications for Bars, Plates, Skelp, Shapes and other material. The matter of prices is a little unsettled yet, and while in some instances low figures have been mentioned, the general feeling is to get back to the rates ruling four or five weeks ago. It should not cause surprise, however, if some orders are booked at low prices, as there are a good many mills anxious to get work to start the year with, and until these are out of the way it is hardly to be expected that prices will show much improvement. The feeling is very hopeful, nevertheless, much more so than it was two or three weeks ago, and there is reason to believe that the coming year will open with plenty of business, steady prices, and fair prospects of further improvement as the season advances. Quoted prices to-day are about as follows: Best Refined Bars, 1.8¢ @ 1.9¢; Grooved Skelp, \$1.85 @ \$1.90; Plates, 2¢ @ 2.10¢; Steel do., 2.2¢ @ 2.35¢ and Angles, 2¢ @ 2.1¢.

Steel Rails.—There is a better feeling in the market, and manufacturers begin to see their way to several good-sized orders at an early date. Prices are quoted \$28 at mill, although a sale was made to-day at a price seemingly below that, but it is said that the cut was in freight and not in the price of Rails.

Louisville.

LOUISVILLE, KY., December 24, 1888.

Pig Iron.—Among smaller consumers buying has been confined to carload lots. There have been heavy purchases made by Pipe and Car companies; one of 12,000, another of 2000 tons of Iron for future delivery. Iron is selling very low, there being no stability to the market, buyers being able to set prices. It is felt, however, that in January a change will take place showing some improvement. Inquiries are numerous for Iron for future delivery, and unless the market is demoralized heavy purchases will be made during the coming month. Among the Car companies there is a strong demand for Car-Wheel Irons owing to new contracts having been made which will insure work for some time to come. We quote as follows:

Southern Coke, No. 1 Foundry, new classification.....	\$15.50 @ \$16.00
Southern Coke, No. 2 Foundry, new classification.....	15.00 @ 15.75
Southern Coke, No. 3 Foundry, new classification.....	14.50 @ 15.00
Gray Forge.....	14.00 @ 15.50
White and Mottled, different grades.....	13.50 @ 14.00
Silver Gray, different grades.....	13.75 @ 14.50
Southern Charcoal, No. 1 Foundry.....	16.50 @ 17.00
No. 1 Mill.....	15.25 @ 15.75
Southern Car-Wheel, standard brands.....	22.50 @ 23.50
Southern Car-Wheel, other brands.....	18.50 @ 20.00
Hanging Rock Coke, No. 1 Foundry.....	16.00 @ 16.50
Hanging Rock Charcoal, No. 1 Foundry.....	20.00 @ 21.50
Hanging Rock, Cold Blast.....	21.25 @ 24.25
Hanging Rock, Warm Blast.....	@

Detroit.

WILLIAM F. JARVIS & Co., under date of December 24, report as follows: Business for the past week has been very quiet, and the lack of buying is attributed mainly to the near approach of the holidays. There seems to be a general determination on the part of buyers to wait until after the 1st of the year. Several small sales have been made, but none of any magnitude. While the majority of sellers are holding firm, yet the few who have offered concessions have caused buyers to expect the same from others. With a dull market, but prices generally firm, we quote as follows:

Lake Superior Charcoal, all numbers.....	\$20.00 @ \$20.50
Lake Superior Coke, all ore.....	19.75 @ 20.25
Lake Superior Coke, cinder mixed.....	18.00 @ 18.50
Standard Ohio Black Band.....	19.75 @ 20.25
Southern No. 1.....	17.75 @ 18.25
Southern Gray Forge.....	15.75 @ 16.25
Southern Silvery.....	17.00 @ 17.50
Jackson County (Ohio) Silvery.....	18.50 @ 19.00
Old Wheels.....	20.25 @ 20.75

Chattanooga.

Office of *The Iron Age*, Carter and 9th Sts., CHATTANOOGA, December 24, 1888.

Pig Iron.—Nothing has occurred during the week to change the market, the supply and demand being about equal. Some consumers are claiming that the small increase of stocks of Iron on hand indicate a lower scale in prices in the near future, but this increase could not be other than expected so near the close of the year, and it remains to be demonstrated if these predictions prove true. So far as the Southern furnaces are concerned the demand has kept up remarkably well, and there are but few furnaces in the Southern district that are not well filled up with orders that have been taken at past prices and who have a regular set of customers

that it would take something besides a slight falling off in prices to induce them to seek other sources for their supply. At present there are large lots of Iron going East, some of them under old contracts and some under new, at prices that have ruled for the past month or two. There is no concession in prices reported, and while trade for the past 30 days has not been quite as active as previously, the call for shipments early in the coming year strongly indicates that the demand will be more than fully made up in January and February, and so far no reason can be assigned why quotations should be changed. The Southern steamship associations have affirmed the December rates to northern and western points for the month of January, with the exception of a reduction of 84 cents to Kansas City, Leavenworth, Atchison and St. Joseph. The present rates from Chattanooga and Birmingham are \$3.75 to Philadelphia and New York and \$4 to Boston.

Cleveland.

CLEVELAND, December 24, 1888.

Iron Ore.—The amount of unsold Ore on the docks at lower lake ports has been reduced to about 90,000 tons. Lots of from 2000 to 6000 tons of non-Bessemer Ores have been sold at about \$4.60. The amount of unsold Ores on the dock includes a round lot of high-grade Bessemer, which, although held at a fancy price, is likely to be sold immediately after the holidays. Indications are not lacking of a slight advance all round in next year's prices, and it is now thought probable that sales for next season's delivery will be made before January 10. The advance will probably not exceed 50¢ per ton over the prices prevailing at the opening of navigation this year. About 30,000 tons of Ore have been sent forward to the furnaces during the past week, and the docks will be entirely cleared up before next year's shipping season from the upper lakes begins.

Pig Iron.—The market has been very quiet for the past week, a condition always looked for in the holiday season. Some disposition has been manifested by a few sellers anxious to reduce their stocks to make concessions, but this has only been done by the smaller dealers. A large majority of manufacturers are, however, holding their products firmly at former quotations, preferring to carry their Irons over into January, when a livelier buying movement is anticipated. Mill Irons are still the favorites in the market, although just at present no important sales are reported.

Old Rails.—Buyers are waiting for a break in the market before making purchases in any considerable quantity, sellers still demanding \$24.50 @ \$25 for Old American Rails.

Cincinnati.

Office of *The Iron Age*, Fourth and Main Sts. (CINCINNATI, December 24, 1888.)

Pig Iron.—The changes in the local Pig Iron market, during the week, have been unimportant. The volume of business has been of reduced proportions, the Christmas tide rising so high as to discourage both buyers and sellers in their efforts to do business, yet the volume of transactions has been fully equal to the average at this season. Individual sales have been mostly small, but there have been several orders for 1000-ton lots of both Foundry and Forge grades. The easier feeling noted a week ago has not given place to further weakness, nor yet has it been succeeded by a firmer tone. It is observable that a few furnaces are still

disposed to sell, and this implies concessions in prices, but the majority are not pressing their production, and the ranges of prices remains about the same as a week ago.

Foundry.

Southern Coke, No. 1 (new classification).....	\$16.25 @ \$16.75
Southern Coke, No. 2 (new classification).....	15.50 @ 16.00
Southern Coke, No. 3 (new classification).....	15.00 @ 15.25
Ohio Soft Stone Coal, No. 1.....	17.00 @ 17.50
Ohio Soft Stone Coal, No. 2.....	15.50 @ 16.00
Mahoning and Shenango Valley.....	18.00 @ 18.50
Hanging Rock Charcoal, No. 1.....	21.00 @ 22.50
Hanging Rock Charcoal, No. 2.....	19.00 @ 22.00
Tennessee and Alabama Charcoal, No. 1.....	18.50 @ 19.50
Tennessee and Alabama Charcoal, No. 2.....	17.50 @ 18.00

Forge.

Strong Neutral Coke.....	15.00 @ 15.25
Mottled Neutral Coke.....	14.00 @ 14.25
Gray Forge.....	14.50 @ 14.75

Car-Wheel and Malleable Irons.

Southern Car-Wheel.....	20.00 @ 25.00
Hanging Rock, Cold Blast.....	22.00 @ 25.00
Lake Superior Car-Wheel and Malleable.....	21.00 @ 22.00

Manufactured Iron.—There has been a moderate demand only during the week and prices of standard and reliable makes have been unchanged.

Old Material.—There has been little trading during the week and prices are nominally unchanged. Old Rails are quotable at \$23 and Old Wheels at \$19 @ \$19.50 per ton, cash, Cincinnati.

Nails.—There has been a moderate jobbing demand, which has been met readily at previous prices.

Pittsburgh.

Office of *The Iron Age*, 77 Fourth Ave., (PITTSBURGH, December 24, 1888.)

A good many mills have about all they can do working up old contracts. It is customary with a good many Iron firms to take stock and make needed repairs in January, and it is expected that quite a number of mills will shut down this week and remain so until about the middle of January. The outlook for the year 1889 is very generally regarded as being favorable. Some are of the opinion that the volume of business will exceed that of 1888.

Pig Iron.—The market is in a rather peculiar condition, and it is difficult to report satisfactorily. While business men, generally, are hopeful of a stronger market early in the new year, some few contracts have been made for delivery during the first quarter of 1889 at a concession from present prices; others, however—and these are in the majority—are demanding an advance, but, as a matter of course, they are making no sales. Now that a few contracts have been made for delivery between January and April at prices from 25¢ to 50¢ per ton for immediate delivery, it is probable that business will be confined to supplying immediate wants, as there are very few furnacemen willing to contract ahead at the prices noted, and consumers, in view of what has been done already, will not feel like paying more. A good many furnacemen are averse to selling ahead from the fact that if the market goes up they are held up for the last pound, while if it goes the other way they claim that all kinds of tricks are resorted to in order, if possible, to get out of the same. One of our oldest furnacemen, in referring to this matter the other day, said that his experience in selling for future delivery was unsatisfactory, and that he has concluded hereafter to abstain therefrom. Some producers are of the opinion that the market is more likely to advance than decline, as they allege that cost of production is more likely to be increased than reduced; already Coke men are trying to

advance prices of Coke. We quote prices for present delivery as follows:

Neutral Gray Forge.....	\$15.75 @ \$16.00, cash.
White and Mottled.....	15.00 @ 15.50, "
All Ore Mill.....	18.25 @ 18.50, "
No. 1 Foundry.....	17.50 @ 17.75, "
No. 2 Foundry.....	18.75 @ 17.00, "
No. 1 Charcoal Foundry.....	24.00 @ 24.50, "
No. 2 Charcoal Foundry.....	22.00 @ 22.50, "
Cold Blast Charcoal.....	25.00 @ 28.00, "
Bessemer Iron.....	17.00 @ 17.25, "

There were sales reported of 1300 tons Gray Forge for immediate delivery at \$16, cash; 1500 tons do. for January and February delivery at \$15.50, cash; 2000 do. for January, February and March at \$15.50, cash; 1000 tons Bessemer at \$17.05, cash; 1000 do. \$17.25, cash, and 1000 for February and March at \$17, cash.

Muck Bar.—There is less inquiry, and the market is weaker; we now quote at \$28.75 @ \$29, cash, with a sale of 500 tons reported at \$29. Consumers report that they have no trouble in buying all they want at \$29, cash.

Manganese.—Sales Ferromanganese 80 % at \$54.50 @ \$55, cash; and Spiegel 20 % at \$28 @ \$28.50, cash.

Manufactured Iron.—There is but little new business at present, nor is it to be expected with the close of the year so near at hand. Prices remain about as last quoted, although for a desirable order they might be shaded somewhat. Bars, \$1.80 @ \$1.85; Plates, \$2.10 @ \$2.25; No. 24 Sheet, \$2.80 @ \$2.90, all 60 days, with the usual discount of 2 % off for cash.

Nails.—So far as relates to Pittsburgh, business is very dull, with but little prospect of any immediate improvement.

Wrought-Iron Pipe.—The Pipe trade continues dull, as it usually is at this particular time, and there is not likely to be much if any improvement for some time to come. Not only is business exceedingly light, but it is very unsatisfactory, as prices are being cut to such an extent that there is little or no margin for profit. A meeting of manufacturers is reported to have taken place in Philadelphia the other day, but if so its object and results have not yet been divulged. What is wanted is organization and co-operation, and until there is, no substantial improvement can be looked for. The great trouble in the way of an organization is a lack of confidence in each other on the part of the manufacturers. Prices are so irregular at present that it is impossible to give reliable quotations. There are but few orders offering, and as a consequence whoever gets these has to shave close.

Old Rails.—There is not much doing, but it is expected that there will be an increased demand early in the new year, as a good many consumers are low in stock, and will soon have to replenish. We continue to quote American Tees at \$25 @ \$25.25, with a sale of 1500 tons reported at \$25.25.

Steel Rails.—Are still quoted at \$28 cash, at works in Pittsburgh, but it is possible that for a desirable order the price quoted would be "cut" somewhat, notwithstanding it is claimed that \$28 is now the bottom price, and it is claimed that there is no margin below the price quoted.

Billets, &c.—There is but little inquiry for Bessemer Steel Billets, and the market is weaker. We now quote \$28.25 @ \$28.50, cash. Sales at \$27.90, cash; Domestic Steel Bloom Ends and Rail Ends unchanged at \$19 @ \$19.50.

Railway Track Supplies.—Prices remain unchanged. Spikes \$2.15, 30 days; Splice Bars, \$1.80 @ \$1.85; Track Bolts, \$2.80, with Square, and \$2.90 with Hexagon Nuts.

Old Material.—The demand for everything in this line continues light, but is expected to improve early in the new

year. Prices unchanged. No. 1 Wrought Scrap, \$21 net ton; No. 1 Wrought Turnings, \$18.50 @ \$14; Car Axles, \$25 @ \$26; Cast Scrap, \$15.25 @ \$15.50, gross; Cast Borings, \$12 @ \$13; Old Car-Wheels, \$19.50 @ \$20; Old Steel Rails, store prices, \$18.50; long lengths, \$20.50.

New York.

Office of *The Iron Age*, 66 and 68 Duane street.
NEW YORK, December 26, 1888.

Foundry Pig.—The week has been quiet, no announcement having been made as yet of the opening prices. In some quarters the opinion is being expressed that the aggressive character of Southern competition may lead to a lowering of prices by about \$1. It is intimated, however, that the leading interests may reach an understanding whereby cutting may be avoided. Some Southern Iron has been sold at \$17.50 for 1889 delivery, and some transactions have been closed, the price to be dependent upon the market at time of delivery. We quote No. 1 Foundry, \$18 @ \$19 and No. 2, \$16.50 @ \$17.50.

Scotch Pig.—During the past month considerable Scotch Pig has sold for delivery during the early months of 1889. We quote: Coltness, \$20.50 @ \$21; Shotts, \$20.25 @ \$20.75; Langloan, \$20.25 @ \$20.50, and Dalmellington, \$19.50 @ \$19.75.

Spiegeleisen.—We quote \$26.75 @ \$27 for 20 %, and \$54 for 80 % Ferro.

Plates.—We quote Iron Tank, 2¢ @ 2.2¢; Shell, 2.25¢ @ 2.4¢; Steel Tank and Ship Plate, 2.15¢ @ 2.25¢; Shell, 2.35¢ @ 2.5¢; Flange, 2.6¢ @ 2.75¢, and Fire-box, 3½¢ @ 4¢.

Structural Iron.—We quote Sheared Plates, 2¢ @ 2.1¢; Universal Mill Plates, 2.1¢ @ 2.2¢; Angles, 2¢ @ 2.10¢; Tees, 2.5¢ @ 2.6¢, and Channels and Beams, 3.3¢ on dock for all sizes. Foreign Beams are quoted 2.55¢ @ 2.75¢.

Bar Iron.—We quote: Carload lots on dock, half extras, Common, 1.7¢ @ 1.75¢; Medium, 1.75¢ @ 1.8¢, and Refined, 1.8¢ @ 2¢.

Steel Rails.—The market is quiet and steady, sales during the week being confined to a few small lots. There is considerable inquiry from the South, there being at least three blocks in the market for 10,000 tons and upward each. It is persistently asserted that \$28 at Eastern mill is being cut, and as steadily denied.

Merchant Steel.—The market continues in a demoralized condition. As an instance of it, it is reported that 500 tons of Harrow Steel were sold to a Western consumer at \$43 ½ ton, 3 % off, delivered, with the option of taking 500 tons more. Tire Steel has sold at 2.05¢, delivered, in the West, and 2.15¢ has been done for all sizes.

Wire Rods.—Cheap sellers in Germany are reported to be filled up for the present, and importers claim that they cannot secure Rods and deliver them here under \$41 @ \$41.50. No business has been done at anything higher than \$39.50 thus far.

Old Rails.—No transactions are reported. A lot of 500 tons is offered at \$23.50 from store, with the probability that \$23.25 will secure it.

Rail Fastenings.—The market for Spikes is weaker, quotations having declined to \$2.10 @ \$2.15, delivered. Angle Bars are selling at 1.85¢ delivered.

The Pump Manufacturers' Association held a meeting at the Grand Pacific Hotel, Chicago, on Wednesday and Thursday of last week. It was decided inexpedient to

form a trust or pool, but it was agreed that the low prices which have heretofore prevailed necessitated a revision of discount sheets. By unanimous vote of the association the price of iron pumps was advanced 2 per cent. The following officers were elected for the ensuing year: President, H. M. Wade, Batavia, N. Y.; vice-president, P. W. Bailey, Seneca Falls, N. Y.; treasurer, M. L. Bailey, New Britain, Conn; secretary, L. L. Morrison, New York.

Financial.

The most important news of the week is the confirmation of the reports of an agreement among the railway systems of the Southwest by which rates are to be restored to a remunerative basis. Not only this, but there is evinced a determination not only to advance rates but to maintain them, and at the same time conform strictly to the requirements of the Interstate Commerce law. The special feature that particularly distinguishes the new arrangement from any that has preceded it for many years is the harmonious co-operation of railroad presidents and leading financiers in effecting the result. The presidents will meet again directly after the holidays to perfect the plan, of which the present agreement will be the basis. It is distinctly understood that this agreement is a temporary one, being for 60 days. Another forward step to the same end is a decision by the general managers, at a meeting held in Chicago on Saturday, to restore Western and Southwestern freights January 1st. The principal changes are in rates on packing-house products and live stock, which have been long demoralized.

The Stock Exchange markets have been influenced by the improved railroad situation, nevertheless there is little substantial gain, the movement being irregular and at times feverish. The strongest were the coal stocks, especially Lackawanna, which shows remarkable gains. Rock Island advanced in spite of the reduction of its quarterly dividend from 1½ to 1 ¢. On Saturday, under the combined influences of an unfavorable bank statement and a sharp break in Omaha preferred, a fractional recession in prices was recorded. A drop of ¾ points in Omaha preferred was a surprise. On Monday stocks were buoyant, in the belief that the new freight rate agreement would be maintained.

United States bonds were firm and in good demand, and railroad bonds were higher. Quotations are as follows:

U. S. 4½s, 1891, registered.....	108¼
U. S. 4½s, 1891, coupon.....	108¼
U. S. 4s, 1907, registered.....	127
U. S. 4s, 1907, coupon.....	128
U. S. currency 6s, 1896.....	119
U. S. currency 6s, 1898.....	122
U. S. currency 6s, 1897.....	125
U. S. currency 6s, 1898.....	127½
U. S. currency 6s, 1899.....	130

The total amount of bonds purchased to date under the circular of April 17 is \$100,829,300, of which \$51,396,650 are 4 % and \$49,432,650 are 4½ %. The cost of these bonds was \$119,402,568, of which \$66,010,877 was paid for the 4s and \$53,391,691 was paid for 4½s. For some weeks past the offerings of 4½s have been almost exclusively from banks or financial corporations and brokers.

Money has a hardening tendency, in anticipation of the annual settlements and shifting of loans usual at this season, but an easier feeling soon after the new year has fairly opened is confidently looked for, as large amounts will be released in the payment of interest and dividends. Institutions marked up their loans 4 @ 5 %. The demand for 30 to 60 day time loans was unusually strong. Rates were 4 to 4½ % for three months or less, and 5 to 6 % for four to six months. Commercial paper was in limited supply, the demand being fairly good and coming mainly from out-of-town sources. Rates were for 60 to 90

days' indorsed bills receivable 5 to 5½ %, longer dates 6 @ 6½ %. It is remarked that the condition of banking affairs throughout the country is remarkably favorable, and respecting the National banks Comptroller Trenholm says they have never been sounder or under better management.

According to the Custom-House report the exports of specie from New York during the week were \$1,428,325, making the total since January 1 \$45,515,000, against \$18,082,000 for the same time last year and \$47,000,000 in 1886. The imports of specie for the week were \$257,000; total since January 1 \$7,805,000.

The weekly statement of the associated banks of this city shows a heavy decrease of reserve, equal to \$2,297,600, reflecting the recent exports of gold and the large shipments of currency to the South and West, chiefly for the movement of cotton. The surplus now held is \$7,574,625, against \$9,036,400 at the corresponding time last year and \$7,232,200 in the fourth week of December, 1886. This is the first time in a number of months when the surplus of reserve has fallen below the amount of the year previous, but it occasions no anxiety. The changes in the averages show an increase in loans of \$1,513,500, a decrease in specie of \$1,355,200, a decrease in legal tenders of \$1,513,200, a decrease in deposits of \$2,283,200, and a decrease in circulation of \$83,000.

The market for sterling was quiet and steady. The leading bankers are not looking for a further export of gold immediately. Posted rates for sterling were \$4.85 @ \$4.89½. On the Paris Bourse the week prices were notably firm, considering the Panama Canal collapse, and closed strong owing to extensive re-buying by leading financial firms.

General trade is quiet, aside from the temporary spurt caused by holiday demands. The staple commodities are nearly all weaker, particularly flour and wheat. The best patent spring wheat flour is offered in London at prices relatively much lower than here. Corn was in better demand for export. Sugars were dull, and coffee had a downward tendency. Cotton was much more active at a decline, based on estimates of a large yield. The dry goods market is in an unusually good shape, promising strength in the future.

The importations of merchandise at this port during the week were \$7,102,000, of which about \$5,000,000 represent general merchandise. Since January 1 the aggregate is \$451,272,000, against \$456,480,000 for the same time last year.

The east-bound shipments from Chicago last week were phenomenal. The Board of Trade statement shows an aggregate for all the roads of 111,000 tons, against 108,000 for the preceding week, and 54,000 tons for the corresponding week last year. This is the largest volume of east-bound business for a single week on record.

Metal Market.

Copper.—Friday's London quotations showed no change and since then there have been none; they were for spot Chili Bars, £77. 10/; do., futures, £78; good merchantable brands, £77. 10/; spot, and £78, futures, and Best Selected, £80. Sales, 375 tons. Hardly anything has transpired here, the nominal range for spot and December being 17.20¢ @ 17.50¢ for Lake. The Lake companies, headed by the Calumet and Hecla, which, it is stated, conceived the new plan, are said to have made the syndicate the proposition to pay them all alike—14¢ ¾ lb outright, instead of 13¢ and 50 % of the figure over this, which would simplify accounting and expedite the same. It is believed the syndicate would accede

to this, leaving it free to advance the price to a point that may increase the profit without curtailing consumption still further. The fact is that the statistics are getting worse all along, the visible supply on December 17, in England and France, being 98,880 tons, against 95,840 tons on December 1 and 45,130 on December 1, 1887, without counting some 2200 tons afloat from England to the Continent. Hence, the visible supply may be figured at something like 100,000 tons on the other side; and, adding thereto 30,000 tons on this side, it will be found that £9,100,000 are thus held in one hand, or, reduced to American gold, \$45,500,000 or thereabout, a mighty amount. With the Rio Tinto Company the syndicate's contract has been extended to 1902.

Tin.—The London quotation remained unaltered last week. Straits, spot, £97. 2/, and futures, £98. Sales, 580 tons. Here only 10 tons, February, were sold at 21.85¢, and 20 tons, March, at 21.90¢ @ 21.95¢, the nominal quotation for spot and December being 21.70¢ @ 22¢ on 'Change, while in the open market spot is procurable at 21½¢, and in a jobbing way at 22¢ @ 22½¢. **Tin Plates.**—Nothing of any consequence has been done in either spot or futures. The last Liverpool quotation was 13½. We quote on a lifeless market at the close, large lines, ½ box: Siemens-Martin Steel, Charcoal Finish, \$4.75 @ \$5.50; Coke Finish, \$4.65 @ \$4.70; Terns, \$4.12½ @ \$4.25; Coke Tins, \$4.22½ @ \$4.30; and Wasters, \$4.12½ @ \$4.15.

Lead.—The market has been dull, not over 200 to 300 tons being sold at 3.70¢ @ 3.82½¢, closing at 3.75¢ @ 3.80¢, and strong. The fact is that very little Lead is offering, hence the firm tone in spite of the little doing. St. Louis quiet at 5.50¢. Soft Spanish improved in London from £12. 15/ to £12. 17/ since our last. The auction sale of 800 tons is postponed to January 3.

Spelter.—Sales have been restricted on the spot to trifling lots of Common Domestic at 5¢ @ 5½¢, while Silesian, unaltered—£18. 5/ in London—cannot be quoted any higher than 5.75¢ nominally.

Antimony.—There has been a fair demand, while the stock is light and the metal is strong at 13¢ Cookson and 11¢ Hallett, the latter still ruling at £45 in London.

New York Metal Exchange.

The following sales are reported:

WEDNESDAY, December 19.		
10 tons Tin, March.....	21.95¢	
10 tons Tin, March.....	21.90¢	
10 tons Tin, February.....	21.85¢	
FRIDAY, December 21.		
16 tons Lead, March.....	3.87½¢	
WEDNESDAY, December 26.		
10 tons Tin, spot.....	21.70¢	
20 tons Tin, March.....	22.10¢	

Coal Market.

The Anthracite Coal market is without any new feature whatever, excepting a firmer tone since the resolve to curtail production has taken effect. Reading refuses to make any concession in price, and the Lehigh Coals are sold close to the schedule. Stocks at all points are liberal. An enforced curtailment resulted from the drawing out of several collieries scattered throughout the mining regions. From Philadelphia it is learned that the furnace demand has improved, affording a ready market for all the larger sizes. The Murray shaft, at Wilkesbarre, Pa., operated by the Lehigh and Wilkesbarre Coal Company, suspended work and will be sunk deeper to a rich vein. The Baltimore and Ohio Railroad, under its new president, Chas. F. Mayer, aspires to become the largest producer of Semi-Bituminous Coal

in America. The schedule prices remain as before—viz., Hard White Ash, Lump, \$4.50; Broken, \$4.15; Egg, \$4.40; Stove, \$4.65; Chestnut, \$4.55; Free-Burning, f.o.b., Broken, \$3.95; Egg, \$4.30; Stove, \$4.65; Chestnut, \$4.65; Pea, \$2.75.

The Seaboard Steam Coal Association held another meeting in Philadelphia last week and agreed to articles for the regulation of the Bituminous trade during the ensuing year. All the Soft Coal interests shipping Bituminous fuel to tidewater on the Atlantic Coast were represented and entered into an agreement excepting the Beech Creek Railroad. Galloway C. Morris will continue to act during the coming year as the Association Commissioner. According to the articles of agreement each shipper will be required to pay into the pool 20¢ per ton for each ton of Coal shipped by his road, and it will be held by the Commissioner for four months. The tide-water tonnage to be pooled this year is estimated at about 5,000,000 tons.

Imports.

The imports of Iron and Steel, Hardware, &c., at this port from December 14 to December 20, inclusive, and from January 1 to December 20, inclusive, were as follows:

Iron and Steel.			
	Dec. 14. to Dec. 20.	Jan. 1 to Dec. 20.	
Iron Ore: A. Earnshaw.....	298	8,438	
Pig Iron: G. T. Carter.....	500	1,830	
N. S. Bartlett.....	200	5,700	
Crocker Brothers.....	200	15,584

British Iron and Metal Markets.

[Special Cable Dispatch to The Iron Age.]

LONDON, WEDNESDAY, Dec. 26, 1888.

Nearly all branches of the market for Iron and Steel have been quiet, as far at least as business for the past week is concerned. In Metals there has also been the quietude common to the holiday season, and comparatively little variation in prices. Steel makers note some exception to the rule in the instance of shipbuilding and railway sorts, and also in the demand for Billets, prices for which are very firm. Most brands of Scotch Pig have ruled very steady, as have also Hematites, despite the moderate demand; but Middlesboro' Pig has weakened a fraction under the influence of freer offerings and accumulations of supplies in makers' hands.

The situation in the Copper market has undergone no remarkable change, and business with consumers is still adversely affected by the artificial character of present prices. Consumers and smelters purchase only the supply they may need for covering necessary wants, and give "outside" brands the preference wherever practicable. Producers whose stock is not taken up by "syndicate" contracts offer freely, first to the trade and then to the "syndicate" if outlet is not found elsewhere.

The speculation in Block Tin has been moderate and reveals no new feature in the situation from any standpoint. The monthly sale of Billiton realized a parity of £97. 12/6 in Holland. Other metals have been traded in to a moderate extent only.

A fair reasonable business has been done in Tin Plate at previous rates. There is an encouraging demand for future deliver-

ies, and makers express confidence in better prices ruling soon after the holidays.

Scotch Pig.—Trade has been moderate, and prices show only slight variation. Glasgow freights are a shade firmer.

No. 1 Coltness, f.o.b. Glasgow	51/
No. 1 Summerlee, " "	50/
No. 1 Gartsherrie, " "	48/6
No. 1 Langloan, " "	49/6
No. 1 Carnbroe, " "	44/6
No. 1 Shotta, " " at Leith	49/6
No. 1 Glengarnock, " Ardrossan	48/
No. 1 Dalmellington, " "	43/6
No. 1 Eglinton, " "	42/

Steamer freights, Glasgow to New York, 3/, Liverpool to New York, 10/.

Cleveland Pig.—Demand has been moderate, and the market barely steady. No. 1 Middlesboro', G. M. B., 36/; No. 3 do., 33/.

Bessemer Pig.—Dealings have been on a more restricted scale, but prices have remained steady. West Coast brands, mixed numbers, 44/6, f.o.b. shipping point.

Spiegeleisen.—The market rather quiet, but firm. English 20 % quoted 80/, f.o.b. N. W. England shipping point.

Steel Rails.—Prices remain firm under the support of continued good demand. English sections quoted at £3. 19/ @ £4, and light sections £4. 2/6 @ £4. 10/, f.o.b. at N. W. England shipping point.

Steel Blooms.—Demand moderate and prices unchanged. We quote £3. 18/6 for 7 x 7, f.o.b. at N. W. England shipping point.

Steel Billets.—There has been a brisk demand and the market is strong. Bessemer, 2½ x 2½ inch, £4. 2/6, f.o.b. at N. W. England shipping point.

Steel Slabs.—A moderate business at about former prices. Bessemer, £3. 18/6, f.o.b. at N. W. England shipping point.

Old Rails.—The market quiet and prices without change. Tees quoted at £3. 5/ @ £3. 7/, and Double Heads, £3. 8/ @ £3. 10, c.i.f. New York.

Scrap Iron.—Prices are as before and the demand moderate. Heavy Wrought quoted at £2. 2/6 @ £2. 5/, f.o.b.

Crop Ends.—Moderate sales making at about previous rates. Bessemer quoted £2. 7/6 @ £2. 10/, f.o.b.

Tin Plate.—There has been a fairly good trade, and sellers are rather firmer. We quote, f.o.b. Liverpool:

IC Charcoal, Allaway grade	15/3 @ 15/6
IC Bessemer steel, Coke finish	13/6 @ 13/9
IC Siemens	13/9 @ 14/
IC Coke, B. V. grade	13/3 @ 13/6
Charcoal Terne, Dean grade	12/ @ 12/3

Manufactured Iron.—Business has slackened somewhat, but prices are held firmly throughout. We quote, f.o.b. Liverpool:

Staff. Ord. Marked Bars	£ s. d. @ 8 2 6
" Common	5 12 6 @ 5 15 0
Staff. Bl'k Sheet, singles	@ 7 10 0
Welsh Bars (f.o.b. Wales)	5 0 0 @ 5 2 6

Tin.—Operations have been on a moderate scale and prices have varied slightly. Straits quoted at £97, spot, and £98 for three months' futures.

Copper.—Chili Bars firm but quiet. Other kinds slow and unsettled. Chili Bars, £77. 10/, spot, and £78, three months' futures. Best Selected, £74. 10/.

Lead.—There has been a better demand and prices are firmer at £12. 15/ for Soft Spanish.

Spelter.—The demand has continued fairly active and prices steady at £18. 2/6 @ £18. 5/ for ordinary Silesian.

BELGIUM.

BRUSSELS, December 15, 1888.—*Iron.*—Our market has remained firm. The official quotation for Forge Pig in Luxembourg remains 4.20 francs \approx 100 kg. Athus sold 21,800 tons of Pig, deliverable during the first quarter of next year. The price of Pig is now at a level, enabling rolling mills to execute a great many orders. Following are the quotations: Luxembourg Foundry Pig, 4.90; Charleroi do., 6.30; Forge, 4.70 @ 5.60; Merchant Iron, free on board Antwerp, No. 1, 11.50; No. 2, 12.25; No. 3, 13; Beams, do., 11.75; Angles, 12.50; Sheets, Nos. 2 to 4, 15 @ 24; Thin, 18; Steel, 17. Cockerill and Denain together furnish the Porto Rico railroads 12,000 Steel Rails, a French company 10,000 tons Steel Sleepers; these are French Ponsard Steel Sleepers. Cockerill also furnishes Queensland 2000 tons of Steel Rails, and our Government a new fast Steel steamer in the sum of 1,049,000 francs. This steamer makes 17½ knots per hour. For each one-tenth knot over 17 knots the Government pays Cockerill 10,000 francs additional.—*Moniteur des Intérêts Matériels.*

GERMANY.

HAMBURG, December 15, 1888.—*Iron.*—While Iron Ore has continued tending upward in Rhenish Westphalia, this has also been the case with Forge Pig, which is about 1 mark \approx ton dearer. Greater animation has been noticeable in Spiegel, which has advanced from 53 marks, 10 to 12 $\frac{1}{2}$, to 54. Luxembourg Forge Pig has remained sustained at 37.10 marks \approx ton. Finished Iron has been doing tolerably well for domestic use; for export it cannot be moved. Boiler works, foundries and rolling stock manufacturers are all of them doing remarkably well. Sets of Car-Wheels have been held at 315 marks at the works, but some Belgian makers underbid this figure. Steel Rails have been furnished the Prussian Government at 118.20 marks \approx ton, and no foreigners have underbid this. One of the leading Steel works quotes Steel Rails for mines 115 and Plates 150. The Wire branch is still upset; the Westphalian maker who declines to join a renewal of the Wire Nail syndicate declares that he does not wish to bind himself to fixed rates for the export trade, but that he will join any new strictly domestic syndicate. *Metals.*—Lead has declined to 13.80 @ 14.80 marks \approx 50 kilos, German. *Spelter.*—The Upper Silesian group of Spelter works announce that the renewal for three years and a half of the International Spelter Syndicate from July 1 next is a desideratum, provided all makers agree that production be increased 5%. They consider a timely ventilation of the matter desirable.—*Borsenhalle.*

WEST INDIES.

PORT OF SPAIN, TRINIDAD, November 9, 1888.—*Asphaltum.*—During the fortnight a steady export demand has prevailed at \$14.04 \approx ton, f.o.b., for Boiled, and \$9.84 Crude, including the export duty. Shipments since January 1 amount to 46,097 tons, against 38,905 in 1887 and 31,677 in 1886. *Exchange* may be quoted \$4.80 @ \$4.86, 90 days, on London.—*E. P. Masson.*

NEW ZEALAND.

NELSON, October 12, 1888.—*Copper.*—For the purchase and further development of the Aniseed Valley Copper mines in this district, Middle Island, the New Zealand Copper Company, Limited, has been formed, with a capital of £150,000 in £2 shares.—*Dunedin Mail.*

SOUTH AFRICA.

DURBAN, NATAL, October 18, 1888.—*Gold.*—According to mail advices from Delagoa Bay, there have been discovered on Sir Donald Currie's Gold fields, in Swaziland, extensive deposits of low-grade Gold Ores. The Ore is friable, the amount of it inexhaustible, and the find is considered one of the most important yet made in South Africa.—*Argus.*

The Pittsburgh committee of freight agents received notice last week from Commissioner Fink that the action of the committee in advancing the rates on iron and steel articles was ratified by the commissioners, and the new rates will

take effect January 1. They were advanced from the special rates formerly used to the basis of the fifth and sixth classes. The new rates from Pittsburgh are as follows: To New York, 18 and 15 cents; Philadelphia, 16 and 13; Baltimore, 15 and 12; Rochester, 14 and 11; Buffalo, 12 and 9; Utica, 16 and 13; Syracuse, 16 and 13; Oil City, 10 and 7. The former figures are for less than carloads, and the latter for carload shipments.

The Duration of Lightning Flashes.

It is well known that the lightning flash, or the spark between the terminals of an influence machine, exists for so short an interval of time as to be beyond measurement by any ordinary means. But notwithstanding the acceptance of this knowledge the peculiarities of some of the flashes photographed have been supposed to be due to the camera, or the sensitive plate, being at the time in a state of vibration. To test this line of thought Mr. James Wimshurst, according to *Engineering*, has made a dark slide for his camera in which is fitted a train of clockwork carrying a disk, upon which is an arrangement for holding the sensitive plate. When all is complete for photographing a flash the clockwork is wound up, the sensitive plate then rapidly acquires great velocity, which at the maximum reaches 2500 revolutions per minute, and with the plate rotating at this speed the spark is photographed. A photograph taken under these circumstances in no way indicates movement in a sensitive plate, for the photograph throughout its length is as sharp and as clear as though the plate had been at rest. The experiment is interesting, for it not only shows the infinitely short existence of the spark, but it also shows that chemical change in the sensitive film takes place in an equally minute interval of time.

The Secretary of War has awarded the contract for furnishing \$1,500,000 worth of steel forgings for 8, 10 and 12 inch high-power guns to the Bethlehem Iron Company, their bid being the lowest and within the statutory price. Award has also been made of the contract for furnishing cast-iron bodies for 80 mortars to the Builders' Company, of Providence, R. I., and that for the steel parts of the mortars to the Midvale Steel Company. The bids for assembling and completing the mortars were rejected as excessive.

The New York Hydraulic Supply Company have asked permission to lay mains through the city streets for the purpose of supplying public and private buildings with hydraulic power. The company profess to be prepared to pipe water from Poughkeepsie into the Croton reservoirs in sufficient quantity to supply the city's needs, without the addition of the proposed Quaker Bridge and other storage dams. The matter has been referred to the Department of Public Works.

In discussing a paper on triple-expansion marine engines recently read before an English engineering society, it was pointed out that in two ships alike in every respect except that the one has two-crank and the other three-crank engines, the consumption of coal per indicated horse-power is precisely the same, but that the three-crank engine drives its ship half a knot, or 6 per cent., faster than the two-crank engine. This is a very important point, and one which has not been sufficiently dwelt on by marine engineers, because in discussing the relative merits of the two and three crank engine it has been practically limited to comparing the consumption of coal per indicated horse-power.

Legal Decisions.

ASSIGNMENT OF WAGES.

A. who was employed by a steamboat company made an assignment to E. of his wages, under this employment, from October 15 to April 1 following. A. was discharged from the employment, but was again so employed on November 1 next ensuing. At the time of the discharge the company and A. contemplated this re-employment. The assignment was made for groceries furnished and to be furnished to A. and his family. A. failed to pay for the groceries and E. demanded from P., the proper officer of the company, during the term of the employment, the amount of the wages earned, which exceeded the grocery bill. Payment was refused and an equitable action brought—*Edwards vs. Peterson*—to which the defense was made that the assignment was not valid, since it was not made under an existing contract. The case was reserved for the Supreme Judicial Court of Maine, which upheld the contract. Judge Haskell, in the opinion, said: "Future wages to be earned under a present contract, imparting to them a potential existence, may be assigned, although the contract may be indefinite as to time and amount. This at law. But in equity an assignment of wages will be applied to wages to be earned under a prospective employment which is in contemplation. The assignment here is of wages to be earned of a certain employer within a specified time. It was seasonably recorded. No claim is made under it until actual notice has been given to the employer. No other creditor intervenes by an attachment, or otherwise objects to the validity of the assignment. The controversy is practically between the immediate parties to it. It cannot be said to contravene public policy. The consideration was most meritorious, and the assignment was not given to delay creditors. Whether such an assignment would be valid against subsequent attaching creditors, with or without notice, it is not necessary to decide. It is clear to our minds that this assignment must be upheld."

LIABILITY OF BANK DIRECTORS.

Depositors in a bank sued its directors for money lost by them because of the defalcation of the cashier. This officer owned one-fifth of the stock, was the leading spirit in the bank, was a man of recognized business ability, and was supposed to have the highest integrity. Yet it appeared that for nine years he had been making false entries in the books of the bank and had embezzled thereby a large amount of money. The services of the directors were gratuitous, and when the old bank was merged into the new one no new books were opened, so that the cashier was enabled to conceal his former defalcations, but there was nothing to excite the directors' suspicions, the fraud having been perpetrated through false entries. The duties of cashier, bookkeeper and teller were all performed by the defaulter. In this case the trial court held the directors were not responsible for negligence, and gave them a judgment and the case on appeal. Savings Bank of Louisville's Assignee *vs. Caperton* was also decided by the Court of Appeals of Kentucky in favor of the directors. That court, in the opinion, said: "Subordinates, and a cashier is such, must be supposed to act honestly until the contrary appears, and the law does not require their employers to entertain jealousies and suspicions without some apparent reason. The test of due care by the directors must necessarily be whether they have omitted that care which men of common prudence take of their own concerns. The examination by the directors of the books of the bank was

made in the usual way, and the fraud practiced eluded detection by means of a false balance-sheet. It is not for the court to point out the mode banks are to pursue to detect frauds; if they take the usual and uniform method adopted, not only by this, but other banks, they cannot be subject to the charge of negligence."

BANKING—COLLECTION.

N. was the receiving and paying teller of a bank, and in his embezzlement of \$30,000 he took \$1500, the proceeds of a note which had been left with him for collection. He entered the note in his own account, and had it put to his credit. The bank denied its liability, and M., the depositor, sued it and recovered a judgment. The case, on appeal to the Supreme Court of Texas—*City National Bank of Fort Worth vs. Martin*—was also ruled against the bank. Judge Maltbie, in the opinion, said: "It appears that N., the teller, after this money came into his hands, induced M. to allow him to lend it for him on a note, and that N. then took this note into his possession, and after collecting as his own in his account with the bank he appropriated the proceeds. It is claimed by the bank that this transaction relieves it of liability for the acts of the teller. But the bank does not do any such business as negotiating outside loans for its customers; it must be held to bring it in the regular banking business. It is further objected that he was only a teller to receive and pay out money; that he had no authority to collect notes. Let it be conceded that the duties of a teller, by the rules of banking, are thus limited. It was shown on the trial that the teller had on other occasions made collections for the bank; that would bind it for such collections by the teller. But, if this had not been shown, it is a well-known fact that the collection of money for others is a part of the regular business of all banks, and when a bank opens its doors for business with the public, and places officers in charge, persons dealing with them in good faith, and without notice of any want of authority in such officers, and the act done is within the apparent scope of the officers' authority, whether the officers were clothed with such authority or not, the party so dealing would be protected. If a bank does not wish the public to deal with any particular one of its officers at its regular place of business, in a particular line of that business, it would be its duty to so notify the public in some effectual way. The public certainly could not be expected to know that the person acting for the bank in the ordinary way was not duly authorized to perform customary duties. The bank must pay this judgment."

ATTORNEY AND CLIENT; MONEY RETAINED BY ATTORNEY.

W. took a summary proceeding to compel K., an attorney at law, to pay over money in his hands which W. claimed had been collected for him. K. replied that the money retained was his fee for collecting interest on a judgment for four years, he charging about 4 per cent. for his fee. W. denied that K. acted as his attorney at law in making these collections, though K. was his attorney of record in the judgment. The court below made a summary order upon K. to pay the retained money over to W., but on the appeal, *in re Kennedy*, to the Supreme Court of Pennsylvania, that court removed the order. Judge Paxson, in the opinion, said: "In the allegation of W., the petitioner, that there was no relation of attorney and client between them, it is very plain that the petition must be dismissed. It is only by virtue of such relation that the court has any jurisdiction to interfere in a summary manner in disputes between a client and his attorney. The court might as well make an order upon an

attorney to pay his tradesmen's bills. A man does not lose his right to a jury trial by being at attorney at law; he is fully entitled to try an issue of fact between himself and his client by a jury trial, as is any other citizen."

Efficiency of Marine Engines.

Improved valve gears, pistons, bearings, both as regards design and arrangement, the use of separate pumps for feed and circulating water, have all added to the efficiency of the mechanism of modern marine engines, although the multiplication and special arrangement of parts in some cases may have neutralized this improvement. Increased piston speed has led directly to economy of weight, the power developed being proportional to the speed of the piston, and the weight not being affected by the increased speed to any great extent. In the early marine engines from 150 to 200 feet per minute were the average piston speeds; now from 600 to 800 feet per minute are common, while speeds of upward of 1000 feet per minute are not unknown.

In order that high speeds may be safely and economically employed, it is necessary that the moving parts should be carefully balanced, the steam passages and ports carefully proportioned, the bearing surfaces ample, and that provision be made for a thorough system of lubrication. The extended use of steel has been the means of reducing weights of marine engines and boilers to a very considerable extent, a matter of which the importance will be more fully appreciated when we consider the statement which has been made that every ton of dead-weight capacity is worth, on an average, \$50 per annum for freight—that is to say, that every 100 tons saved from the weight of the engines and boilers, without increasing the cost of working, is equivalent to about \$5000 a year additional income to the owners.

Machinery for the Removal of Blast Furnace Cinder.—The *Engineer* reports that Hawdon's patent machinery for removing and loading up slag from the blast furnaces as fast as it is made is gradually getting more and more into use, and—at all events, in the Cleveland districts—is likely eventually to supersede all the older methods. It is already applied to the blast furnaces at Messrs. Sir B. Samuelson & Co.'s works, at Newport, and is also in operation at those of Edward Williams. The machinery is of the simplest kind. It consists of a small engine, which by means of gearing turns a pair of sheaves, round which a pair of long horizontal endless chains, like those of a dredging machine, pass. The other end of the chains passes round a similar pair of sheaves placed on a framework above the level of the wagons into which it is proposed to load the slag. Across the chain, and close together, are cast-iron dishes. The chains and dishes dip into a water tank on their way to the loading place. The stream of slag from the furnaces is made to pour into the dishes at the engine end. As they are filled they pass onward, the slag being cooled in the tank, and finally delivered in comparatively small pieces into the truck at the other end. The advantages of the new system are obvious. The old-fashioned plan of casting into large blocks, to be afterward broken up with great difficulty, is evidently wrong in principle. With Mr. Hawdon's system there is no dirt or dust, and the whole process goes on, day and night, with scarcely any attention beyond removal of the full wagons and substitution of empty ones. When tipped into barges for conveyance to sea there is no difficulty or danger to the craft. This is clearly not the case where it is delivered to the loading quay in masses weighing several tons.

Hardware.

There have been a number of conferences between manufacturers, but, for the most part, these have been for the purpose of considering the condition of the market and reaching a general understanding, rather than of taking any special action in regard to prices. There are, consequently, comparatively few changes to report, the general condition remaining as before. It is not anticipated that the opening of the year will bring with it many important changes.

Wire Nails.

For several weeks, while the agreement between the manufacturers of Wire Nails has nominally been maintained, there have been indications that the real condition of things was not entirely satisfactory, and that with an ostensible adherence to the terms of the arrangements there was in covert ways more or less irregularity. The result has been, in accordance with an intimation in our last issue, the practical breaking up of the combination, from which one of the leading Western companies has withdrawn, thus leaving the market again open and characterized by a good deal of uncertainty as to its future course. It is early at this writing to give definite figures, especially as in the existing condition of things buyers are indisposed to place orders for any considerable quantities, but we understand that some low prices have been named.

Cut Nails.

The New York market is quiet, with a slight disposition being manifested to purchase. We continue to quote \$1.80 @ \$1.90 for carload lots of Iron Nails.

A committee of Eastern Nail manufacturers has been conferring lately with representatives of the Western mills. It appears that, broadly, the outlines of the recently formed association in the Ohio Valley are as follows: According to the number of machines in each factory each mill is given a certain allotment. Monthly certified reports of sales are made. The aggregate of sales thus arrived at is credited pro rata to each concern according to its allotment. If its sales during the month have exceeded the allotment, the firm pays 10 cents per keg for the excess. If they are under it the works receive 10 cents per keg for the quantity below the allotment. It will be observed that this arrangement differs considerably from the usual allotment scheme, and that the makers do not know until the report is made up whether or not they have exceeded their share. It would certainly seem that the arrangement would cause a stoppage of indiscriminate cutting, under which the Nail trade in all parts of the country has suffered.

Miscellaneous Prices.

There has been another advance in Rope, both Manila and Sisal having been moved up $\frac{1}{2}$ cent per pound since our last issue. The following are the manufacturers' prices for large lots, with the regular discount of $1\frac{1}{2}$ per cent. for cash in 10 days:

	per pound.
Manila, $\frac{1}{4}$ inch and larger.....	14 $\frac{3}{4}$ c
Manila, $\frac{3}{8}$ inch.....	14 $\frac{1}{2}$ c
Manila, $\frac{1}{2}$ and 5-16 inch.....	13 $\frac{3}{4}$ c
Manila, Tarred Rope.....	13 $\frac{3}{4}$ c
Manila, Hay Rope.....	14 $\frac{3}{4}$ c
Sisal, $\frac{1}{4}$ inch and larger.....	12 $\frac{3}{4}$ c
Sisal, $\frac{3}{8}$ inch.....	12 $\frac{1}{2}$ c
Sisal, $\frac{1}{2}$ and 5-16 inch.....	13 $\frac{3}{4}$ c
Sisal, Hay Rope.....	12 $\frac{3}{4}$ c
Sisal, Tarred Rope.....	11 $\frac{3}{4}$ c
Sisal, Medium Lath Yarn.....	11 $\frac{1}{4}$ c

The market continues very strong, and, owing to the difficulty of obtaining the raw material, some manufacturers are refusing orders.

The following is the price list of the Union Metallic Cartridge Company, 19 Maiden lane, New York, and Bridgeport, Conn., for their Loaded Paper Shells, to which reference was made in our last issue. The U. M. C. Gun Wads are used, 1 card-board, 2 black edge over powder, 1 card-board over shot; packed 25 in a box, 500 in a case. The list as given below is subject to a discount of 40 per cent.

	Per 1000.
12 Ga. "Club" Waterproof, 8 drams, 1 oz. Nos. 7, 8, 9, 10, shot.....	\$25 00
12 Ga. "Club" Waterproof, $\frac{3}{4}$ drams, 1 $\frac{1}{2}$ oz. Nos. 5, 6, 7, 8, 9, shot.....	25 00
12 Ga. "Club" Waterproof, $\frac{3}{4}$ drams, 1 $\frac{1}{2}$ oz. Nos. 2, 3, 4, 5, 6, 7, 8, shot.....	26 00
12 Ga. "Club" Waterproof, $\frac{3}{4}$ drams, 1 $\frac{1}{2}$ oz. B.B. Nos. 2, 3, 4, shot.....	26 00
10 Ga. "Club" Waterproof, 4 drams, 1 $\frac{1}{2}$ oz. Nos. 8, 9, 10, shot.....	27 50
10 Ga. "Club" Waterproof, $\frac{4}{4}$ drams, 1 $\frac{1}{2}$ oz. Nos. 6, 7, 8, shot.....	27 50
10 Ga. "Club" Waterproof, $\frac{4}{4}$ drams, 1 $\frac{1}{2}$ oz. Nos. 5, 6, 7, 8, shot.....	28 50
10 Ga. "Club" Waterproof, $\frac{4}{4}$ drams, 1 $\frac{1}{2}$ oz. B.B. Nos. 2, 3, 4, 5, 6, 7, 8, shot.....	28 50

The above 38 combinations are regarded as sufficient for general requirements, but all other loads will be supplied to order at the following additions to list prices:

	12 Ga.	10 Ga.
Chilled Shot.....	\$1.00	\$1.00
2 U. M. C. Pink Edge Wads.....	1.10	1.60
American Wood Powder.....	10.00	12.50
Schultz Powder.....	15.00	20.00

The manufacturers of Rivets have been conferring in regard to the condition of the market, but no change has been made in prices. The condition of this line of goods is regarded as very satisfactory and the regularity which has prevailed for some time is gratifying.

Henry Huber & Co., 81 Beekman street, New York, send out the following sheet of trade discounts with their recently issued catalogue of plumbing goods:

	Dis. per cent
Pneumatic Water Closets: Tidal Wave class.....	20
Cascade.....	20
Slop Safes, Cast Iron Enameled and Porcelain.....	20
Syphon Water Closet, Surf.....	20
Closet Pulls.....	Net
Ornamental Brackets, Cast Iron, Bronzed.....	20
Ornamental Brackets, Cast Brass.....	20
Floor Plates.....	Net
Closet Seats.....	20
Washout and Hopper Combinations.....	20
Pneumatic Flushing Apparatus.....	20
Cast Iron and Copper Lined Wood Cistern.....	20
Earthenware Hoppers and Closet Bowls, Cast Iron Enameled Hoppers.....	20
Cast Lead Service Boxes.....	20
Urinals and Periodical Flushing Cisterns.....	20

Carr's Cabinet Woodwork.....	25
Repairs.....	20

Wrought-Steel Locks.

The Russell & Erwin Mfg. Company, New York and New Britain, Conn., make on page 64 an announcement which will be recognized as of special interest and importance, relating as it does to a new line of goods which they are now prepared to supply to the trade. These new goods are reversible mortise knob Locks and Latches, made from wrought steel, which they offer at prices which puts them in competition with the regular cast-iron goods. The following numbers, including both Locks and Latches, are now ready for the market, and are sold from the list prices given, which are subject to the usual discount:

No. 1040, Mortise Latch, Wrought-Steel Case and Front, Iron Bolt.....	\$1.65
No. 1041 $\frac{1}{2}$, Mortise Latch, Wrought-Steel Case, Brass Front and Bolt.....	4.75

No. 1750, $\frac{3}{4}$ -Inch Mortise Knob Lock, Wrought-Steel Case and Front, two Bolts and Nickel-Plated Key.....	3.65
No. 1751, $\frac{3}{4}$ -Inch Mortise Knob Lock, Wrought-Steel Case and Front, two Bolts and Nickel-Plated Steel Key.....	5.00
No. 1753, $\frac{3}{4}$ -Inch Mortise Knob Lock, Wrought-Steel Case, Brass Front, two Bolts, Bright Cases and Nickel-Plated Key.....	8.00
No. 1754, $\frac{3}{4}$ -Inch Mortise Knob Lock, Wrought-Steel Case, Brass Front, two Bolts, Bright Cases and Nickel-Plated Steel Key.....	8.50

In addition to the strength and finish of these goods, their lightness is especially emphasized, as indicated in the following statement of weights: Locks, complete with screws, packed in cases of 12 dozen—weight per case, 141 pounds; Latches, complete with screws, packed in cases of 50 dozen—weight per case, 221 pounds. This line will be enlarged, we are advised, as rapidly as may be; and, meanwhile, this new departure and advance in manufacturing methods will be regarded as of especial significance and importance.

Trade.

Our advices from Louisville, under date of December 22, are as follows:

The Hardware trade of Louisville, Ky., has held its own remarkably well during the past week, sales being quite up to last report and above corresponding time of last year. A jobber, speaking of the reduction of profits, asserts that, to make the same aggregate amount of sales, the trade has now to handle double the quantity of goods that it took about ten years ago, with comparatively little reduction in the expenses of selling and shipping; and, as an instance, mentioned the price was then on a certain Lock 10 per cent. on list, and now it is 70 per cent. off. The consumers get the benefit of all this margin caused by competition, first between manufacturers, and then between distributors. This is all very good for the consumers, but their needs are limited in every line, and when a break comes, like those of Wire Nails and Barbed Wire, it helps no one, and shows that production is too great, and looks as if manufacturers were not working on a safe basis, when they are compelled to sell at any sacrifice just to secure means to meet maturing paper. It discloses to the dealers a weak status, which shakes their faith, not only in those goods, but all similar lines.

Barbed Wire is completely demoralized. Certain mills who reach this territory, after stocking up the small trade through the South and West at low figures, have made another break for the jobbers. Where it will end, no one knows. Unlicensed Wire, made west of the Mississippi, is going largely into the South. It is apparent that some Wire Nail mill acted in bad faith and succeeded in breaking up a happy family that was pointed to with pride by their older Cut Nail brethren. What is causing the general weakness displayed by the Iron and Steel trade is hard to get at, especially as all were looking for a coming régime of prosperity to manufacturers, preceded by excellent crops over the country. The strong consumptive demand is as yet the great safety valve of the trade. A few more such orders as the Ohio Falls Car Company has just secured from the Pennsylvania Railroad Company will brace up matters considerably in this section, and will give many a Merry Christmas and Happy New Year in the families of the mechanics.

Items.

The Lehigh Coal and Hardware Company, Lehigh, Pa., are preparing to issue a Seed Catalogue for the season of 1889, in which a number of pages will be devoted to advertisements.

The Ludlow-Saylor Wire Company, St. Louis, Mo., have issued their catalogue No. 19, which is devoted to Wrought Iron and Wire Fences, Counter and Office Railings, Window Guards, Wirework and Wire Goods of different kinds. An interesting line of Fences is thus exhibited, especial attention being called to the company's new Iron Fences, in which, instead of having the upright rods passed through the horizontal bars or rails, thus impairing their strength, the rails are left entire, the picket-heads being separately clamped on. The clamps and picket-heads are made of malleable iron, thus giving greater strength, and the point is made that by this method

of construction a choice of picket-heads may be had by the purchaser. On the first page of the catalogue is the representation of the artistic sign separately illustrated on page 6.

Wiley & Russell Mfg. Company, Greenfield, Mass., in the catalogue and price list recently issued, describe their Patent Screw-Cutting and other Labor Saving Machinery and Tools, special prominence being given to the Lightning and Green River Screw Plates and Bolt-Cutting Machines for hand and power. Their Taps are referred to as all machine relieved, the teeth being adjusted with absolute precision and uniformity, both as to shape and size, by special machinery, which is said to be exceptionally complete. They direct special attention to their Spiral Reamers, both for chucking and finishing. The catalogue illustrates their well-known line of Shrinkers, Tire Benders, Drilling Machines, Bolt-Cutting Machines, &c.

The McFadden Company, successors to Tallman & McFadden, 1025 Market street, Philadelphia, Pa., are about to issue a new catalogue, No. 80, of which we have been favored with an advance copy. It is a large and well-printed volume showing the exceedingly complete line of goods handled by them, including Tools, Hardware, Supplies, Cutlery, &c. The volume is an interesting exhibit of the variety of tools used by mechanics, and represents many staple machines and articles, together with many others that are not so widely known, including a number of novelties. The volume abounds in illustrations, which, with the descriptive matter, are compactly arranged, permitting the representation in comparatively small space of a large variety of goods. In their notice to the trade they explain that they have endeavored to make the catalogue complete by illustrating such tools, devices and supplies as their experience has shown to be required to meet the demands of their customers, and emphasize the point that they are not a commission house, and carry in stock all the standard sizes of every line listed in the book, and have the best facilities for promptly supplying other patterns. A very satisfactory index is prefixed to the volume, and the last page of the cover is occupied by an excellent representation of the front of their building.

A regular meeting of the Heavy Hardware Jobbers' National Union was held at the Grand Pacific Hotel, Chicago, on Wednesday and Thursday of last week. An informal dinner was given to the visiting members by the Chicago jobbers on Wednesday evening at the Union League Club house.

Edwin Hunt's Sons, 182 Lake street, Chicago, conduct a jobbing house which has had quite a notable history. It was founded in New York in 1833, its first location being at 70 John street. It was then removed to the corner of Platt and Gold streets, afterward to 19 Platt street, and in 1852 it was transferred from New York to Chicago. In the latter city the first store occupied was 79 Lake street, from which place it was removed to 84 Lake street. This was before the Tremont House was raised, and the streets of Chicago were then almost impassable for mud. It was necessary to build a bridge across Lake street to transfer goods. At this location the great Chicago fire of 1871 caught the house, and it went down in the general conflagration. After the fire a temporary shanty was secured at 146 Michigan avenue, in which business was conducted until better quarters were secured at 58 and 60 Lake street. From that place removal was finally made to the firm's present quarters. It is a remarkable fact that almost the only salvage from the

great fire was the padlock on the front door and the hasp which it secured. These have quite a history also. The padlock is a curiously made English letter padlock, having four rings with the full alphabet on each, thus setting to a four-letter combination. This padlock was used on the door of the firm's first store in New York, and is in use on their door at present. For 30 years the combination was never changed, as in all that time the same persons opened and closed the door. The hasp is only less venerable than the padlock, having been in use continuously since 1847.

The plumbing trade ought to congratulate itself on the number of handsome trade catalogues which it possesses, for the value and convenience of these publications can only be estimated by those who are favored with their use. The latest of the kind is sent us by Henry Huber & Co., 81 Beekman street, New York. The volume is 11 x 7½ inches in size, and is substantially and tastefully bound in dark cloth and contains over 200 pages. In the introductory note Messrs. Huber & Co. announce that since the issue of their 1887 catalogue they have added so many modifications of their pneumatic water-closet that they have found it necessary to issue a complete list of these closets in connection with numerous other goods of their manufacture, such as wash-basins, urinals, wash-out and hopper combinations, flushing cisterns, cast iron and copper lined, of many different styles. The volume is an exceptionally handsome publication; all the illustrations are finely executed, and are printed on excellent paper, and the accompanying text is very plain and clear. All the illustrations have necessary particulars, such as dimensions, &c., and wherever the principle of construction is referred to the operation is thoroughly explained. Accompanying it is a sheet of discounts, which we republish this week among prices in another column.

We are advised that the Braddock Wire Company, Pittsburgh, Pa., have given the exclusive agency for their Barb Wire for the Ohio and Mississippi valleys to the John F. Hazen Company, Cincinnati, Ohio.

The Standard Company, 57 Haverhill street, Boston, Mass., advise us that they have decided to make only double float Beaters, the Duplex and Rival. They refer to the price of the Rival as having been reduced so low that it is taking the place of the cheaper Beaters, and they will consequently no longer make the Acme, Kingston or Standard.

Walter L. Spitz and Joseph M. Rowland, of Philadelphia, lately with the Lloyd & Supplee Hardware Company, will return January 1 to Newlin, Knight & Co., with whom they were both formerly connected.

The trade will observe on page 48 the special notice signed "Territory," answers to which are to be addressed to our Chicago office. The advertiser desires to buy a part or a whole interest in a good retail Hardware house. We are advised that he is a man of large acquaintance in the trade, with a personal acquaintance with many manufacturers, and the opportunity is regarded as a favorable one for a party desiring thus to increase his capital, or dispose of a part, at least, of his business.

The Winchester Repeating Arms Company, New Haven, Conn., have issued their 1889 calendar, which contains striking and attractive illustrations relating to the sporting use of their Arms, their Repeating Rifles and Shot-Guns being thus brought prominently to notice.

Tendencies in Trade.

We continue below extracts from letters from manufacturers in regard to the question as to whether or not their direct dealings with retailers are increasing:

Pennsylvania.—We have agencies in New York and Boston, and, so far as Wire Nails are concerned, we think there is a decided disposition on the part of manufacturers to cater particularly to the carlot buyers. In these days of active competition there is, perhaps, no trade that the manufacturer can truthfully say belongs to him, but our experience is that the large jobbers particularly can be diverted at any time by the smallest concession, but the retailer is not so liable to change about.

New York.—In the Eastern States and New York and Pennsylvania our trade is almost entirely with the retail trade, and in the vicinity of large cities—like Philadelphia, for instance—the retail dealers send orders direct to us, although they can buy at the same price from the jobber and get the goods in less time than when ordered from us. We have repeatedly notified some of the retail dealers to this effect, but the orders come to us all the same, and we begin to believe that most retailers prefer to buy direct, even at the same price.

Pennsylvania.—Chicago is the only Western agency we have established, but we find that so much territory is tributary to Chicago that we do not deem it advisable to establish any other Western agency. It is not our experience that the direct trade between the retailers and manufacturers is increasing.

New York.—We have no established agency in any Western city except Chicago, but dispose of our product principally through the jobbing trade. Formerly we sent out salesmen and solicited the retail trade, which, at the time, was successful, but latterly, owing to the fact that Cutlery is carried as a side line by so many travelers, the expenses are too large in proportion to the amount of sales, and we are compelled to do our business through jobbers.

Connecticut.—Our Chicago house is the only Western house which we have established. All the principal jobbers in St. Louis handle our goods, and indeed the same is true of all the jobbers throughout the West. Our staple goods are principally handled by jobbers, while our fine Hardware is so largely special that it is difficult to generalize from it as to any tendency of the manufacturers to deal with the retailer direct.

Ohio.—We do not think there is any increase in the direct trade between the manufacturers and the retailers. Small manufacturers cannot afford to pay traveling men to drum such trade. They prefer to do business with the jobbers, so that their goods will reach all the trade and be continually before the buyers. A manufacturer who does his business through jobbers is represented by as many as 300 salesmen. We believe in protecting the jobbers.

Illinois.—Our observations are that the retailers, such as now buy from the jobber, want to put themselves on record with their trade as buying direct, and everything being equal will give the manufacturer the preference. They can then say to their customers: "We buy direct; our expenses are moderate, and we can sell you cheaper than the larger dealer." We think the opportunity is all that is wanted for the retailer to draw his supplies direct from the manufacturer.

New York.—We have no direct representation west of Chicago, as we cover the trade all through with our travelers, taking Chicago as headquarters and shipping point for the Western trade. We are supplying the jobbing trade almost universally with our goods. At the same time we have felt almost the necessity of going to the retail trade, as the jobbing trade are not enthusiastic over a new line until,

as they say, there is a demand for them. In other words, they do not stop to investigate the merits of a line of goods, simply saying, "When we have a call for your goods we will order them." For this reason we have in the East gone to the retail trade quite extensively, and at the same time we have turned in our orders to the jobbing trade.

Ohio.—In reference to the Western market, would say we formerly depended more on that than Eastern market, as our line was more particularly adapted to that section of the country, but as we have largely increased our line we are looking more to the East, at the same time increasing our Western business. In reference to the direct trade with retailers, would say that we find where retailers buy in a small way they prefer to give their trade to the jobbing houses, thus saving their freights. We have some good trade with houses who do not claim to be jobbers, but are in a position to handle large quantities of some special goods of ours. While we have a good many customers among the jobbers, and do our best to protect them in their profits, yet we feel that one man's money is as good as another's, and are inclined to name our low prices to parties who can buy the largest quantity and pay their bills promptly.

New Jersey.—The West is proving a better market for us every year, from which we argue that the manufacture of fine Hardware, &c. is possible outside of Connecticut.

Ohio.—There is undoubtedly an increasing tendency on the part of large consumers to try and get their supplies of Screws direct from the manufacturers, but so far as retailers are concerned it is easier for them to order items like Screws, Tacks, &c., from the jobber, of whom they are buying their General Hardware, than to divide the order up, particularly as they are very likely to get lower prices for these small items from the jobber than they can from the manufacturers.

Stock-Taking Methods.

Taking account of stock is an engrossing occupation among merchants about this time of the year. In comparatively few branches of trade, however, is this task beset with as much difficulty as in wholesale Hardware. Every year the stock increases in variety, requiring more room for broken packages, and adding to the work of stock-taking immensely. It is impossible wholly to suspend sales during this period, and there is consequently more or less interference with the work of the clerks engaged in inventorying by other clerks getting out goods and filling bills. With a sufficiently large force of clerks it would, of course, be possible to perform this task in a single evening after the last bill of goods had been packed, without interruption from any cause whatever. But few establishments have occasion to employ such a large force regularly, and the temporary addition of inexperienced persons would be a hindrance, rather than an aid, so that such rapid work is not feasible. Under existing conditions, therefore, it is deemed very satisfactory if a complete inventory can be made in three or four days. Even this is remarkably quick work compared with the experience of some of the largest Hardware establishments in the country only a few years since. At that time the greater part of the month was required, and if an active condition of trade prevailed concurrently the result of the inventory was a mere approximation to the stock on hand, and by no means expressed its exact condition. By the methods now followed in well-regulated houses, stock-taking has become much more correct in its results, as well as condensed in time. So far as work is concerned, however, that has not been abbreviated, and in the nature of things cannot be. Preparations

are begun some days, and even a week or more, before the regular business of stock-taking is entered upon. All Shelf Goods are arranged in order, the stock being apt to get slightly mixed in the hurry of getting out goods, which would be a hindrance in stock-taking if allowed to continue at that time. Loose goods or broken packages are tied up after account has been made, and the number contained in the package is then marked on the outside. Packages which have been accidentally turned upside down are straightened, so that a glance will suffice to see what they are. Goods in racks are straightened, and any that have strayed into the wrong bin are put where they belong. As far as possible they are counted, tied in bundles and ticketed; all this saves time, eventually, and can be done by those having charge of the stock at odd intervals. It is considered quite a feature of the preliminary work to arm each man with a brush, and have him remove all dust from the goods and from the shelves at the same time, thus performing a good job of house-cleaning. When the day arrives which has been fixed for

could be laid down. As long as palaces can be made from ice, there is no reason why a house cannot be made from solder.

Exports.

PER BARK J. H. INGERSOLL, FROM NEW YORK, DECEMBER 14, 1888, FOR PORT ELIZABETH, SOUTH AFRICA.

By *Coombs, Crosby & Eddy.*—32 Plows, 11 dozen Plow Parts, 5 dozen Hardware, 3 dozen Plow Parts, 12 dozen bundles Washboards, 12 dozen Traps, 104 dozen Plows, 10 dozen Axes, 1 dozen Sewing Machines, 3000 pounds Nails, 4 Pumps, 227 Stoves, 6 Wringers, 9 Washing Machines, 5 dozen Washboards, 3 gross Stove Polish, 9000 feet Safety Fuse, 6 Meat Cutters, 8 dozen Edge Tools, 3 gross Hardware, 6 Meat Cutters, 6 Snaths.

By *J. Norton & Sons.*—3 boxes Windmills, 120 dozen Pick Handles, 100 dozen Padlocks, 20 cases Slates.

By *A. Field & Co.*—6 Scales, 350 feet Hose.

By *Arkell & Douglas.*—48 sets Nuts, 2 dozen Whip Sockets, 8 cases Hardware, 20 dozen Hay Forks, 30 dozen Picks, 5 Ranges, 30 dozen Picks, 5 dozen Locks, 12 dozen Axes, 1 dozen Corn Shellers, 1 dozen Trucks, 4004 pounds Plow Shares, 2 dozen Draw-Knives, 2 dozen Barrows, 1 case Planes, 20 dozen Handles, 1 1/2 dozen Bird Cages, 1000 Handles, 1/2 dozen Scales, 1 package Castings, 5 1/2 dozen Planes, 1 dozen Axes, 5 Ranges, 151

Solder House for Advertising Purposes.

stock-taking it is the custom in one large establishment, which has come under our notice, to put two clerks at each end of a section of shelves and two in the center. They count the contents of each compartment, and mark the kinds of goods and the number of each on a card which is then tacked on the shelf. They are followed by a clerk who enters the quantities thus shown in a stockbook. For the purpose of guarding against errors in this list the manager of each department then follows with a clerk, and they make up a separate list, with which the first list is compared. The work is thus done expeditiously, as the packages were previously put in order, and it is also done accurately, or as nearly so as possible.

Dressing Show Windows.

A Boston correspondent writes: A very good "attraction" for the show-window of a plumber or dealer in metals can be made from bars of solder. Those who have made cobhouses in their childhood will require very little instruction in this style of architecture. The engraving gives an idea of a style of house that can be constructed from bars of solder. Those of an inventive turn of mind can, without doubt, improve upon the design presented. If the house was made larger, a rail fence constructed of the same material could be introduced, and in place of green grass in the yard, sheets of metal of some kind

dozen Locks, 1 dozen Shellers, 2 dozen Draw-Knives, 1 dozen Barrows, 1 case Planes, 18 dozen Washboards, 8 dozen Axes, 60 dozen Brooms, 20 dozen Handles, 1/2 dozen Scales, 1092 pounds Plow Shares, 30 dozen Shovels, 75 dozen Axes, 1 dozen Wire Goods, 7 dozen Chimneys, 1 box Castings, 5 Ranges, 104 Agricultural Implements.

By *W. H. Crossman & Bro.*—14,000 pounds Nails, 102 cases Plow Parts, 50 dozen Hatchets, 150 dozen Brooms, 100 dozen Handles, 8 Scales, 10 Scales, 2 Scales, 22 dozen Hatchets, 93 cases Plow Parts, 10 dozen Clocks, 24 dozen Locks, 24 dozen Curry Combs, 33 cases Slates, 57 cases Plow Parts, 103 dozen Hatchets, 20 dozen Picks, 1/2 dozen Sledges, 1 case Hardware, 5580 pounds Sash Weights, 314 pounds Sash Cord, 90 dozen Brooms, 12,500 pounds Nails.

PER BARK EMITA, FROM NEW YORK, DECEMBER 14, 1888, FOR CAPE TOWN, SOUTH AFRICA.

By *Arkell & Douglas.*—10 dozen Axes, 3 1/2 gross Axle Grease, 25 gross Clothes Pins.

By *M. Bertiner.*—1 Sewing Machine, 10 Stoves.

By *Strong & Trowbridge.*—9 cases Scales, 3 cases Handles, 6 cases Polish, 12 cases Axle Grease, 21 cases Clothes Pins, 2 cases Axes, 79 dozen Brooms, 7 cases Clocks.

By *W. B. Fox & Bro.*—1700 pounds Brooms, 635 Handles.

By *Leayercraft & Co.*—2247 pounds Rope.

By *W. H. Crossman & Bro.*—3 gross Blacking, 11,198 pounds Sisal Rope, 100 dozen Brooms, 6 dozen Wagons, 6 1/2 gross Axle Grease, 23 bundles Carriage-Ware.

PER BARK RICHARD PARSONS, FROM NEW YORK DECEMBER 15, 1888, FOR SIDNEY, N. S. W.

By *Arnold, Cheney & Co.*—8 cases Handles, 13 cases Brooms, 100 cases Handles, 21 cases

- Axles, 29 cases Axles, 380 boxes Clothes Pins, 45,968 pieces Roofing Slate.
- By McLean Bros. & Rigg.*—15 dozen Wrenches, 8800 Bolts, 8 dozen Shears, 8 Anvils, 6 Forges, 500 pounds Tacks, 12 dozen Curry Combs, 5 dozen Braces, 9 dozen Handled Axes, 3 dozen Corn Knives, 20 dozen Picks, 1½ dozen Store Trucks, 50 packages Carriage-Ware, 41 dozen Hand Lamps, 37 packages Carriage-Ware, 7 packages Agateware, 6 Corn Shellers, 120 gross Clothes Pins, 6 dozen Washboards, 140 pounds Nails, 8 dozen Axes, 4 gross Hooks.
- By V. Basanta.*—4 gross Hooks, 323 reams Sandpaper, 8 dozen Axes, 10 dozen Saws, 800 dozen Handles, 2 dozen Jacks, 50 dozen Axes, 30 dozen Hoes, 24 dozen Hoes, 24 dozen Wrenches, 42 dozen Wire Goods, 4 dozen Choppers, 2½ dozen Planes, &c., 36 dozen Saws, 924 pounds Nails, 6 9-12 dozen Lamp Goods.
- By Arkell & Douglas.*—30 dozen Handled Axes, 50 dozen Hammers, 85 dozen Traps, 1 dozen Handled Axes, 62 dozen Picks, 5 dozen Handled Axes, 7½ dozen Wheels, 30 sets Axles, 290 pounds Bolts, 375 pounds Hardware, 6400 Spokes, 130 sets Fellos, 1 case Hardware, 6 sets Bows, 12 pairs Iron Braces, 7800 Bolts, 1175 pounds Hardware, 4900 Spokes, 350 sets Fellos, 2 cases Hardware.
- By A. S. Lascelles & Co.*—24 cases Axle Grease, 45 cases Axes, 3 dozen Bush Hooks, 20 dozen Axes, 500 Broom Handles, 100 boxes Clothes Pins, 10 dozen Spades, 2 dozen Cages, 8 dozen Blocks, 3 dozen Grindstone Fittings, 6 dozen Gate Locks, 1 gross and 6 dozen Wire Rat Traps, 4 dozen Braces, 2½ gross Razor Strops, 9 cases Scales, 12 dozen Barbers' Scissors, 2 dozen Sad Irons, 112 pounds Washita Stones, 1 gross Locks, 10 gross Polish, 2 dozen Hair Clippers, 2 cases Hardware, 4 dozen Meat Cutters, 3 cases Hardware, 1 case Cartridges, 66 dozen Traps, 8 gross Lead Pencils.
- By George R. Patterson.*—4500 pounds Manila Cordage.
- By W. H. Crossman & Bro.*—54 dozen Handles, 3 cases Plow Parts, 2 dozen Corn Mills, 1 case Hay Cutter Fittings, 71 Corn Shellers, 9 Wine Presses, 4 dozen Churns, 1 cask Pumps, 21 dozen Axes, 8 dozen Mattocks, 24 dozen Spading Forks, 3830 pounds Tacks, 2 cases Carpenters' Tools, 74 gross Wicks, 9 Stoves, 10 Windmills, 11 packages Hardware, 50 Vises, 2 dozen Guns, 1 case Gun Fittings, 12 dozen Mattocks, 12 dozen Wrenches, 40 dozen Handles, 38 dozen Files, 20 dozen Axes, 16 dozen Picks, 12 nests Pails, 6 dozen Rolling Pins, 18 dozen Washboards, 100 boxes Clothes Pins, 1 dozen Wringers, 15 dozen Razor Strops, 8 dozen Stencils, 33 cases Hardware, 8 cases Tools, 6 dozen Mattocks, 600 feet Hose, 7½ dozen Saws, 10,000 Cartridges, 1 dozen Reloading Tools, 1½ dozen Corn Mills, 6 dozen Rolling Pins, 12 nests Pails, 8 cases Hardware, 1 case Tools, 2 cases Lamp Goods, 1 gross Mop Handles, 2 cases Tools, 9 dozen Rakes, 36 dozen Handles, 30 dozen Cow Bells, 34 dozen Handles, 6000 Cartridges, 10 gross Machinery Oil, 6 dozen Grindstones, 4 cases Tools, 9 packages Hardware, 46 packages Carriage Ware, 7 cases Hardware, 1½ dozen Lawn Mowers, 2 cases Lamps, 2 cases Tools, 1 case Hardware, 4 cases Store Trucks, 6 cases Shellers.
- By Peters & Calhoun Company.*—2 cases Saddlery.
- By Fairbanks & Co.*—8 packages Trucks, 2 barrels Wheels.
- By Lazarus & Rosenfeld.*—1200 dozen Slates, 4 dozen Skates.
- By Rogers, Smith & Co.*—10 packages Plated-Ware.
- By Strong & Trowbridge.*—5 casks Pumps, 4 cases Carriage Castings, 2 cases Enamel Dressing, 8 cases Tools.
- By Coombs, Crosby & Eddy.*—25 cases Hoes, 48 cases Handles, 2 cases Clocks, 2 dozen Hammers.
- By W. K. Freeman.*—1583 pounds Tackle Blocks.
- By F. B. Wheeler & Co.*—4 cases Harness, 1629 pounds Wire Cloth, 10 dozen Brushes, 9 Poles and Neck Yokes.
- By H. W. Peabody & Co.*—24,000 feet Fuse.
- By Ansonia Clock Company.*—84 boxes Clocks, 26 boxes Clocks, 52 boxes Clocks.
- By P. D. Ackerman & Bro.*—3 casks Plated-Ware, 3 casks Plated-Ware, 3 casks Plated-Ware.
- By Bradley & Hubbard Mfg. Company.*—25 cases Lamp Goods.
- By Waterbury Clock Co.*—18 boxes Clocks.
- By Healy & Earl.*—12 cases Pumps, 8 packages Forges.
- By Russell & Erwin Mfg. Company.*—11 cases Hardware.
- By Meriden Britannia Company.*—2 packages Plated-Ware, 6 packages Plated-Ware.
- By Singer Mfg. Company.*—900 Sewing Machines and Parts.
- By Manhattan Brass Company.*—65 packages Hardware.
- By A. Field & Co.*—6 dozen Harness Trimming, 2 cases Harness-Ware.
- By H. F. Roberts.*—1 box Clocks, 1 box Clocks.
- By S. H. Payne.*—815 Skates, 100 Skates.
- By K. W. Cameron & Co.*—7 boxes Castings, 2 cases Saddlery, 1 case Saddlery, 1 case Saddlery, 1 case Harness Oil, 6 packages Blacking, 2 packages Blacking.
- PER BARK PANDA, FROM NEW YORK, DECEMBER 17, 1888, FOR PORT NATAL, AFRICA.
- By W. H. Crossman & Bro.*—54 cases Plow Parts, 48 dozen Handles, 10 dozen Axes, 120 dozen Brooms, 4803 pounds Sisal Rope, 8 Washers, 1 dozen Corn Shellers, 1 dozen Store Trucks, 2 dozen Axes, 12 dozen Hatchets, 100 dozen Handles, 6 dozen Axes, 128 dozen Handles, 6¼ dozen Meat Cutters, 120 dozen Hatchets, 77 cases Plow Parts, 1½ dozen Mangles, 10 dozen Axes, 560 pounds Nails, 120 dozen Brooms, 1 dozen Churns, 8 dozen Wheelbarrows.
- By Higginum Mfg. Company.*—2 cases Corn Mills.
- By Coombs, Crosby & Eddy.*—26 cases Plows, 1000 Broom Handles, 12 dozen Tools, 10 cases Slates, 36 doz. Handles, 12 dozen Hardware, 50 dozen Tools, 6 sets Axles, 34 pieces of Plated-Ware, 1 dozen Clocks, 1 Lamp.
- By Corner Bros. & Co.*—8 cases Hardware, 6 cases Slates, 103 cases Hardware, 180 cases Agricultural Implements.
- By Marcial & Co.*—9 Corn Shellers, 16 Axes, 22 Springs, 68 Axes, 5 dozen Brackets, 18 dozen Locks, 78 dozen Brackets, 266 pounds Stone, 15 pounds Wire Nails, 36 pounds Wire, 44½ dozen Bits, &c., 9 Trucks, 16 Dozen Picks, 5 dozen Axes, 7 dozen Hatchets, 1 dozen Adzes, 5 dozen Irons, 9 dozen Wrenches, 6 Meat Choppers, 194 dozen Handles, 11 dozen Saws, 5 dozen Trowels, 5 dozen Screw Drivers, 1 dozen Gauges, 24 dozen Compasses, 6 dozen Saw Backs, 12 Saws, 24 Clamps, 15 dozen Files, 2 dozen Braces, 10 Washers, 10 dozen Brooms, 10 dozen Handles, 5 dozen Rolling Pins, 5 gross Clothes Pins, 16 Plows, 125 Plow Points, 50 Plow Wheels, 6 Trucks, 6 Corn Shellers, 16 Plows, 4 Churns, 24 Pumps.
- PER SHIP GENERAL DOMVILLE, FROM NEW YORK, DECEMBER 17, 1888, FOR MELBOURNE, AUSTRALIA.
- By W. H. Crossman & Bro.*—450 dozen Handles, 11 4-12 dozen Perambulators, 6 cases Lamp Goods, 10 packages Hardware, 3 Wagon Jacks, 3 packages Oil Stones, 12 Gross Cotton Lines, 1 gross Whip Stocks, 3 dozen Meat Choppers, 200 pounds Handles, 396 dozen Handles, 12 cases Tools, 14 cases Hardware, 8 packages Lamp Goods, 124 dozen Axes, 3 gross Machine Oil, 1 dozen Meat Choppers, 1-6 dozen Sausage Stuffers, 2 dozen Bush Hooks, 14 dozen Axes, 2 dozen Hatchets, 4 dozen Mattocks, 600 pounds Nails, 4 cases Plated-Ware, 3 cases Hardware, 4½ dozen Rakes, 5 dozen Spading Forks, 6 cases Hardware, 8 cases Tools, 4 dozen Wringers, 2 dozen Clocks, 14 dozen Perambulators, 200 Boxes Clothes Pins, 30 kegs Nails, 14 Lawn Mowers, 00 dozen Axle Grease, 1 case Tools, ½ dozen Meat Choppers, 7 cases Tools, 5 packages Hardware, 102 pounds Rivets.
- By Arkell & Douglas.*—5000 pounds Nails, 60 dozen Hatchets, 25 dozen Brooms, 500 Broom Handles, 1 gross Shade Rollers, 1 gross Match Safes, 7 dozen Granite-Ware, 2 dozen Velocipedes, 48 dozen Handles, 1 dozen Wringers, 1½ dozen Saws, 10 dozen Axes, 1 gross Broom Handles, 50 gross Clothes Pins, 450 pounds Horse Nails, 13 gross Lamp Wicks, 1320 Spokes, 3 dozen Shafts, 1 dozen Locks, 100 pounds Castings, 2 dozen Wringers, ½ dozen Augers, 1 dozen Clocks, 10 dozen Hoes, 4 dozen Axes, 32 dozen Saws, 3 gross Hat and Coat Hooks, 3 dozen Meat Choppers, 1 box Hardware, 5 dozen Saw Handles, 6 dozen Wringers, 6½ dozen Braces, 60 dozen Tools, 6 gross Shoe Blacking, 2 dozen Miter Boxes, 2 dozen Wringers, 12 dozen Plumbs, 19 dozen Axes, 14 dozen Chisels, 46 dozen Axes, 8 dozen Braces, 1646 pounds Castings, 108 dozen Handles, 6 dozen Transom Lifters, 21 dozen Axes, 6 dozen Tools, 47 reams Sandpaper, 8 dozen Plumbs, 20 dozen Hoes, 4 dozen Lampware, 3 gross Hammers, 1 case Lamp Goods, 100 pounds Nails, 756 pounds Castings, 800 Spokes, 8 sets Wheels, 5 sets Wheels, 8 sets Wheels, 1134 pounds Bolts, 6 sets Wheels.
- By R. W. Cameron & Co.*—24 packages Carriage Ware, 15 cases Axles, 11 boxes Castings, 6 cases Bolts, 6 cases Axles, 5 cases Axles, 7 cases Axles, 4 cases Bolts, 18 cases Bolts, 18 cases Axles, 12 boxes Bolts, 7 boxes Saws, 11 boxes Hardware, 2 cases Hardware, 1 case Emery-Wheels, 1 box Hames, 3 Blowers, 8 boxes Agricultural Machinery, 1 Blower, 1 case Hardware, 4 cases Hardware, 4 cases Saddlery, 2 cases Window Shades, 1 case Forks, 2 cases Plumbs and Levels, 14 cases Door Locks, 2 cases Saws, 12 cases Axes, 6 cases Perambulators, 1 case Perambulators, 105 kegs Cut Steel Nails, 3 boxes Malleables, 10 boxes Bolts, 16 boxes Hubs and Spokes, 7 boxes Carriage Axles, 3 boxes Carriage Forgings, 5 boxes Hubs, 108,000 Slates, 52 cases Hardware, 176 cases Hardware, 50 boxes Clothes Pins.
- By Strong & Trowbridge.*—1 case Tools, 1 case Traps, 1 case Tools and Saws, 1 case Traps, 2 cases Rivets, 1 cask Pumps, 1 case Castings, 2 cases Wrenches, 2 cases Whetstones, 2 cases Lampware, 6 cases Machine Oil, 3 cases Hardware, 1 case Nails, 1 case Tools, 1 case Castings, 65 cases Axes, 30 cases Handles, 37 cases Handles, 15 cases Handles, 1 case Axles, 2 cases Carriage-Ware.
- By H. W. Peabody & Co.*—3 cases Tills, 1 case Clocks, 8400 pounds Nails, 19 packages Hardware, 13½ dozen Handles, 1 case Cartridges, 1 case Lampware, 1 case Agricultural Implements, 19 cases Wood-Working Machinery, 3 cases Hardware, 8 packages Hardware, 24,000 feet Fuse, 11,200 pounds Barb Wire, 4 cases Hardware, 31 packages Wringers, 1 cask Pumps, 2380 pounds Axle Grease, 20 cases Edge Tools, 2140 pounds Bolts, 101 pieces Hardware, 700 pounds Axle Grease.
- By McLean Bros. & Rigg.*—27 dozen Dog Collars, 12 dozen Padlocks, 4 gross Lead Pencils, 54 Store Trucks, 18 packages Lampware, 1 gross Scroll Saws, 18 dozen Pruning Shears, 57 dozen Wrenches, 57 dozen Saws, ½ dozen Store Trucks, 38 dozen Hammers, 48 dozen Axes, 24 dozen Lampware, 2 dozen Irons, 7 cases Agateware, 38 dozen Gate Latches, 1 dozen Drills, 30 dozen Brackets, 10 dozen Hay Forks, 48 dozen Mouse Traps, 8 dozen Carpet Sweepers, 95 dozen Axes, 3 dozen Alarm Tills, 60 gross Safety Pins, 24 Scrapers.
- By R. W. Forbes & Son.*—40 Axes, 2 boxes Oil Stone, 2 cases Kitchen-Ware, 3 packages Pumps, 4 boxes Clocks, 40 Oilers, 9 crates Hardware, 3 Oil Stoves, 3 cases Stamped-Ware, 8 packages Hardware, 12 Handles, ½ gross Match Safes, 12 dozen Forks, 493 Carriage Bolts, 4 Picks, 6 dozen Axes, 144 packages Carriage Woodware, 396 pounds Sandpaper, 150 sets Axles, 35 packages Carriage Hardware, 21 boxes Axes, 43 packages Carriage Woodwork.
- By Seth Thomas Clock Company.*—1818 Clocks.
- By Joseph Dixon Crucible Company.*—418 pounds Lead Pencils.
- By Nevins & Haviland.*—41 gross Shade Rollers.
- By J. W. Norton & Sons.*—1136 dozen Handles.
- By Singer Mfg. Co.*—520 cases Sewing Machines and Parts.
- By Waterbury Watch Company.*—6 cases Clocks.
- By Barber & Co.*—3997 pounds Iron Castings.
- By Welsh & Lea.*—15 cases Iron Bolts, 6 cases Saws.
- By Ansonia Clock Company.*—41 boxes Clocks.
- By Peck, Stow & Wilcox Company.*—4 cases Tools, 46 cases Hardware, 23 packages Hardware.
- By Morris, Strouse & Co.*—9 dozen Table Casters, 24 dozen Hammers, 72 dozen Iron Tacks, 1 dozen Money Drawers, 42 pounds Stone, 46 dozen Mouse Traps, 3 dozen Clothes Wringers, 350 gross Safety Pins, 6 gross Shade Rollers, 28 gross Tools, 32 gross Tools, 3 gross Kitchen Forks, 2 gross Hatchets, 50 pairs Roller Skates, 21 gross Drawer Pulls.
- By A. Field & Co.*—36 sets Springs, 78 Axes, 9 gross Snaps, 2 cases Harness Ware, 6 dozen Brushes, 2 gross Axle Grease, 2 gross Harness Ware, 4 gross Axle Grease, 3 gross Harness Ware, 12 gross Whips, 16 dozen Hardware.
- By Healy & Earl.*—2 cases Sandpaper, 2 cases Sandpaper, 10 cases Steam Governors, 2 cases Emery Machinery, 18 cases Woodworking Machinery.
- By Winchester Repeating Arms Company.*—12 Guns, 12,000 Metallic Cartridges.
- By Mailler & Quereau.*—6 cases Cultivators.
- By S. H. Payne.*—26 cases Plated-Ware.
- By E. Miller & Co.*—24 packages Lamp Goods, 22 packages Lamp Goods.
- By Bradley & Hubbard Mfg. Company.*—7 packages Lamp Goods.
- By Itley, Doubleday & Co.*—6¼ gross Axle grease.
- By W. K. Freeman & Co.*—20 cases Hardware.
- By F. B. Wheeler & Co.*—72 sets Axles, 6625 pounds Carriage Woodwork, 3 cases Hardware, 12 dozen Axes, 20 packages Hardware, 68 sets Harness.
- By Coombs, Crosby & Eddy.*—48 dozen Handles, 5 gross Hardware, 100 boxes Clothes Pins, 5 dozen Hardware, 11 dozen Hatchets, 28 dozen Rakes, 3 dozen Tools, 47 cases Slates.

The next annual meeting of the Ohio Institute of Mining Engineers will be held at Lyndon Hall, Columbus, Ohio, January 10 and 11, 1889. A large number of very excellent papers are expected, and the meeting promises to be one of great interest.

The Yankee Land Roller.

The accompanying illustration represents this machine, which is manufactured by the Wheel and Seeder Company, of Fond Du Lac, Wis. It is so constructed that the shell can be shipped empty, thus securing an important saving in freight. After it is received, the shells can be filled with stones to give the requisite weight, adapting it for use on different soils. The rollers weigh only from 600 to 800 pounds, and will weigh when filled from 1200 to 2800 pounds, as may be desired. The rear sections of this roller are hung independently on a pawl and socket coupling, and the weight of the driver is equally distributed on each section. It can be easily uncoupled by raising the tongue and unhooking the front section from the cross bar. The draft of the rear roll is referred

in which the blade is secured. The highest priced or Perfection screw-driver, Fig. 1, is intended to answer the same purpose as the ratchet drivers now in the market, with the advantage of greater

polished blade as the Perfection driver, but it differs from the latter in having a malleable iron sleeve, with external ribs or corrugations, firmly secured to the blade, and this sleeve thus attached to the

Fig. 1.—The Perfection Screw Driver.

simplicity and facility for use. As will be observed by the cut, a twelve-sided cone is fastened to the end of the blade, and this cone fits a corresponding twelve-sided cup which is firmly embedded in the wood of the handle at its strongest point. A coiled steel spring lies in the cup be-

blade is forced into the body of the handle, the corrugations cutting their way through the wood, the opening being closed with a wooden plug of the same material as the handle itself. Thus it will be seen that instead of having a tang driven into the weakest and smallest part

The Yankee Land Roller.

to as lessening the weight of the tongue on the horses' necks, thus making it easier on the horses. It is so equipped that it is easily handled, and turns around without difficulty. These rollers are built in three sizes: Three rolls, 9 feet wide, diameter of roll, 16 inches; three rolls, 12 feet wide, diameter of roll, 16 inches; three rolls, 15 feet wide, diameter of roll, 16 inches. The sections have cast-iron and hardwood staves $1\frac{1}{4}$ inches thick. The journal and portion of head can be removed for the purpose of filling the sections with grout or heavy mixture to get the desired weight. The following advantages in these rollers are referred to by the company: That they do the best work by getting the requisite weight on the ground; that they are easily handled, as they are not bound together with unnecessary framework; and that the taking off of two nuts separates the three sections, so that they can be readily stowed away.

New Screw-Drivers.

J. H. Sternbergh & Son, Reading, Pa., well known as manufacturers of bolts, nuts, rivets, washers, &c., have just entered upon the manufacture of an entirely new line of screw drivers embracing three different styles, illustrated herewith. The blades of these tools are made of round steel, highly polished, with elegant points, which are referred to as hardened and tempered for the purpose. The three styles of screw-drivers and the special features of their construction are represented in Figs. 1, 2 and 3, which give a sectional view of the handles, showing the manner

neath the cone. In driving a screw with this tool the blades become fast by pressure on the handle, as the cone is thus forced into its cup, and when the pressure is released the cone is forced out by the action of the screw, thus making it serve the function of a ratchet screw-driver, so that a screw may be driven into the wood

of the handle, the wood of which is liable to split, this screw-driver has the blade secured on the strongest part of the handle and firmly embedded, so that under severe use the handle is not liable to be injured in the least.

The Ideal screw-driver, Fig. 3, is described as having a flat beech wood

Fig. 2.—The Acme Screw Driver.

or turned out from the wood without shifting the hand. In this respect the manufacturers allude to the driver as having the advantage of simplicity over the screw-drivers having pawls to shift, and being more or less liable to get out of

handle of the natural color of the wood with brass ferrules, and differs from the other two described in having that part of the shank which enters the handle squared half its length and forced through a smaller bore than the size of the blade

Fig. 3.—The Ideal Screw Driver.

order on account of their complicated construction. The tools are finely finished, with nickel-plated ferrules and ebonized handles.

The Acme screw-driver, Fig. 2, has a mahogany finished handle with nickel-plated ferrule, and the same highly

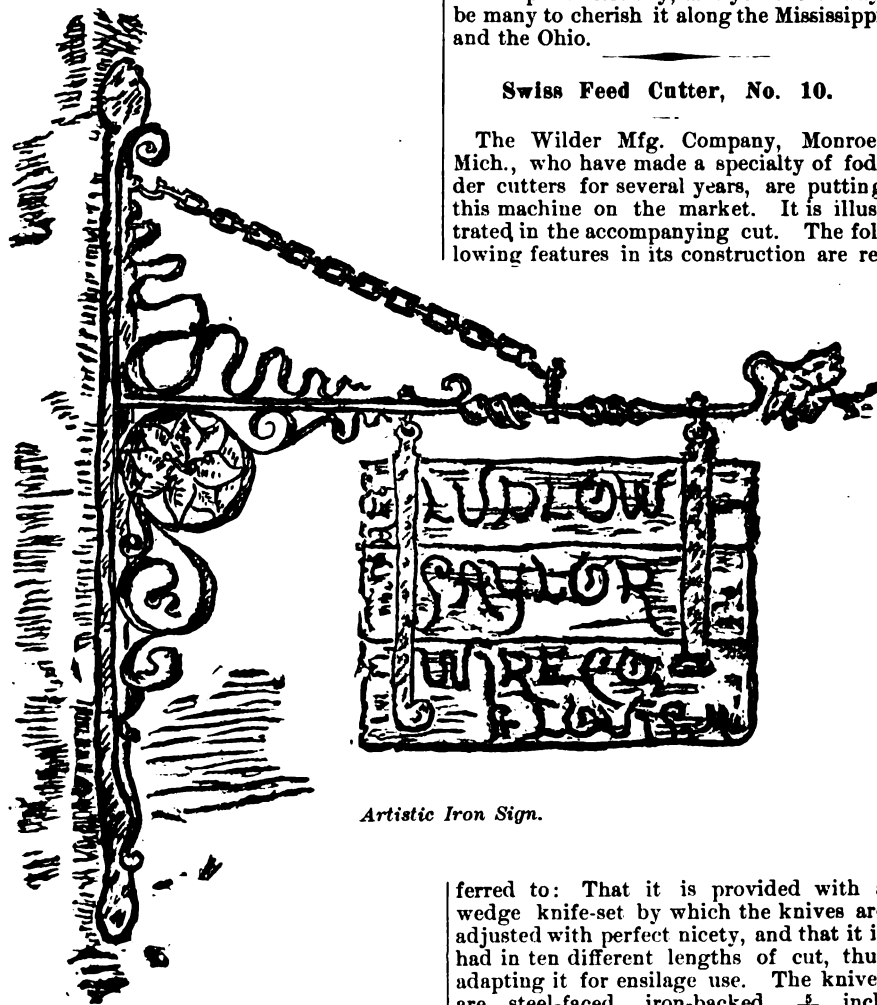

itself, thus firmly embedding the shank in the hardwood of the handle and making a substantial and elegant tool. It is, however, offered to meet the demand for a cheaper tool than either of the two above mentioned, while at the same time the blade will be as highly polished and

of the same material as the Perfection and Acme. It is thus the intention of the manufacturers in offering these three styles of screw-drivers to meet the wants

at a snail's pace and with ruinous consumption of steam power by the towboats. The idea of using such a route in competition with the lakes is too ludicrous to contemplate seriously, and yet there may be many to cherish it along the Mississippi and the Ohio.

Swiss Feed Cutter, No. 10.

The Wilder Mfg. Company, Monroe, Mich., who have made a specialty of fodder cutters for several years, are putting this machine on the market. It is illustrated in the accompanying cut. The following features in its construction are re-

Artistic Iron Sign.

of the trade, embracing low-priced, medium and ratchet screw-drivers. These goods will be placed on the market on January 1.

Artistic Sign.

The accompanying illustration represents a wrought-iron sign, which is manufactured by the Ludlow-Saylor Wire Company, St. Louis, Mo. It is made of iron throughout. The sign-board is usually painted black, and the letters are raised copper. The sign is treated in imitation of the Bauer-Barff process, and from its unique character, the tastefulness of the design, its attractiveness and durability will doubtless be appreciated by the trade.

A Cleveland paper says the scheme made public at St. Paul, Minn., for establishing a route for iron ore shipments from the Lake Superior region to Pittsburgh, by rail to the Mississippi at the head of navigation and thence by river to the heart of the Western Pennsylvania iron region, may tickle the fancy of St. Paul enthusiasts, but it is a ridiculous child of some nimble imagination. The rail haul to St. Paul would be nearly or quite equal to the distance from the lake ports to Pittsburgh, and the question would therefore resolve itself into one of competition between the lake route and a river waterway twice as long. Judging from the experience of the Pittsburgh coal shippers with their barges, about the only time when much coarse freight can be sent down the Ohio is during a freshet or flood, and that would be the precise time when the ore barges could not possibly be towed up stream, except

ferred to: That it is provided with a wedge knife-set by which the knives are adjusted with perfect nicety, and that it is had in ten different lengths of cut, thus adapting it for ensilage use. The knives are steel-faced, iron-backed, $\frac{1}{8}$ inch thick, and described as perfectly tem-

pered. The precision with which, by means of the wedge knife-set, the knives can be adjusted, thus allowing the machine to be run at a high rate of speed without wearing the knives or blades or producing friction, is also alluded to. The capacity of the machine when run by power is stated to be from 1500 to 2500 pounds per hour, varying according to speed, nature of material and length of cut.

Improved Wick Raiser.

The American Oil Stove Company, Gardner, Mass., have lately incorporated in the construction of their American and Baby American oil stoves a form of wick raiser for which strong claims are made. The engraving presented herewith will afford the reader a very good idea of

Improved Wick Raiser.

its general appearance and the manner in which it operates. An inspection of the cut reveals the fact that the raisers consist essentially of two spindles, grooved both longitudinally and transversely, and so geared together that the crests of one spindle come opposite the longitudinal grooves of the other. The arrangement allows of a free passage for the oil, while the raisers engage the wick at 26 different points. Each spindle is constructed in a solid piece, no solder being employed. The housing or receptacle for the raiser is flush with the edge of the wick tube, which allows the raiser to come full to the edge of the wick. The device is claimed to give very good results in operation, all the essential constructive features being

Swiss Feed Cutter, No. 10.

fully covered by patents. It is strongly made, easily operated, and, possessing few parts, will not easily get out of order.

It is a curious development of the Treasury secret service that Italians constitute about one-half of the counterfeiters put under arrest. The United States can easily dispense with this development of the fine arts.

CURRENT HARDWARE PRICES.

DECEMBER 26, 1888.

Note.—The quotations given below represent the Current Hardware Prices which prevail in the market at large. They are not given as manufacturers' prices, and manufacturers should not be held responsible for them. In cases where goods are quoted at lower figures than the manufacturers' name, it is not stated that the manufacturers are selling at the prices quoted, but simply that the goods are being sold, perhaps by the manufacturers, perhaps by the jobbers, at the figures named.
